All our words, indeed, are, properly speaking, of learned origin; and many of them may have been introduced unnecessarily; but mere pedantry has had very little share in their introduction. They have, for the most part, been adopted, not from the classic, but from the low and (strange as the association may appear) philosophic Latin; not directly from the schools, or from mere scholars; but from the professions, and in connexion with the arts and sciences, and institutions, and inventions, and improvements, and business of life. The schools and colleges are, indeed, distant reservoirs of the regular supplies; but the cisterns whence they are directly received, the immediate channels of communication, are government, legislation, jurisprudence, theology, physic, &c. &c.; or, to include all in two words, the sciences and the arts. The great agents in the formation of our language (as of every language) have been authors (such as ever had any influence—for there are many writings that never had readers) and orators, legislators and lawyers, ministers of state and ministers of religion, physicians and apothecaries, inventors and improvers in all the sciences and arts which are in any respect connected with the wants and wishes of men. These are the influential, the assimilating, the transmuting agents of every people. Hence the obvious reason, as before intimated, why the English language is partly Greek, but chiefly Latin.

SECT. IX.—VOCABULAR REDUNDANCY AND DEFICIENCY.

These extremes not only meet in the same language; but in proportion as it is remarkable for the one, it is also remarkable for the other. The most defective and least philosophic languages present these attributes so strikingly as to render them obvious to every enquirer. Take, for example, the Saxon, which is evidently what all languages are in a greater or less degree, remarkable for vocabulary redundancy and vocabulary deficiency: they have too many and too few words: they have too many of one sort and too few of another: they have a superfluous multitude of words of general import, but they are poor and destitute of particular, distinctive, and definitive terms: they will furnish you with a thousand names for one and the same entity (like the wonderful Arabic, to which its admirers give the praise of a thousand names for a sword); but there are a thousand entities for which they supply no name.

Both these opposite qualities are evidently great faults—not perfections in language. As to the one, there never, probably, has been but one opinion, and that sufficiently correct; but concerning the other, much error and confusion have prevailed. One will eulogize the copiousness of a language by exaggerating the number of names which it possesses for one object; another will affirm, that there are no two words, in any one language, that are precisely synonymous. The last is one of those positions which are so freely hazarded on all subjects, concerning which men consider themselves fully justified by established usage, in thinking little and saying much. The usual boast of verbal copious-

ness is as if a savage were to demonstrate how extraordinary his wealth is by exhibiting a thousand bows, kept for his own exclusive use; or as if a mechanic were to prove the amazing abundance of his tools by exhibiting a thousand hammers.

What is wanted is a sufficient number of apt tools or verbal instruments for every intellectual purpose. Tried by this test, the English has, perhaps, as little imperfection as any language, ancient or modern; though it has much useless and cumbrous copiousness of one description of terms, and considerable deficiency of another. It has (like every other language) too many terms of general, and too few of particular import: it has too many generic and too few specific and individualic terms: there are a thousand names for one logical genus; but many of the logical species and individuals have no names assigned to them. These two opposite faults (which are mutually proportionate) are two of the grand imperfections of language; and principal causes of much of the error, deception, misunderstanding, controversy, and other evils which have prevailed, and, probably, will prevail to the end of the world: for, if the moral nature of human beings were as good as that of angels, they could not rise to any very high state of perfectibility, without a much less imperfect instrument of verbal intercommunication than they yet possess. We are not very sanguine concerning remedies for any existing evils; but it is something to indicate their causes; the knowledge of which, if not available for any great improvement, is at least likely to remove the mental malady of false theory.

SECT. X.—OF LOGICAL DIVERSITIES OF VERBAL SIGNIFICATION.

It is probable that the author would not have invited attention to the distinctions indicated above, but for a small publication entitled, *A Table of the Springs of Human Actions*, by the acute Jeremy Bentham.

There can be no doubt that the fact, so distinctly stated in the above publication, was previously as familiar to minds in any considerable degree logical, as was the principle of mental association before it was so distinctly stated by Mr. Hobbes. Indeed, some remarks of the latter (as, where he distinguishes among different names applied to the same thing, according as it is liked or disliked) approach so very nearly to the very distinctions employed by Mr. Bentham, that the author concluded, that the philosopher of Westminster had borrowed from the philosopher of Malmsbury.

All words that have any import (for some are as destitute of import as mummies are of life), are obviously distinguishable into passionate and unpassioned, or passionate and dispassionate: the one indicate thoughts, the other sentiments; i. e. the one indicate mere perceptions or acts of the understanding (the dry pure light of reason, as Bacon terms it): the other indicate thoughts as imbued with (or, as Bacon terms it, drenched in) the affections: in the one, logical entities are presented, unaccompanied by any judicial decision concerning them, by the affections; in

the other, they are accompanied by a sentence of approbation or disapprobation: in the one there is no indication of feeling, any more than if the mind were pure abstract intellect, incapable of emotion; in the other there is an expression of feeling, either of like or of dislike, either of pleasure or of displeasure, or (what is the lowest degree of the same thing) either of approbation or disapprobation.

As all words are either impassioned or unimpassioned; so all the former obviously admit of being ranged in two opposite classes, answering to the opposite states or acts of mind, which are expressed by the terms approbation and disapprobation, affection and disaffection. Hence, after separating all words into impassioned and unimpassioned, Mr. Bentham again divides the first division into eulogistic and dyslogistic, and thence denominates the unimpassioned class neutrologistic.

Perhaps the scientific purpose intended, is as well accomplished by these as by any designations that could be invented. If there be any objection to them, it is, that they are not sufficiently popular. Perhaps approbative, disapprobative, and neuter or neutral, would be more obvious distinctions: non-probative might be objectionable. But what is wanted for such purposes is a designative phraseology of fixed and definite import: that which is least popular is most likely to ensure these qualities: and it is a tribute of respect due to inventors and improvers not hastily to reject or lightly to alter the terms employed by them.

From the very nature and general habitudes of the human mind; from the history of man; from our own observation and experience, it might be inferred that language has much of an impassioned and little of an unimpassioned character; that it is composed chiefly of eulogistic and dyslogistic, and contains few neutrologistic terms. Human beings as infallibly impress their own likeness upon their mental and moral, as upon their natural offspring. Hence the obvious similitude of idiomatic peculiarity to national character; or the correspondence which exists between the genius of a language and the genius of a people; for, according as the one is more or less impassioned (not to advert to other circumstances here), so is the other. But whatever natural, mental, moral, and political diversities may exist in mankind, they all agree in this, that they are more under the dominion of passion and prejudice than the guidance of reason: hence, every language (even the wisest, comparatively considered) has much of the attribute of absurdity: and every language (even the most neutrologistic) has much of a passionate and little of a dispassionate character. Every language, therefore, is very fit for rhetoric (taken in the widest possible import), but very unfit for logic; is an apt and powerful weapon of passion and prejudice, but a very defective instrument of reason.

It is of some importance to know things as they truly are, whether we can change them or not; for without that knowledge there is no chance of improvement. There is very little reason to hope for a perfect language; but in proportion as we understand the nature, and become ac-

quainted with the imperfections, of that which we have, the more are we likely to make a proper use of it; and to guard against the errors and prejudices and other evils which result from its unfitness for logical purposes: the important principle of utility will be more steadily kept in view; enquiry after truth will be more successful; discussion will be more fair and honorable, and the temper of disputants more candid. He who strives not for rhetorical display or polemic victory; who aims only at truth in theory and utility in practice; who wishes not to take any unfair advantage of the understanding of those to whom he speaks or writes, will endeavour to employ neutrologistic phraseology: and he who is determined to prevent, if possible, others from taking an unfair advantage of his understanding, will carefully watch the verbal movements, and will guard against the stratagems and assaults of impassioned language, consisting of eulogistic and dyslogistic terms.

Before leaving this subject, it may be useful to subjoin a few distinct remarks.

1. Out of the most multitudinous vocabulary, very few terms, comparatively considered, can be selected that are absolutely neutrologistic; i. e. purely intellectual, without any mixture of sentiment and prejudice and passion. The whole verbal multitude (with the exception of a mere handful of neutrals), belonging either to the eulogistic or dyslogistic faction. They may be distinguished by many shades of character as partisans; but they are all approbative or disapprobative, respectful or disrespectful, admiring or contemptuous, fond or invidious.

2. The neutrologistic terms of a language are not only very few; they are liable to be corrupted. Take a recent instance: what adjective could well be more neutrologistic than radical was only a few years ago? But it had the misfortune to be adopted by a particular class of political reformers; and the consequence has been, that this humble member of the vocabulary is already strongly dyslogistic—deeply imbued with contempt and aversion; and, to many a mind, it is nearly, if not quite, as odious and exasperating as democrat or revolutionist. In this manner have thousands of words been perverted from their primitive simplicity of unimpassioned import; and when once thus corrupted, it is impossible for them to recover their original innocence. There are almost numberless instances of dispassionate, becoming passionate phraseology; but the instances of a contrary process or transmutation are very rare.

3. Eulogistics and dyslogistics are properly antithetic or rather antipathetic to one another; but many words are made to perform both parts: thus *saint* is a gracious eulogistic, as employed by one description of persons; but a most ungracious dyslogistic as employed by another: in the one it indicates sincere partiality; in the other sarcastic bitterness. Any eulogistic may thus be sarcastically converted into a dyslogistic: hence many terms have the two opposite characters at the same time, according to the tempers and opinions of the agents employing them: and hence, also, the radical and permanent change from the one extreme of fixed and universally

received import to the other, which words experience in process of time; for either may be changed into the other; but in the struggle between what is termed the good and the bad sense of a word, the evil spirit generally prevails: for we have many examples of beautiful approbatives being changed in course of time into such ugly disapprobatives as to be quite frightful; but we have few examples of the contrary process. The reason is obvious: ridicule, if not the test of truth, is a test which few people are willing to have either their persons or their opinions tried by; and they as naturally shrink from odious charges. When, therefore, dyslogistic phraseology is applied to that in which persons are interested or implicated, they feel like a man accused of a horrible offence; who is willing to change not only his abode, but his very name, rather than encounter the imputation or bear the odium. Such words as *despot* and *tyrant* were once very loyal names; but it would be libel or treason to apply them now to such persons as they used to designate: *pedant* and *pedagogue* were once of very innocent and laudable import; but the persons so designated became ashamed of their antique name, and consider themselves insulted or persecuted when it is now applied to them: *parson* and *priest* were at no great distance of time very respectable and even honorable names; but instead of being proud of them, or making a noble stand for their eulogistic dignity against the lewd laity; the reverend gentlemen, to whom they were applied, became ashamed of them, and were willing to assume such a servile name as minister, or such a clumsy designation as clergyman; and, if these be fated to become dyslogistic, they also will be discarded.

It was remarked in another place, that the tendency is for the members of the vocabulary to sink, not to rise in the scale of dignity; as we have numerous instances of polite words and phrases becoming vulgar; but few or no examples of a contrary process. The same holds with the eulogistic and dyslogistic distinctions: we have almost numberless instances of the former sinking into the latter, but few instances of the latter rising into the former: and these few instances are only found when the persons or parties intended to be mortified and disgraced, by a dyslogistic designation or nickname, take kindly to it and glory in it; for then the malignant intention of their enemies is defeated, and a reaction commences in favor of the persecuted. *Christian* (as well as *Nazarene*) was perhaps at first a nickname; but the persons thus designated took kindly to the invidious distinction, and gloried in it, as well as in that ignominious peculiarity of their religion, the *cross*. The result was, that both rose in process of time into the highest estimation. *Quaker* was originally a nickname; but the *Friends*, who have always possessed too many respectable qualities to be a degraded caste (for in that case the most honored designation ever invented must have sunk with them), took, if not cordially, at least patiently and meekly to their nickname, and described themselves as the people commonly called *Quakers*: the result is, that Quaker is become an eulogistic,

or, at least, has lost all its dyslogistic import: and it is as respectable in common usage as their own fond *Friend*, with less quaintness.

All that was intended by these instances was illustration; which being, it is hoped, fully accomplished, it is unnecessary to detain the reader longer with the subject; but there is one other consideration that deserves to be stated.

It is now sufficiently apparent, perhaps, that, as language has little of a dispassionate and much of a passionate character, so many entities both physical and metaphysical have no neutrologistic designation: they are never presented to the understanding as mere strangers, whose character is to be discovered by acquaintance—for their name proclaims their character: it is either a badge of honor or a badge of disgrace; and those wearing it can have no interview with the understanding, absolutely free from all prejudice or sinister agency; but are introduced by the high authority of universal consent either as approved or condemned, as good or bad, as amiable or hateful.

The entities that have two distinct sets of names, i. e. eulogistic and dyslogistic, answering to the views and feelings of the persons employing them, are sufficiently numerous (even if no other cause existed) to produce incalculable diversity of opinion, endless controversy, and factious hostility.

PART II.

OF THE PARTS OF SPEECH OR THE GRAMMATIC DISTINCTIONS OF WORDS.

The parts of speech are usually said to be nine; but Mr. Tooke, as well as others before him, reduced them to two. Many of his remarks respecting them are not only acute but just; and it will be proper to examine minutely what he has advanced.

Mr. Horne Tooke (as well as Plato and other ancients, and Vossius and other moderns) resolves all the parts of speech into noun and verb. Thus far he is very explicit and very positive; but farther he has not proceeded. He affirms, indeed, that the verb is properly a noun; but he adds, that it is something more than a noun; what that something more or verbalising property is, he either could not or would not inform the world.

The opinions of Horne Tooke (though hitherto barren of any very important effects or useful results) have met with cordial reception: and all who now write about grammar acknowledge his authority. That hardy reasoner, the late Dr. Geddes, expressed the hope of being able to prove at some future period that all verbs were originally nouns. In this opinion the learned doctor was avowedly saying after Mr. Tooke, who also hoped to be able to accomplish extraordinary things at some future period. Numerous testimonies in favor of his opinions might be adduced from recent grammatic works. The following is a pretty good synopsis of his principles, extracted from a recent grammar.

‘Every abstract term in language had, originally, a sensible, palpable meaning, generally a substantive meaning. Adjectives are, originally, either nouns or verbs. Pronouns take their rise from nouns, verbs, and numerals. Articles, or,

more properly, definitives, are nothing but pronouns used in a particular sense, and for a particular purpose. Interjections are chiefly verbs; some are substantives. Adverbs, for the most part, originate in adjectives; a few are verbs and nouns. Conjunctions and prepositions are generally verbs and nouns.

‘Nouns constitute, in general, the primitive words in all languages. Verbs are the first-born offspring of nouns. They are nouns employed in a verbal sense; at least the greatest quantity of words are of this class; a few, indeed, appear to have started into being at once as verbs, without any transmigration through a substantive state.’

If Mr. Horne Tooke had not entangled himself with *en* and *th* and *to* as meaning *do*, and as being necessary verbal adjuncts, it would have been easy to understand what (we should have supposed) he must have intended by verbs being something more than nouns. The following are examples of nouns, employed in a verbal sense, without the assistance of any verbal adjunct; gallant men *eye* the fair—*hand* them a chair, or *seat* them on a sofa—*back* their friends—*face* their enemies—*spur* their horses—*chase* their dogs—*kenel* their hounds—*bag* their game—*take* their money—*stake* their property—*shield* their honor, and *pistol* their enemies. A thousand such instances might be collected (without much trouble) of sensible, palpable, substantive meanings, and of nouns employed in a verbal sense: and it is probable that most of those words which now appear in the abstract state of mere verbs, were previously names of physical entities.

It is true, that, in all such instances as those presented above, there is ellipsis, i. e. something left out: gallant men back their friends and face their foes; i. e. do back their friends, and do face their foes; which is the old mode of the sentence, and that which we still adopt when we wish to speak emphatically; and even then there is much more implied than expressed; there is much verbal ellipsis: but for the same reason that the meaning remains when so much expression is left out, the same meaning might have been conveyed if the omitted expression had never existed. Children (as also foreigners) when beginning to speak our language, can make themselves understood by merely pronouncing nouns. My child, now playing round my table, has just said, ‘*Pa*, me book.’ The fond father understood her as readily, and as perfectly, as if she had said, ‘Please, my papa, will you give to me a book?’ or, ‘Please, my papa, will you take up one of these books from this table, with one of your hands, and then put it into my hands?’ for I wish to amuse myself with handling it and looking at it; but I am not tall enough to reach it, else I would not be at the trouble of asking you to hand it to me.’

If language had the rude origin which Mr. Horne Tooke always supposes, it is certainly very improbable that such a metaphysical part of speech as the verb, according to our modern notions of it (i. e. a word which signifies *to be*, *to do*, or *suffer*, &c.), had any distinct, separate, or independent existence. Add to this the fact that a very great number of verbs (as well as of

all the other parts of speech) are, without doubt or controversy, resolvable into nouns.

Now we believe full justice has been done to the statements contained in the *Diversions of Purley* : and now, perhaps, many persons would suppose the subject to be satisfactorily disposed of : all words are resolvable into nouns, and nouns are names, and what more would we have ; for, as we cannot proceed ad infinitum, we must stop somewhere ; and where so proper to stop as with the names of things ! This has certainly some show of reason, and is much more satisfactory than putting the world on the back of an elephant, and the elephant on the back of a tortoise, and the tortoise on the back of nothing : it does happen, however, that where the difficulty seems to end with *Horne Tooke* and others, it only begins with the author : not that he hopes for a palpable demonstration as to the origin of language ; but he does think that the noun requires to be explained and accounted for as much as any part of speech whatever. Granting that it is resolvable into no other part of speech, what is it to be resolved into ? If it be the offspring of no vocabulary parent, nor the result of any etymologic transmigration, but started into being at once a perfect substantive or full-grown noun ; whence, or how, did it start into existence ; What is the reason of its imposition or application ? For if (as *Mr. Tooke* so often affirms) there be nothing arbitrary or unaccountable about language ; if (as he also reiterates) that be a trifling etymology which does not assign the cause or discover the reason for the imposition of any word ; it is doing nothing towards satisfying our philologic curiosity, to resolve all the parts of speech into the noun, and then tell us that a noun is a name. If said noun be in any respect descriptive (and without this, according to *Mr. Tooke*, it could be no significant part of speech) what is its descriptive property—how did it acquire its designative power ?

Here also we shall attempt supplementary explication, that full justice may be done to the claims set up for the noun as being the sole, original, and pre-existent part of speech. The position of *Mr. Tooke*, that there is nothing arbitrary about language, we consider perfectly sound ; and to assert the contrary is (we conceive) manifestly absurd. Even those unmeaning names with which we, in these modern times, are so familiar, called proper nouns, were originally descriptive of some quality, or expressive of some circumstance ; and in the successive re-application of them there is an assignable reason for their imposition ; for such names as *Robert, John, Alfred, Hunt, Fox, &c.*, are not employed at random, as we might suppose such new and strange names as those fabricated by *Swift* ; and even, for the employing of these, there is an assignable reason. Perhaps, indeed, nothing more was ever intended (where the understanding had any share) by affirming the meanings of applications of words to be arbitrary than that, where any one word is employed, some other word might have been used for the same purpose ; or that terms are liable, in process of time, to have their signification changed ; or that they may be differently understood, and applied

in different ages, and even by different persons of the same age and country : and thus (as frequently happens in controversy) one person might affirm, and another might deny, that words are arbitrary signs ; and be all the while disputing about nothing.

But there could be no controversy with *Mr. Tooke*, or with any who adopt his opinions, concerning the present subject of enquiry. He frequently states, as an essential etymologic principle, that there is a reason for the imposition of every word : i. e. that it has a descriptive signification, without which, he insists, it has no signification whatever. In what, then, does the signification of the noun consist ? Or, in other words, whence does the noun itself derive its existence ? This question seems to admit of an easy and satisfactory answer in reference to a certain class of words, formed by what is called *onomatopœia*, or imitation of the sound : such as *buzz, hum, grunt, croak, cluck, click, clock, clang, clink, clash, whirl, whiz, cuckoo*. Many more might be presented ; but these are sufficient as a specimen, which is all that is intended here. If such words be considered nouns, here is a satisfactory origin of the noun (and perhaps, after all, of the whole of language) ; for we have only to suppose the letters that indicate, to the eye, the sounds of which such words consist, contrived (arbitrarily, or conventionally, if you will—for other marks might have been invented and employed), like the signs in the gamut (and the one is just as much a philosophic contrivance as the other), merely for the purpose of literature ; i. e. to extend the utility of the spoken by rendering it also written language. This is certainly the simplest manner of accounting for the origin of language ; the simplicity is in such a case, if not a demonstration, at least a strong argument. The only reasonable doubt seems to be, whether *onomatopœia* could supply a sufficient stock or capital to begin the business of language with : all that the author will venture to affirm, is (for he is not confident) that upon the maturest reflection, aided by considerable enquiry, he thinks it neither impossible nor improbable, that such a small number of words, as seem to originate directly in an imitation of natural sounds, should be available for every verbal purpose ; and that, in the slow process of ages, they should have multiplied into the multitude that now form the largest vocabulary with which we are acquainted.

It has been said above, if such words as *hum, buzz, croak, &c.*, be considered nouns, we have, at once, in *onomatopœia*, a satisfactory origin of the noun as the first part of speech, and that from which all the other parts are derived : but a question still remains, ought such words to be regarded as primarily nouns or verbs ? They indicate not any substantive entities, but sounds ; and what are sounds but actions or motions, produced by certain impulses given to the atmosphere, whose vibratory movement acts upon the tympanum, or beats upon the drum of the ear. With hardly any exceptions, the imitative words, considered as nouns, are also verbs ; there are many imitative verbs without any corresponding nouns ; and in most of those imita-

tive words, which are both verbs and nouns, the former were evidently prior to the latter: as, *click, cluck, clack*, before *clock* and the noun *clack*, &c., &c. The fact seems to be, that the last is related to the first, as effect to cause; and that the verbal sense is not only first, in the order of nature, but the proper original signification; whence the substantive meaning is derived by metonymy, or by mental association, as intimated in a former part of the work.

It is impossible to study either the Greek or Hebrew language (not to mention any other), without perceiving, that if any verbs can be resolved into nouns, there are also many which cannot be thus disposed of: and though the doctrine of Horne Tooke seems, at first view, very convincing; the converse of it seems more evident when we prosecute our enquiries: for whatever may have been the origin of language, nouns in general evidently derive their existence either from attributives or from verbs; and, unless the testimony of onomatopœia be given in favor of the noun, as the pre-existent part of speech, we have no hesitation in affirming, that though many verbs and adjectives be derived from nouns; it is equally true, that all nouns are derived either from attributives or verbs; i. e. before they were substantives they were either attributives or verbs.

This whole enquiry is more curious than useful; and is important only as it serves to abate groundless confidence, to remove false theory, and to make us better acquainted with the meaning of words; for it matters very little what we call them (or what part of speech was first or last), provided we understand them.

It is wittily said by the author of *Hudibras*, that

All a rhetorician's rules

But serve him for to name his tools;

and it may be truly affirmed, that most of the grammatic terms and distinctions serve no useful purpose whatever: but, because they had existed in connexion with Greek and Latin, it was thought necessary or proper to transfer them to the English language.

The different sorts of words, or parts of speech, are said to be nine, viz., interjection, article, conjunction, preposition, adverb, adjective, pronoun, noun, and verb.

SECT. I.—OF THE INTERJECTION.

The interjection, or, as it is better termed, the exclamation, is hardly worthy of notice, being merely an expression of sudden and strong emotion; for which purpose almost any verb, noun, adjective, &c., may be employed; for the only natural exclamations are the vowel sounds, as enunciated by a sudden action of the heart, when strongly excited by surprise, joy, grief, &c. Perhaps these natural, unpremeditated expressions of strong emotion (which are found, with very little diversity, in all languages) ought to be considered as having assisted in originating language; or as having supplied materials for its formation.

SECT. II.—OF THE ARTICLE.

This term is so unmeaning, in its grammatic connexion, that there is some difficulty in ima-

gining how it should have been employed. Grammarians affirm that there are two articles; the one definite, the other indefinite. *The* is said to be definite: it properly ranges with *this* and *that*, called demonstrative pronouns; in connexion with which it will be examined: and therefore, for the present, it is dismissed without further notice.

A is said to be the indefinite article, and to become *an* before a word beginning with a vowel: the fact, however, is, that *an* is contracted into *a* before words beginning with a consonant: and, at no very remote period of our literature, it remained unchangeably *an* before all words. The reason is obvious: *an*, like *cin*, Ger.; *un*, It., Fr., and Span., is merely *anc*, now *one*; i. e. *un-us*, Lat.; and *en*, Gr. *A* book is the same as *one* book; *an* ox is the same as *one* ox, &c., &c. How a numeral adjective can be indefinite is hard to conceive.

No person at all acquainted with English literature is likely to make any mistake in the application of *an* or *a*; and therefore directions concerning it are wholly unnecessary. For any purpose of necessity or utility that grammatic designation *article* can be well spared.

Some write, '*a* union,' &c.; others, '*an* union.' The sole reason of contracting *an* into *a* is euphony; and for the same reason that we write *a youth*, we ought to write or say *a union*, &c.

SECT. III.—OF THE CONJUNCTION.

This is another entity which merits very little consideration. Both conjunctive and disjunctive are intelligible terms; and there are words that might be thus designated if it were necessary to apply any designation to them; but conjunctive conjunction is an empty tautology; disjunctive conjunction is a manifest contradiction. *And* is a connective term, and so are other terms, not enumerated with it as conjunctions, entitled to the same appellation. *Either* contracted into *or*, and *neither* contracted into *nor*, are disjunctive, and so are other words not usually enumerated as disjunctives; but many words, commonly called conjunctions, have as little claim to that designation as to any other which could be applied.

SECT. IV.—OF THE PREPOSITION.

This was, in its original application, sufficiently intelligible and significant; for it was equivalent to prefix; and simply indicated, that the words which it was employed to designate were frequently prefixed to other words. But, as often happens, this was, in process of time, lost sight of; other words besides prefixes were classed under the same designation, and then unmeaning doctrine was communicated; such as, '*Prepositions* serve to connect words with one another, and to show the relation between them. They are, for the most part, put before nouns and pronouns!'

SECT. V.—OF THE ADVERB.

This is truly, as Horne Tooke terms it, the common sink or receptacle for all words that grammarians knew not what to do with, or how to range under the other eight parts of speech.

What is an adverb? Lindley Murray shall answer:—‘An adverb is a part of speech joined to a verb, an adjective, and sometimes to another adverb, to express some quality or circumstance respecting it!’

If any species of insignificance be more objectionable than another, it is that which is ostentatious of the appearance of learning, and which affects the forms of science. Better, surely, have no names than have such as mean nothing: better have no distinctions than have those which are absurd.

All the preceding five parts of speech are more worthy of being discarded than explained: the four that follow have a better claim to attention.

SECT. VI.—OF THE ADJECTIVE OR ATTRIBUTIVE.

The last term has both meaning and utility; and when the grammarian says, ‘An adjective is a word added to a substantive to express its quality: as, an *industrious* man; a *virtuous* woman; a *benevolent* mind;’ there is no violence offered to our understanding: we perceive that the attributive word answers to the description given of it; it indicates some quality, either physical or metaphysical. Thus, in the expressions *white* paper—*black* ink—*sharp* knife, &c., physical qualities are indicated; but—*candid* temper—*acute* mind—*clear* understanding, &c., may be regarded as indicating metaphysical qualities.

A few remarks may be made concerning the attributive:—

1. The simplicity of the English attributive. It has no troublesome changes of termination for gender, number, and case, as in Greek and Latin, and in a less degree Italian and French, &c. Such changes may be necessary in Greek and Latin, &c.; but it does not follow that they are excellencies.

2. The English attributive admits of various changes for the purpose of indicating diversity of signification: these will be noticed under Prefixes and Affixes. It may just be observed here, that the three degrees of comparison, affirmed of the attributive (or adjective), are not unobjectionable: comparative and superlative are intelligible terms; but no useful purpose seems answered by the term positive degree. Such an unmeaning distinction, however, is less to be regretted than the irregularities in the comparatives and superlatives of some adjectives most frequently in use. Mr. Tooke justly remarks, that words most frequently used are most corrupted; and even in Murray’s Grammar we find the following sensible remark:—‘In English, as in most languages, there are some words of very common use (in which the caprice of custom is apt to get the better of analogy) that are irregular: as good, better, best: bad, worse, worst; little, less, least; much or many, more, most; near, nearer, nearest, or next; late, later, latest, or last; old, older, or elder, oldest or eldest.’ Children and foreigners, beginning to speak our language, uniformly say, good, *gooder*, *goodest*; bad, *badder*, *baddest*; little, *littler*, *littlest*, &c., and as uniformly get laughed at as if they were guilty of some risible blunder; such slaves

of mere custom are human beings; so much blind superstition and narrow bigotry have they in their nature; so arrogantly contemptuous are they towards modes (however rational) that differ from their own established forms; so foolishly fond and vain are they of their very faults and failings, their follies and imperfections. Anomalies are faults in language.

The English language possesses many comparative excellencies (and Horne Tooke could not, surely, mean any thing more, when he spoke of the perfections of language); but, in that grand fault anomaly, it is radically corrupt.

Such is the obvious importance or rather necessity of attributives to the significance of language, that the author long considered them the first or pre-existent species of words, whence all the others derived their existence: and, certain it is (whatever Horne Tooke may have said to the contrary), that language could not advance many steps without employing adjectives, and, perhaps, after all, a few terms of this description, to indicate the more obvious and striking qualities of objects, constituted, if not the whole, at least part, of the original invention of language; for, as Mr. Horne Tooke justly remarks, it is the necessary condition of man to have few different ideas (which are quite distinct from the infinite variety of mental movement); and for indicating these ideas a very small number of words would be, in the first instance, sufficient; at least in as far as necessity only for verbal intercommunication was concerned. It deserves also to be remarked, that if many adjectives evidently originate in verbs and substantives, there are many verbs and substantives that as evidently originate in adjectives: and there are many instances in which it would be as difficult, or impossible, to trace the one, as it would be to trace the other, to any pre-existent state or character. It must be confessed, however, that, though not free from difficulty, yet, according to the preponderance of evidence, adjectives must be considered as originating in nouns or verbs: i. e. they are either nouns or verbs employed attributively. The adjectives derived from verbs are obviously the same as participles: which will be considered presently: and in the same manner that verbs become participles, are nouns formed into adjectives.

SECT. VII.—OF PRONOUNS.

‘A pronoun,’ we are told, ‘is a word used instead of a noun, to avoid the too frequent repetition of the same word.’ The name implies as much; and grammarians have thus asserted, perhaps, ever since grammarians existed; but both the designation and the definition are destitute of foundation. Something like proof seems deducible from what is termed the third personal pronoun: as, ‘the man is happy; *he* is benevolent; *he* is useful.’ But can we be favored with one proof or illustration drawn from any other pronoun? Show a single successful experiment with *I*, *We*, *Thou*, *You*, &c. Instead of what nouns are these pronouns used to avoid the too frequent repetition of the same word? Here is a short and easy method of terminating all controversy.

The noun to which the pronoun belongs can be omitted, and is often omitted; just as sentences may be rendered elliptic in many other respects and their meaning be preserved: but it does not follow that the words denominated pronouns stand instead of nouns; any more than it can be truly said that those words which remain in any elliptic or abridged sentence stand instead of the words omitted. We can frequently use *he, she, it, they*, alone; i. e. without expressing the nouns to which they respectively belong: just as we can frequently use such words as, *this, that, these, those, former, latter, first, last, above, foresaid, &c.* (which have all, in fact, as much claim to the title of pronoun, as those words on which it has been conferred), without expressing the nouns to which they direct attention; but if we wish to be emphatic or definite (as in legal writings for example), we express the noun, and do not trust it to be understood. Take the following illustration: The grammarians have delivered many strange opinions: they aforesaid (or the said—or—these) grammarians affirm, that such words as, *he, she, it, &c.*, are pronouns, i. e. that they are used instead of nouns; but I, the author, do testify that the words referred to, are not truly pronouns, but (if they must have a name) nouns; for they and nouns are mutually related, not as principal and substitute, or president and vice-president, but as fellow-servants; and, if one of them be occasionally absent so as to occasion the work of both to be performed by the other, yet the one thus enjoying leave of absence must instantly re-appear, whenever called for, to secure greater definiteness.

The phraseology of the grammarians, such as, *definitive, demonstrative, &c.*, indicate that they were not far from the truth: only what have been termed personal pronouns are as truly demonstrative, as those words are to which the term is applied. Their sole use is to demonstrate, i. e. to direct attention to some object or noun, which is always either expressed or understood: and, for the same reason: that the noun is not always expressed but often understood, so is the pronoun also frequently omitted in elliptic modes of expression. If we say in Latin, *hic homo*, it is equivalent to *ecce homo*; in English, behold man; yon man; that man; this man; the man, &c.: and, if the man be actually in sight (and those words called pronouns suppose the object in view either of the eye or of the mind; or rather direct the view to an object), *ecce homo*, or *hic homo*, *yon man*, &c., can be dispensed with; as the business of directing attention to him can be accomplished by pointing with a finger, or by some other visible sign.

Thus, what are called personal pronouns, relative pronouns, demonstrative pronouns, definite article, and some other words not classed under any of these designations, all serve one and the same purpose, i. e. they point to some object or some noun; and, therefore, they cannot stand in its stead. If it were necessary to give such words a particular designation, they might be designated demonstrative nouns, or simply demonstratives; but such unnecessary terms are more conducive to ignorance than to knowledge:

and the words in question are properly verbs in what is called the imperative mood.

Pronouns, as they are called, may be considered in reference to number, gender, and case. There is, doubtless, some advantage in diversity of termination for the purpose of indicating singleness and plurality; yet that this advantage is much less than grammarians suppose, is evident from the little use made of numeral distinction in English nouns. Without any loss of meaning, but with much grammatic convenience, we have no numeral diversity in our relatives—who, which, what, that, and in what is called our definite article the. What numeral distinctions can appear more necessary than *thou* and *you*? Yet if *thou* had not found protection among the Quakers, and refuge in prayer, it would have wholly perished; and that royal pronoun *we*, threatens to supersede I; for established usage is, already, almost as shy of it as of *thou*.

Any sign of *gender* is as little necessary as of number: hence, except in the third person singular, no such sign exists. Lindley Murray (whose grammatic celebrity entitles him to some preference as an authority), indeed, tells us, 'The persons speaking and spoken to, being at the same time the subjects of the discourse, are supposed to be present; from which, and other circumstances, their sex is commonly known, and needs not to be marked by a distinction of gender in the pronouns: but the third person or thing spoken of being absent, and in many respects unknown, it is necessary that it should be marked by a distinction of gender.' Well then, what becomes of this necessity in the third person plural, which contains no sign of distinction in gender? The grammarist could not but perceive his statement to be too hazardous, unless accompanied by some saving clause; and therefore he subjoins, 'at least, when some particular person or thing is spoken of, that ought to be more distinctly marked: accordingly, the pronoun singular of the third person has the three genders, *he, she, it*!' There is a useless but embarrassing distinction attempted, if not already effected, between who and which; as if the former belonged exclusively to persons, and the latter to things and animals devoid of reason. Up to a very recent period there is the sanction of the best usage for disregard of such petty distinctions, which serve no purpose except to render English composition difficult.

We have seen how little the distinctions of number and gender are necessary: but the distinctions of *case* (except what is called the genitive) are worse than useless; for they cause much embarrassment: were it not for these, and a few other grammatic nuisances, the English language would be the simplest, easiest, and most manageable ever constructed.

The truth is, we have varieties of termination, called cases, for no reason whatever save that they existed in Greek and Latin; but, though such varieties of termination might be necessary or useful in these languages, it does not follow that they are either necessary or useful in English; which accomplishes by position the same purpose which the former effected by case: hence, fortu-

nately, we have no accusative case of nouns ; which retain the same unchanged form whether nominatives or objectives. If every purpose of speech be accomplished, without change of termination in nouns, what can render such change necessary or useful in pronouns ? If this, that, these, those, which, what, it, the, &c., be fully competent to the purpose for which they are employed, without any change, what could possibly incapacitate the other words of the same class for performing their office, if they appeared only in a single form ? But it is useless to reason on the subject. We have *me, thee, him, whom, &c.* ; merely because the monkish grammarians found *me, te, eum, quem, &c.*, in the Latin language. Nor is it surprising that, in borrowing so much from it, they should have adopted more than was necessary ; but why should we consecrate their blunders !

We object to all unnecessary intricacies in language ; but we have no objection to any useful contrivance : hence what is called the genitive case has been exhibited in connexion with the connouns ; because it is somewhat useful and strictly agreeable to analogy ; for nouns in general admit of such a change of termination to denote possession, connexion, or relation, and to avoid a longer mode of expression : as, 'Mr. Tooke's work,' for the work of Mr. Tooke ; 'Locke's Essay,' for the Essay of Locke. So, if either of these authors has been spoken of, and is therefore supposed to be in view, we might say, *he's* work ; *he's* Essay. His, its, whose, should evidently, for the sake of analogy, be *he's*, *it's*, *who's* : and, for the same reason, *you's* is preferable to *your* ; *they's* to *their*, &c., if custom would permit.

What, then, is this termination called possessive or genitive ? It is a contraction of *is*, also anciently *es* ; for what is now put *man's*, was formerly *manis*, or *manes* ; and every one is familiar with the use of what is called the apostrophic sign, i. e. the comma put to indicate the omission of a letter. If, then, *'s* be a contraction of *is* or *es*, what is *is* ? It is the sign of the genitive singular, third declension of Latin nouns ; which was adopted by the Saxon writers to answer the same purpose in the native language which they were forming : and there can be no doubt that said *is* was originally a separate word, answering in meaning or use to *of* with us : which *of*, as well as the termination *is*, is a contraction or fragment of some compound word. *Man's* is the same in English as *hominis* in Latin : *Man's* condition is the same in significancy as, the condition of man ; or the human condition. In the last instance, *human* is an adjective formed upon *homo*, anciently *humo*, by adding *an* ; which *en* serves the same purpose as the termination *is*, or our *of* ; i. e. it denotes connexion or relation. Our word *man*, as noticed in another place, is a contraction of *human*, and elliptical for *human being* : hence the reason why the following expressions are all equivalent : *Conditio hominis*, *humana conditio* ; *Man's* condition, the condition of man, the human condition.

There is little or nothing gained by contracting *manis* or *manes* ; *birdis* or *birdes*, into *man's*, *bird's*, &c. The reason of its adoption was, evi-

dently, to distinguish what is called the genitive or possessive from the plural termination ; for they were both *es* or *is*. When, therefore, *birdis*, for example, was contracted into *birds* plural, the possessive was put *bird's* ; and this distinction has sufficient utility (at least to the eye, for it is useless in reference to the ear) to warrant its retention.

It has been observed that the plural was formerly the same as the possessive or genitive termination. The same is the case in the Latins. The terminations *æ, i, is*, are signs of the genitive singular and nominative plural : as *Musæ*, means both of a song and songs ; *Domini*, of a lord and lords ; *Sermonis*, of a speech and speeches ; only the plural, in the third declension, is generally *es* : as, *Sermones*, &c. ; but, originally, there was no difference between it and the genitive singular.

SECT. VIII.—THE NOUN OR SUBSTANTIVE.

Here the name may be first considered. The grammarians of the learned languages have, with some show of reason, employed the terms noun substantive and noun adjective ; i. e. a name that can stand by itself without any assistance ; and a name that requires to be added to, or rested upon, another. There is, as usual, in these terms, a good deal of false theory, concerning which we cannot stop to enquire at present. But, though the grammarians of the learned languages have noun substantive and noun adjective, why should their vernacular imitators, after treating noun and substantive as synonymous, prefer the latter to the former ? Probably the sole reason was, that the one seemed a more respectable looking word than the other. But substantive, besides being apt to suggest the notion of substance, is objectionable for other reasons, as being connected with false theory. Noun, (i. e. nomen, name), is perhaps as intelligible and appropriate a term as can be found for the purpose. It is desirable that names or designations should at least possess the negative merit of not being false guides ; but in general we must proceed much further in our enquiries than they can conduct us. What then is that which we agree to call noun ? How shall we define it ?—*Hoc opus !* There is nothing so important, in a philosophic view, as correct definition ; but, at the same time, there is nothing so difficult. 'A noun,' says the grammarist, 'is the name of any thing that exists, or of which we have any notion.' But if a noun be the name of any thing which exists, how can *nothing*, or any one of those words which denote non-existence, be a noun ? And if the expression, any thing of which we have any notion, mean more than any thing which exists, it means too much to be a correct definition ; for all words that have any signification, are names of things (either physical or metaphysical), of which we have a notion : and if it be affirmed that thing denotes a real existence, in distinction from attribute, action, relation, &c., then, also, the definition is not only incorrect, but manifestly false ; for many words are called nouns which denote no such absolute entity ; and the contrary supposition is not merely a philologic error, but

a cause of much metaphysical absurdity, which men give and receive as sound ratiocination.

We define a noun to be a grammatic designation, given not only to all those words which are the names of sensible objects, as, man, horse, bird, tree, stone, lake, river, city, &c.; but also to all those words which can be employed in a sentence as if they were names of such objects, as, hunger, reason, virtue, vice, nothing, non-existence, &c. Any of the latter words can be employed exactly as the former in connexion with other words, to form a sentence: as, man is a rational animal: reason is very different from imagination: nothing is preferable to what is evil. Thus any word which can be put together as the agent or subject, the nominative or object of a verb, is entitled to the grammatic designation of noun: and we know not of any other definition which is admissible as correct.

All words thus designated, may be distinguished into nouns physical, and nouns metaphysical: many of the latter are not names of entities, but of nonentities; such as, fate, luck, chance, &c.: few of these, comparatively, denote absolute existents any way analogous to physical objects: they, for the most part, merely indicate qualities, motions, relations, thoughts, feelings, &c. &c. Many, even of those nouns which may be considered physical, are not properly names of things or absolute existents, but of motions: as current, stream, storm, wind, wave, billow, breath, sound, &c. &c.

This unsubstantial nature of what are called substantives, which 'give to airy nothings a local habitation and a name,' is certainly a great convenience in language; i. e. to enable men to talk without meaning, and 'say an infinite deal about nothing': it is wonderfully subservient to effective rhetoric, and deceitful sophistry; but it is very unfavorable to sound reasoning and true philosophy; it must, therefore, be set down as one of the radical imperfections of language; and, in guarding against the deception of words, it is particularly necessary to examine their import. Many of them mean nothing; many are of uncertain import; many, being imbued with error and prejudice, serve only to impose on the understanding.

The importance of etymology consists in ascertaining the descriptive or distinctive import of words; which is not indeed of any great utility as to physical nouns; for they answer the purpose of designation, even if their significance be not perceived. The names London, Paris, Thames, Rhone, sun, moon, like Dante, Milton, &c., answer the purpose of designation completely however ignorant we may be of their etymology: and it might be even argued (as it has been argued) with some show of reason, that the more of such ignorance exists, the better, as the etymological meaning might only tend to deceive, by its erroneous representation; as, for example, in the designation Pacific Ocean. The case is very different, however, as to metaphysical nouns (and all metaphysical words, i. e. words employed for metaphysical purposes); for every thing depends upon ascertaining their significance, or their insignificance; i. e. whether they mean any thing or nothing; and

whether their meanings present natural or chimerical ideas to the imagination, and true or false notions to the understanding. If metaphysical nouns be taken as if they were mere designations, like what are called proper names, without any regard to the reason of their imposition, the consequence must be error and deception; and this, as already intimated, is one of the principal causes of verbal imposture, and metaphysical absurdity, or false and deceitful philosophy; to which the only effectual counteraction that can be opposed, is sound etymology; though it will never, perhaps, accomplish all that Horne Tooke predicted.

We must also consider case, gender, and number, in reference to nouns. The grammaticists seem, in general, half ashamed of the poverty of our language in this particular; and they have endeavoured, with the very best intentions, to enrich it with imaginary cases: and they aver it to have, at the very least, three cases, viz. the nominative, possessive, and the objective. Lindley Murray, indeed, informs us, that he was long harassed with doubts on the subject. 'The author of this work long doubted the propriety of assigning to English substantives an objective case; but a renewed, critical examination of the subject, an examination to which he was prompted by the extensive and increasing demand for the grammar, has produced in his mind a full persuasion, that the nouns of our language are entitled to this comprehensive objective case!'

But, after all, our language is simpler than even its Saxon and Gothic ancestors; for English nouns have no change of termination, commonly called case; save that which is called possessive, alias genitive; as man's for *of man*, woman's for *of woman*, &c.; and many English nouns do not admit even of this change; yet this defect of cases occasions no loss of significance, no inconvenience.

The reader must be informed that *gender* means kind, and that there are three kinds of nouns, viz.; such as denote males, or he-animals; such as denote females, or she-animals; and such as denote neither the one nor the other, having no sexual distinction whatever: moreover, he must be informed, that in this instance the English language is richer than several of its neighbours; for some of them have both masculine and feminine gender, i. e. male and female kinds of nouns, but no neuter kind. It seems, also, very necessary to inform him, that there are metaphoric males and females; figurative ladies and gentlemen. 'Figuratively in the English tongue,' we are told, 'we commonly give the masculine gender to nouns which are conspicuous for the attributes of imparting or communicating, and which are, by nature, strong and efficacious. Those again are made feminine which are conspicuous for the attributes of containing or bringing forth; or which are peculiarly beautiful or amiable. Upon these principles, the sun is said to be masculine; and the moon, being the receptacle of the sun's light, to be feminine. The earth is generally feminine. A ship, a country, a city, &c., are likewise made feminine, being receivers or containers. Time

is always masculine, on account of its mighty efficacy. Virtue is feminine from its beauty, and its being the object of love. Fortune and the church are generally put in the feminine gender! This is the sublime of metaphoric gender, and sexual distinction, and grammatic sentimentality! There is, indeed, something of the whimsical in metaphoric gender and matrimony; for with our old, rude, ancestors, the Saxons, the moon was not the wife, but the husband of the sun.

It must be matter of self-gratulation to the sentimental French, that they are not driven to the necessity of figurative genders; as all their nouns are either masculine or feminine; so that they can appear to talk about ladies and gentlemen when speaking of battles and spectacles, plays and operas, metaphysical entities and nonentities.

The business of gender is a very serious affair in Greek, Latin, and even in Italian, French, &c.; but nothing can be more simple in English; for, except in a few instances, it is left, as it should be, to the meaning of words as indicative of the natures of objects, and not distinguished by different sets of terminations; which are more troublesome than useful. The grammarians, indeed, assert, 'nouns, with variable terminations, contribute to conciseness and perspicuity of expression.' We have only a sufficient number of them to make us feel our want; for when we say of a woman, she is a philosopher, an astronomer, a builder, a weaver, we perceive an impropriety in the termination which we cannot avoid; but we can say, that she is a botanist, a student, a witness, a scholar, an orphan, a companion, because these terminations have not annexed to them the notion of sex.

If all these assertions were admitted, still the advantage of variable terminations might be denied; for it could be proved, that they produce a preponderance of inconvenience: but though they contribute to conciseness and perspicuity in such languages as Greek and Latin, in which the personal pronouns are seldom expressed; they are not necessary to perspicuity, and would contribute very little to conciseness, in English composition; and if the question be fairly tried, by a sufficient number of instances, the English will be found equal to any language (however incumbered with inflection) in conciseness and perspicuity.

What impropriety is there in saying of a female, that she is an astronomer, philosopher, &c., any more than in saying, she is a botanist, scholar, &c.? The truth is, that having, very unnecessarily, adopted a number of foreign distinctions of gender, we are apt to fancy that they are very necessary, or would be extremely desirable to all nouns; just as a little indulgence is apt to produce a restless longing after useless or hurtful luxuries: so that, instead of saying, 'We have only a sufficient number of variable terminations to make us feel our want;' we ought rather to say, we have a sufficient number of them to produce false notions and fantastic desires; and it would be much wiser to discard some we have, than long for more. Such titles as countess, duchess, empress, princess, &c.,

may remain; but what utility is there in actress, arbitress, benefactress, conductress, huntress, patroness, poetess, protectress, tutoress, votaress? Even the eyes and ears (by which grammarians are wont to judge) are surely better pleased with the expressions, she is a clever actor, she is the arbiter, benefactor, conductor, patron, poet, protector, &c., than she is a clever actress, she is the arbitress, &c.

To perspicuity, such feminine terminations contribute nothing, because the pronoun *she*, which accompanies the noun, indicates the feminine gender as definitely as it is possible for any termination to indicate the same thing: and as to conciseness; that, in most cases, is better effected by one termination than by several. Thus, to say, Attend, ye actors, is more concise, than, Attend ye actors and actresses: ye adulterers, is more concise than, ye adulterers and adulteresses, &c.

We have much reason for congratulation concerning gender in reference to English nouns; for they have fortunately escaped the troublesome incumbrance of variable termination; and, however the grammarians may lament their rude simplicity, there is not much danger that they will ever be changed into the likeness of Greek and Latin substantives.

As to *number*, the only change of termination in English nouns, besides the affix *'s*, to denote *of*, is that which is employed to indicate the plural; or, that more than one is meant. The plural affix has been already explained in treating of pronouns. There can be little doubt that the two terminations of singular and plural import have some utility; yet, that it is much less than we are apt to imagine, is abundantly evident from the number of nouns which we have with only one termination, without experiencing any inconvenience; as sheep, deer, swine, &c. In these cases, if it be intended to indicate the singular number, or that one is meant, the purpose is fully accomplished by prefixing *a*; which, as already shown, is a contraction of *an*, i. e. *† ane*, i. e. *one*. In such a connexion, what is called (very absurdly) the indefinite article, answers a useful purpose; whereas, in ninety-nine applications out of 100, it is wholly useless; only, having been always accustomed to this, as to many other insignificant expletives, we should think composition strange and incomplete without it. In all such expressions as a book, a house, a horse, a table, &c., a might very properly be termed the insignificant article; which was probably the meaning intended by the phrase—indefinite article. The expression a sheep is as definite as *two* sheep, *three* sheep, *several* sheep, *many* sheep, *the* sheep, *these* sheep, *those* sheep, &c. So also, when the illiterate say, a shilling, *two* shilling; a foot, *two* foot, &c.; and we have not the least doubt, that, if all nouns had thus possessed only one termination, the advantage would have been considerable, not only as to simplicity and facility (for the distinctions of singular and plural, frequently cause an embarrassment), but also significance.

A question long perplexed the author, which seems now to admit of an easy answer. Whence

originated the perpetual recurrence and useless application of what is called the indefinite article, not only in English, but also in most, or in all of the modern languages? For if *a*, *an*, *un* (It. *Fr.* & *Sp.*) *ein* (Ger.) be, as they manifestly are, *one*, (un-us, en,) how, in the name of significance, should they be connected with almost every singular noun? If singular mean *one*, why commit the tautology in almost every sentence of adding the adjective *one*?

The sole reason of this fact is, we believe, that the practice originated when the distinction of singular and plural did not exist; or, at least, did not generally prevail among nouns; and when it was as necessary to say *a* horse, or *one* horse, as *a* sheep, or *one* sheep: the habit of applying the numeral adjective † *one* (now *one*), *ein*, *un*, like many other habits, remained, after the reason on which it was founded had ceased. Many Latin nouns have no distinction of singular and plural in the nominative case, (and their accusative plural is the same as the nominative); and a very great proportion of Saxon nouns have, in spite of Saxon grammaticists, manifestly no distinction of number. Like the nouns sheep, deer, swine, &c., if not restricted, they suggest more than one of a sort or kind to the understanding; and therefore it was necessary to join to them *one* or *one*, when one was intended to be indicated; just as it was necessary to employ the numeral adjectives *two*, *three*, *four*, &c., when *two*, *three*, *four*, were to be denoted.

If, however, there were one regular plural affix to English nouns, we might felicitate ourselves in the possession of it as an important addition to our grammatical treasure; but, unfortunately, instead of being simple and uniform, it is such a jumble of anomaly as sets all principle and rule at defiance. The principal irregularities may be arranged under the following heads.

1. Some nouns have the obsolete plural affix *en*: as oxen instead of oxes; men, women, i. e. contraction of manen, womanen; which ought now to be mans, womans; children and brethren have two obsolete affixes, viz. *er* and *en*; each of which is, we believe, for *es*, adopted from the third declension of Latin nouns; and which we still retain, but generally contract it into *s*.

2. Nouns ending in *o*, have the irregularity of sometimes contracting the affix *es*, and sometimes not; as folio, folios; nuncio, nuncios; punctilio, punctilios; seraglio, seraglios; cargo, cargoes; echo, echoes; hero, heroes; negro, negroes; manifesto, manifestoes, &c.

This is such a petty irregularity, and at the same time so easily remedied, that it ought not, surely, to remain: let the *e* be uniformly dropped, or uniformly retained: the former seems the more advisable measure.

3. Most nouns ending in *f* or *fe*, are rendered plural by changing *f* or *fe* into *ves*; as, loaf, loaves; half, halves; wife, wives; but why should not these be loafs, halves, wives, staffs; like griefs, reliefs, reproofs, ruffs, &c.? If grammatical authority serve only to establish anomaly, it is itself a nuisance; and our understandings and our practice are more honored in the breach, than in the observance of its tyrannical laws.

4. 'Nouns which have *y* in the singular, with no other vowel in the same syllable, change it into *ies* in the plural; as beauty, beauties; fly, flies,' &c. But why should these not be beautys, flys, dutys, &c.; like key, keys; delay, delays, &c.?

This is one of the evils of having more than one alphabetic sign for one sound; and it is of recent introduction like many other anomalies.

5. Such irregularities as the following seem to have originated in the Saxon antipathy to polysyllables, so discernible in many words, which are reduced to the favorite monosyllable: foot, feet; goose, geese; tooth, teeth; louse, lice; mouse, mice; penny, pence; die, dice. But why not follow analogy, as children and foreigners do in learning our language; and say, foots, geoses, tooths, louses, mouses, pennys, dies, &c.? But how strange and ridiculous such words sound! exclaim all the dutiful subjects of established usage. But is it not much more ridiculous to be the slaves of mere custom, however absurd? Only accustom your eyes and ears and mouths for a single month, to the analogies of your own language, in those instances in which the strangest blunders have been consecrated into grammatical proprieties, and you will be reconciled to them for ever.

It is the custom at present, in adopting words from the learned languages, to preserve their learned plural termination. In this we act more strangely than our neighbours; for how are mere English scholars to know the meaning and use of foreign terminations? Why not make the plural of automaton, automatons; criterion, criterions; appendix, appendixes; medium, mediums; memorandum, memorandums; stratum, stratus; vortex, vortexes, &c.? Surely good sense is better than learned pedantry; and it is manifestly more pedantic than judicious to graft foreign peculiarities on a vernacular language; or, in naturalising learned strangers, not to make them conform to the manners of the natives.

SECT. IX.—OF THE VERB.

This is the most difficult of all the grammatical entities. The name verb (verbum) means word; which latter is merely a corruption of the former. We have only to suppose, then, that this very formidable part of speech was designated the word, by way of eminence, on account of its vast importance. Nor is it worth while to quarrel with a name, when it does not indicate some egregious error or absurdity. If, then, a verb be a word, what is that word when considered as a part of speech? What is its grammatical character? Lindley Murray must reply: 'a verb is a word which signifies to be, to do, or to suffer, as, 'I am, I rule, I am ruled.' Other grammaticists have attempted greater accuracy of definition; but their attempts have not been sufficiently successful to deserve notice.

It will probably appear to the reader very extraordinary, that the grammarist should define the verb to be a word; and instantly exemplify his definition by giving, not one word, but two or more words: as, 'I am, I rule, I am ruled.' The blunder is easily explained. The definition was not made for the English, or, indeed, for

any modern language, but for the Greek and the Latin; in which it can be strictly exemplified: as, *sum*, I am; *rego*, I rule; *rego*, I am ruled: so, also, if we take what is called the infinitive: *esse*, to be; *regere*, to rule; *regi*, to be ruled. In all these Latin instances the verb is one word; but each of the English instances consists of, at least, two words. This is another proof of the absurdity of transferring grammatic definitions, distinctions, and rules, from Greek and Latin to the English language; which is as truly ridiculous as it would be to give the history of Greece or Rome, with a few slight changes of names and dates, as a correct history of England. But how insignificantly diminutive would a vernacular grammar appear without the lucubrations of old Lily, or of Crates Mellotes, done into English! Hence that mass of absurdity which has been dignified with the name of grammar. Most of it was from its first existence (perhaps in Egypt or Babylon) dark and chaotic; and all of it as applied to the modern languages, especially to the English (so dissimilar to Greek and Latin), is as devoid of reasonableness and utility as the philosophy of Aristotle. To many persons such statements are redundant; and for the sake of brevity, as also of intelligibility, to mere English scholars, we adhere as closely as possible to the English language.

The question then is, What is a verb? We deny that there is any such entity as a verb in the sense of the grammaticists: i. e. one, single, separate, uncompounded word, which signifies to be, to do, or to suffer. But it may be replied, Have you not just admitted, that in Latin the definition holds, 'a verb is a word;' for *sum*, is one word; as also *rego*. True; but each of these is properly a compound word: i. e. two or more words joined together; just as if we were to write, *Iam*, *Irule*, *Iamruled*; or, *tobe*, *torule*, *toberuled*. The movable affix, in the Latin words, is as properly a distinct word as the prefix is in the instances *Irule*, *torule*.

Though, then, the definition 'a verb is a word which signifies to be, to do, or to suffer,' does hold as to Latin and Greek; it is not true, as to any language whatever, that one simple or uncompounded word can signify, to be, to do, or to suffer. The error of the grammarians originated in mistaking syntactic for verbal meaning; i. e. in supposing that one word can convey a meaning which requires two or more words. This error, productive of other errors, originated in ignorance concerning the elliptic or abridged state of language, as found existing among every people; for nothing was more calculated to deceive theorists, who would naturally suppose that one word performed the office of several; as if there could be existence without some existent concerning whom the affirmation is made; or action, apart from an agent.

We have already considered the difficulty attending the origin of language, and the origin of some words called verbs: and it would answer no useful purpose to detain the reader with another discussion of the same troublesome question. In all those words called verbs, which are manifestly nouns, there is no difficulty: as,

'to hand, to face, to back,' &c.; 'I hand, we hand, they hand'; 'brave men back their friends and face their enemies.' In such instances, all that is necessary is to join two nouns; or a pronoun and a noun, or to prefix the preposition *to*, to convey the notion of agency.

Mr. Horne Tooke (as already noticed) holds, that every verb is properly a noun; and that it is something more than a noun: he intimates, moreover, that he agrees with the Stoics in considering the infinitive the proper verb, free from all incumbrance of number and person. It is difficult to conjecture what he really intended; but he seems to have considered the affix of the Greek, Latin, Saxon, &c. (in what is called the infinitive mood), as well as *to*, in the English, to be equivalent to *do*, or *act*; as if the expression, *to back a friend*, *to face an enemy*, were, *do back a friend*, *do face an enemy*. If such were the case then, *to*, and the Latin affix *are*, &c., are to be considered as properly the verb; and the proper enquiry would be, what is the nature of that which is thus connected with a noun to convert it into a verb? After the fullest enquiry and reflection, we are convinced that the verbal affixes, to what is called the infinitive mood, in Latin, Greek, Saxon, &c., are the very same as the simple adjective affixes: *are* is the same word, whether it appear in *amare*, to love, or *cellare*, of a cell: *en* (*ein*, Gr.) is the same word, whether it appear in *loven*, to love, or *golden*, of gold. In all such cases the affix merely serves to connect the word going before with the word coming after; or to give notice that the word to which it is attached is to be taken in connexion with some other word for the purpose of conveying a particular meaning. In short, the affix in such cases answers the same purpose as our preposition *to*; which also indicates that one word is to be taken in connexion with another; and which, like the forementioned affixes, is doubtless a mere particle or fragment of a compound word.

If, then, the common definition, a verb is a word which signifies to be, to do, and to suffer, be wrong; what definition is to be received as correct? But though we point out the falseness or absurdness of an old doctrine, it does not follow that we must forthwith supply its place with a new one. It is impossible to put any thing sound and solid in the place of baseless theories; and the purpose of enquiry is generally answered when they are made to vanish away like dreams when men awake. We have just seen that there is no such thing, in the English language, as a verb; i. e. a word which signifies to be, to do, or to suffer; for, to express existence, possession, relation, agency, &c., two or more words are necessary; and whenever one word seems competent to the business (as in Latin, &c.), it is not a simple, but a compound word, i. e. two or more words joined together.

'Verbs,' we are told, 'are of three kinds; active, passive, and neuter.' The sole reason why such distinctions were ever applied to the English language, is, that they previously existed in connexion with Latin; but to suppose that the same distinctions will equally suit all lan-

guages, is as unreasonable as to attempt to make a coat to fit the moon in all her changes. We say nothing at present of the original character of such distinctions; for if they had been distinguished in their first application by absolute wisdom, they might be perverted into utter folly by being transferred to the English language. The distinctions in question have been discarded by the more sensible grammarians; who, instead of saying verbs are active, passive, or neuter, distinguish them into transitive and intransitive. The only conceivable utility in this distinction is, its subserviency to a grammatic rule; which says, verbs active or verbs transitive govern the objective case: as, truth ennobles *her*; she comforts *me*, &c. Here ennobles is considered a verb transitive, because the action passes over to the object; and if that be represented by a pronoun, it must be in what is called the objective or accusative case: but such instances as, *I sit*, he lives, they sleep, are denominated intransitive, because the effect is confined within the subject or nominative of the verb, and does not pass over to any object.

This distinction, however, might be very well dispensed with; for it would answer every purpose, to say, when a pronoun is the object of a verb, or that in which the action of a verb terminates, it must be in the objective case: as, '*I love her*;' '*she loves me*,' &c.; not, '*I love she*;' '*she loves I*.'

With all that avidity for multiplicity of distinction which characterises grammaticists, there is a distinction which has wholly escaped them; though it seems of some use, and has long obtained the patronage of Hebrew grammar: it may be denominated the verb causative; and all we intend is elucidation. *Lay* is manifestly the causative of *lie*; for it is equivalent to, cause or make to lie: thus, also, sit and set; rise, raise, rouse; see, show, &c. &c. In this manner a great number of words are employed causatively, to avoid a lengthy mode of expression: as, to *run a hare*, for, to *make a hare run*; *show*, for, *make to see*, &c. In many instances the same word is diversified in spelling and pronunciation from the original form, when employed causatively: as, *show*, a diversity of *see*; *raise*, *rouse* of *rise*; *set* of *sit*; *lay* of *lie*, &c.: and thus many words are resolvable into one word, which do not seem to have any connexion. Many verbs, however, are employed both causatively and uncausatively, or, as commonly expressed, both as active and neuter, without any diversity of spelling or pronunciation.

'To verbs,' we are told, 'belong, number, person, mood, and tense.' This also is affirmed concerning English words for no reason whatever, except that the same grammatic position had previously existed in connexion with Greek and Latin. 'Verbs,' it is said, 'have two numbers, the singular and the plural: as, *I love*, we love.' Here, again, the example is at variance with the definition; for the distinction, as to singular and plural, exists not in the word *love*, but in the pronouns *I* and *we*. In Latin, indeed, the definition can be exemplified: as, *Amo*, *I love*; *Amamus*, we love. Here are two numbers, singular and plural; because the terminations

of the verb perform the office of the pronouns in our language.

'In each number,' we are told, 'there are three persons; as,

Singular.

Plural.

First Person, *I love*;

We love;

Second Person, *Thou lovest*;

Ye or You love;

Third Person, *He loves*.

They love.

'Thus the verb, in some parts of it, varies its endings, to express or agree with different persons of the same number. In the plural number of the verb there is no variation of ending to express the different persons; and the verb, in the three persons plural, is the same as in the first person singular. Yet this scanty provision of terminations is sufficient for all the purposes of discourse, and no ambiguity arises from it: the verb being always attended, either with the noun, expressing the subject acting or acted upon, or with the pronoun representing it.'

It appears, then, that diversities of termination are not necessary to the English verb, as it is always attended either with a noun or pronoun; which noun or pronoun answers the purpose accomplished by termination in Greek and Latin: and for the same reason that the verb is without any variation in connexion with *I*, *We*, *You*, *They*, it might also have been without any variation in connexion with *Thou*, *He*, *She*, *It*: as, *I love*; *Thou love*; *He, She, or It love*; *We love*, &c. It is evident that the terminations or affix *est*, after *Thou*, and *eth* changed into *es*, *s*, after *He, She, or It*, answer no necessary or useful purpose; but occasion much embarrassment. Disuse these needless diversities of termination, and you discard at once nearly all the rules of syntax, or render them needless.

Whatever may have been the origin of the affixes *est*, *eth*, *es*—they are, evidently, nuisances in the English language; but perhaps the curiosity of the reader, respecting their adoption, may call for some explication. We find, in our olden literature, *eth* connected with all the persons and numbers of pronouns (*en* was also generally employed as an affix, at one time, especially in the plural number of verbs): as, *I loveth*, *Thou loveth*, *He loveth*, *We loveth*, *Ye loveth*, *They loveth*. From this, it is evident that *eth* could not be either a personal or a numeral affix: i. e. whatever it might indicate, if it indicated any thing, it could not denote number or person. After more enquiry and reflection than the question is perhaps worth, considered by itself, the conclusion in the mind of the author was, that the affix *eth* was corrupted from the Latin affix *at*, *et*, or *it*; or, that it is *Thau* (Gothic), *Thuc* (German *Thun* infin.), i. e. Do affixed instead of being put before the verb, as it is at present, when employed. The last seems the more probable conjecture; for when *Do* is employed, the affix disappears; which is some approach to evidence, that the one was considered equivalent to the other, if not the very same: as, *I do love*, *Thou do love*, or *doth love*: he *do*, or *doth love*; not *thou doth lovest*, he *does loves*. Whatever may have been the origin of *est*, *eth*, *es*, contracted into *s*, they are manifestly useless and troublesome appendages.

The doctrine of *moods* is self-convicted of absurdity : for the grammaticists are obliged to make such a confession as the following :—Though this mood (the imperative) derives its name from its intimation of command, it is used on occasions of a very opposite nature, even the humblest supplications of an inferior being to one who is infinitely his superior : as, ‘Give us this day our daily bread ; and forgive us our trespasses!’ Opinions are divided concerning the exact number and proper definition of moods. Yet, with all the love of complication, an obvious distinction is omitted ; for if what is called the infinitive mood deserve any designation, it ought to be called the impersonal verb ; or the impersonal state of the verb ; but the term impersonal was pre-engaged ; being applied to what is evidently the third person of some verbs—or verbs that are used only in the third person.

In reference to Greek and Latin, the traditional doctrine of moods may be tolerated ; because it serves at least the purpose of designating the various terminations of verbs, which must be committed to memory ; but, in reference to the English language, it possesses no redeeming quality.

Tense is a corruption of *tempus*, contracted into time. The grammatic judgments have been wonderfully divided about tense ; which is not surprising when we consider how much the subject has baffled the most metaphysical intellects ; and that it extorted the following humble confession from St. Augustine : *Quid sit Tempus, si nemo quærat a me, scio ; si quis interroget, nescio.* Mr. Harris has enumerated no fewer than twelve tenses ; but more moderate grammarians are content with half the number ; not without an apology for insisting on so many. ‘Tense,’ they tell us, ‘being the distinction of time, might seem to admit only of the present, past, and future ; but to mark it more accurately, it is made to consist of six variations, viz. the present, the imperfect, the perfect, the pluperfect, and the first and second future tenses!’ Others, still more moderate, are content with half this number ; and insist only on three tenses ; the past, the present, and the future ; others refuse to admit that there is a future or present tense ; and some deny the existence of tenses altogether. In all such cases of diverse judgment and doubtful distinction, simplicity is an argument of considerable weight ; so that, if there were no preponderating evidence, we would rather agree with those who hold that there are no tenses, than with those who assert that there are three, six, or twelve ; but though the doctrine of tenses has, to some extent, realised itself ; and we have, or seem to have, some notions of distinctions as to time, in connexion with verbs ; yet it can be as clearly proved as the nature of the case admits, that no such distinction really belongs to them ; and that, where such a notion does exist, it is wholly accessory or associated ; not primary—not intended to be indicated by any changes which are made upon the words called verbs, in any language. The enquiry, indeed, is attended with no substantial utility, except as it serves to remove false theory ; for nothing is preferable

to absurd opinions : silence is better than loquacious impertinence. Before, however, we enter directly on the consideration of tense ; let us first examine those words designated auxiliary or helping verbs, for the right understanding of these will, in a great measure, supersede the necessity of a formal disquisition concerning tense.

With respect to the auxiliary or helping verbs : viz. do, have, shall, will, may, can, let, must, be, two affixes must be noticed as being really all the changes of termination that properly and usefully belong to English verbs : viz. *ed* and *ing*. The last was, anciently, *ante*, *ant*, *and*, &c. (for there is great diversity of spelling in the *olden* literature) and was evidently borrowed from the Latin participle : *ing* seems merely a spelling of the same affix, accommodated to the nasal pronunciation that acquired possession of the English language after the conquest. The use of *ing* is precisely the same as the participle-affix *ans*, *ens*, in Latin, and *on* in Greek ; and has precisely the same use, and is, in fact, the same word as the adjective affix *an*, *en*, &c. ; for all the difference between what is called a participle and what is called an adjective, is, that the one is formed on a verb and the other on a noun ; and this difference is, in many cases, so very slight, that the same word is considered either adjective or participle.

The corresponding, or rather the same affix, in the other languages, is, *ande*, Swed. ; *ende*, Ger. ; *ant*, Fr. ; *ante*, It. From this view, it plainly appears, that as the Latins borrowed the affix in question from the Greeks, their literary masters ; so the modern nations of Europe borrowed it from the Latins, their literary masters.

The affix *ed*, *at*, Swed. ; *et*, Ger. ; *ato*, It. ; is evidently the same as that which exists in what is misnamed (for it is active as well as passive) the Latin perfect, passive participle. Thus, *dubit-o*, *dubitatus*, is, with us, *doubt*, *doubted*, &c. &c. If, then, the English affix be merely that of the Latin ; what is this Latin affix ? We can hardly expect absolute certainty in such a matter ; but we believe it is what is called the third person singular of the perfect, with adjective terminations appended. Thus, *amat*, he loves, *amavit*, he has loved, *amavitus*, a, um, contracted into *amat-us*, a, um. The *av* is a contraction of *hab-eo* : so that *amavit* is equivalent to, *love-have-he, she, or it ; amaverunt* is equivalent to, *love-have-they ; or they-have-love*.

Whatever distinctions may be interposed respecting ‘the perfect tense not only referring to what is past, but also conveying an allusion to the present time,’ every one knows that there is no distinction of meaning, or difference of application, between what are called the preterite imperfect and the preterite perfect in Latin. The reason is plain : *amabat* consists of the three same words as *amavit* ; i. e. *am*, love, *hab*, have, and *at*, signifying agent or subject, he, she, or it, as determined by the connexion.

For the same reason that the preterites in Latin often appear to indicate past time or perfected action ; so the English affix *ed* often appears to indicate the same ; but unfortunately for distinctions, even of the simplest kind, the

definition propounded as if the English verb denoted action either terminated or not terminated, is not free from objections.

We have no wish to discard the affix *ed*; but it is evidently much less necessary or useful than grammaticists would readily admit; for many verbs are destitute of it, such as *shut, set, thrust, spread*, &c., without any inconvenience or loss of significance; and when ungrammatical people omit the affix, or employ what is called the present instead of the imperfect, their meaning is perfectly intelligible. The truth is, we are very apt to fancy that useless things are necessary, merely because we have been used to them; and we have not the smallest doubt that, if the affix in question had never been adopted, our language would have been as significant without, as it now is with, this termination. But if it were regularly affixed, there would be no objection to its existence: the great grammatic evils we have to complain of, are those irregularities which so much abound; and which serve only to render the verbal apparatus difficult and unwieldy.

If we discard all useless parts and irregularities, what are called the auxiliary verbs will appear in the following manner:

I do, thou do, he, she, or it do. We do, you do, they do. I doed, thou doed, he, &c., doed. We doed, you doed, they doed.

To do, doing, doed,

I have, thou have, he, &c., have. We have, you have, they have. I have, thou have, he, &c., have. We have, you have, they have.

To have, having, have.

In consequence of *have* being contracted into *had*, we have such extraordinary combinations as the following: I *have had*, I *had had*; and not only the former, but the latter of these expressions is set forth in proper grammatic order, as a necessary and regular tense.

Let and must require no notice in this place. Can and may merely express power: I *can go*, is equivalent to, I am able to go—I have power, permission, liberty, &c., to go. I may resign, is equivalent to, I have power to resign; and in spite of idle doctrines concerning potentials, the shorter is merely an abridged form of the longer expression. *May*, when the affix *ed* is assumed, is corrupted into *might* instead of *mayed*. Will, Vol-o, is,

I will, thou will, he, &c., will. We will, you will, they will. I willed, corrupted into *would*, thou willed, he, &c., willed.

To will, willing, willed.

Shall,

I shall, thou shall, he, &c., shall; we shall, &c.: I shalled, corrupted into *should*, &c.

Shall seems most entitled to the designation auxiliary verb, for it does not appear to have much distinct significancy of its own; but it is, we believe, merely a diversity of *will*; and considering the perplexity caused by it, not only to Scotchmen and foreigners, but even to the English themselves, who often blunder in applying *shall* and *will*, its existence is no grammatic cause of congratulation.

The preceding verbs have some irregularities;

but they are simplicity itself when compared with the verb *be*; in which there is more of wanton anomaly than could well be found within the same compass, if we were to search all the languages of the world. The remark of Mr. Turner applies equally to the English substantive verb: 'The Anglo-Saxon substantive verb is compounded of several verbs. We can trace no fewer than five in its different inflections.' Words much in use are most liable to be corrupted and rendered irregular. Our ancestors adopted many irregularities, of what is called the substantive verb, from their literary neighbours: but confusion is worse confounded by their unskilful agency.

Am is plainly *apu*, Gr.; *sum*, Lat.: *is*, a corruption of *esti*, *est*; *was* is a corruption of *esse*; *were* is *fuere*, *fuere*, Fr.; *fuero*, It.; *art* and *are* seem corrupted from † *weorth*, to be, he made: thus far we have a jumble of anomaly; but in what remains we have an entirely different word, and one which might be very easily rendered a competent substantive verb, at once simple and regular.

Be, † *beo* and † *bio*, i. e. *fio*, i. e. *bioo*.

The illiterate, particularly the peasantry, for they always adhere more closely to analogy than their grammatic superiors, have this as the sole substantive verb in the following manner:

To be, being, beed.

I be, thou be, he, &c., be; we be, you be, they be: I beed, thou beed, he, &c., beed; we beed, you beed, they beed.

Thus, by merely removing those nuisances, *est*, *eth*, *es*, or *s*; and by making the regular affix *ed* supersede the obsolete affix *en*; we have such simplicity and regularity, that even a child could not err in employing this familiar, household word. Fortunately *be* remains unchanged in what are called the future tense, and the subjunctive and potential moods: as, I shall *be*, thou shalt *be*, he shall *be*, &c. If I *be*, if thou *be*, &c. I may *be*, he may *be*, &c.

Having reviewed the grammatic auxiliaries, we may now approach the main body of verbs, which consist of very irregular forces: and, for the conceit of the allusion, we will make train our fugleman.

To train, training, trained.

I train, thou train, he train, we train, &c.: I trained, thou trained, he trained, &c.

This is such simple manœuvring that a child might go through the whole exercise; yet it is all that is either necessary or useful: and to change train from an active to what is called a passive state, all that is necessary is, *be* put before it, as accompanied with the affix *ed*. Thus,

I be loved, thou be loved, &c.

I beed loved, &c.

To be loved, being loved: having been loved.

We have no doubt that if *ed* had never been adopted as a verbal affix, the business could have been well accomplished without it; but, having been adopted, it may remain; only irregularities deserve to be banished.

When the auxiliaries are united with the re-

gular verbs, the junction is effected in the following manner :

I do train, thou do train, he do train, &c. :
I doed train, thou doed train, he doed train, &c.
I have trained, &c. : I have trained, &c.
I will train, thou will train, he will train, &c.
I shall train, &c.
I shall have trained, thou shall have trained,
he shall or will have trained.

But, if the moods be abandoned, the tenses yet remain.

The truth is, as before intimated, if any notion as to time ever exist in connexion with any verb, it is wholly accessory or associated, and not signified by the verb itself. In general what is called the *present* tense simply indicates action, being, relation, &c. : what are called the *past* tenses, generally indicate existence, action, relation, &c., as terminated ; which, of course, is closely associated in the mind with the notion of the *past*. What is called future tense properly indicates volition. Thus, if I say, I will publish the present work in the month of May : the sentence is equivalent to, I intend to publish in the month of May ; or, I am resolved to publish in the month of May. Here the notion of *future* is manifestly an associated, not the primary notion. It is true that the word is applied to many objects in which volition does not exist ; as in the following expressions : The moon will rise at eight to-night ; the sun will rise at six to-morrow morning. These are instances of a very numerous class of expressions which are metaphoric or allusive, rather than strictly and literally proper, though, from having been long used, they appear quite literal.

If the grammatic doctrine of tenses were admitted, what is gained by it ? Does it impart any instruction ? Does it render Tyro better acquainted with language or more master of composition ? If it does not answer such a purpose, it is evidently worse than useless.

Irregular verbs, like all anomalies, are exceedingly troublesome, especially to learners. Most of them, evidently, originated in blundering carelessness ; or in that aversion to polysyllables which operated so powerfully on our Saxon ancestors. Had grammar-makers endeavoured to remove such irregularities, they would have done some good ; but, instead of such useful service, their first labor was to consecrate and confirm all the perversions which they found actually existing ; and thus they prevented our language from *righting* itself, as it would have done, to a considerable degree, if it had been left wholly to analogy, free from the fetters of arbitrary rules established on anomalous precedents ; for there is a constant effort on the part of children and foreigners, and all the ungrammatic, to restore uniformity ; which effort is so well backed by reason, that it would doubtless prevail but for the despotic authority of written grammar.

With the view of inducing influential writers and speakers to set the example of banishing irregularities from the verbs, we will present them in the following distributions :—

First, Verbs that have both a regular and irregular form.

Awake	awaked	† awoke	† awaken	
Bend	bended	† bent		
Bereave	bereaved	† bereft		
Build	builded	† built		
Catch	catched	† caught		
Chide	chided	† chid	† chidden	
Cleave	cleaved	† clave		
Clothe	clothed	† clad		
Crow	crowed	† crew		
Dare	dared	† durst		
Deal	dealed	† dealt		
Dig	digged	† dug		
Dwell	dwelled	† dwelt		
Freeze	froezed	† froze	† frozen	
Gild	gilded	† gilt		
Grave	graved	† graven		
Gird	girded	† girt		
Hew	hewed	† hewn		
Knit	knitted	† knit		
Load	loaded	† laden		
Mow	mowed	† mown		
Saw	sawed	† sawn		
Shape	shaped	† shapen		
Shave	shaved	† shaven		
Shear	sheared	† shorn		
Shine	shined	† shone		
Show	showed	† shown		
Shrink	shrinkd	† shrunk		
Slay	slayed	† slew	† slain	
Sow	sowed		† sown	
Spill	spilled	† spilt		
Strive	strived	† strove	† striven	
Strow	strowed	† strown		
† Strew	† strewed			
Swell	swelled	† swollen		
Thrive	thrived	† throve	† thriven	
Wax	waxed	† waxen		
Work	worked	† wrought		
Wring	wringed	† wrung		

There can be no unwillingness, even in the most dutiful disciples of custom, to discard all the above forms with the dagger prefixed ; for most of them have an olden uncouthness, except to the lovers of antique obsolescence.

Secondly, verbs that might be restored to analogy, or rendered regular without offering much violence to established usage : as,

Beseech	beseached	† besought		
Bleed	bled	† bled		
Blood	blooded	is still better		
Blow	blowed	† blew	† blown	
Choose	choosed	† chose	† chosen	
Cleave	cleaved	† cleft	† clove	† cloven
	to split.			
Cling	clinged	† clung		
Creep	creeped	† crept		
Draw	drawed	† drew	† drawn	
Drive	drived	† drove	† driven	
Drink	drinked	† drank	† drunk	
Feel	feeled	† felt		
Flee	fleed	† fled		
Fly	flyed	† flew	† flown	
One of these duplicates had better be discarded.				
Fling	flinged	† flung		
Forsake	forsoaked	† forsook	† forsaken	
Grow	growed	† grew	† grown	
Hang	hanged	† hung		

Hear	heard	† heard	
Keep	kept	† kept	
Know	known	† knew	† known
Lay	laid	† laid	
Lie	lied	† lay	† lain
Leave	left	† left	
Lose	lost	† lost	
Pay	paid	† paid	
Ring	ringed	† rang	† rung
Rise	rose	† rose	† risen
Say	said	† said	
See	saw	† saw	† seen
Shake	shook	† shook	† shaken
Shoe	shod	† shod	
Sing	sung	† sang	† sung
Sink	sunk	† sunk	
Sleep	slept	† slept	
Slide	slid	† slid	† slidden
Sling	slinged	† slung	
Slink	slinked	† slunk	
Smite	smote	† smote	† smitten
Speak	spoke	† spoke	† spoken
Speed	speeded	† sped	
Spend	spent	† spent	
Spin	spun	† span	† spun
Spit	spit	† spat	† spitten
Spring	sprung	† sprang	† sprung
Steal	stole	† stole	† stolen
Stick	stuck	† stuck	
Sting	stung	† stung	
Stink	stank	† stank	† stunk
Stride	strode	† strode	† stridden
Strike	struck	† struck	† stricken
String	strung	† strung	
Swear	swore	† swore	† sworn
Swim	swam	† swam	
Swing	swung	† swung	
Teach	taught	† taught	
Tear	tore	† tore	† torn
Tell	told	† told	
Think	thought	† thought	
Throw	threw	† threw	† thrown
Weave	wove	† wove	† woven
Weep	wept	† wept	
Win	won	† won	

Most of these are already familiar to us, as being constantly heard among the ungrammatical members of society, who are the great majority of the whole population; and, when our mouths and ears have somewhat practised on these analogies, they will not shy much at such strange regularities as the following:—

Abide	abided	† abode	
Be	beed	† been	
† Am	† was		
Bear	bearred	† bare	† bore † borne † born
Begin	beginned	† began	† begun
Bid	bidded	† bade	† bad † bidden † bid
Bind	binded	† bound	
Bite	bited	† bit	† bitten
Break	breakred	† broke	† broken
Breed	breeded	† bred	
Bring	bringed	† brought	
Buy	buyed	† bought	
Come	comed	† came	
Do	doed	† did	† done
Fall	fallled	† fell	† fallen
Feed	feeded	† fed	

Fight	fighted	† fought	
Find	findel	† found	
Give	gived	† gave	† given
Go	goed	† went	† gone
Have	haved	† had	
Hide	hided	† hid	† hidden
Hold	holdel	† held	† holden
Lead	leaded	† led	
Make	made	† made	
Meet	meeted	† met	
Rend	rended	† rent	
Ride	ridel	† rode	† rid
Run	runned	† ran	† run
Seek	sceked	† sought	
Send	sended	† sent	
Shoot	shootel	† shot	
Sit	sitted	† sat	† sitten
Stand	standel	† stood	
Take	taked	† took	† taken
Tread	treaded	† trod	† trodden
Wind	winded	† wound	
Write	writel	† wrote	† written

The following have no change of termination; yet, as already noticed, they answer every purpose of speech as well as those that have the affix *ed*: having a great affection for simplicity we are rather partial to such unchanged verbs; but as *ed* has been adopted, and has become the general rule, perhaps it ought to be uniformly affixed: thus, beat, beated; burst, bursted; cast, cated; cost, costed; cut, cutted; eat, eated; featen; hit, hitted; let, letted; put, putted; read, readed; rid, rided; set, setted; shed, sheded; shred, shreded; shut, shutted; split, splitted; spread, spreaded; sweat, sweated; thrust, thrusted.

Observe, 1. That most of the irregular verbs have descended from Saxon times; when there was a different manner of forming what is called the imperfect besides affixing *ed*.

2. The termination *en*, which appears so often in what is called the perfect passive participle, is a relic of a regular affix, now obsolete; and, for the same reason that it has been wholly discontinued in what is called the infinitive mood (for we never say or write to loven, &c.), it ought to be entirely disused, except as an immovable affix; as, *flaxen, golden, flattern, blacken*, &c.

Many of the irregularities, exhibited above, are merely contractions or corruptions of the verbs with the regular affix: as, bereft contraction of bereaved; clad of clothed; dealt of dealed; dwelt of dwelled; gilt of gilded; spilt of spilled; cleft of cleaved; crept of creeped; felt of feelled; fled of fleed; kept of keepled; left of leaved; shod of shoed; slept of sleepled; wept of weeped; &c.

There is still a great tendency to such contractions as, *smelt* for *smelled*; *learnt* for *learned*, &c.; but the grammarians have very properly remonstrated against such instances; and, for the same reason, the author remonstrates against all irregularities, whether more or less modern. Instead of indulging foolish mirth or contemptuous ridicule, when children, foreigners, and illiterate natives follow the guidance of analogy and say, *growed, knowed, blowed, seed*, &c.; men ought to be ashamed of their own want of re-

flection—their appreciation of worthless distinctions—their blind reverence for anomalies, made up of blunders and corruptions—and their slavish submission to the tyranny of an arbitrary kind of grammar, which attempts to prove its legitimacy by giving reasons for what reason never dictated.

PART III.

PREFIXES AND AFFIXES.

Prefixes are those words which are joined on the left or at the beginning of other words: as, *unknown*, *revisit*, &c.: affixes or postfixes are those words which are joined on the right or at the end of other words: as, *heedless*, *mindful*, &c. It is evidently of some importance that these should be explained; especially such of them as have no separate existence in the English language. Such words are generally particles; i. e. small parts of compound words: and some of them are fragments of sentences. Post, after, (for example), is evidently what is called p. p. of *pono*, (hence *pone*, behind), and must have been originally connected with other words to express the meaning now indicated by it alone, in some such manner as the following: *positum a tergo*, &c.

It is only on this supposition that the actual meaning of many words can be accounted for.

SECT. I.—OF PREFIXES.

This term is more definite than preposition; which last term was originally employed for the same purpose as we now employ the former; and in this view there are both meaning and sense; in any other view there is neither: hence, as already intimated, the unmeaning definition of preposition, as commonly given by the grammarians.

The prefixes may be presented in the following classes:—

1. GREEK.—*An* (both *an* and *un* in Gothic), *in*, and both *in* and *un* with us: as, *involuntary*, *unwilling*; i. e. not voluntary, not willing: so that the prefix *an*, *in*, *un*, has precisely the meaning of *ne*, *non* (i. e. *ne*, *ne*), not: it is a negative prefix.

The Greek grammarians have made the same mistake about the above prefix as the English grammarians, concerning what they call the indefinite article. Both say that *a* becomes *an* before a word beginning with a vowel; whereas, *an* becomes *a* before a word beginning with a consonant. Observe again, that one of our duplicates of this prefix, i. e. *un*, is derived directly from Greek, through our Gothic ancestors; the other from the Latin. Hence we prefix *un* to Saxon words (themselves corruptions of Greek and Latin); and *in*, the Latin corruption of *un*, to Latin words: as, *involuntary*, *unwilling*. We perceive something of impropriety, or uncouthness, i. e. a departure from established usage, if we interchange them: *inwilling*, *unvoluntary*; but the latter being more vernacular, or idiomatic, does better than the former. Of course, as a consistent advocate of simplicity and uniformity, the author would have one of these duplicates of the negative prefix discontinued; and that which was adopted from the Latin, as being less idiomatic, should be turned off; but to this

there is certainly a great obstacle; for many words compounded of *in* have been received into our language; as *infirm*, *infallible*, &c. ¶

In addition to all the other anomalies, there are many useless diversities of the same word, which have been adopted first directly from the Greek, then from Latin, Italian, French, &c. &c.: thus many forms of the same verb, noun, &c., have been imported from other languages; and then these have been yet more diversified by the caprices of spelling and pronunciation.

Ana or *an*, which is the same in German, and with us changed into *on*. This is a word of frequent occurrence; but it is not much used as a prefix.

An is changed into *en*, changed into *in*; which we have both as a prefix and a preposition. Of this, also, we have a duplicate, which we borrowed from the French; as, *inquire*, *enquire*; *indite*, *endite*; &c. It would certainly be advisable to discard the French and adhere uniformly to the Latin form of spelling; as, *inchant*, *†enchant*; *indict*, *†endict*; *ingrave*, *†engrave*, &c.

There can hardly be any reasonable doubt that *ana*, *an*, *en* (with us *on*, *in*), and *an*, *a* (*in*, with us *un* and *in* negative), are but one and the same word, or fragment of a word; and that the difference of meaning is owing to ellipsis, i. e. difference of composition.

Anti, in front of, directed to, opposed to: it has only the last meaning when a prefix with us: as, *antireformer*, i. e. one who is opposed to reform; *antiabolitionist*, one who is opposed to the abolition of negro-slavery. *Ante* (i. e. *anti*) is equivalent to, in the front, ahead of, before: *antediluvian*, i. e. before the deluvium, corrupted into *deluge*; *antemeridian*, i. e. before the sun be at the meridian—before noon. From *ante* is *avante* (It.), (i. e. *a-ante*) contracted into *van*.

Apo, *ab*, contracted into *a*, and Ger. *†* aff, *†* af, off, of. Both off and of are frequently used; but only the former is employed as an affix, and that but seldom.

Ex, *er*, *ex*, contracted into *e*; corrupted into *†* uss, *†* ust, *aus*, Ger., out. Out is not much used as a prefix: *ex* is much employed as a prefix in Greek and Latin, and *aus* in Ger. The general meaning is the same in all the different languages; i. e. it is compounded of that of the prefix, and of that of the other word. *Exler* and *outlaw* both mean out of, or without law; only the first is a person that is not subject to law; the second is a person that has not the protection of law.

On *ex* is formed *extra*, i. e. out of, beyond: *extraordinary*, beyond ordinary; *extraparochial*, not comprehended within any parish.

Hemi, *semi*, i. e. half: as, *hemisphere*, i. e. a half sphere; *semicircle*, a half circle, or the half of a circle. *Hemi* is a contraction of *hemisa*, a contraction of *he messe*; i. e. the feminine article, and *messe*, *media*, medium, middle.

Para, *peri*, *per*, &c., *per*. This, like so many other particles, or verbal fragments much in use, is exceedingly vague. As a Greek prefix, it occurs in but few words adopted into the English language. As a Latin prefix: *per* means through, completely, much: as, *perfect*, completely done, finished, complete; *perform*, to form completely;

to finish, &c. When not employed as a prefix, *per* is equivalent to by: as, *per centum*—by the hundred.

Pro, *pro*, *præ*, corrupted into *for*, *fore*. *Præ*, *pre*, and *fore*, as prefixes, are exactly equivalent: as, preordain, foreordain; predict, foretell, &c. *Pro* is generally equivalent to forward, i. e. forward, or forth: as, produce, i. e. to lead forward, or bring forth; propel, drive forward, &c. *For* is prefixed to very few words, and is equivalent to *pro* in some of its connexions and applications.

Hyper, or *hyper*, *super*, *supra*, corrupted into *up*, *upper*, *uber*, and *oben* Ger. † *uber*, *ober*, Heb. *over*, † *bove*, *boven* Dut., i. e. be over, whence above. It is not meant that *ober*, Heb., † *uber*, &c., are derived from *hyper*, as *super*, &c.; but they are all manifestly the same word with the same meaning. *Hypercritical*, i. e. over critical; supernatural, above natural, or above the course of nature; supervisor, overseer, &c. *Super* is contracted into *sur* by the French: surcharge, surfeit, survey, &c.; i. e. overcharge, overdo, overlook, or view all over, &c.

Aber, in the names of towns, means over, like *sur*, upon, &c.: as, Aberdeen, i. e. over or upon the Don; Abergavenny, i. e. over the Gaveny; Aberistwyth, i. e. over the Istwyth, &c.

Inver, i. e. *infra*, is just the opposite of *aber*: as, Inverness, i. e. under the Ness; Inverury, i. e. under the Ury, &c. Thus we have Newcastle-under-Line as well as Newcastle-upon-Tyne, &c.

Hypo, or *hypo*, changed into *sub*, whence *subter*; all which are prefixes: we have few Greek words with the prefix *hypo*; but we have many Latin words with *sub*, &c.: as, subscribe, i. e. underwrite, or write under; sub-tenant, i. e. under-tenant, &c.

Dia, *dis*, *de*, through, from, out, apart. The primary use of both *dis* and *de* may be termed separative: as, diffuse, to pour out, or asunder; depart, to part from, leave, go off: in many words they rather add to the force than to the meaning of words: demonstrate, to show forth (monstro, to show); despoil, to spoil, &c. In many words they are simply negative: discredit, not to credit, &c. In some words *de* has the signification of down or downwards: as, descend, go down; degrade, make to descend to a lower grade, step, or station; despise, literally, look down upon.

Dis, *de*, like *ex*, *e*, *ab*, *se*, are directly opposite to *ad*, *con*, *ob*, *in*. The last may be termed connectives: the first disconnectives. As negatives, *dis*, *de*, *un*, are exactly equivalent: discover, uncover (the first is now used only metaphorically); dethrone, unthroned; demoralise, to render immoral, &c.

Malus, *mal*, ill, bad, contracted into *mes*, *me*, Fr.; *mis*: malecontent, mal-content, Fr.; malformation; misuse, misadventure, &c. *Mésuser*, *mésaventure*, Fr., i. e. not well content, bad formation, to use ill, a bad adventure: thus, miscalculate, misadvise, mistake, &c.

The following are LATIN prefixes or prepositions: *ad*, corrupted into *adu*, † *du*, now *to*, and into *at*; and contracted into *a* in It. Fr. Sp. and Eng.: as, abed, asleep, ashore, aground, &c.;

i. e. in bed, in sleep, on shore, on ground, &c. In all such expressions *as*, to go a begging, a fishing, a hunting, &c., *a* is *ad* contracted; and the meaning is, to go to begging, to fishing, &c. *Ad* and its contraction *a*, and its diversified forms *at*, *to*, have precisely the same meaning.

The last consonant of the prefix is usually changed into the first consonant of the word with which it is joined; as, adunccio, annuncio, to announce; assulto, to assault, i. e. leap upon, to attack.

The illiterate classes of the English, particularly cockneys, are guilty of using *a*, i. e. *ad*, most unreasonably: as, I was a saying, he was a hearing, he is a going.

Circum, in a circle, round, about.

Circumnavigate, to navigate round, or sail round; *circumambulate*, to amble, or walk round, &c.

Inter, i. e. *in* and *ter* an adjective affix, within, between, among; interline, to write between lines; interlope, to leap between, or among; interregnum, interreign, the time between the reign of one king and that of another.

Intro, in or into: introduce (*duco*, lead), to lead, or bring in, &c.

Intra, within.

Internus, *Internalis*, internal.

Interior.

Introco, corrupted, through the Fr., into enter, whence entry, entrance, &c.

Con, with, to: *Concurro*, concur, run together, unite; confront, to place front to front; confluent, flowing together; commingle, to mingle together.

Contra, corrupted into counter; facing, opposite, against: contradict (*dico*, speak), to speak against, or deny; counteract, to act in opposition to; countermand, to order the contrary of what was ordered before, &c.

Contrarius, *contrary*; *contrarietas*, *contrariety*.

Ob (*epi*), upon, to, before, for, &c.: *obligo*, *oblige* († *Ligo*, bind), bind to; *occur* (*curro*), run to, meet, happen.

Trans, contracted into *tra* (It.), and corrupted into *through* (and *très*, Fr.), *thorough* (*durch*, Ger.): it answers to *through*, *over*, *beyond*: transgress, trespass, to *pass over*; *transatlantic*, beyond the Atlantic; translucent, shining through, clear. *Très* is employed by the French as we employ *very*, *exceedingly*.

Ultra (corrupted into *oultre*, Fr.), beyond, above, high, &c.; ultra-royalist, one who has very high notions of royalty, a high tory.

Uterior, further.

Sine, without, (i. e. *sit ne*, be not), contracted into *se*, is strictly a separative or disconnective; segregate, to separate from the flock; seligo, selectum, *select*, to choose out of. This prefix has much the same use as *de*, *dis*, *di*, and *un*, in.

Re, again, back: re-enact, enact again; restate, state again; rebound, bound back.

In Dutch *re* is corrupted into *her*; as, *herplant*, replant; *hermaak*, remake.

It is unnecessary to explain those words sometimes employed as prefixes, which have a separate existence in the language: such as, with, down, &c. There is but one Anglo prefix

that appears to require notice, viz. *be*: as in befriend, bespeak, belie, &c. This prefix is possibly the verb *be*; but we rather think it is the preposition *by* (*bey* Ger.), i. e. *abu*, Goth., i. e. *ab*.

In some cases this prefix gives a particular meaning to a verb: as, belie, bespew, &c. Some nouns are formed into verbs, in connexion with it, which do not exist as verbs in a simple or separate state—as, befriend, behead, &c.; but frequently it imparts no meaning: thus, becalm, to calm; becloud, to cloud, &c.

Arch, i. e. *arch-os*, chief, is employed as a prefix: arch-priest, a chief-priest; archbishop, a chief bishop; arch-rogue, a chief or great rogue, &c.; arch-heretic, a chief or remarkable heretic.

SECT. II.—OF AFFIXES OR POSTFIXES, i. e. WORDS ADDED TO THE END OF OTHER WORDS.

Affixes of *adjectives* may be arranged under the following heads:—

1. Simple adjectives or connectives: an, en, in, on, &c.; ad, ed, id, &c.; ate, ite, &c.; al, el, ile, &c.; ar, er, ary, &c.; ic, ick, ig, contracted into y and corrupted into ish (*isch*, Ger.; *esco*, It.; *esque*, Fr.); human from humo, now homo; golden, frigid, partial, singular, customary, domestic, † frosty, now frosty, Spanish, Waspish, picturesque.

All these affixes, which the modern have in common with the learned languages, might, as already intimated, be called possessive or genitive: thus, *conditio hominis*, *humana conditio*, man's condition, the condition of man, the human condition, are all equivalent expressions.

Observe, such affixes are frequently redundant, i. e. two or more are put where one is sufficient: as *philosophical*; *etymological*; *eastern*; *western*, &c. &c., instead of *philosophic*, &c.

Concerning the etymology of these affixes, it is, perhaps, idle to offer a conjecture, as they are mere fragments of words; *id*, &c., seems a contraction of *eidos* (used adjectively), *ic* or *ik*, &c., of *eikos*, *like* (which word is also employed as an adjective affix); and, perhaps, all the rest have a similar derivation; but we cannot be confident respecting them.

2. Separative or negative affixes of adjectives. We have one of this description, which answers exactly to the negative prefix *in* or *un*, viz. *less*, i. e. † *los*, i. e. *lost*, deprived of, without: as, *witless*, *friendless*, *careless*; without wit, without a friend, without care: the Ger. is *los*: as *gottlos*, *godless*; *grundlos*, *groundless*. Our present form of this affix seems to have originated (like many other modern spellings) in etymologic error; by supposing it to be the adjective *less*, or comparative of little.

3. Diminutive affixes of adjectives. We have one of this description, viz. *ish*: as, *sweetish*, a little sweet; *saltish*, a little salt: *ish*, is a corruption of the Greek diminutive *isk*; which is in Italian, *uccio* and *uzzo*, and in Span. *ico*.

4. Augmentative affixes: these are † *sum*, † *sum*, *some*, *ful*, *ous*.

† *Sam*, † *sum*, now *some*, is the Latin superlative affix, *ssim-us* or *sum-us*, i. e. *summ-us*, highest, greatest, most, much, very: *troublesome*, *lightsome*, causing much trouble, giving much light. In Ger. this affix is *sam*; our present spelling originated in the etymologic error of supposing it to be *some*; which still exists as a separate word, but which has an opposite meaning.

Ful, i. e. full, requires no explanation here. *Ous*, is the French form of *os* (like *our* for *or*), a Latin augmentative affix: *calamitos-us*, *culamitos*, having or causing much calamity.

These three affixes are equivalent though not always interchangeable; for it is not customary to put the one for the other at choice. We say *troublesome*; but *trouful*, *troubous*, seem awkward. The old writers, indeed, took more liberty in this way.

The Latin affix *os*, is manifestly the same as *or*, *ar*, and seems to be a fragment of *maxim-us*, greatest, most, much, very.

There are some adjective affixes that cannot be ranged under any of the above designations: as *able* (i. e. *habilis*, *habile*—see *habeo*), which might be termed potential passive: *teachable*, *moveable*, *mutable*, *mutabile*, &c.; i. e. that may be taught, that may be moved. But there are instances in which it is employed as active rather than passive: *forcible*, *conversable*, &c., i. e. *forceful*, that can converse. This use of the affix is not frequent; and, perhaps, it ought to be discontinued.

It is almost unnecessary to mention that our adjective *able* is the same word; only it is hardly ever applied as passive: we say, *able to see*, but not *able to be seen*.

Alike, like, often contracted into *ly* (*lich*, Ger. and *gleich*, i. e. *ge-leich*, *lyk*, Dut.), i. e. *aligki-os*, perhaps a corruption of *eikel-os*, *equal-is*, equal: *gentlemanlike* or *gentlemanly*, *friendlike*, or *friendly*, &c.; i. e. *like a gentleman*, as a friend: this is generally what is termed an adverbial termination: as, *boldly*, in a bold manner, *proudly*, in a proud manner, &c.

Horne Tooke derives *like* from the compound *gelyk* or *gliche*; but he does not attempt to inform us what *gleich* is derived from.

We may notice the affixes *ward* and *wise* here: as in *homeward*, *backward*, *sidewise*, *longwise*, &c., in the direction of home, in the direction of the back, in the direction of the side, in the long direction or manner: *ward* is a corruption of *versus*. See *ward* under *ver*-o; *wise* is for † *wayis*, † *way's*, genitive of *way*, i. e. *via*.

Affixes of nouns are, *head* also *hood*, *dom*, *ship*, *ness*, *th*, *ty*, *tude*, *ary*, *ry*, *ment*, *men*, *mony*, *age*, *ation*, *ction*, *ition*, *otion*, *ution* and *asion*, *esion*, &c., *ant*, *ent*, *or*, *cr*, *ist*, *ism*, *ling*, *lin*.

As the terminations of words are exceedingly liable to be corrupted, it is hardly possible to arrive at a satisfactory opinion concerning the derivation of many affixes: those of the nouns are particularly difficult.

The affix *head*, *hood* (*heid*, Dut., *heit*, Ger.), would seem at first sight the noun *head*: as if † *manhead* or *manhood* were *head man* or *great man*; but there is so little obvious connexion between the meaning suggested by this word,

whether taken literally or figuratively, and the use of hood as an affix in many applications, that we have conjectured the last to be either a corruption of had, or, what seems more probable, of tudo. Another form of the same affix in German is od, and in Welsh there is edd and dod. But, whatever be the derivation of hood, it means exactly the same as tudo, ty, &c., i. e. state, condition: widowhood is being a widow; falsehood is being false, or that which is false.

Dom (*thum*, Ger.) seems evidently a contraction of *domain* or *dominion*: kingdom, popedom, princedom, dukedom, that which is subject to a king, &c. In such instances the affix is strictly proper; but, like other words, it was extended to more vague applications: as wisdom, freedom, &c., i. e. being wise, free; or the state of being wise, free.

Ship, *schaft*, Ger., has also occasioned much trouble. We have conjectured it might, as also *haft*, Ger., be a corruption of † *hafd*, *hauft*, Ger., i. e. caput; then we have supposed it might be *have*; again, we have thought it might be a corruption of *super*; which, so far as meaning is concerned, is the most likely derivation. But, whatever be the derivation, it evidently serves the same purpose as *hood*, *dom*, *tus*, *ty*, *tude*, &c.: as lordship, the domain of a lord, the power, authority, dignity, &c., of a lord; worship, † worshipship, i. e. being worthy, or considered worthy, of honor; whence, as a verb to worship, i. e. to honor; worshipful, honorable, or considered full of worth, very worthy; courtship is the business, state, or process of courting.

The preceding affixes are not much employed, and may be regarded as antique terminations; for they are hardly affixed at pleasure in the present time.

The affix of most general application is *ness*, *niss*, Ger.; which, as well as *ezza*, It., and *esse*, Fr., seems a corruption of *essentia*, essence. Almost any adjective can be converted into a noun by this affix: round, roundness, *ritondo*, *ritondezza*, It.; feeble, feebleness, *foible*, *foiblesse*, Fr.; noble, nobleness, *noblesse*, Fr. So also in Ger. *finster*, dark, *finsterniss*, darkness.

Horne Tooke seems to have fancied that the above termination was the same as *ness* in the names of places on the sea coast: as *Sheerness*, *Foulness*, &c.; but the latter is manifestly nose or nasus; and it would be difficult to discover any connexion between nose and the affix in question.

The affix *th* in connexion with nouns is considered by Mr. Tooke the same as the verbal affix *eth*: we have by turns supposed it might be that, or, perhaps, *the*, what is called definite article, or a corruption of *ty*. The last is rather our present opinion. But whatever be its derivation, its use is the very same as *ty*, *ness*, &c.: as, wide, width; wideness; long, † length, length, longness; true, *truth*, the same as verity, i. e. *veritas* from *verus*.

The affix *ty*, like *té*, Fr., *tu*, It., *dad*, Sp., is a corruption of the Latin affix *tas*, *tat*, and Greek *tes*; as bounty, *bonté*, Fr., *bonta*, It., *bondad*, Sp., *bonitas* from *bonus*, good; vanity, *vanité*, Fr., *vanita*, It., *vanidad*, Sp., *vanitas* from *vanus*, vain.

There is the same use of *tude*, i. e. *tudo*, Lat. and in the ablative *tudine*; which is adopted by the Italian: *magnitude*, *magnitudine*, It., *magnitudo*, from *magnus*, great.

The termination *ary*, contracted into *ry*, is properly the Latin adjective affix *aris* or *arius*: as actuary, apothecary, &c., i. e. *actuarius*, from *actus*; so cavalry, formed on † *cavallus*, *caballus*, a horse, a war-horse; rivalry, formed on *rival*; pleasantry, on *pleasant*, &c.

The terminations *ment*, *men*, *mony*, are evidently the same affix: fragment-um, a broken part, from † *frag-o*, to break; document-um, that which shows, from *doc-eo*, to show; commandment what is commanded, from *command*; acumen, sharpness, or that which has a point, from *acu-o*, to point, make sharp; patrimonium, patrimony, what descends from a father (*pater*), an inheritance, &c.

This affix is frequently an adverbial termination in Italian, French, and Spanish: importunamente, It. and Sp., importunement, Fr., importunately, &c.

The termination *age*, seems in some instances the augmentive *accio*, It., i. e. *ar*, Lat.; as *vilagio*, It., village, the augmentive form of *villa*; *viaggio*, It., voyage of *via*, a way, a journey; *personaggio*, It., personage of *persona*, person, foliage, *feuillage*, Fr., of *feuille*, Fr., or *foglia*, It., *folium*, a leaf.

In the modern Italian, *accio* has become a contemptuous augmentive; but, as it remains in the form of *aggio*, it is either neutrologistic or eulogistic.

In such instances as the following *age* is simply a connective or possessive affix; and seems to be a corruption of *ac*, *ic*, *ag*, or *ig*, already noticed, under simple adjectives: *personage*, *vicarage*, *poundage*, *tonnage*, &c. In all such cases, *age*, as explained under simple connective affixes, merely means of, connected with, belonging to: *parsonage* house is the house of a parson; *parsonage* benefice is the benefice of a parson; *poundage* custom, *charge*, *rate*, &c., is equivalent to per pound; *patronage* is the power or agency of a patron.

A numerous class of verbal nouns, derived from the Latin, terminate in *ation*, *acion*, *asion*, *etion*, *esion*, *ition*, *icion*, *ision*, *olion*, *osion*, *ution*, *usion*. In Italian these terminations are *azione*, *acione*, &c., being the form of what is called the ablative singular of the Latin. When the modern Latin, i. e. the Italian, discontinued the ancient cases, it retained this as the only singular termination, for no other reason, perhaps, than its agreeable sound. With us, the French, and the Spaniards, the final *e* is dropped: thus, commend, commendation, *commendazione*, It.; complete, completion; compose, composition, *composicion*, Sp., *composizione*, It.; confuse, confusion, *confusione*, It.

With few exceptions, the French and the English are the same: the Italian differs from them in having the final *e* and *z*, instead of *t*: Spanish has generally *c* instead of *t*.

The last-mentioned nouns are formed on what is called the supine. Thus, *factum*, to make or do; *factio*, ablative *factione*, a making or doing; *occursum*, to fall or happen, *ocasio*, ablative

occasione, a happening; intrusum, to intrude, intrusio, ablative intrusione, an intruding or intrusion.

It is evident that all such words are of the same nature as our verbal nouns, terminating in *ing*, i. e. participles put substantively; *auditis* is the same as hearing; *visio*, *visione*, vision, seeing. There can in general be no necessity, therefore, for explanation to such words, when the verbs have been explained from which they are derived.

As these verbal nouns follow the spelling of the supine or participle, they occasion some orthographic embarrassment to mere English scholars; for whose sake it would have been well, perhaps, if one consonant had been adhered to in naturalising such words. There is no difficulty with those verbs and adjectives which we have from the Latin supine or participle: as, communicate, communication; promote, promotion; profuse, profusion; pollute, pollution; contrite, contrition; profess, profession. Of those verbs which have *d*, the nouns have *s*: deride, derision; protrude, protrusion: but those which assume another syllable terminate in *ation*; as commend, commendation, from *commendatum*.

Nouns terminating in *ant* and *ent* are Latin participles: as, servant from *servo*; patent, from *pateo*, &c. In these, and in nouns generally adopted entire from the Latin, we, as well as our neighbours, have what is in that language called the ablative case.

The termination *or* changed into *er*, *ar*, and in French *eur*, is generally applied to indicate an agent: *Creator*, he who creates; *lover*, one that loves; *liar*, one that lies; *beggar*, one that begs; *amator*, *amateur*, Fr. a lover. In Latin, *or*, like *os*, is merely a masculine sign or affix: as *amor*, love, as well as *amator*, lover, *honor* or *honos*. The French have changed *or* into *eur*, when an agent is indicated, and into *our* when agency, state, quality, &c., are indicated; and Johnson has followed in this, as in several other instances, the French mode of spelling; as, labour, honour, favour, instead of labor, honor, favor.

The termination *ist*, adopted from Greek, answers exactly to *er*, i. e. *or*, from the Latin: as, reformer or reformist; etymologer or etymologist; One of these seems more fit and graceful in some connexions than the other: *er*, having been longer and more generally used, does better in connexion with vernacular words: reformer is better than reformist; but *etymologist* seems better than *etymologer*; *geographer* again seems more graceful than *geographist*. Much in all such cases depends on custom; which has mighty sway over our mental and moral habits.

The adjective affix *an*, or *ian*, is employed in connexion with many nouns ending in *ia*, to form a new noun indicating an agent: as, from music, musician; logic, logician; optics, optician; metaphysics, metaphysician.

The Latin termination *ura*, in French and English *ure*, frequently occurs: as creature from *creare*; picture from *pictum*, pingo to paint.

The Latin termination *tia* is changed into *ice*, *ce*, *cy*: as, mal-us, malitia, malice: frequens,

frequent, frequentia, frequency; prævalentia, prevalence.

The Greek termination *ism*, is frequently appended to words which are not of Greek extraction: as, Calvinism, the doctrinal system of Calvin; Gallicism, a Gallic or French idiom; vulgarism, a vulgar expression; truism, an obvious or a trite, true remark.

Many verbal nouns (nouns formed from verbs) terminate in *ence*, i. e. *entia*, Lat.; as, providence, contracted into *prudence*, foreseeing, providing, taking care of; credence, believing; precedence, preceding, &c. All such words answer exactly to our own participles employed as nouns; as, hearing, seeing, smelling.

We have noticed *age* as properly an augmentative in such words as *village*, *personage*, &c.: *oon* (one, It.), *oon*, is also an augmentive: as, *matron*, *patron*, *matrona*, *patronus*; formed on *mater*, *pater*; *saloon*, *salon*, Fr., *salone*, It., a great hall, from *sala*, It., *salle*, Fr., corruption of *aula*, a hall. This Latin affix, which is eulogistic as well as augmentive, seems to be a contraction of *bonus*: thus, *pater-bonus*; *mater-bona*.

We, like the French, have not any vernacular augmentative affix of nouns: such words as *village*, *salon*, &c., were borrowed in the compound state from the Italians.

Most of the diminutive affixes of nouns are now obsolete, though they yet remain as inseparable terminations in many nouns.

The Latin diminutive affix is *uncul* contracted into *cul*, *ull*, *ul*, *ell*, *el*, &c., and in Italian *ello*, in Spanish *uelo*, *illo*: as *particula*, *particle* (from *pars*, *part-is*), a small *part*; *morsicuncula*, contracted into *morsel* (from *morsus*, a bite), a little bite, a snap; *bestiola*, corrupted into *beetle*, a little beast or creature; *sedicula*, contracted into *sedile* (from *sedes* a seat), corrupted into *saddle*, *settle*, *school*. Thus a great number of words terminating in *le* or *le* are properly diminutives: many of them have been adopted directly from the Latin; many have been received through the French or Italian.

The above affix, *uncul*, seems a contraction of *uncialis*, of an *inch*, of the magnitude of an *inch*; which is equivalent to small, little.

The Italian has two other diminutives, viz. *etto* (*ette*, Fr., *et*, Eng., *ito*, Sp.) and *ino*; which are found in many words: as pocket, diminutive of *poke*, *pouch*, *poche*, Fr.; ballot, *ballotte*, Fr., *pallotta*, It., of *ball*, *balle*, Fr., *palla*, It.; bullet, *boulet*, Fr., of *boul*, Fr., another form of *balle*: kitten, *gattino*, It., diminutive of cat, *gatto*, It., French.

The French formerly employed the diminutives at pleasure like the Italians and Spaniards, but they have long disused them; and this of course is a subject of boasting with Voltaire, in reply to the Italian critics who accused the French of having no diminutives. We had them formerly, says Voltaire; but they possessed not sufficient dignity for the noble language of the Bourdaloues and Massillons!!

It will, perhaps, flatter the French to remark that we probably discontinued the use of diminutives, because they set us the example.

Most of the diminutive terminations which we have traceable to the Italian, were derived through the French.

We have noticed *ish*, i. e. *uccio*, It., *ico*, Sp., *isk*, Greek, under adjective affixes. as, in sweet-*ish*, brackish, saltish, &c. We had it formerly *ock*, *uck* (as it still exists in Scotland; as, *beastock*, contracted into *beasty*, a little beast), as in *hillock*, a little hill.

As *ish*, *ock*, *ico*, Sp., *uccio*, It., &c., seem to be *isk*, Gr.; so, perhaps, *et*, *etto*, It., is the Greek adjective *eton* or *hetton*, a contraction of *elaton* also *elasson*; whence, seemingly, our † *lyt*, *little* and *less*, as also *lad*, *lass*.

We have also as diminutive affixes *kin*, *chen*, Ger., and *lin*, *ling*, *lein*, Ger.; as, *manikin* *männchen* and *manlein*, Ger., little man; *lambkin*, *lammchen*, Ger., little lamb; *goslin*, *ganschen*, Ger., a little goose; *lordling*, contracted into *lording*, *lordchen*, Ger., a little or petty lord. Of all the diminutives of nouns, *ling* is the only one which is not quite obsolete; and even this is hardly applied ad libitum; and having become like the Italian *uccio*, *uzzo*, *ecciuolo*, exceedingly contemptuous, we cannot regret its departure.

Both *kin* or *chen* and *lin*, *ling*, or *lein*, are evidently contractions of *klein*, Ger., little.

Affixes of verbs.—Here, to avoid repetition, we do not intend to notice those terminations already treated of, such as *est*, *eth*, *es*, *s*, *ing*, *ed*, and the irregularities of what is called the substantive verb. The affixes now in view are those immovable terminations which we have in many verbs, viz. *en*, *er*, *ice*, *fy*, *ish*: *en* is the obsolete sign of what is commonly called the infinitive mood, and is manifestly the same as the Greek *ein*: as *philian*, † *loven*, to love; having been once connected with many verbs it was considered a fixture, and therefore remains, though it adds no meaning; as, *slacken*, to slack, *blacken*, to black, &c. Here, as in other instances, custom has the effect of making us fancy that *en* gives meaning or force or dignity; but if we had been more used to slack, black, &c., than to slacken, blacken, the case would have been reversed. However, as *en* causes no inconvenience, it may remain; especially as some words (after we have been so long used to it) would seem exceedingly awkward or unmeaning without it: as *enliven*, *brighten*, *frighten*.

The verbal termination *ice* is adopted from Greek: as, baptize, to immerse; a new verb formed on *bapto*, to dip or *bathe*; liberalize, to render liberal; temporize, to suit the times (*tempora*): brutalize, to render brutal; demoralize, to render immoral; authorize, to give authority to, &c.

The verbal termination *er*, is (like *en* in Saxon and German, and *ein* in Greek) the French, Italian, Spanish and Latin affix of what is commonly called the infinitive mood: as, *batuo*, *beat*, *batuere*, corrupted into *battere*, It., *battre*, Fr., *batir*, Sp., *batter*; sputo, to spit, spout, sputare, *sputter*, corrupted into *spurt*, spirt. We have many verbs formed upon nouns by assuming this affix: as, *pester*, from *pest*; *flutter* (and Fr.), from *flatus*, &c.

Where we have duplicates of the same verb as *beat* (*batu-o*) and *batter* (*batuere*), the latter form is generally augmentive: *batter*, is to beat much or forcibly; *sputter*, is to spit much or forcibly.

The verbal termination *ish*, is a corruption of *is*, the first person present indicative of the same verbs in French: as, flourish, banish, garnish (corrupted into furnish), &c., in French, *fleuris*, *bannis*, *garnis*, &c. The *s* is now silent in French; but it was not silent when such words were adopted into the English language; and, as *oui* was anciently *ouis*, we have it corrupted into *yes*.

A verbal affix of very general use is *fy*, i. e. *fio*, or rather *facio*, to make: as, *rectify*, to make rect-um or right; *beautify*, to make beautiful; *brutify*, to make a brute, i. e. of a human being. In this, as in so many other cases, there is a less proper application of *fy*, which tends to produce equivocality: as, *verify*, *justify*, &c., which do not mean to make true, to make just; but to prove true, to prove just.

PART IV.

RATIONAL GRAMMAR OF THE ENGLISH LANGUAGE.

This is presented chiefly for the sake of contrast to arbitrary grammar; and, after what has been already written, it is hardly necessary to show how widely different the one is from the other. It must be remarked, that a rational kind of grammar of the English language, is a desideratum; as the present grammatic rules are, in many respects, absurd, being calculated to render it not more but less fit for its professed purpose. Happily, though the principle of utility has been little regarded, and though there has been much blind legislation to establish a despotic system of syntactic propriety, our language is yet one of the simplest and freest in the world; and, with a very moderate reform, might be wholly disencumbered from all grammatic perplexity and difficulty. And we are surely as competent to simplify and improve our grammar, as to simplify and improve our machinery: and we have only to lay aside one of the double forms of the pronouns, or to agree that either form shall be proper in any position; to substitute *be* as a regular verb for that jumble of anomaly now employed; to throw away the useless terminations *est*, *eth*, *es*, or *s* (appended to verbs in connexion with thou and he, &c.), and to disallow all anomalies of verbs, nouns, and adjectives.

The only imaginable objection to such grammatic improvement is, that it would appear strange: but so is every thing new, however excellent, till we become used to it. Every new fashion seems odd, if not ridiculous, when first introduced; but it soon appears more excellent than that which it supersedes. We have only to set up an enlightened and useful custom in the room of the old, inconvenient grammatic usage, and it will immediately begin to acquire the venerable qualities of the approved, established, and ancient form of speech; and the oldest institutions and customs were once new.

If it be asked, What is the amount of utility in the proposed alteration? That is considerable in every view of the question. It is important to have a sensible instead of a senseless kind of grammar; one for which satisfactory reasons can be assigned to youths and foreigners. It is of considerable utility to have an easy in-

stead of a difficult kind of syntactic propriety ; for, with the former, the writer or speaker is enabled to direct his whole consideration to the justness of his thoughts and the meaning of his words ; but a complicated syntax distracts his attention ; and, having to accomplish the two operations of good sense and good grammar at one and the same moment, the consequence frequently is, that both are badly performed. We sometimes find good sense expressed in bad grammar ; and we often find good grammar garnishing bad sense ; nay, even bad composition is often dressed up in good grammar ; and composition essentially good often appears in faulty grammar.

We are willing to subscribe to the motto assumed by Lindley Murray, from the lectures of Dr. Blair : ' They who are learning to compose and arrange their sentences with accuracy and order, are learning at the same time to think with accuracy and order ; ' as also to another sentence of the same rhetorician : ' The study of arranging and expressing our thoughts with propriety, teaches to think as well as to speak accurately.' But how are we to understand accuracy and propriety in all such propositions ! If they mean what is commonly called grammatic propriety and accuracy, such as saying, *thou lovest*, instead of *thou love* ; *we were*, instead of *we was*, &c. ; there is just as little connexion between such etiquette and learning to think accurately, or to express thought accurately, as there is between learning to bow, and learning to reason. Logical accuracy of expression is of the highest importance ; and this is the proper object of rational grammar : but this is so far from being identical with arbitrary grammar, that the one is often at variance with the other.

The reader is now sufficiently aware of the true character of arbitrary grammar. It was not dictated by reason, and therefore cannot be referred to any rational principles. But though we wish to see it discredited by a general disuse of all anomalies and unmeaning terminations, and changes of verbs and pronouns, yet such reform must be effected (if ever effected) by the influential members of the literary world. All others must be content with established usage. They must endeavour to speak and write grammatically, merely to avoid the imputation of ignorance and illiterateness.

For the use of those who must prudently comply with the prescribed etiquette, or established manner, we shall endeavour to present it in as intelligible a form, and in as small a compass, as possible.

SECT. I.—THE CUSTOMARY GRAMMAR OF PRONOUNS.

The words called pronouns are, I, me, thou, thee, he, him, she, her, it, we, us, you or ye, they, them, who, whom, which, this, these, that, those.

There can be no mistake respecting the meaning of these words, with any persons who have heard them pronounced a few times in the common course of speech : *I* is perceived to indicate the same person as *me*, *thou* as *thee*, *he* as *him*, &c. ; but as these double forms of the same

words had necessarily, in Latin, different uses, the English grammatists thought a similar diversity proper in the English language ; and they have succeeded in making a useless and embarrassing distinction an essential part of grammar. Grammatic propriety, as to the pronouns, may be included in the following particulars :—

These we will range in two classes—

1. I, thou, he, she, who, we, they.

2. Me, thee, him, her, whom, us, them

[Ye or you, it, which, that, this, &c., are not included in the above enumeration ; because, fortunately, they have but one form.]

Those of the first class are called by grammarians nominatives, or are said to be in the nominative case : those in the second class are called objectives, or are said to be in the objective case ; but we shall, for the sake of intelligibility, call the one (I, thou, he, she, &c.) the first form ; and the other (me, thee, him, &c.) the second form of the pronoun. There is a peculiar manner of employing the pronouns, for which it is not easy to give any rule perfectly accurate. The nearest approach to accuracy seems this : when any one of the words, commonly called pronouns, is employed to indicate an agent, it is put in the first form ; and when it is employed to indicate an object of some action, it is put in the second form. Thus : I love thee ; thou lovest me ; he loves her ; she loves him ; they love us ; we love them ; the man whom she loves is the person who loves her. These are all examples of proper grammar, and when inverted they present instances of improper grammar : *Me love thou ; thee lovest I ; him loves she ; her loves he ; them love me ; us love they ; the man who her loves is the person whom loves she.*

Another approximation to accuracy, as a general rule, might be put thus :—When the pronoun stands before the verb it is put in the first form ; when it stands after the verb it is put in the second form ; as, I see them, they see us, &c. This is the usual, but not the invariable, order of composition in the English language, and therefore the above would not hold as a universal rule ; for, in such instances as the following, the second form of the pronoun, or what is called the objective case, stands before the verb : whom seek ye ? he whom ye seek. Here, in both cases, *whom* is the object of the verb seek, though it stands before it. Nor is the other imperfect rule less objectionable, viz. when the pronoun denotes an agent, it is in the first form or nominative case, and when it denotes the object of an action, it is in the second form or objective case ; for, by employing the verb in what is called the passive, instead of the active voice, the grammatic relation of agent and object is wholly changed, as is evident in the following examples :—Thou art loved by me ; I am loved by thee ; she is loved by him : not *thee* art loved by *I*, &c.

It is impossible to give accurate and adequate rules concerning that which can never be reduced to rational principles ; for ' what reason did not dictate, reason can never explain.'

Perhaps the most unobjectionable rule that can be given is the following :—A pronoun is

always in the first form or nominative case, except first, when it is the object of a verb active or transitive: as, you love *him*, *whom* I hate; he dreads *us*, but despises *them*; we, as well as they, disregard *him*, but respect *her*, &c. In these instances the pronouns *him*, *whom*, *them*, *us*, are, in the language of grammarians, governed by the active verbs (*love*, *hate*, *dreads*, &c.), in the accusative or objective case. Every reader, however little acquainted with the subject before, must now, it is presumed, understand what is meant by the position. Every pronoun is in the first form or nominative case, except first, when the object of a verb active. But there is a second exception, viz. when a pronoun is preceded by any of those words called prepositions; or (to adopt the common grammatical phraseology), when the pronoun is governed by a preposition.

The words called prepositions are, of, to, from, over, through, above, for, by, in, below, beneath, under, into, at, with, before, after, behind, within, without, up, beyond, about, near, down, on, upon, off, against, among, between, &c.

When these words come immediately before any pronoun, it is to be put in the second form, called objective case, or accusative case: as, I went with *them*, from *him* to *her*, &c., &c.: not, I went with *they*, from *he* to *she*, &c.

The most usual grammatical improprieties, as to the pronouns, consist in putting *me* for *I*, *him* for *he*, *her* for *she*, *them* for *they*, &c., in the following manner: Who is there? *Me*, instead of *I*. May William and *me* go to London? It should be William and *I*. *Them* and *us* went out together; *they* and *we* went out together. *Him* and *her* are well matched; *he* and *she* are well matched.

When *he* or *she* is applied to objects devoid of sex, respect must be paid to established usage. The sun must be spoken of as *he*, the moon as *she*, &c. It is absurd to attempt to assign any rational principle for this custom, which varies among different nations; for, with the Anglo-Saxons, the sun was spoken of as *she* and the moon as *he*. We, in this matter, follow the Latins, who followed the Greeks, who probably followed the Egyptians, who perhaps imitated the Babylonians; for much of the general agreement, or common consent, of nations and languages, is referrible, not to reason, but to custom founded on imitation.

Illiterate persons very frequently employ *them* instead of *these* or *those*: thus, *them* men were very noisy; it should be *those* men were very noisy: hand me *them* books,—*those* books, or *these* books.

There is often a departure from propriety in changing from one person and number to another: thus, every man knows *their* own affairs best; it ought to be, every man knows *his* own affairs best. Can any one be certain, at *their* first entrance on life, that *they* shall be always successful; it should be *his* and *he*.

The grammaticists have succeeded in establishing a distinction between *who* and *which*: the former is to be employed only when speaking of persons: as, the man *who* came, the woman *who* came, the men *who* are, the buds *which* are, the

trees *which* grow, &c.; not the man *which* was, &c., the birds *who* are, &c. Fortunately *that* is equally free from change to denote nominative and accusative, and from any particular manner of application. We can say, the man *that* was here, the bird *that* sings, &c.

Some of the grammaticists have endeavoured to interdict the use of *whose* (i. e. properly *who's*), except in connexion with a person, like *who* and *whom*: but they have not succeeded. We can say, the bird *whose* leg was hurt, as well as the man *whose* leg was hurt.

Persons are apt, without care, to blunder in applying *this* and *these*, *that* and *those*: as *this* twelvemonth, instead of *these* twelvemonths: *those* or *these* kind of people, instead of *that* or *this* kind of people.

There is hardly any difference between the application of *this* with its plural *these*, and *that* with its plural *those*. If two objects, or sets of objects, be referred to, *this* and *these* are applied to the nearer, in time, place, or reference; *that* and *those* are applied to the more distant: thus, *this* is a more irksome part of the author's task than *that* which led him to treat of more intellectual topics: *these* are the petty, unmeaning, and useless distinctions of arbitrary grammar now under consideration; but *those* enquiries, to which, in a former part of this work, he directed the attention of the reader, are of a loftier character.

SECT. II.—THE CUSTOMARY GRAMMAR OF VERBS.

We must exhibit the combinations, or what are called the conjugations of verbs, beginning with that jumble of anomalous incoherence, or of dissimilar parts, commonly designated the substantive or neuter verb *to be*.

I am.	We	} are.
Thou art.	Ye or you	
He	They	
She	These	
It	Men	
John	Birds,	
Man,	&c.	
&c.		

The above is denominated the present tense, indicative mood.

I	We	} were.
He	Ye or you	
She	They	
It	These	
Man,	Men,	
&c.	Birds,	
Thou wast.	&c.	

The above is called, by some, the imperfect tense; by others, the past tense.

The other parts of what is called the substantive verb, are, *be*, *being*, *been*; as, *to be*; I shall *be*; I *being*; I have *been*.

It is hardly possible for any mistake to happen in these parts, except, perhaps, that children and foreigners would be naturally induced by analogy (unless prevented by the force of custom) to say, I have *beed*, having *beed*, &c., instead of, I have *been*, having *been*.

We have noticed how simple the substantive verb would be, if rendered regular, by discard-

ing all such dissimilar parts as, *am, is, are, was, were*: thus, *I be, &c., I beed, &c., I have beed, being, having beed*. But established usage prohibits such reasonable simplicity and utility.

When directly preceded by *let, may, might, can, could, will, would, shall, should*, *be* is unchanged; thus, let me be, let him be; I may be, he may be; I might be, he might be; I can be, I could be; I will, shall, would, or should be, &c.

The grammatists have conferred on such combinations a number of high-sounding, but insignificant or absurd designations; as, imperative mood, potential mood, &c. &c.

When the substantive verb is immediately preceded by *if* († *gif*, i. e. *give*), *though*, *suppose*, *grant*, and other similar terms, which usually indicate uncertainty or contingency, established usage is so various as to set rules at defiance: thus,

If	}	If I be, or if I am;
Though,		If thou be, or if thou art;
&c.		If he be, or if he is,
		&c.
		If I was, or if I were;
		If thou wast, or if thou wert;
		If he was, or if he were,
		&c.

Present grammatic usage leans more to *if I were* than *if I was*, and to *if he were* than *if he was*; but, concerning the distinction between indicative and subjunctive, grammatists are as much divided as custom: and according to the old doggerel couplet,

When doctors disagree,
Disciples are free.

The following words, called auxiliary verbs, have no change of termination, except in connexion with *thou*: thus,

I may, thou mayest, he may, we may, you may, they may.
I might, thou mightest, he might, we might, &c.
I can, thou canst, he can, we can, &c.
I will, thou wilt, he will, we will, &c.
I shall, thou shalt, he shall, we shall, &c.

Wilt and *shalt* are contractions of *willest, shallest*; as *would, should*, are of *willed, shalled, &c.*

In all the combinations of *may, can, &c.* (with the exception of what is called the second person singular), there is as much grammatic simplicity as can be wished; for there are no useless and embarrassing inflections or changes: thus,

I	}	may	}	be.
He		can		
We		shall		
		will		
&c.		could		
		should		
		might		
I	}	may	}	love.
He		can		
We		will		
You		shall		
They		could		
&c.	would			
		should		
		might		

The verb *have*, so much used in connexion with other verbs, is, owing to contraction, of a very irregular form: thus,

I have, thou hast (contraction of *havest*), *he hath, or has*, contraction of *haveth, or haves*, *we, ye or you, they, &c., have*.

The above is commonly called the **present tense**.

I	}	had (contraction of <i>haved</i>), <i>thou hadst</i> ; he had; we, you, or they had.
He		
We		
&c.		

The above is called, by some, the imperfect, by others, the past tense. There is another combination, or reduplication, of the same word, called **pluperfect tense**.

I	}	have had: thou hast had.
We		
You		
They		
He	}	hath, or has had; we, you or they have had.
She		
It, &c.		

To have is called the infinitive mood; *having* is called the present participle; *had* is called, by some, the past participle; by others, the perfect participle.

Do is also frequently employed in connexion with other verbs; and in what is called the past tense, † *doed*, is now contracted into *did*:

I do, thou dost, he doth, or does; we, &c., do.
I did, thou didst, he did, we did, &c.

What is denominated a regular verb is combined with nouns and pronouns in the following manner:

I	}	train, or do train.
We		
You or ye		
They		
These		
Men		
&c.		

Thou trainest, or dost train.

He	}	trains, or does train.
She		
It		
Man		
&c.		

This is commonly called **present tense, indicative mood**.

I	}	trained, or did train.
He		
She		
&c.		

We	}	trained or did train.
You		
They		
&c.		

Thou trainestst, or didst train.

This is commonly called either the imperfect or the past tense, indicative mood.

I have trained, &c. is called the perfect tense.

I had trained, &c., is called the pluperfect tense.

I shall or will train, &c., is called the first future tense.

I shall or will have trained, &c., is called the second future tense.

To train is called infinitive mood. *Training* is called present participle.

Trained is called past participle, or passive participle. But these designations are as useless, for any practical purpose, as they are unmeaning or absurd.

By connecting the past participle of an active or transitive verb, with the substantive verb, what grammarians term the passive voice is formed: thus,

I am trained, &c. I was trained, &c. I have been trained, &c. I had been trained, &c. I will or shall be trained, &c. &c. &c. If I am or be trained, &c. I may be trained, &c. &c. &c.

It is wholly unnecessary to exhibit the verbs more fully. The reader will clearly perceive how the various combinations are formed.

All those verbs which do not admit of being combined with the substantive verb are called intransitive or neuter: such as, *sit, stand, lie, sleep, &c.* We can say, *I am trained, loved, watched, &c.;* but we do not say, *I am sat, stood, slept, &c.*

One grammatical distinction of verbs, therefore, is into active and neuter, or transitive and intransitive: the former, as already noticed, when acting upon the pronouns, put them in what is called the objective case: thus, *I love him, not I love he; he loves me, not he loves I.*

A certain number of verbs are called irregular, because they do not assume *ed*, for what are called the past tense and perfect participle, like, *I love, I loved, I have loved.* Thus, according to custom, we must not say, *I begunned, I have begunned;* but, *I began, I have begun.*

The following is a list of the irregular verbs:—

1. Those which admit of no change (as *I put, I have put*): put, cost, beat (sometimes *beaten* is employed as the participle; as, *he is beaten*), burst, cast, cut, hit, hurt, let, rid, set, shed, shut, split, sweat, read.

2. Such as have one anomalous termination: as, abide, abode; sell, sold (corruption of *selled*); beseech, besought; bind, bound; bleed, bled; breed, bred; bring, brought; buy, bought; catch, caught; cling, clung; creep, crept; dig, dug; feed, fed; feel, felt; fight, fought; find, found; flee, fled; fling, flung; get, got; gild, gilt (also regular); gird, girt (regular); grind, ground; have, had (contraction of *haved*); hang, hung; also *hanged*, or regular; hear, heard (contraction of *heard*); held, hold; keep, kept (contraction of *keepd*); lay, laid (contraction of *layed*); lead, led; leave, left; lend, lent; lose, lost; make, made; meet, met; pay, paid (contraction of *payed*); say, said (contraction of *sayed*); seek, sought; send, sent; shoe, shod; shoot, shot; shrink, shrunk; sing, sung; sink, sunk; sit, sat; sleep, slept; sling, slung; slink, slunk; speed, sped; spend, spent; spill, spilt, also spilled; spin, spun; stand, stood; stick, stuck; sting, stung; stink, stunk; string, strung; swing, swung; teach, taught; tell, told (contraction of *telled*); think, thought; weep, wept.

3. Those which have two or more anomalous terminations: as, *I begin, I began, I have begun: begin, began, begun; know, knew, known; rise, rose, risen; arise, arose, arisen; blow, blew, blown; awake, awoke (also awaked), awaken; bear (to bring forth), bare, born; bear (to carry),*

bore, borne; begin, began, begun; bid, bade, also bad and bid, bidden, also bid; break, broke, broken; choose, chose, chosen; cleave, clove or cleft, cloven or cleft; come, came, come; dare, durst, dared; do, did, done; draw, drew, drawn; drive, drove, driven; drink, drank, drunk; eat, ate, eaten; fall, fell, fallen; fly, flew, flown; forsake, forsook, forsaken; freeze, froze, frozen; give, gave, given; go, went, gone; grow, grew, grown; knew, know, known; ring, rang, or rung; run, ran, run; see, saw, seen; shake, shook, shaken; slay, slew, slain; slide, slid, slidden; smite, smote, smitten; speak, spoke, spoken; spit, spat, spit or spitten; spring, sprang, sprung; steal, stole, stolen; stride, strode or strid, stridden; strive, strove, striven; swear, swore, sworn; swim, swam, swum; take, took, taken; tear, tore, torn; throw, threw, thrown; tread, trod, trodden; wear, wore, worn; weave, wove, woven; write, wrote, written.

The reader may compare these irregular verbs with the exhibition of them in a former part of the work, where it is proposed to render them regular.

Pronouns and nouns, when combined with verbs, are commonly distinguished into number and person: thus,

I am, first person singular.

Thou art, second person singular.

He

She

It

Man

&c.

We are, first person plural.

Ye or you are, second person plural.

They

These,

Men

&c.

Thou is obsolete, except in prayer and among the Quakers, and in jocular or contemptuous speech; for, instead of saying *thou art, thou mayest, thou lovest, &c.*, when addressing one person, we say, *you are, you may, you love.* But in prayer to God we say, *thou art, thou mayest, thou wast, thou lovest, &c.*

SECT. III.—DIRECTIONS CONCERNING THE SUBSTANTIVE VERB.

Ungrammatical people are apt to say, *I be, thou be, he be, we be, you be, they be;* instead of, *I am, thou art, he is, we are, you are, they are.*

There is seldom any mistake made by persons who are at all accustomed to grammatical language except in the third person; in which the greatest grammatical proficients are apt to blunder, particularly in extemporaneous speaking, when their sentences are long and intricate; employing *is* for *are* and *are* for *is*, and *was* for *were*, or *were* for *was*.

Grammatical propriety admits of this plain rule.

When one object is spoken of, *is* for the present, and *was* for the past, must be employed: when two or more objects are spoken of, *are* for the present, and *were* for the past, must be employed. Thus,

Man *is* a rational creature: he *is* the natural lord of the lower animals, which *are* commonly called irrational; but he *is* mortal as well as they *are*, and some of them *are* longer lived than he *is*. Plato and Aristotle *are* two of the most ancient philosophers whose writings *are* extant; but neither the one nor the other *is* to be compared with some modern philosophers.

Some persons blunder by using *were* instead of *was*: thus, I *were* at London yesterday, he *were* in the country last week, for, I *was* in London yesterday, he *was* in the country last week. But the most common grammatic error is in employing *was* instead of *were*: as, we *was* there, you *was* there, they *was* there, for we *were*, you *were*, they *were*.

The following are instances of grammatic inaccuracy: the improper words are put in Italics.

Was we wrong? *Was* you there? *Was* they here? *Was* the ancients well acquainted with science? *Was* Plato and Aristotle truly great philosophers? There *is* many authors in the present time. There *are* some kind of writings which *is* wholly destitute of merit when tried by the test of utility; which *are* the true standard of excellence. The mechanism of clocks and watches *were* wholly unknown a few centuries ago. Folly and vice *is* often united. There *was* more equivocators than one.

The substantive verb being of frequent recurrence, the grammatic learner should practise much upon it to acquire a correct habit; keeping this obvious principle steadily in view as to the third person, viz., When one object is spoken of, *is* or *was*, not *are* or *were*, must be used: when two or more objects are spoken of, *are* or *were*, not *is* or *was*, must be used; i. e. when the nominative to the verb is singular, *is* and *was* must be employed; but when the nominative is plural, *are* and *were* must be employed.

The following are examples of false grammar:—

The smiles of counterfeit friendship *is* to be suspected; it should be, *are* to be suspected. The number of the inhabitants of Great Britain *are* greatly increased of late years; *is* greatly increased. Nothing but vain and foolish pursuits *are* agreeable to some persons—*is* agreeable. There *is* many occasions in life in which silence and reserve *is* true wisdom; it should be *is*; because many an occasion *is* one entity or a singular nominative; as, also, silence or reserve; for every disconnective word (*neither, nor, either, or, &c.*) has just the opposite effect of a connective word, such as *and*. The business that related to ecclesiastical meetings, matters, and persons, *were* to be ordered according to the king's direction,—*was*. The affairs belonging to the church, *was* to be ordered by the king,—*were*. In him *was* happily blended true dignity and affability,—*were*. In him *were* happily blended true dignity with affability,—*was*. The conjunction *and* connects two or more singular nouns or pronouns into a plural nominative; but *with, besides, as well as*, and such words, do not connect two or more singular nouns and

pronouns into a plural nominative. The support of so many of his relations *were* a heavy tax upon his industry,—*was*. The support of his mother and the expense of his sister *were* a heavy tax upon his industry,—*were*. The support of his mother, with the expense of his sister, *were* a heavy tax on his industry,—*was*. What *is* wisdom and virtue to the sons of folly? Reconciliation *was* offered on terms as moderate as *was* consistent with a permanent union. Not one of all these sons of folly *are* happy. And the fame of his person and of his wonderful actions *were* diffused abroad. The variety of the productions of genius, like those of art, *are* without limit. To live soberly, righteously, and piously, *are* required of all men: here, to live (not soberly, righteously, and piously) *is* the nominative to the verb. To be of a pure and humble mind, to exercise benevolence, to cultivate piety, *is* the sure means of becoming peaceful and happy. Here there are three distinct entities spoken of or enumerated in the nominative to the verb, and, therefore, not *is* but *are* should be used.

SECT. IV.—DIRECTIONS CONCERNING THE WORDS CALLED AUXILIARIES OR HELPING VERBS.

These are, may, might, can, could, will, would, shall, should; and, fortunately, they have no change of termination except that they assume *st* in connexion with *thou*: thus, I may, thou mayst, he may, &c.: will and shall, have, instead of *willest, shallest, wilt* and *shalt*.

All, therefore, that the grammatic learner has to remember in using these words is to put *st* with *thou*: thus, thou mayst train, thou mightst train, thou canst train, thou couldst train, thou wilt train, thou shalt train, thou shouldst train.

Do is frequently employed as an auxiliary, and changes thus: I do, thou doest or dost, he doeth, or *doth* or does, we, you, they, &c., do; I did, thou didst, he did, we did, &c.; I have done, thou hast done, &c.

Here all you have to remember, is to put *est* or *st* with *thou*, and *eth* or *es* with *he, she, it*, or any one object in the third person present: in the past tense *did* remains unchanged, except that *st* is added after *thou*.

Children and foreigners, following analogy, naturally say, I do, we do, &c.; I doed, he doed, we doed, &c., I have doed, &c.; instead of which they must learn to say and write, I do, thou dost, he doth or does, &c.; we did, thou didst, &c.; I have done, &c.

Have is also, with another verb, considered auxiliary, and is similarly contracted: thus, I have, we have, you have, they have, thou hast, he hath or has; I had, thou hadst, he had, we had, &c.

Here, again, you have only to remember to say or write, thou *hast*, he *hath* or *has*, thou *hadst*; in all the other combinations *have* and *had* undergo no change.

The termination *eth* or *th* is now almost obsolete; *es* or *s* being commonly used: thus, he trains, she loves, it rains; not he traineth, she loveth, it raineth.

SECT. V.—DIRECTIONS CONCERNING REGULAR VERBS.

These are, fortunately, very simple; for they have no useless and troublesome changes or terminations, except *est* or *st* in connexion with *thou*, and *eth*, *th*, *es*, or *s*, in connexion with *he*, *she*, *it*, or any one object or singular nominative in the third person, and what is called present tense. The only mistake, therefore, which persons are apt to commit, who are at all accustomed to grammatic usage, is in not putting *est* in connexion with *thou*, and *es*, or *s* in connexion with *he*, *she*, *it*, or any singular noun, in the present tense. The second person singular, i. e. *thou*, is (as already intimated), never used except in prayer, and by the Quakers, and in jocular or contemptuous discourse. The chief attention, therefore, of the grammatic learner should be directed to the third person singular, present tense; and he has only to keep this explicit rule steadily in view. When the nominative is singular, i. e. when one object is connected with the word called a regular verb, *es* or *s* must be affixed; but when the nominative is plural, i. e. when two or more objects are indicated, *es* or *s* must not be affixed. Thus,

John *trains* the pointers: John and James *train* the pointers: John or James *trains* the pointers. William *possesses* good sense, and *loves* instruction; he diligently *applies* to useful learning; and his brothers *possess* much affection for him: they, too, *love* instruction, and *apply* diligently to learning.

The following are instances of grammatic impropriety: the improper words (i. e. in having, or in not having *es* or *s* affixed) are put in Italics.

All joy and tranquillity *dwells* there: much joy, or at least tranquillity, *dwell* there. Thoughtless and intemperate pleasure usually *deteriorate* both mind and character: intemperate pleasures usually *deteriorates* both mind and character. Ignorance and negligence *has* produced the effect: ignorance or negligence *have* produced the effect: ignorance with negligence *produce* bad consequences: negligence as well as ignorance *produce* bad consequences. Not only his fortune, but his reputation *suffer* by his misconduct. The king and his courtiers *has* passed by: the king with his courtiers *have* passed by: the king as well as his courtiers *have* passed by. Nothing *delight* me so much as the works of nature. Public and private happiness, national dignity, and all that is most interesting to human beings in this world, *depends* greatly on the character of the government.

In all the above instances, the attentive learner will perceive that the words put in Italics are wrong, because *es* or *s* is affixed when the nominative is plural, or omitted when the nominative is singular. There is some difficulty at first, in ascertaining the nominative, or promptly discovering whether it be plural or singular. To this point, therefore, the grammatic student should apply particular attention, until it becomes quite familiar to him. The following remarks are intended for his assistance:—

1. All nouns and pronouns that are evidently plural, i. e. which indicate two or more objects, must not have *es* or *s* affixed to the verb with

which they are connected: as they, these, those, men, women, children, houses, &c.: thus, they love us—not they *loves* us. These are the friends of the poor—not these *is* the friends of the poor. Men naturally love their children—not *loves*. People do not consider how much they are improved by adversity—not people *does* not consider how much *it* is improved by adversity, &c.

2. When two or more singular nouns and pronouns are enumerated or added together, they form a plural nominative to the verb: thus, John and James and William love play: John, James, William, equally love play. Robert and his sister Mary often walk together in the fields: both he and she prefer the country to the city: they are fond of botany, and seldom return from their walks without some botanic specimens.

In all such cases the pronouns must be in the plural number.

3. Two or more circumstances form a plural nominative: thus, to see the beauties of nature, and to listen to the music of the groves, *produce* agreeable sensations—not *produces*. The flashing lightning and the reverberating thunder, naturally *produce* strong emotions, especially in the minds of timid persons. To speak truth, to be diligent in business, punctual to engagements, and honorable in transactions, *are* important rules of prudential wisdom; and they seldom fail to give respectability to the character of every one who diligently observes them.

The conjunctive *and* is the only word that connects two or more nouns, pronouns, or members of a sentence into a plural nominative: thus, the sun that shines, the rain that descends, and the wind that blows, *produce* good to mankind. The conjunction is sometimes omitted: the sun, the rain, the wind, *produce* good to mankind. Such words as *with*, *as well as*, &c., though they seem connective, do not form a plural nominative: thus, the king with his body guard *has* just passed—not *have*. The king as well as his attendants *has* passed by.

All disconnective words, such as *neither*, *nor*, *either*, or, have the opposite effect of *and*. There *is* in many people, neither knowledge nor virtue—not *are*. It is either John or James that *delights* in music. Beauty, wealth, or fame, *is* a very precarious possession.

Except when the noun or pronoun coming after the disjunctive is plural, the nominative is always singular: thus, neither adversity nor enemies *disturb* his equanimity—not *disturbs*. Neither enemies nor adversity *disturbs*—not *disturb*. It is better in such cases, if possible, to put the plural word last; but, in all such forms of expression, the inconvenience of arbitrary grammar is strikingly obvious.

Concerning nouns which indicate plurality when considered in one view, and unity or individuality when considered in another—there is no uniform grammatic usage. Some authors would write, ‘My people do not consider; *they have* not known me:’ others, *my people does* not consider: *it has* not known me. The multitude eagerly *pursue* pleasure as *their* chief good. The multitude eagerly *pursues* pleasure as *its* chief good. The council *were* divided in their sentiments. The council *was* divided in *its* senti-

ments. In such cases there is, fortunately, not yet any established etiquette, or despotic authority: the speaker or writer is left to the freedom of his own will; only having once made choice as to plural or singular, there is propriety in keeping to it; not saying, my people *do* not consider: *it has* not known me: or, my people *does* not consider: *they have* not known me, &c.

4. Any noun, pronoun, or member of a sentence immediately preceded by a preposition, is never included in the nominative to a verb. This is worthy of attention, as tending to prevent grammatic blunders; many of which happen from supposing that plural nouns, pronouns, or expressions, are the nominative, merely because they come before the verb: hence such instances of false grammar as the following.—The number of the signatures *are* twenty. The number of places *amount* to twenty. Many a failure in the transactions of business and in human affairs *originate* in imprudence. John with James and William *live* in the country. In all these examples, the nominative is singular, and therefore *is*, not *are*, should be employed; and the regular verb should have *s* affixed, thus: the number of the signatures *is* twenty: the number of the places *amounts* to twenty. Many a failure in the transactions, &c., *originates* in imprudence. John, with James and William, *lives* in the country.

The following are instances of grammatic impropriety:—

The language should be perspicuous and correct: in proportion as either of these two qualities are wanting, the language is imperfect. Every one of the letters *bear* date after his banishment. Each of his children *behave* badly. Of the diversities in human character, some *is* better and some *is* worse; none *is* wholly faultless. *None*, i. e. *no one*, is properly singular, but custom has assigned to it a plural import. *Some*, like *many*, when a singular noun is not put after it, is always plural: thus, some one *says*; some author *says*; many a one *has* said so; many an author *has* said so, &c. But if these adjectives be not connected with a singular noun, they are always considered plural: thus, some *say*—not *says*. Many *have* said so—not *has* said.

SECT. VI.—DIRECTIONS CONCERNING THE IRREGULAR VERBS.

These have been exhibited; and the grammatic learner should either commit them to memory or practise much upon them. They differ from the regular verbs only in not having *ed* affixed in what is called the past tense. The following are some of the most frequent ungrammatical uses of the irregular verbs:—

I *knowed* him long ago; I have *knowed* him many years—it should be, I *know*, I *have known*. The wind *blowed* hard last night; the wind has *blowed* hard all day—*blew*, has *blown*. John *bued* a knife yesterday, and he has *bued* a pencil to-day—*bought*. The horse *druved* in the waggon yesterday, and he has *druved* in the plough to-day—*drew*, has *driven*. The corn *groued* well in the spring, and has *groued* well ever since—*grew*, has *grown*.

It is to be hoped that literary persons of sufficient influence will set the example of discarding such anomalous proprieties; but, in the mean time, the middle and lower classes of the grammatic world must prudently, perhaps, do homage to established usage.

SECT. VII.—REMARKS ON THE PREPOSITIONS.

When, as already noticed, these come immediately before any pronoun which has two forms (called nominative and objective), it must be put in the second form, or objective case: thus, I went with *her* to *them* from *him*: John gave this book to *me*, and said it was a present to both of *us*, &c.—not with *she*, to *they*, from *he*, &c. There is a very general mistake, as if *than* and *as* had the same effect in changing the form of the pronoun: thus, I am older than *her*; she is wiser than *him*; we are not so rich as *them*; but it does not follow that they are more happy than *us*—it should be, than *she*, than *he*, as *they*, than *we*.

The learner should commit the prepositions to memory, or render them familiar by frequent inspection. There is some diversity in their application; for even such as are strictly synonymous, are not all (according to preponderating usage) interchangeable. In the following examples, the first mode of expression is best sanctioned by established usage:—

He found the greatest difficulty in speaking, or of speaking. His abhorrence of Popery—abhorrence to Popery. It is a change for the better—to the better. He was very different then from what he is now—to what he is now. I differ from you in opinion—I differ with you in opinion. There is no need of it—for it. This is no diminution of his greatness—to his greatness. It is derogatory from his authority—to his authority. It is no derogation of his honor—to his honor. It is consonant to our nature—with our nature.

Such niceties of appropriation may not be wholly disregarded; but liberty is better than slavish subjection to mere custom.

It is of some importance that the grammatic disciple should learn to disuse useless words and syllables. *Upon* and *on* are synonymous; and, as the prefix *up* is useless, it should be discarded: thus, He came on horseback—not upon horseback. *Along*, *together*, &c., are often uselessly employed before *with*: John went along with James—better, John went with James. The ship, together with her cargo, was burned—The ship with her cargo was burned—or, The ship and her cargo were burned.

Wherever prepositions can be omitted, without obscuring the meaning, composition is improved by the omission: thus, He went last Monday—is better than, He went on last Monday. The rain has been falling a long time—is better than, The rain has been falling for a long time. He could not forbear expressing his displeasure—is better than, He could not forbear from expressing his displeasure, &c.

It is become a kind of rule, that whenever a present participle (i. e. a verb with *ing* affixed), has the before it, *of* should be placed after: thus, At the hearing of this intelligence—not At the

hearing this intelligence. But it would be better to omit both *the* and *of*: thus, 'If the cares of Hampden had been directed to the unfolding and guiding his dispositions.' 'Mallet, of the King's Bench, fell under the displeasure of the House of Lords for being privy to the preparing a petition.' It would be better to omit *the* (which is often as useless in composition as a mummy in a deliberative assembly), and write, If the cares of Hampden had been directed to unfolding and guiding his disposition; better still—directed to unfold and guide his disposition. Mallet fell under displeasure—for being privy to preparing a petition; still better—for being concerned in preparing a petition.

Such clumsy modes of expression might be easily avoided; but *the* and *of* are equally useless in such connexions. A good general rule is, to omit every word not necessary to express the meaning of a sentence; and to adopt such modes of construction as will enable the composer to express his meaning in the fewest words. Swerve *from* the path—is better than, Swerve *out of* the path—because, in the first sentence, one word (*from*) performs the office of two words (*out of*) in the last.

There is always a want of dignity in terminating sentences with such insignificant words as prepositions: Whom will you present it *to*? He is a poet I am much pleased *with*—better, To whom will you present it? He is a poet with whom I am much pleased—or still better, I am much pleased with him as a poet.

SECT. VIII.—DIRECTIONS CONCERNING ADJECTIVES.

1. Ungrammatical speakers and writers are apt to use adjectives instead of adverbs: thus, He walks *bad*—for walks *badly*. He is *miserable* poor—for *miserably* poor. He acts *agreeable* to his instructions—for *agreeably*. He speaks his mind very *free*—*freely*. John went *direct* to the city—*directly*. James is *steady* employed—*steadily* employed.

The rule is, to add *ly* to the adjective to express the manner of any action or quality: thus, He sleeps *soundly*—not He sleeps *sound*. They wait *patiently*—not *patient*. They stand *peaceably* (contraction of † *peaceableness*)—not *peaceable*. He spoke *forcibly* (contraction of † *forcibleness*)—not *forcible*. He is *evidently* prejudiced—not *evident*.

There is an awkwardness in the double affix *ly*, which is better avoided: He lived soberly and *goddily*—better *piously*. He acted *friendlily* towards me—better *kindly*.

2. Double comparatives and superlatives should not be employed; such as, *more stronger*, *more superior*, *most strongest*, &c. *More* is equivalent to the affix *er*, and *most* to *est*; when, therefore, they are united there is manifest tautology.

3. Such adjectives as the following do not admit of comparative or superlative words and affixes, viz. chief, extreme, perfect, right, universal, &c.

It is evidently illogical to say *chiefest*, *extremest*, *more perfect*, *most perfect*, *more right*, *most* or *more universal*.

More and *most*, or the affixes *er* and *est*, may be employed at pleasure; but the general practice is to use the form which is most agreeable to the ear: thus, *more friendly*, *most friendly*, in preference to—*friendlier*, *friendliest*.

4. According to the grammarians the comparative should be employed in reference to two objects: thus, John and James are of the same age, but James is the *stronger* of the two—not *strongest*. This rule, however, is not uniformly observed even by grammatical speakers, and it has some appearance of grammatical pedantry. There is, however, an evident propriety in using only the superlative in reference to three or more objects: Of the three brothers Robert is *most* learned.

The following expressions are faulty: Of all the nations of Europe our own has *fewer* imperfections—*fewest*. The representative form of government is the best of any; better thus: Of all forms of government the representative form is the best; or, the representative is the best of all the different forms of government; or simply, (certainly the best mode of expression), the representative is the best form of government. The simplest and shortest mode of expression is the best *of any*: the two last words are wholly expulsive.

SECT. IX.—REMARKS ON COMPOSITION.

The reader must be aware that good composition and good grammar are not identical; that the last is, at best, only an accomplishment; and that the first is of the highest importance. There are two very different senses in which composition may be pronounced good, according as it is viewed in reference to logic or to rhetoric, i.e. as tried by sense or by taste. Concerning the last there is no wisdom in disputing; for it is as arbitrary as fashion. Persons, indeed, who wish to have an agreeable style, will not wholly disregard it; and they may read with advantage the writings of Blair and other rhetoricians. All who wish to have smooth diction will avoid, as much as possible, harsh words and combinations of words in sentences: all who value elegance of composition will avoid low words, phrases, and metaphors. Persons of rhetorical habitudes delight in eulogistic and dyslogistic phraseology; those of a logical determination prefer neutrologistic expression. It is believed that such persons, however different from one another, may consult, with some advantage, a preceding pair of this work. All we intend here, is to present a few remarks on composition, considered simply as a medium of meaning, or of mental intercommunication, i.e. as an interpreter of the understanding, without any reference to taste, considered as a distinct entity from sense.

Swift, we believe, defines good composition—'right words in right places.' This, with due allowance for the vagueness of epigrammatic brevity, is a tolerable approximation to a good definition; and it indicates two important particulars necessary to be kept in view: judicious choice and skilful arrangement of words. The best preparation for such judicious choice, and skilful arrangement, is intimate acquaintance with etymology and literature.

The properties essential to a perfect sentence, as defined by Blair, are, 'perspicuity, unity, strength, harmony.' The last property is excluded from our present consideration. A judicious composer will not disregard the ear; but the understanding is the primary object; and he will never sacrifice sense to sound, or meaning to euphony.

Perspicuity, according to the above rhetorician, is resolvable into purity, propriety, and precision. His remarks on purity and propriety are too vague to merit transcription. 'Precision,' he writes, 'signifies retrenching all superfluities, and pruning the expression in such a manner as to exhibit neither more nor less than an exact copy of his idea who uses it.' This does not seem essentially different from his account of strength in composition. 'The first rule which we shall give for promoting the strength of a sentence is, to take from it all redundant words.' 'As sentences should be divested of superfluous words, so, also, should they appear without superfluous members.' Much that he advances on strength belongs to harmony. Two or three of his remarks on unity seem worthy of transcription. 'Unity is an indispensable property. The very nature of a sentence implies one proposition to be expressed. It may consist indeed of parts; but these parts must be so intimately knit together as to make the impression upon the mind of one object, not of many. To preserve this, we must observe that, during the course of the sentence, the scene should be changed as little as possible. There is generally, in every sentence, some person or thing which is the governing word. This should be continued so, if possible, from the beginning to the end. Should a man express himself in this manner: After we came to anchor, they put me on shore, where I was saluted by all my friends, who received me with the greatest kindness. Here, though the objects are sufficiently connected, yet, by shifting so often the person—*we, they, I, who*—the sense is nearly lost. The sentence is restored to its proper unity by the following construction: Having come to anchor I was put on shore, where I was saluted by all my friends, and received by them with the greatest kindness. Another rule is, never to crowd into one sentence things which have so little connexion that they might be divided into two or more sentences. The following is an instance of faulty composition: Their march was through an uncultivated country, whose savage inhabitants fared hardly, having no other riches than a breed of lean sheep, whose flesh was rank and unsavory, by reason of their continual feeding upon sea-fish. Here the scene is repeatedly changed. The march of the Greeks, the description of the inhabitants, through whose country they passed, the account of their sheep, and the reason of their sheep being disagreeable food, make a jumble of objects slightly related to each other, which the reader cannot, without difficulty, comprehend under one view.'

Definiteness seems the single word most expressive of our notion of good composition; for indefiniteness is the most predominant fault, and that which, more than any other, defeats the pro-

fessed purpose of language. The great object of every composer should be, to express his meaning so distinctly as to render doubts concerning it impossible. Rules never can create excellence, but they may afford considerable assistance in acquiring mastery in an art; and for the benefit of young composers we venture a few directions.

1. *Endeavour to express your meaning in as few words as possible.*—The shortest is (all other things being equal) the best mode of expression. Many a bad sentence is rendered a good one merely by throwing away useless expletives or superfluous words. Such terms as verbosity, verbiage, verbosity, wordiness, indicate the general sentiment concerning the present question, and admonish the composer that his words should be few and well ordered. He will find this the surest guide—the best assistant in composing well; whilst it tends, more than any other rule, to relieve him from perplexity, and to render his task easy. 'Feeble writers,' says Blair, 'employ a multitude of words to make themselves understood, as they think, more distinctly; and they only confound the reader.' 'The first rule which we shall give for promoting the strength, [substitute definiteness] of a sentence is, to take from it all redundant words. Whatever can be easily supplied in the mind is better omitted in the expression. It is certainly one of the most useful exercises of correction, in reviewing what we have written, to contract that round-about mode of expression, and to cut off those useless excrescences which are usually found in a first draught.' 'As sentences should be divested of superfluous words, they should also appear without superfluous members. In opposition to this is the fault so frequently met with, of the last member of a period being no other than the repetition of the former in a different dress. For example, speaking of beauty, 'the very first discovery of it,' says Mr. Addison, 'strikes the mind with inward joy, and spreads delight through all its faculties.' In this instance scarcely any thing is added by the second member of the sentence to what was already expressed in the first.'

The composition of Addison was long considered the 'model of the middle style;' but it is remarkably surcharged with redundant words, and young composers will find it a very improving exercise to practise condensation on the loose papers of the Spectator, 'by contracting round-about modes of expression and cutting off useless excrescences.' Let them try how many superfluous words can be discarded; or with what brevity of expression the same meaning may be conveyed. Let them try how much better than Addison they can express a meaning or construct a sentence. This emulous mode of studying the most excellent compositions is far more conducive to improvement than imitation, which tends more to enslave and enfeeble the imitator than to produce original excellence. It should be a rule never to use a word, or mode of expression, merely because it has been employed. Bad sentences escape from the best writers; and, therefore, instead of relying on doubtful authorities, or following the guidance

of precedents, young composers should endeavour to erect a standard for themselves by acquiring a perfect knowledge of language, i. e. by intimate acquaintance with etymology and literature. Many of the worst modes of expression are imitated faults; and, when called in question, persons using them can give no better reason than that they have seen or heard them.

2. *Avoid as much as possible insignificant words.*—Of all the parts of speech, those commonly called articles, conjunctions, prepositions, and adverbs, are the least significant. It is a good general rule, therefore, to omit them whenever the omission does not mar the meaning of composition, or do violence to established usage; and to adopt such modes of expression as render them least necessary.

The same remark applies to pronouns, especially those of the third person, and the relatives and demonstratives. When these are much employed, the usual consequence is indefiniteness; for as there are, generally, several preceding entities, the reader has to guess which of them is referred to by *it*, *they*, *who*, *which*, &c., when such words are frequently interposed. And, though skilful disposition or collocation will tend greatly to secure distinctness, the best general rule is to adopt such modes of construction as render fewest of those words necessary which have any tendency to throw confusion or obscurity over composition.

3. *Guard against tautology in employing synonymous words.*—This is a very common fault. Many writers suppose that they are enriching their composition with additional thoughts, when they are only encumbering it with synonymous terms; or that they are expressing their meaning more fully and forcibly, when they are only mufﬂing it in verbiage. This is so much the general practice—the established usage in composition, that young composers should rather lean to the opposite extreme; and in the structure of language—all the usual modes of expression are so essentially tautologic and verbose, that there is very little danger of pruning verbiage too unsparingly, and of not leaving sufficient foliage (as advised by Dr. Blair) to shelter and adorn the fruit.

4. *Adopt that arrangement of words which presents your meaning most distinctly.* The following remark of Dr. Blair is judicious: ‘From the nature of our language, a leading rule in the arrangement of our sentences is, that the words or members most nearly related, should be placed as near to each other as possible, so as to make their mutual relation clearly appear. This rule is too frequently neglected even by good writers. A few instances will show both its importance and its application.’

Some of these instances we will, for the sake of brevity, present in our own manner: ‘By greatness,’ says Mr. Addison, ‘I do not only mean the bulk of any single object, but the largeness of a whole view.’ Better thus: I mean by greatness, not merely the magnitude of any single object, but that of a whole view. ‘Are these designs,’ says lord Bolingbroke, ‘which any man who is born a Briton, in any circumstances, in any situation, ought to be ashamed

or afraid to avow?’ Better thus: Should any Briton ever be ashamed or afraid to avow these designs: or, Are not these designs worthy the fearless avowal of every Briton? ‘It is folly to *pretend* (Sherlock’s Sermons) to arm ourselves against the accidents of life by heaping up treasures, which nothing can protect us against but the good providence of our Heavenly Father.’—It is folly to endeavour, by heaping up riches, to arm ourselves against the accidents of life: for nothing can protect us against them but the good providence of our Heavenly Father.—The reader may compare the above with Blair’s Lectures.

The following quotations are remarkable instances of faulty composition.

‘The tide of fortune had set so strongly in favor of the king, immediately after the surrender of Bristol, as would infallibly have reduced hearts less devoted and minds less energetic, than those of many who guided the resistance against him, to despair.’—The tide of fortune, which set so strongly in favor of the king, immediately after the surrender of Bristol, would infallibly have reduced to despair, hearts less devoted and minds less energetic than those which guided the resistance against him. ‘This *had*, for a series of years, *had* the effect of giving an appearance of peace and tranquillity to Ireland, which had been almost without example.’ Perhaps all this means nothing more than, This gave to Ireland, for a series of years, an unusual appearance of tranquillity. ‘In unison with these proceedings, on the part of those who supported the public cause and commensurate with the urgency of the case, were the preparations made for the protection of the metropolis.’—The preparations made for the protection of the metropolis, were in unison with these proceedings, and commensurate with the urgency of the case. The sentence is still very indifferent: ‘on the part of those who supported the public cause,’ is mere surplus.

These examples furnish abundant evidence that there is a close connexion between multiplicity of words and faulty arrangement. We have, said, that many a bad sentence is rendered a good one, simply by throwing away useless words. In the following instances the useless parts are marked by italics.

‘The king’s march against Gloucester was the first decisive evidence *that was afforded* of the change in public affairs.’ ‘The defence of the city was conducted with great courage and *resolution*.’ ‘The events announced were far from being such as he wished *them to prove*,’—‘which are requisite to *the forming* a great warlike leader,’—‘devoted himself to *the forwarding* the cause of his sovereign,’ still better, devoted himself to promote the cause of his sovereign; better still, he devoted himself to the cause of his sovereign; for ‘whatever can be easily supplied in the mind is better omitted in the sentence.’ The judicious use of ellipsis tends rather to produce explicitness than obscurity, whilst it affects brevity. We ought to put others to as little trouble as possible in apprehending our meaning; hence the importance of endeavouring to present it to them both distinctly and concisely. The two grand qualities, therefore, of good composition.

are definiteness and conciseness, or perspicuity and brevity. These excellencies rest not on taste, but on sense; and every sensible man may, if he chooses, possess them.

A few remarks concerning *metaphor* may not be wholly without utility. A great part of language is, of necessity, metaphoric, and therefore we cannot reasonably interdict figurative expression. Whether a better system of mental intercommunication might not be invented is a fair question for consideration; but that which we now employ is essentially metaphoric; and perhaps more logical error, or metaphysical absurdity, results from mistaking figurative for literal phraseology, than from the injudicious use of metaphors. All, therefore, that can be reasonably insisted on, is a judicious use of figurative language.

The following suggestions, perhaps, deserve the attention of young composers:

Never employ metaphor for the sake of metaphor, i. e. never adopt a figurative except when it evidently expresses your meaning more effectually than a literal mode of expression. The converse of this seems the rule adopted by many. They appear never to employ plain unmetaphoric diction, but when they cannot conveniently avoid it: they are always making an effort to produce effect, or to display their genius: their main object is to surprise or astonish by the novelty and brilliancy of their imagery. Take the following specimens from a work now before us: 'Too agitated to still down his bitter and perturbed spirit to the tranquil pursuit of his art, the stings of his lacerated and disappointed feelings found vent in a medium more adapted to give a rapid and ready expression to powerful

emotion.' 'The answer of the poet, whose own feelings of misery come at once upon the canvas, is the very epic of melancholy discontentment—a discontentment engendered by the finest sensibility, blasted in its hopes and its efforts for ameliorating human sufferings and amending human institutions.' 'But that fatal pre-eminence which the lowly worship and the envious malign, gives only a finer faculty for suffering; and while it opens the sources of petty vexations, and exalts the poignancy of the greater moral afflictions, it places its gifted victim at an immeasurable distance from the heartless enjoyments and trifling pleasures of more ordinary humanity.'

These are eloquent specimens of the metaphoric proliferation of the present literature, whose characteristic peculiarities are ambitious display and striking effect.

When the author or the orator is actuated by any rhetorical rage for metaphors, it is not wonderful that they should be strangely obtruded and jumbled and mangled and misapplied; or, that they should frequently answer any purpose save that of being a distinct medium of intercommunication between one understanding and another. It would be easy to collect in a short space of time a thousand objectionable examples from the most eloquent and tasteful productions of the current literature; but the young composer should view them not as patterns of excellence or models for imitation, but as beacons to warn him of the danger of venturing eagerly, among metaphors on which so many make shipwreck of reason and common sense. When the imagination is not the servant but the tyrant of the understanding; there is some degree of mental derangement.

GRAMMARIAN was anciently a title of honor, literature, and erudition, being given to persons accounted learned in any art or faculty. But it is now often used as a term of reproach, to signify a dry plodding person, employed about words and phrases, but inattentive to the true beauties of expression and delicacy of sentiment. The ancient grammarians, called also philologists, must not be confounded with the grammatists, whose sole business was to teach children the first elements of language. Varro, Cicero, Messala, and even Julius Cæsar, thought it no disgrace to be ranked amongst grammarians, who had many privileges granted to them by the Roman emperors.

GRAMMONT (Philibert, count), son of Antony, duke of Grammont, a celebrated wit of Charles II.'s court. He served in the French army under the prince of Condé and Turenne, but, having paid his addresses to a lady who was also a favorite of Louis XIV., he was obliged to retire to England, and was highly distinguished by Charles II. He was indebted for his chief support to his gambling habits, in which he was very successful. He married Miss Elizabeth, daughter of Sir George Hamilton, and died in 1707. His Memoirs were written by his brother-in-law, count Hamilton, who followed the fortunes of James II.

GRAMMONT, or GEERSBERGHE, a town of West Flanders, on the Dender, and divided by that river into the upper and lower towns. Its manufactures are linen, carpeting, and paper. There is a canal to Alost. Population 6000. Fourteen miles east by south of Oudenarde, and twenty-one W.S.W of Brussels.

GRAMPIAN HILLS, a chain of mountains in Scotland, which run from east to west, almost the whole breadth of the kingdom. See SCOTLAND.

GRAMPOUND, a town of England, in Cornwall, seated on the Valle, over which there is a bridge. The inhabitants have a considerable manufacture of gloves; and send two members to parliament. It is supposed to be the Voluba of the ancients, as it stands on the same river; and, on the building of the bridge, the name was changed into Grand-pont. It was made a borough by Edward III., and endowed with several privileges, particularly freedom from toll through all Cornwall, a market on Saturday, and three fairs; which the burgessers hold of the duchy of Cornwall in fee farm, at the rent of about twelve guineas. Its privileges were confirmed by Henry VIII.; but it did not send members to parliament till the reign of Edward VI. It is a corporation, and has a mayor, eight magistrates, a recorder, and town clerk. The

mayor is chosen annually the Tuesday before Michaelmas, and the members by the majority of the magistrates and freemen. It is forty-six miles south-west of Launceston, and 260 west by south of London.

GRAN, a county and town of Hungary, lying on both sides the Danube. Its extent is about 406 square miles, and wine, corn, and fruits are cultivated; but the greater part of the country is covered by the mountains of Arpas, which contain numerous marble quarries. Population of the county 47,000.

The town, also called Esztergom, is a free town of Hungary, and an archbishop's see, at the conflux of the Danube and the Gran. Two new streets have been lately added to it. The Danube is crossed by a bridge, consisting of a large platform fixed across two barges, and fastened to other boats at anchor. It is very wide here. The archbishop is primate of Hungary, and possesses various high prerogatives, particularly that of crowning the king. The citadel stands on a lofty hill, and the town-house is a good building. Gran has been several times taken by the Turks. A dreadful fire broke out here in April, 1818, which destroyed 220 houses, the hospital, military chapel, &c. Thirty miles north-west of Buda, and seventy-five south-east of Presburg. Long. 18° 50' E., lat. 47° 40' N.

GRAN, a river of Upper Hungary, which rises in the palatinate of Gomer, and flows into the Danube, opposite to the above town.

GRANADA, or Upper Andalusia, is a province of the south of Spain, about 200 miles in length, and from forty to seventy in breadth, lying east and west on the Mediterranean: on the north is a part of Andalusia; and its south-west extremity approaches Gibraltar. It is sometimes called the kingdom of Granada, and is still governed by the laws of Castile, and divided into the four bishoprics of Granada, Malaga, Almeria, and Guadix. The lofty snow-crowned ridges of the Sierra Nevada, and the Alpuxarras, traverse it, and the temperature varies according to the situation, being cold among the mountains, in the valleys extremely hot and temperate, though with a hot wind on the sea-coast. The Vega (orchard) de Granada, about thirty miles in length and sixteen in breadth, is one of the richest and most delightful valleys in the world. It is of great elevation when compared to the level of the sea; but the mountains which surround it rise to a great height above it. The tracts near the Xenil, which are often overflowed from the mountains, are laid out chiefly in rice, following hemp and flax as a crop. Of the vines, cultivated on the sides of the hills, the wine is but indifferent. Silk is better attended to. On the coast are raised coffee, sugar, and indigo. The other productions are lemons, oranges, pomegranates, olives, figs, almonds, capers, wax, and honey. Raisins are also a considerable article of export. The mountains are rich in marble, minerals, and ores, and the province has several salt springs.

Granada made a part of the ancient *Bætica*; and was inhabited by the *Bastuli*, the *Sexitani*, &c. It was the last Spanish kingdom possessed by the Moors, and was not annexed to the crown

of Castile until 1492. The Moorish features, are still to be traced in the present population; and their monuments are found throughout the province. On their surrender to the Castilians, in 1492, promises were made them of religious liberty; but in 1500 a persecution commenced which compelled them to quit the kingdom; and, with the great numbers that emigrated, there also fled the chief sources of public prosperity. The present population is about 700,000. The export trade of the province takes place principally at Malaga. The other towns of importance are the capital, Ronda, Loxa, and Almeria. Martello towers are erected in certain parts of the coast.

GRANADA, a city in the south of Spain, and capital of the foregoing province, is situated partly on hills, and partly on level ground, at the extremity of the Vega de Granada. It exhibits to the traveller the form of a brilliant half moon, its streets rising above each other, crowned by the ALHAMBRA. See that article. On entering, the streets are found narrow and irregular; the buildings displaying visible marks of decay.

Granada is divided into four quarters, and stands on two distinct hills, the Darro flowing between them, and falling into the larger stream of the Xenil, outside the walls.

Granada is nearly as large as in the days of its independence. The cathedral containing an elegant monument to the memory of Philip I and his queen Johanna, and another to Ferdinand and Isabella, has several paintings of Alonzo Cano: the archbishop's palace is also an elegant building, as likewise is the mansion of the captain general of the province. But the grand ornament of Granada is the Alhambra.

Granada was formerly called Illiberia, and founded, says tradition, by Liberia, great-granddaughter of Hercules, daughter of Hispan, and wife to Hesperus, a Grecian prince, and brother to Atalanta. Others maintain that it was founded by Iberus, grand-son of Tubal, and that it took the name of Granada, or Granata, from Nata, the daughter of Liberia; the word Gar, in the language of the time, signifying grotto, i.e. the grotto of Nata, because that princess studied astrology and natural history in this country. It is certain that such a person as Nata, or Natayde, existed in the first ages of Granada; and that, in the place where the Alhambra now stands, there was a temple dedicated to Nativala. Granada is said to have been founded A. A. C. 2808. In the time of the Romans it was a municipal colony. A description of Granada, in Latin, written in 1560, by George Hosnanel, a merchant at Antwerp, who travelled into Spain, is to be found in the work, entitled *Civitates Orbis Terrarum*, printed at Cologne in 1576; with a good plan of the city of Granada. This city is 125 miles south-west of Murcia, and 183 south of Madrid.

GRANADA NEW, once a province of Spanish South America, has now become the western part of the new republic of COLOMBIA, in which, or our article SOUTH AMERICA, all the interesting features of the present state and history of this province are detailed.

GRANADE. See GRENADE.

GRANADIER. See GRENADIER.

GRANADILLOES, or GRENADINES, dangerous islands of the Caribbees, in America, having St. Vincent on the north, and Granada on the south. They were ceded to Britain by the treaty of peace in 1763.

GRANARY. In constructing a granary Sir Henry Wotton advises to make it look toward the north, because that quarter is the coolest and most temperate. Mr. Worlidge observes, that the best granaries are built of brick, with quarters of timber wrought in the inside, to which the boards may be nailed, with which the inside of the granary must be lined so close to the bricks, that there may be no room left for vermin. There may be many stories one above another, which should be near each other; because the shallower the corn lies, it is the better, and more easily turned. The two great cautions to be observed in erecting granaries are, to make them sufficiently strong, and to expose them to the most drying winds.

The method of managing corn in many parts of England, particularly in Kent, is this:—To separate it from dust and other impurities, after it is threshed, they toss it with shovels from one end to the other of a long and large room; the lighter substances fall down in the middle of the room, and the corn only is carried from end to end of it. After this they screen the corn, and then, bringing it into the granaries, it is spread about half a foot thick, and turned about twice in a week: once a week they also repeat the screening it. This management they continue about two months; after which they lay it a foot thick for two months more; and in this time they turn it once a week, or twice if the season be damp, and now and then screen it again. After about five or six months they raise it to two feet thickness in the heaps, and then they turn it once or twice in a month, and screen it now and then. After a year they lay it two feet and a half or three feet deep, and turn it once in three weeks or a month, and screen it proportionably. When it has lain two years or more, they turn it once in two months, and screen it once a quarter; and how long soever it is kept, the oftener the turning and screening is repeated, the better the grain will keep. It is proper to leave an area of a yard wide on every side of the heap of corn, and other empty spaces, into which they turn and toss the corn often. In Kent they make two square holes at each end of the floor, and one round in the middle, by means of which they throw the corn out of the upper into the lower rooms, and so up again, to turn and air it the better. Their screens are made with two partitions, to separate the corn from the dust which falls into a bag, and when sufficiently full this is thrown away, the pure and good corn remaining behind. Corn has by these means been kept in our granaries thirty years: and it is observed, that the longer it is kept the more flour it yields in proportion to the corn, and the purer and whiter the bread is, the superfluous humidity only evaporating in the keeping. At Zurich, in Switzerland, they have been said to keep corn eighty years, or longer, by these methods. The public granaries at Dantzic are seven, eight, or nine

stories high, having a funnel in the midst of every floor to let down the corn from one to another. They are built so securely, that, though every way surrounded with water, the corn contracts no dampness, and the vessels have the convenience of coming up to the walls for their lading. The Russians preserve their corn in subterranean granaries of the figure of a sugar loaf, wide below and narrow at top: the sides are well plastered, and the top covered with stones. They take care to have the corn well dried before it is laid into these storehouses, and often dry it by means of ovens; the summer dry weather being too short to effect it sufficiently. At Dantzic the wheat, barley, and rye, of a great part of Poland, are there laid up in parcels of twenty, thirty, or sixty lasts in a chamber, according to the size of the room; and this they keep turning every day or two, to keep it sweet and fit for shipping. A thunder storm has sometimes been of very terrible consequences to these stores; all the corn having been found so much altered by one night's thunder, that though over night it was dry, fit for shipping or keeping, and proper for any use, yet in the morning it was found clammy and sticking. In this case there is no remedy but the turning of all such corn three or four times a day for two months or longer; in which time it will sometimes be recovered, though sometimes not. This effect of thunder and lightning is only observed to take place in such corn as is not a year old, or has not sweated thoroughly in the straw before it was threshed out. The latter inconvenience is easily prevented by a timely care; but, as to the former, all that can be done is carefully to examine all stores of the last year's corn after every thunder storm, that if any of it have been so affected, it may be cured in time; for a neglect of turning will utterly destroy it. According to Vitruvius's rules, a granary should always be at the top of a house, and have its openings only to the north or east, that the corn may not be exposed to the damp winds from the south and west, which are very destructive to it; whereas the contrary ones are very necessary and wholesome to it, serving to cool and dry it from all external humidity, from whatever cause. There must also be openings in the roof to be set open in dry weather, partly to let in fresh air, and partly to let out the warm effluvia which are often emitted by the corn. The covering of the roofs should always be of tiles, because in the worst seasons, when the other openings cannot be safe, there will always be a considerable inlet for fresh air, and a way out for the vapors by their joinings, which are never close. If there be any windows to the south, great care must be taken to shut them up in moist weather, and during hot southern winds. There must never be a cellar, or any other damp place under a granary, nor should it ever be built over stables; for, in either of these cases, the corn will certainly suffer by the vapors, and be made damp in the one case and ill tasted in the other.

The preservation of grain from the ravages of insects may be best effected by timely and frequent screening, and ventilation; as little or no inconvenience will follow corn iodged dry, but what evidently results from a neglect of these

precautions. For, whether the obvious damage arise from the weevil, the moth, or the beetle, that damage has ceased at the time the vermin make their appearance under either of these species, they being, when in this last state of existence, only propagators of their respective kinds of vermiculi which, while they continue in that form, do the mischief. In this last, or insect state, they eat little, their principal business being to deposit their eggs, which unerring instinct prompts them to do where large collections of grain furnish food for their successors while in a vermicular state. It is therefore the business of industry to prevent future generations of these ravagers, by destroying the eggs previous to their hatching; and this is best accomplished by frequent screening, and exposure to draughts of wind or fresh air. By frequently stirring the grain, the cohesion of their eggs is broken, and the nidus of those minute worms is destroyed, which on hatching collect together, and weave numerous nests of a cobweb-like substance for their security. To these nests they attach, by an infinity of small threads, many grains of corn together, first for their protection, and then for their food. When their habitations are broken and separated by the screen, they fall through its small interstices, and may be easily removed from the granary with the dust. Those that escape an early screening will be destroyed by subsequent ones, while the grain is but little injured; and the corn will acquire thereby a superior purity. But by inattention to this, and sometimes by receiving grain already infected into the granary, these vermin, particularly the weevil, will soon spread themselves in that state every where upon the surface, and darken the walls by their number. Under such circumstances hens, with new hatched chickens, if turned on the heap, will traverse, without feeding (or very sparingly so) on the corn, wherever they spread; as they seem insatiable in the pursuit of these insects. When the numbers are reduced within reach, a hen will fly up against the walls, and brush them down with her wings, while her chickens seize them with the greatest avidity. This being repeated as often as they want food, the whole species will in a day or two be destroyed. Of the phalena, or moth, and the small beetle, they seem equally voracious: on which account they may be deemed the most useful instruments in nature for eradicating these noxious and destructive vermin.

M. Du Hamel and Dr. Hales recommend various contrivances for blowing fresh air through corn laid up in granaries or ships, to preserve it sweet and dry, and to prevent its being devoured by weevils or other insects. This may be done by nailing wooden bars or laths on the floor of the granary about an inch distant from each other, when they are covered with hair-cloth only: or at the distance of two or three inches, when coarse wire-work, or basket-work of osier, is laid under the hair-cloth, or when an iron plate full of holes is laid upon them. These laths may be laid across other laths, nailed at the distance of fifteen inches, and two or more deep, that there may be a free passage for the air under them. The under laths must come about six inches short

of the wall of the granary at one end of them; on which end a board should be set edgewise, and sloping against the wall: by this disposition a large air-pipe is formed, which, having an open communication with all the interstices between and under the bars, will admit the passage of air below forcibly through a hole at the extremity of it, into all the corn in the granary, that will consequently carry off the moist exhalations of the corn. The ventilators for supplying fresh air may be fixed against the wall, on the inside or outside of the granary, or under the floor, or in the ceiling; but, wherever they are fixed, the handle of the lever that works them must be out of the granary, otherwise the person who works them would be in danger of suffocation, when the corn is fumed with burning brimstone, as is sometimes done for destroying weevils. Small moveable ventilators will answer the purpose for ventilating corn in large bins in granaries, and may be easily moved from one bin to another. If the granary or corn ship be very long, the main air-pipe may pass lengthwise along the middle of it, and convey air, on both sides, under the corn. In large granaries, large double ventilators, laid on each other, may be fixed at the middle and near the top of the granary, that they may be worked by a wind-mill fixed on the roof of the building, or by a water-mill. The air is to be conveyed from the ventilators through a large trunk or trunks, reaching down through the several floors to the bottom of the granary, with branching trunks to each floor, by means of which the air may be made to pass into a large trunk along the adjoining cross walls: from these trunks several smaller trunks, about four inches wide, are to branch off, at the distance of three or four feet from each other, which are to reach through the whole length of the granary, and their farther ends are to be closed: seams of one-tenth or one-twelfth of an inch are to be left open at the four joinings of the boards, where they are nailed together, that the air may pass through them into the corn. In some of these smaller trunks there may be sliding shutters, to stop the passage of the air through those trunks which are not covered with corn; or to ventilate one part of the granary more briskly than others, as there may be occasion. There must also be wooden shutters, hung on hinges at their upper part, so as to shut close of themselves; these must be fixed to the openings in the walls of the granary on their outside; by these means they will readily open to give a free passage for the ventilating air, which ascends through the corn to pass off, but will instantly shut when the ventilation ceases, and thereby prevent any dampness of the external air from entering: to prevent this, the ventilation should be made only in the middle of dry days, unless the corn, when first put in, is cold and damp. In smaller granaries, where the ventilators must be worked by hand, if these granaries stand on staddles, so as to have their lowest floor at some distance from the ground, the ventilators may be fixed under the lowest floor, between the staddles, so as to be worked by men standing on the ground, without or within the granary. A very commodious and cheap ventilator may be made for small granaries

ries, by making a ventilator of the door of the granary; which may be easily done by making a circular screen, of the size of a quarter of a circle, behind the door; but for this purpose, the door must open, not inwards but outwards of the granary, so that as it falls back, it may be worked to and fro in the screen; which must be exactly adapted to it in all parts of the circular side of the screen, as well as at the top and bottom. But there must be a stop at about eight or ten inches from the wall, to prevent the door from falling back farther; that there may be room for a valve in the screen to supply it with air: which air will be driven in by the door, through a hole made in the wall near the floor, into the main air-trunk, in which there must be another valve over the hole in the wall, to prevent the return of the air.

GRAN'SON, *n. s.*

GRAN'NAM, *n. s.*

grandevity. High rank, as grandee. External splendor, either in a literal or figurative sense, is called grandeur. Grandific is making great: and grandity is an obsolete word, synonymous with grandeur. Grandam and grannam are contractions of grand and dame, and form familiar appellations of grandmother.

I am a daughter, by the mother's side

Of her that is *grand-mother* magnific

Of all the gods, great Earth, great Chaos Child.

Spenser. Faerie Queens.

Thy *grandmother* Lois, and thy mother Eunice.

2 Tim. i. 5.

I meeting him, will tell him that my lady

Was fairer than his *grandam*, and as chaste

As may be in the world. *Shakespeare.*

Thinkest thou, that I will leave my kingly throne,

Wherein my *grandsire* and my father sat? *Id.*

Why should a man whose blood is warm within,

Sit like his *grandsire* cut in alabaster? *Id.*

One was, saying that his great-grandfather and grandfather, and father, died at sea: said another that heard him, an' I were as you, I would never come at sea. Why, saith he, where did your great-grandfather, and grandfather, and father die? He answered, where but in their beds? He answered, an' I were as you, I would never come in bed.

Bacon.

Augustus Cæsar, out of indignation against his daughters and Agrippa his *grandchild*, would say that they were not his seed, but imposthumes broken from him. *Id.*

God hath planted, that is, made to grow the trees of life and knowledge, plants only proper and becoming the paradise and garden of so *grand* a Lord.

Raleigh's History.

Our poets excel in *grandity* and gravity, smoothness, and property, in quickness and briefness.

Camden.

These hymns may work on future wits, and so
May great-grandchildren of thy praises grow. *Donne.*

Fair daughter, and thou son and *grandchild* both!

Milton.

What cause

Moved our *grand* parents in that happy state,

Favoured of heaven so highly, to fall off

From their Creator. *Id.*

Our *grand* foe, Satan. *Id.*

So clomb this first *grand* thief into God's fold. *Id.*

He 'scaping, with his gods and reliques fled,

And towards the shore his little *grandchild* led.

Denham.

Thy *grandsire*, and his brother, to whom fame

Gave, from two conquered parts o' th' world, their name. *Id.*

He hoped his majesty did believe that he would never make the least scruple to obey the *grandchild* of King James. *Clarendon.*

As pirates all false colours wear

T' entrap th' unwary mariner,

So women to surprise us spread

The borrowed flags of white and red,

Display 'em thicker on their cheeks

Than their old *grandmothers* the Picts. *Hudibras.*

We have our forefathers and great *grandames* all before us as they were in Chaucer's days. *Dryden.*

Thy tigress heart belies thy angel face:

Too well thou shewest thy pedigree from stone;

Thy *grandame's* was the first by Pyrrha thrown. *Id.*

Almighty Jove augment your wealthy store,

Give much to you, and to his *grandsons* more. *Id.*

The women

Cried, one and all, the suppliant should have right,

And to the *grandame* hag adjudged the knight. *Id.*

Some Houswives teach their teachers how to pray,

Some Clarks have shewed themselves as wise as they;

And in their Callings, as discreet have bin,

As if they taught their *grandames* how to spin.

George Withers.

As a magistrate or great officer, he locks himself from all approaches by the multiplied formalities of attendance, by the distance of ceremony and *grandeur*.

South.

When a prince or *grandee* manifests a liking to such

a thing, men generally set about to make themselves considerable for such things. *Id.*

They had some sharper and some milder differences, which might easily happen in such an interview of *grandees*, both vehement on the parts which they swayed. *Wotton.*

The wreaths, his *grandsire* knew to reap

By active toil and military sweat. *Prior.*

Some parts of the Spanish monarchy are rather for ornament than strength: they furnish out vice-royalties for the *grandees*, and posts of honour for the noble families. *Addison.*

Oft my kind *grannam* told me, Tim, take warning.

Gay.

A voice has flown

To re-enslave a *grand* design. *Young.*

Grandfathers in private families are not much observed to have great influence on their *grandsons*, and, I believe, they have much less among princes. *Smyth.*

Our *grandchildren* will see a few rags hung up in Westminster-hall, which cost an hundred millions, whereof they are paying the arrears, and boast that their *grandfathers* were rich and great. *Id.*

So mimick ancient wits at best,
As apes our *grandsires* in their doublets drest.

Pope.

Sons, sires, and *grandsires*, all will wear the bays,
Our wives read Milton, and our daughters plays.

Id.

Blush *grandeur* blush! proud Courts! withdraw
your blaze;

Ye little stars! hide your diminished rays. *Id.*

He that negotiates between God and man

As God's ambassador, the *grand* concerns

Of judgment and of mercy, should beware

Of lightness of his speech. *Cowper.*

Here dons, *grandees*, but chiefly dames abound,
Skilled in the ogle of a roguish eye,
Yet ever well inclined to heal the wound,
None through their cold disdain are doomed to die
As moon-struck bards complain by Love's sad archery.

Byron.

GRAND (Joachim le), a political writer, was born in 1653, at St. Lo, in Normandy. He entered into the congregation of the Oratory, which he quitted to become a tutor at Paris; after which he went to Portugal and Spain, as secretary to the French embassy. He had a controversy with bishop Burnet, respecting the divorce of Henry VIII. and his queen Catherine, on which subject he published three volumes. He died at Paris in 1733. Other works of his, are—1. A Translation of Lobo's History of Abyssinia. 2. De la Succession à la Couronne de France.

GRAND (John Baptist le), born at Amiens in 1737, was surnamed d'Aussy, because his father was a native of Auxy-de-Chateau, and educated at Amiens in the college of the Jesuits, of which he became a member, and was appointed professor of rhetoric at Caen. He was made secretary of the military school on the suppression of the society, and, in 1796, conservator of the manuscripts in the French national library. He died in 1801, and is known by his *Fableaux*, or *Tales of the twelfth and thirteenth Centuries*, 5 vols. 8vo. 2. *Contes devots, Fables, et Romans anciens, pour servir de suite aux Fableaux*. 8vo. 3. *Histoire de la vie privée des Français*. 4. *A Tour to Auvergne*, 3 vols. 8vo. 5. *Vie d'Apollonius de Tyane*, 2 vols. 8vo. At the time of his death, he was engaged on a History of French Poetry, which he left unfinished.

GRAND ISLE is an island of New York, in the Niagara, four miles above the Falls. It contains 48,000 acres, and belongs at present to the town of Buffalo.

Also the name of a county in the north-west part of Vermont. Population 4445. It is composed of islands in Lake Champlain; the largest are North and South Hero.

GRAND RIVER is a river of Louisiana, which runs south into the Missouri, 240 miles from the Mississippi. It is navigable for boats about 600 miles. Also a river of Louisiana, which runs south-east into the Arkansas. It is navigable about 200 miles.

THE GRAND TRAVERSE is a string or range of islands in Lake Michigan; mostly small and rocky. Many of the rocks are of an amazing size, and appear as if they had been fashioned by the hands of artists. On the largest and best stands a town of the Ottoways.

GRANDE, a river of Brasil, in the Bahia, which rises in the mountains to the westward of the valley of the Rio Francisco, and, running east, falls into that river in lat. 11° 35' S.

GRANDE, a large river of Brasil, in the province of Minas Geraes, rising in the mountains to the westward, and falling, after a long course to the north-east, into the Atlantic in lat. 15° 26' S.

GRANDE, a river of Zanguebar, Eastern Africa, supposed to be a branch of one great river, from which the Quilimane is also derived. At its mouth are several alluvial islands. It falls into the Indian Ocean, about lat. 2° S.

GRANDE, RIO, a large river of Western Africa, falling into the Atlantic, about 200 miles to the south of the Gambia. Its sources are little known, but are supposed to lie in a range of mountains extending inwards from Sierra Leone, and joining those of Kong. The kingdom of Fouta Jallo lies along its right bank, and its shores are occupied by the various tribes of the Balantes, Biafarras, Papels, &c., and by the kingdoms of Ghinala and Biguba. Near the mouth it divides into various branches, forming alluvial islands, which form a portion of the archipelago of the Bissagos. Its whole course is about 500 miles direct.

GRANDIER (Urban), a curate and canon of Loudon in France, whose death has made him famous in the annals of superstition, was born at Bouvere near Sablé, in the latter part of the fifteenth century. He seems, as an eloquent and able preacher, to have been envied by the monks of Loudon, and, being accused of an improper attention to women, was condemned to forfeit his benefices. When an appeal to the parliament of Paris acquitted him, his enemies induced some nuns of Loudon to declare themselves bewitched by him, and persuaded cardinal Richelieu that he was the author of a satire upon his family and person. The issue was, that on the most absurd evidence, Grandier was declared guilty, and ordered to be burnt alive, a sentence which he endured with heroic firmness, on the 18th of April, 1684.

GRANGE, *n.s.* Fr. *grange*. A farm; generally a farm with a house at a distance from neighbours.

For he is wont for timber for to go,
And dwellen at the *grange* a day or two.

Chaucer. The Miller's Tale.

At the moated *grange* resides this dejected Mariana.

Shakspeare.

One, when he had got the inheritance of an unlucky old *grange*, would needs sell it; and, to draw buyers, proclaimed the virtues of it: nothing ever thrived on it, saith he; the trees were all blasted, the swine died of the measles, the cattle of the murrain, and the sheep of the rot; nothing was ever reared there, not a duckling nor a goose.

Ben Jonson.

The loose unlettered hinds,

When for their teeming flocks and *granges* full,
In wanton dance they praise the bounteous Pan.

Milton.

If the church was of their own foundation, they might chuse, the incumbent being once dead, whether they would put any other therein; unless, perhaps, the said church had people belonging to it; for then they must still maintain a curate; and of this sort were their *granges* and priories.

Ayliffe.

GRANGE (Joseph de Chancel de la), a French poet, was born in 1676 in Perigord, and wrote his first comedy at nine years old, and a tragedy at sixteen. The work, however, which made him most known, was a satire, entitled *Philippics*, against the duke of Orleans. For this he was seized, and ordered to be imprisoned in the isle of St. Margaret, from whence he made his escape to Sardinia, and afterwards to Holland. He died in 1758. His works are in 5 vols. 12mo.

GRANGER (James), an English clergyman, and biographer, was a native of Berkshire, and educated at Christ Church, Oxford; soon after leaving which, he obtained the vicarage of Ship-lake in Oxfordshire. Having made a collection of portraits of Englishmen, chronologically arranged, he published his *Biographical History of England*, 1769, 2 vols. 4to., in which the lists of engravings were accompanied by short memoirs and anecdotes, illustrative of their modes of dress, manners, &c., and the different periods of history concerned. He subsequently produced a supplementary volume; and in 1775 a second edition of the whole work. He died April 15th, 1776, in consequence of an apoplectic fit the preceding day, while administering the sacrament. A collection of his correspondence was published by James Peller Malcolm, 8vo., and a continuation of the *Biographical History* through the reigns of George I. and George II. by the Rev. Mark Noble.

GRANI, from Irish greann, a beard; in our ancient writers, mustaches or whiskers. The Roman Catholics give us a reason why the cup is refused to the laity, *Quia barbati, et prolixos habent granos, dum poculum inter epulas sumunt, prius liquore pilos inficiunt, quam ori in-fundunt.*

GRANICUS, a small river near the Hellespont in Lesser Asia, remarkable for the first victory gained by Alexander the Great over the armies of Darius. Justin and Orosius tell us, that the Persian army consisted of 600,000 foot and 20,000 horse; Arrian makes the foot amount to 200,000; but Diodorus tells us, that there were only 100,000 foot and 10,000 horse. The Macedonian army did not exceed 30,000 foot and 5000 horse. The Persian cavalry lined the banks of the Granicus, in order to oppose Alexander wherever he should attempt a passage; and the foot were posted behind the cavalry on an easy ascent. Parmenio wanted Alexander to allow his troops some time to refresh themselves; but he replied, that, after having crossed the Hellespont, it would be a disgrace to him and his troops to be stopped by a rivulet. Accordingly a proper place for crossing the river was no sooner found, than he commanded a strong detachment of horse to enter; he himself followed with the right wing, which he commanded in person; the trumpets in the mean time sounding, and loud shouts of joy being heard through the whole army. The Persians let fly such showers of arrows against the detachment of Macedonian horse, as caused some confusion; several of their horses being killed or wounded. As they drew near the bank, a most bloody engagement ensued; the Mace-

donians attempting to land, and the Persians pushing them back into the river. Alexander, who observed the confusion they were in, took the command of them himself; and landing, in spite of all opposition, obliged the Persian cavalry, after an obstinate resistance, to give ground. However, Spithrobat, governor of Ionia, and son-in-law to Darius, still maintained his ground, and did all that lay in his power to bring them back to the charge. Alexander advanced full gallop to engage him, and both were slightly wounded at the first encounter. Spithrobat, having thrown his javelin without effect, advanced sword in hand to meet his antagonist, who ran him through with his pike as he raised his arm to discharge a blow with his scymitar. But Rosaces, brother to Spithrobat, at the same time, gave Alexander such a furious blow on the head with his battle-axe that he beat off his plume, and slightly wounded him through the helmet. As he was ready to repeat the blow, Clitus with one stroke of his scymitar cut off Rosaces's head, and thus in all probability saved the life of his sovereign. The Macedonians then, animated by the example of their king, attacked the Persians with new vigor, who soon after betook themselves to flight. Alexander immediately charged the enemy's foot with all his forces, who had now passed the river. The Persians, disheartened at the defeat of their cavalry, made no great resistance. The Greek mercenaries retired in good order to a neighbouring hill, whence they sent deputies to Alexander, desiring leave to march off unmolested. But he, instead of coming to a parley with them, rushed furiously into the middle of this small body; where his horse was killed under him, and he himself in great danger of being cut in pieces. The Greeks defended themselves with incredible valor for a long time, but were at last almost entirely cut off. In this battle the Persians are said to have lost 20,000 foot and 2500 horse, and the Macedonians only fifty-five foot and sixty horse.

GRANITE. See GRAIN.

GRANITE, in lithology, a genus of stones of the order of *petra*, belonging to the class of *saxa*. The principal constituent parts of this stone are felt-spar or rhombic quartz, mica, and quartz. These ingredients constitute the hardest sort of granite, and that most anciently known. That into which schoerl enters is more subject to decomposition. They never have any particular texture or regular form, but consist of enormous shapeless masses extremely hard. In the finer granites the quartz is transparent; in others generally white or gray, violet or brown. The felt-spar is generally the most copious ingredient, and of a white, yellow, red, black, or brown color. The mica is also gray, brown, yellow, green, red, violet, or black; and commonly the least copious. The schoerl is generally black, and abounds in the granites that contain it. Hence the color of the granites depends principally on that of the spar or schoerl. The red granites consist commonly of white quartz, red felt-spar, and gray mica; the gray ones of white quartz, gray, or violet felt-spar, and black mica. The black granites commonly contain schoerl

instead of felt-spar; and the green usually contain green quartz. On exposing granite to the flame of a blow-pipe, the component ingredients separate from one another. Mr. Gerhard, having melted some in a crucible, found the felt-spar run into a transparent glass; below it the mica lay in form of a black flag, the quartz remaining unaltered. It melted somewhat better when all the three were powdered and mixed together; though even then the quartz was still discernible by a magnifying glass. Hence we may explain the reason why grains of a white color are sometimes found in volcanic lavas. The mixture of mica prevents the silex or quartz from splitting or cracking; and hence its infusibility and use in furnace-building. Granites are seldom slaty or laminated. In those of a close texture, the quartz and schoerl predominate. They take a good polish; for which reason the Egyptians formerly, and the Italians still, work them into large pieces of ornamental architecture, for which they are extremely fit, as not being liable to decay in the air. Wallerius describes eighteen species of granites, besides many others akin to this genus. Those described by Cronstedt are, 1. Loose or friable, which comes from France, and is used at the brass-works for casting that metal in. 2. Hard or compact, of which there are two varieties, red and gray. The former is met with of two kinds; viz. fine-grained, from Swappari in Lapland, or coarse-grained, from the province of Dalarne in Sweden. The gray, with other colors, is met with on the coast round Stockholm and Norland in Sweden. 'That granite may be produced,' says Kirwan, 'at this day, from the agglutination of its own sand, we have an evident proof in the mole constructed in the Oder in the year 1722; it is 350 feet in length, fifty-four in height, of that breadth at top, and 144 at bottom; the walls were made of blocks of granite, fastened with iron cramps, the chinks stopped with moss, and the space between the walls filled with granite sand; this sand, by the oozing of the water impregnated with iron, or other causes, is now at last rendered so hard and compact as to prevent any more water from traversing it, and cannot be distinguished from natural granite.' It is for this reason that granite is so much used in the improved roads round about London, which have been what is commonly called Macadamised. See *ROADS*.

GRANITELLO, a genus of stones of the order of petrae, belonging to the class of saxa. There are two species: 1. That composed of distinct particles, found in several of the mountainous parts of Sweden. In some of these there is a predominance of quartzose particles, in others of micaceous; in which last case the stone is slaty, and easily split. 2. That composed of convoluted particles. It is met with of different colors, as whitish, gray, greenish, and reddish. Both these kinds of stone are used in building furnaces, on account of the powerful resistance they make to the fire; but the latter is preferable to the other, on account of its containing a little of a refractory clayish substance. It is likewise of great use in mills, where the fellow is a coarse sand-stone.

GRANTIVOROUS, *adj.* Lat. *granum* and *voro*. Eating grain; living upon grain.

Grantivorous birds, as a crane, upon the first peck of their bills, can distinguish the qualities of hard bodies, which the sense of men discerns not without mastication.

Broune.
Panick affords a soft demulcent nourishment, both for *grantivorous* birds and mankind. *Arbuthnot.*

GRANT, *v. a. & n. s.*

GRANT'ABLE, *adj.*

GRANTEE, *n. s.*

GRANTOR, *n. s.*

GRANTED, *part.*

From Fr. *garantir*, Junius and Skinner; perhaps, as Minshew thinks, from Lat. *gratuito*, or rather from *gratia* or *gratificor*. To admit that which is not yet proved; to allow; to yield; to concede. There are four meanings to this word, to give; to convey; to admit; to bestow something which cannot be claimed by right. A grantor is he by whom any grant is made: a grantee he to whom it is made. Grant, a gift; a boon; it has in law a special meaning; and is 'A gift in writing of such a thing as cannot aptly be passed or conveyed by word only; as rent, reversions, services, advowsons in gross, common in gross, tithes, &c., or made by such persons as cannot give but by deed, as the king, and all bodies politic; which differences be often in speech neglected, and then is taken generally for every gift whatsoever, made of any thing by any person; and he that granteth it is named the grantor, and he to whom it is made the grantee. A thing is said to be in grant, which cannot be assigned without deed.'

The God of Israel *grant* thee thy petition that thou hast asked of him. *1 Sam. xviii.*

Then hath God also to the gentiles *granted* repentance unto life. *Acts xiii. 18.*

— *Grant* us ladie shene
Eche of us, of thy grace a bone.

Chaucer. House of Fame.

Madame! thus say sayid thei, we be
Folke that which he besechen the,
That thou *grawnten* us, now, gode fame
And let our workes have gode name. *Id.*

This thing was *granted* and our other swore
With full glad herte.

Id. Prologue to Canterbury Tales.

All the land is the queen's, unless there be some *grant* of any part thereof, to be shewed from her majesty. *Spenser.*

They gather out of Scripture general rules to be followed in making laws; and so, in effect, they plainly *grant*, that we ourselves may lawfully make laws for the church. *Hooker.*

But of this so large a *grant*, we are content not to take advantage. *Id.*

— Didst thou not kill this king?
— I *grant* ye. *Shakspeare.*

Suppose, which yet I *grant* not, thy desire
A moment elder than my rival fire,
Can chance of seeing first thy title prove?

Dryden.

This *grant* destroys all you have urged before. *Id.*

Courtiers juggle for a *grant*,
And when they break their friendship plead their want. *Id.*

Grant that the fates have firmed, by their decree,
The Trojan race to reign in Italy. *Id. Æneid.*

To smooth the way for popery in Mary's time, the *grantees* were confirmed by the pope in the possession of the abbey-lands. *Swift.*

I take it for *granted*, that, though the Greek word which we translate *saints*, be in itself as applicable to things as persons, yet in this article it signifieth not holy things, but holy ones. *Pearson.*

If he be one indifferent as to the present rebellion, they may take it for *granted* his complaint is the rage of a disappointed man. *Addison's Freeholder.*

But *grant* that actions best discover man;
Take the most strong and sort them if you can. *Pope.*

He heard, and *granted* half his prayer;

The rest the winds dispersed. *Id.*

A duplex querela shall not be *granted* under pain of suspension of the *grantor* from the execution of his office. *Ayliffe.*

The office of the bishop's chancellor was *grantable* for life. *Id.*

Not only the laws of this kingdom, but of other places, and the Roman laws, provide that the prince should not be deceived in his *grants*. *Davies.*

But though I *grant* him these excellencies, I must be pardoned, when I censure either his judgment or his virtue. *Beattie.*

Nor was thy respite *granted* to my prayer;

This fleeting grace was only to prepare

New torments for thy life, and my despair.

Byron. Child Harold.

GRANT, in law. To every good grant, it is said, the following things are requisite: 1. That there be a person able to grant. 2. A person capable of the thing granted. 3. That there be a thing grantable. 4. That it be granted in such manner as the law requires. 5. That there be an agreement to, and acceptance of, the thing granted, by him to whom made. And, 6, There ought to be an attornment where needful.—Co. Lit. 73. But grants and conveyances are good without attornment of tenants, notice being given them of the grants, by stat. 4 Anne c. 16, § 9. Grants are taken most strongly against the grantor in favor of the grantee: the grantee himself is to take by the grant immediately, and not a stranger, or any in futuro; and if a grant be made to a man and his heirs, he may assign at his pleasure, though the word 'assigns' be not expressed.—Lat. 1, Saund. 322. The use of any thing being granted, all is granted necessary to enjoy such use: and in the grant of a thing, what is requisite for the obtaining thereof is included.—Co. Lit. 55. So that if timber trees are granted, the grantee may come upon the grantor's ground to cut and carry them away. See **GIFTS**.

GRANT OF THE KING. The king's grants are matters of public record: for the king's excellency is so high in the law, that no freehold may be given to, nor derived from, him, but by matter of record. To this end a variety of offices are erected, communicating in a regular subordination one with another, through which all the king's grants must pass, and be transcribed and enrolled; that the same may be inspected by his officers, who will inform him if any thing contained therein is improper, or unlawful to be granted. These grants, whether of lands, honors, liberties, franchises, or aught besides, are contained in charters or letters patent; that is open letters, *literæ patentes*: so called because they are not sealed up, but exposed to open view, with the great seal pendant at the bottom: and are usually directed or addressed by the

king to all his subjects at large. And therein they differ from certain other letters of the king, sealed also with his great seal, but directed to particular persons and for particular purposes: which therefore, not being designed for public inspection, are closed up and sealed on the outside, and are thereupon called *writs-close*, *literæ clause*; and are recorded in the close-rolls, in the same manner as the others are in the patent rolls.—2 Comm. 346, c. 21.

GRANT (Francis), lord Cullen, an eminent lawyer and judge of Scotland, was born about 1660, and, having entered as an advocate, made a distinguished figure at the Revolution, by opposing the old lawyers, who warmly argued on the inability of the convention of estates to make any disposition of the crown. The abilities he showed in favor of the Revolution recommended him to an extensive practice; in which he acquired so much honor, that, when the union between the two kingdoms was in agitation, queen Anne, without application, created him a baronet, with a view of securing his interest in that measure; and soon after made him a lord of session. The same talents that recommended him to this honorable office, were conspicuous in the discharge of it; which he continued for twenty years with the highest reputation; when, after an illness which lasted but three days, he expired without agony on March 16th, 1726.

GRANT (Charles), an eminent and most benevolent East India proprietor and director, born in Scotland in 1746, was by the death of his father at the battle of Culloden left to the care of his uncle, who sent him out to India. Here he soon found patronage in the civil service, and in 1770 returned to Scotland and married. In 1772 he went out to Bengal as a writer, and was shortly after appointed secretary to the board of trade. In this situation he became the patron of various Christian missions, and in 1790, on his return to England, obtained a seat in the East India direction, and in the house of commons. He now wrote his important *Observations on the State of Society among the Asiatic Subjects of Great Britain*, which in 1813 the house of commons caused to be printed for the use of its members. Mr. Grant was also one of the commissioners appointed by parliament to superintend the building of new churches; a member of the Society for promoting Christian Knowledge; and a vice-president of the Bible Society. His death took place October 31st, 1825.

GRANTHAM, a borough and market town of Lincolnshire, on the road from London to York. It is supposed to have been a Roman station. It is governed by an alderman and twelve justices of the peace, a recorder, a coroner, an escheator, and twelve common-councillors. It has a fine large church with a stone spire, one of the loftiest in England, being 300 feet high; and which appears to lean to one side. Grantham has a good free school, where Sir Isaac Newton received his first education, besides two charity schools. It sends two members to Parliament, and is seated on the Witham, thirty miles south of Lincoln, and 110 north of London.

GRANVILLE (George), lord Lansdowne, was descended from the family of Rollo, the first

ake of Normandy. At eleven years of age he was sent to Trinity College, Cambridge, and at the age of thirteen admitted M. A., having, before he was twelve, spoken a poetical address of his own composition to the duchess of York, when she visited the University. In 1696 his comedy called the *She Gallants* was acted at the theatre royal in Lincoln's Inn-fields, as was his tragedy called *Heroic Love* in 1698. In 1702 he translated into English the second Olynthian of Demosthenes. He was M. P. for the county of Cornwall in 1710; afterwards secretary of war, comptroller of the household, then treasurer, and one of the privy council. In 1711 he was created baron Lansdowne. On the accession of king George I. in 1714 he was removed from his treasurer's place; and in 1715 entered his protest against the bills for attainting lord Bolingbroke and the duke of Ormond. He entered into the scheme for raising an insurrection in the west of England; and was committed to the Tower, where he continued two years. In 1719 he made a speech in the house of lords against the bill to prevent occasional conformity. In 1722 he withdrew to France, and continued abroad nearly ten years. At his return, in 1732, he published a fine edition of his Works in 2 vols. quarto. He died in 1735, leaving no male issue.

GRANVILLE, a considerable walled sea-port town on the coast of Normandy, in the department of La Manche. It stands on a peninsular rock, and has two suburbs. It has a considerable traffic with the neighbouring island of Jersey; and fisheries all along the coast. It sends out a number of vessels to Newfoundland. Population 5000. Twelve miles north-west of Avranches, and thirteen S.S.W. of Coutances.

GRANVILLE, a fertile country of North Carolina, in Hillsbury district, bounded on the south-east by Warren county, south by Wake, south-west and west by Orange, and north by Virginia. Williamsborough is the capital.

GRANVILLE, a post town of Washington county, New York, near which is a valuable marble quarry. It is twelve miles south-east of Whitehall, and sixty north-east of Albany. Population 3717.

GRANULE, *n. s.* } Fr. *granuler*,
GRANULOUS, *adj.* } *granulation*; Lat.
GRANULARY, *adj.* } *granum*. Small
GRANULATE, *v. n. & v. a.* } compact particles
GRANULATION, *n. s.* } like grains. To granulate is to break into small masses or raise in small asperities; it is also a surgical term, descriptive of the process by which ulcers are healed, from the resemblance of their surfaces to clusters of small grains—these are named granulations. Granulation is also the act of pouring melted metal into cold water, that it may granulate or congeal into small grains: it is generally done through a colander, or a birchen broom. Gunpowder and some salts are likewise said to be granulated, from their resemblance to grain or seed. Granule is a small compact particle.

Small-coal, with sulphur and nitre, proportionably mixed, tempered, and formed into *granulary* bodies, do make up that powder which is used for guns.

Broune's Vulgar Errors.

With an excellent microscope, where the naked eye did see but a green powder, the assisted eye could discern particular *granules*, some blue, and some yellow.

Boyle on Colours.

I have observed, in many birds, the gullet, before its entrance into the gizzard, to be much dilated, and thick-set, or, as it were, *granulated* with a multitude of glandules, each whereof was provided with its excretory vessel.

Ray.

The juice of grapes, inspissated by heat, *granulates* into sugar.

Sprat.

Tents in wounds, by resisting the growth of the little *granulations* of the flesh, in process of time harden them, and in that manner produce a fistula.

Sharp's Surgery.

GRANULATION, in chemistry, is an operation by which metallic substances are reduced into small roundish particles, to facilitate their combination with other substances. This operation consists only in pouring the melted metal slowly into a vessel filled with water, which is in the mean time to be agitated with a broom. With melted copper, however, which is apt to explode with great violence on the contact of water, some precautions are to be observed. In the brass works at Bristol, copper is granulated, without danger of explosion, by letting it fall in small drops into a large cistern of cold water covered with a brass plate. In the middle of the plate is an aperture in which is secured with Sturbridge clay a small vessel, whose capacity does not exceed a spoonful, perforated with many minute holes through which the copper passes. A stream of cold water passes through the cistern. If allowed to grow hot, the copper will fall to the bottom, and run into flat pieces instead of granulating. Lead or tin may be granulated by pouring them when melted into a box; the internal surface of which is rubbed with powdered chalk, and the box strongly shaken till the grains have become solid. Metals are granulated, because their ductility renders them incapable of being pounded, and because filing is long and tedious, and might render the metal impure by an admixture of iron from the file.

GRAPE, *n. s.*

GRAPE-STONE, *n. s.*

GRAPE-HYACINTH, *n. s.*

GRAPE-SHOT, *n. s.*

Fr. *grappe*; Italian *grappo*, *graspo*; Belg. *krappe*; Teut. *trauben*. The fruit of the vine, and the seed contained in the grape; a flower; shot of a peculiar kind used in battle.

And thou shalt not glean thy vineyard, neither shalt thou gather every *grape* of thy vineyard; thou shalt leave them for the poor and stranger.

Lev. xix. 10.

For no man, at the first stroke,

Ne may not fel adoune an oke—

Nor of the reissins have the wine

Till *grapes* be ripe and wel afine.

Chaucer. Remount of the Rose.

And sometimes floures spring as in a mede,

Sometimes a vine and *grapes* white and rede.

Id. The Frankelmeins Tale.

Nay in Death's hand the *grapestone* proves

As strong as thunder is in Jove's.

Cowley.

Anacreon, for thy sake

I of the *grape* no mention make;

Ere my Anacreon by thee fell,

Cursed plant, I loved thee well.

Id.

When obedient Nature knows his wil,

A fly, a *grapestone*, or a hair can kill.

Prior.

Here are the vines in early flower descried,
Here *grapes* discoloured on the sunny side. *Pope*.
Within a cable's length their vessels lay
Off Ismail, and commenced a cannonade
Which was returned with interest I may say,
And by a fire of musquetry and *grape*
And shells and shot of every size and shape.

Byron.

GRAPE. See VITIS.

GRAPE HYACINTH. See HYACINTHUS.

GRAPE MANGROVE, GRAPE SEA-SIDE. Two species of polygonum.

GRAPE-SHOT, in artillery, is a combination of small shot, put into a thick canvas bag, and corded strongly together, so as to form a kind of cylinder, whose diameter is equal to that of the ball adapted to the cannon. The number of shot in a grape varies according to the service or size of the guns: in sea-service nine is always the number; but by land it is increased to any number or size, from an ounce and a quarter in weight to three or four pounds. In sea-service the bottoms and pins are made of iron, whereas those used by land are of wood.

The following statement exhibits the number and sorts of shot contained in the grape, for guns of different species:—

Guns.	Species of Shot in the Grape.	Number in each.	Number in each Box.
42 pounders .	4 lb.	9	4
32 ——— .	3	9	4
24 ——— .	—	9	6
18 ——— .	1½	9	8
12 ——— .	1	9	10
9 ——— .	13 oz.	9	12
6 ——— .	8	9	20
4 ——— .	6	9	20

GRAPHICAL, *adj.* } Greek γραφω, to de-
GRAPHICALLY, *adv.* } scribe. Well delineated:
in a picturesque manner.

Write with a needle, or bodkin, or knife, or the like, when the fruit of trees are young; for, as they grow, so the letters will grow more large and *graphical*.

Bacon's Natural History.

The hyena adorata, or civet-cat, is delivered, and *graphically* described by Castells. *Browne.*

GRAPHIOMETER, a mathematical instrument, otherwise called a semicircle; the use of which is to observe any angle whose vertex is at the centre of the instrument in any plane (though it is most commonly horizontal, or nearly so), and to find how many degrees it contains.

GRAPNEL, *n. s.* Fr. *grapin*. A small anchor belonging to a little vessel. A grappling iron, with which in fight one ship fastens on another.

In goth the *grapnel* so full of crokes;

Among the ropes, ran the shering hokes.

Chaucer. Legend of good Women.

GRAPNELLS, or GRAPPLINGS, are fitted with four or five flukes or claws, and commonly used to ride a boat or other small vessel.

GRAPPLE, *v. n., v. a. &* } Teut. *grabbe-*
GRAPPLEMENT. } *n. s.* } *len, grappen*; from
Goth. *graff*, *kraff*, the hand.—Thomson. Ger. *krappeln*, to seize. To contend as wrestlers; to engage in close fight: an iron instrument by which one ship fastens on another.

As two wild boares together *grappling* go,
Chauffing and foming choler each against his fo.

Spenser's Fæerie Queene.

They catching hold of him, as down he lent,
Him backward overthrew, and down him stayed
With their rude hands and griesly *graplement*.

Spenser.

In the *grapple* I boarded them; on the instant
they got clear of our ship, so I alone became their
prisoner.

Shakspeare. Hamlet.

Grapple your minds to sternage of the navy,
And leave your England as dead midnight still.

Shakspeare.

I'll in my standard bear the arms of York,

To *grapple* with the house of Lancaster.

Id.

For Hippagines, vessels for the transporting of
horse, we are indebted to the Saliminians; for *grap-*
pling hooks to Anacharsis.

Heylin.

They must be also practised in all the locks and
gripes of wrestling, as need may often be in fight to
tugg, or *grapple*, and to close.

Milton.

As when earth's son, Antæus strove

With Jove's Alcides, and, oft foiled, still rose

Fresh from his fall, and fiercer *grapple* joined,

Throttled at length in the air, expired and fell.

Id.

Living virtue, all atchievements past,

Meets envy, still to *grapple* with at last.

Waller.

Sometimes, from fighting squadrons of each fleet,

Two *grappling* Ætnas on the ocean meet,

And English fires with Belgian flames contend.

Dryden.

Or did his genius

Know mine the stronger demon, feared the *grapple*,

And, looking round him, found this nook of fate,

To skulk behind my sword. *Id. Don Sebastian.*

Does he think that he can *grapple* with divine ven-
geance, and endure the everlasting burnings? *South.*

Antæus here and stern Alcides strive,

And both the *grappling* statues seem to live.

Addison.

Like one who *grapplies* with his enemy

And strives to strangle him.

Byron.

GRASP, *v. a., v. n., & n. s.* } Teut. *graspen*;
GRASPER, *n. s.* } *Ital. graspere*. To

hold; to seize; to catch; to struggle; figura-
tively to encroach or covet. The substantive
signifies possession, or the power of seizing.

And hastily returned into that place age,

And fond this bynd seching on hondes and on kne,
Grasping all aboute to find, that he had lore.

Chaucer. The Merchantes Second Tale.

See, his face is black, and full of blood;

His hands abroad displayed, as one that *grasp*

And tugged for life. *Shakspeare. Henry V.*

I would not be the villain that thou think'st

For the whole space that's in the tyrant's *grasp*,

And the rich East to boot.

Id. Macbeth.

They looked upon it as their own, and had it even
within their *grasp*.

Clarendon.

This *grasping* of the militia of the kingdom into
their own hands, was desired the summer before.

Id.

Within the direful *grasp*

Of savage hunger, or of savage heat.

Milton.

In his right hand

Grasping ten thousand thunders, which he sent
Before him, such as in their souls infix'd
Plagues. *Milton's Paradise Lost.*

O fool that I am, that thought I could *grasp* water,
and bind the wind. *Sydney.*

Doom, as they please, my empire not to stand,
I'll *grasp* my sceptre with my dying hand. *Dryden.*

Like a miser 'midst his store,

Who *grasps* and *grasps* till he can hold no more. *Id.*

This band and sword hath been acquainted well;
It would have come before into my *grasp*,
To kill the ravisher. *Id. Don Sebastian.*

The left arm is a little defaced, though any one
may see it held something in its *grasp* formerly. *Addison.*

Kings, by *grasping* more than they can hold,
First made their subjects, by oppression, bold. *Dennis.*

So endless and exorbitant are the desires of men,
that they will *grasp* at all, and can form no scheme
of perfect happiness with less. *Swift.*

For what are men who *grasp* at praise sublime,
But bubbles on the rapid stream of time? *Young.*

GRASS'-POLA, *n. s.* field; a level covered

GRAZE, *v. n. & v. a.* with grass. Grasier

GRA'ZER, *n. s.* and grazier, one who

GRA'ZIFR, *n. s.* feeds cattle. Grass-

hopper, a small insect that hops in the summer.
Grass-pola, and grass of Parnassus, plants. Graze,
to eat grass; to touch slightly over a surface; to
feed.

Ye are grown fat as the heifer at *grass*, and bellow
as bulls. *Jer. l. 11.*

Perceive all tho that yeden, there without,
Into the felde, that was, on every side,

Covered with corn and *grass*, that, out of doubt,
Tho one would seken all the worlde wide,
So rich a field could not be espyde.

Chaucer. The Floure and the Leafe.

And as I could, this freshe floure I grette,

Kneling alwaie—till it unclosed was—

Upon the small, and soft, and swete *gras*

That was with floures swete embrouded.

Id. Prologue to the Legend of Good Women.

Land arable, driven, or worn to the proof,

With oats ye may sow it, the sooner to pass,

More soon to be pasture, to bring it to *grass*. *Tusser.*

Ne did he leave the mountains bare unscen,

Nor the rank *grassy* fens delights untryed. *Spenser.*

And shrill *grasshoppers* chirped them round;

All which the ayrie echo did resound. *Id. Virgil's Gnat.*

Mark then a bounding valour in our English,

That being dead, like to the bullets *grazing*,

Breaks out into a second course of mischief,

Killing in relapse of mortality. *Shakspeare. Henry V.*

Her waggon spokes made of long spinners' legs,

The cover of the wings of *grasshoppers*. *Shakspeare.*

Here on this *grass-plot*, in this very place,

Come and sport. *Id. Tempest.*

The greatest of my pride is to see my ewes *graze*,

and my lambs suck. *Id. As You Like It.*

Graze where you will, you shall not house with me. *Shakspeare.*

Jacob *grazed* his uncle Laban's sheep. *Id.*

As every state lay next to the other that was op-
pressed, so the fire perpetually *grazed*. *Bacon.*

All *graziers* prefer their cattle from meaner pas-
tures to better. *Id.*

Physicians advise their patients to move into airs
which are plain champagnes, but *grazing*, and not
overgrown with heath. *Id.*

The sewers must be kept so as the water may not
stay too long in the spring; for then the ground con-
tinueth the wet, whereby it will never *graze* to pur-
pose that year. *Id.*

O happy man, saith he, that, lo! I see
Grazing his cattle in those pleasant fields,

If he but know his good! *Daniel's Civil War.*

Gentle peace, which filleth the husbandman's
barns, the *grazier's* folds, and the tradesman's shop. *Howel.*

I was at first as other beasts, that *graze*
The trodden herb of abject thoughts and low. *Milton.*

Raised of *grassy* turf
Their table was, and mossy seats had round. *Id.*

The beef being young, and only *grass-fed*, was
thin, light, and moist, and not of a substance to en-
dure the salt. *Temple.*

The part of your garden next your house should be
a parterre for flowers, or *grass-plots* bordered for
flowers. *Id.*

Their steeds around,
Free from their harness, *graze* the flowery ground. *Dryden.*

Leaving in the fields his *grazing* cows,
He sought himself some hospitable house. *Id.*

The more ignoble throng
Attend their stately steps, and slowly *graze* along. *Id.*

This Neptune gave him, when he gave to keep
His scaly flocks that *graze* the watery deep. *Id.*

The most in fields, like herded beasts, lie down,
To dews obnoxious, on the *grassy* floor. *Id.*

Some *graze* their land till Christmas, and some
longer. *Mortimer.*

A third sort of *grazing* ground is that near the sea,
which is commonly very rich land. *Id.*

They are much valued by our modern planters to
adorn their walks and *grass-plots*. *Id.*

His flock daily crops
Their verdant dinner from the mossy turf

Sufficient: after them the cackling goose,

Close *grazier*, finds wherewith to ease her want. *Philips*

There silver lakes with verdant shadows crowned,
Disperse a grateful chillness all around;

The *grasshopper* avoids the untainted air,
Nor in the midst of summer ventures there. *Addison.*

The women were of such an enormous stature, that
we appeared as *grasshoppers* before them. *Id. Spectator.*

His confusion increased when he found the alder-
man's father to be a *grazier*. *Id.*

When the fresh Spring in all her state is crowned,
And high luxuriant *grass* o'erspreads the ground,

The lab'rer with bending srythe is seen
Shaving the surface of the weaving green. *Gay.*

The lambs with wolves shall *graze* the verdant mead. *Pope.*

He hath a house and barn in repair, and a field or
two to *graze* his cows, with a garden and orchard. *Swift.*

But for a blooming nymph will pass,
Just fifteen, cowing summer's *grass*. *Id.*

GRASS, in botany, is defined to be a plant having simple leaves, a stem generally jointed and tubular, a husky calyx (called gluma), and the seed single. Hence wheat, oats, barley, &c., are properly grasses; while clover, and some other similar plants, are not grasses, though so frequently called by that name. Of grass the leaves are food for cattle, the small seeds for birds, and the larger grain chiefly for man. And it is observable that nature has so provided that cattle, in grazing, seldom eat the flower intended to produce seed, unless compelled by hunger.

GRASSES, *CULMIFEROUS*, may be divided into two general classes for the purposes of the farmer, to which it might be of use for him to attend, viz.

1. Those which, like the common annual kinds of corn, run chiefly to seed-stalks; the leaves gradually decaying as these advance towards perfection, and becoming totally withered or falling off entirely when the seeds are ripe. Rye-grass belongs to this class in the strictest sense. To it likewise may be assigned the vernal grass, dog-tail-grass, and fine bent grass. 2. Those whose leaves continue to advance even after the seed-stalks are formed, and retain their verdure and succulence during the whole season, as is the case with the fescue and poa tribes of grasses, whose leaves are as green and succulent when the seeds are ripe, and the flower-stalks fading, as at any other time. 'It is wonderful,' Mr. Stillingfleet remarks, 'to see how long mankind has neglected to make a proper advantage of plants of such importance, and which, in almost every country, are the chief food of cattle. The farmer, for want of distinguishing and selecting grasses for seed, fills his pastures either with weeds, or bad or improper grasses; when, by making a right choice, after some trials, he might be sure of the best grass, and in the greatest abundance that his land would admit. At present, if a farmer wants to lay down his land to grass, what does he do? He either takes his seeds indiscriminately from his own foul hay-rick, or sends to his next neighbour for a supply. By these means, besides a certain mixture of all sorts of rubbish, which must necessarily happen, if he chance to have a large proportion of good seeds, it is not unlikely but that what he intends for dry land may come from moist, where it grew naturally, and the contrary. This is such a slovenly method of proceeding as, one would think, could not possibly prevail universally; yet this is the case as to all grasses except the dandel grass, and what is known in some few counties by the name of the Suffolk grass; and this latter is owing, I believe, more to the soil than any care of the husbandman. Now, would the farmer be at the pains of separating, once in his life, half a pint or a pint of the different kinds of grass seeds, and take care to sow them separately, in a very little time he would have wherewithal to stock his farm properly, according to the nature of the soil, and might at the same time spread these seeds separately over the nation, by supplying the seed-shops. The number of grasses fit for the farmer is, I believe, small; perhaps half a dozen or half a score are all he need to cultivate; and how small the trouble would be of such a task, and how great the benefit, must be obvious to every

one at first sight. Would not any one be looked on as wild who should sow wheat, barley, oats, rye, peas, beans, vetches, buck-wheat, turnips, and weeds of all sorts together? yet how is it much less absurd to do what is equivalent in relation to grasses? Does it not import the farmer to have good hay and grass in plenty? and will cattle thrive equally on all sorts of food? We know the contrary. Horses will scarcely eat hay that will do well enough for oxen and cows. Sheep, says Linnaeus, are particularly fond of one sort of grass, and fatten upon it faster than any other in Sweden. And may they not do the same in Britain? How shall we know till we have tried?' *Tracts relating to Natural History.*

1. *Annual meadow grass*, poa annua.—'This grass,' says Mr. Stillingfleet, 'makes the finest turf. It grows every where by way sides, and on rich sound commons. It is called in some parts the Suffolk grass. I have seen whole fields of it in High Suffolk, without any mixture of other grasses; and, as some of the best salt butter we have in London comes from that county, it is most likely to be the best grass for the dairy. I have seen a whole park in Suffolk covered with this grass; but whether it affords good venison I cannot tell, having never tasted of any from it. I should rather think not, and that the best pasture for sheep is also the best for deer. However this wants trial. I remarked on Malvern Hill something particular in relation to this grass. A walk that was made there, for the convenience of the water-drinkers, in less than a year was covered in many places with it, though I could not find one single plant of it besides in any part of the hill. This was no doubt owing to the frequent treading, which above all things makes this grass flourish; and therefore it is evident that rolling must be very serviceable to it. It has been objected that this grass is not free from bents, by which word is meant the flowering stems. I answer, that this is most certainly true, and that there is no grass without them. But the flowers and stems do not grow so soon brown as those of other grasses; and, being much shorter, they do not cover the radical leaves so much; and therefore this grass affords a more agreeable turf without mowing than any other whatever that I know of.' The seeds of this species drop off before they are dry, and, to appearance, before they are ripe. The utmost care is therefore necessary in gathering the blades, without which very few of the seeds will be saved. It ripens from the middle of April to so late, it is believed, as the end of October; but mostly disappears in the middle of the summer. It grows in any soil and situation, but rather affects the shade.

2. *Bulbous fox-tail grass*, alopecurus bulbosus, is recommended by Dr. Anderson, in his Essay on Agriculture, &c., as promising on some occasions to afford a valuable pasture grass. 'It seems chiefly,' he observes, 'to delight in a moist soil, and therefore promises to be only fit for a meadow pasture grass.' The quality that first recommended it to his notice was, the unusual firmness that its matted roots gave to the surface of the ground, naturally soft and moist,

in which it grew; which seemed to promise that it might be of use upon such soils, chiefly in preventing them from being much poached by the feet of cattle which might pasture upon them. Mossy soils, especially, are so much hurt by poaching that any thing which promises to be of use in preventing it deserves to be attended to.

3. *Cock's tail, or feather-grass, stipa pennata.* See STIPA.

4. *Creeping meadow grass, poa compressa*, according to Dr. Anderson, seems to be the most valuable grass of any of this genus. Its leaves are firm and succulent, of a dark Saxon-green color, and grow so close upon one another as to form the richest pile of pasture-grass. The flower-stalks, if suffered to grow, appear in sufficient quantities; but the growth of these does not prevent the growth of the leaves, both advancing together during the whole summer; and, when the stalks fade, the leaves continue as green as before. Its leaves are much larger and more abundant than the common meadow-grass, *poa trivialis*; and therefore it better deserves to be cultivated.

5. *Creeping soft grass, holcus lunatus.* See HOLCUS.

6. *Crested dog's-tail grass, cynosurus cristatus.* Mr. Stillingfleet imagines this grass to be proper for parks, from his having known one, where it abounds, that is famous for excellent venison. He recommends it also, from experience, as good for sheep; the best mutton he ever tasted, next to that which comes from hills where the purple and sheep's fescue, the fine bent, and the silver-hair grasses abound, having been from sheep fed with it. He adds, that it makes a very fine turf upon dry sandy or chalky soils; but, unless swept over with the scythe, its flowering stems will look brown; which is the case of all grasses which are not fed on by a variety of animals. For that some animals will eat the flowering stems is evident by commons, where scarcely any parts of grasses appear but the radical leaves. This grass is said to be the easiest of the whole group to collect a quantity of seeds from. It flowers in June, and is ripe in July.

7. *Fine bent grass, agrostis capillaris*, is recommended by Mr. Stillingfleet, from his having always found it in great plenty on the best sheep pastures, in the different counties of England that are remarkable for good mutton. This grass flowers and ripens its seed the latest of them all. It seems to be lost the former part of the year, but vegetates luxuriantly towards the autumn. It appears to be fond of moist ground. It retains its seed till full ripe, flowers the latter end of July, and is ripe the latter end of August. The same may be said of the mountain and silver-hair grasses.

8. *Flote, or floating fescue grass, festuca fluitans.* See FESTUCA. It is surprising that the seeds of this plant, which are used as nutritious food in Sweden, Germany, &c., have hitherto been neglected in Britain, as they are so easily collected and cleansed. There is a clamminess on the ear of the flote fescue, when the seeds are ripe, that tastes like honey; and for this reason perhaps they are called manna seeds.

Linnaeus, in his *Flora Suecica* (art. 95) says, that the bran of this grass will cure horses troubled with bots, if kept from drinking for some hours. Concerning this grass we have the following information by Mr. Stillingfleet. Mr. Dean, a very sensible farmer at Ruscomb, Berkshire, assured me that a field, always lying under water, of about four acres, was covered with a kind of grass, that maintained five farm horses in good heart from April to the end of harvest, without giving them any other kind of food, and that it yielded more than they could eat. He, at my desire, brought me some of the grass, which proved to be the flote fescue with a mixture of the marsh bent; whether this last contributes much towards furnishing so good pasture for horses, I cannot say. They both throw out roots at the joints of the stalks, and therefore are likely to grow to a great length. In the index of dubious plants, at the end of Ray's synopsis, there is mention made of a grass, under the name of *gramen caninum supinum longissimum*, growing not far from Salisbury, twenty-four feet long. This must by its length be a grass with a creeping stalk; and that there is a grass in Wiltshire, growing in watery meadows, so valuable that an acre of it lets for £10 to £12, I have been informed by several persons. These circumstances incline me to think it must be the flote fescue; but, whatever grass it be, it certainly must deserve to be enquired after.

9. *Great meadow grass, poa pratensis*, seems to approach in many respects to the nature of the purple fescue; only that its leaves are broader, and not near so long; being only about a foot or sixteen inches at their greatest length. Like it, it produces few seed-stalks and many leaves, and is an abiding plant. It affects chiefly the dry parts of meadows, though it is to be found on most good pastures. It is very retentive of its seeds, and may therefore be suffered to remain till the stalks are quite dry. It blossoms in the beginning of June, and its seeds are ripe in July.

10. *Meadow fox-tail grass, alopecurus pratensis.* Linnaeus says, this is a proper grass to sow on grounds that have been drained. Mr. Stillingfleet was informed, that the best hay which comes to London is from the meadows where this grass abounds. It is scarce in many parts of England, particularly Herefordshire, Berkshire, and Norfolk. It might be gathered at almost any time of the year from hay ricks, as it does not shed its seeds without rubbing, which is the case of but few grasses. It is amongst the most grateful of all grasses to cattle. It is ripe about the end of June.

11. *Mountain hair grass, aira flexuosa.* See No. 7, and AIRA.

12. *New American grass.* A new grass from America, named *agrossis cornucopiae*, was some time ago much advertised and extolled, as possessing the most wonderful qualities, and the seeds of it were sold at the enormous rate of £68 the bushel. But we have not heard that it has at all answered expectation. On the contrary, Dr. Anderson, in his *Bee* (vol. i. p. 38) says, that it has upon trial been found to be good for nothing. Of the seeds sown, few ever germinated: but enow of plants made their ap-

pearance, to ascertain that the grass, in respect of quality, is among the poorest of the tribe; and that it is an annual plant, and altogether unprofitable to the farmer.

13. *Purple fescue grass*, *festuca rubra*. See **FESTUCA**.

14. *Rye grass*, *hordeum murinum*. Rye grass is properly the *secale villosum*. Perennial dandel, *lollium perenne*, is also, in some counties of England, improperly called rye grass.

15. *Silver-hair grass*, *aira caryophyllea*. See **No. 7**, and **AIRA**.

16. *Sheep's fescue grass*, *festuca ovina*. See **FESTUCA**. This is perhaps the most valuable grass of all. It is observed to grow and thrive in lands of all qualities and in all situations, from the driest up-land pastures to the very moist part of meadows. It does not part with its seeds till some time after they are ripe, and even quite dry. It makes the thickest and closest pile of any of them, and sends up but few flower-stalks in proportion to its leaves. It flowers in June, and is ripe in July.

17. *Vernal grass*, *anthoxanthum odoratum*, grows very commonly on dry hills, and likewise on sound rich meadow land. It is one of the earliest grasses we have; and from its being found on such kinds of pastures as sheep are fond of, and whence excellent mutton comes, it is most likely to be a good grass for sheep pastures. It gives a grateful odor to hay. In one respect it is very easy to gather, as it sheds its seeds upon the least rubbing. A correspondent of the Bath Society, however, mentions a difficulty that occurs in collecting them, owing to its being surrounded with taller grasses at the time of its ripening, and being almost hid amongst them. If it be not carefully watched when nearly ripe, he observes, and gathered within a few days after it comes to maturity, great part of the seed will be lost. The twisted elastic awns, which adhere to the seed, lift them out of their receptacles with the least motion from the wind, even while the straw and ear remain quite erect. It is found mostly in the moist parts of meadows; very little of it on dry pastures. It flowers about the beginning of May, and is ripe about the middle of June.

GRASS OF PARNASSUS, *parnassa*, Latin. A plant. This plant is called *parnassa*, from Mount Parnassus, where it was supposed to grow; and, because the cattle feed on it, it obtained the name of grass, though the plant has no resemblance to the grass kind.

GRASS, ORCHESTON. See **ORCHESTON**.

GRASS VETCH. See **LATHYRUS** and **TRITICUM**.

GRASS WALKS are made, for the most part, not by sowing grass seeds, but by laying turfs: and indeed the turfs from a fine common or down are much preferable to sown grass: but, if walks or plats are to be made by sowing, the best way is to procure the seed from those pastures where the grass is naturally fine and clear; or else the trouble of keeping it from spiny or benty grass will be very great, and it will scarcely ever look handsome. To sow grass walks, the ground must be first dug; and, when it has been dressed and laid even, it must be carefully raked

over, and all the clods and stones taken off, and then covered over an inch thick with good mould. The seed is to be sown pretty thick, that it may come up close and short; it must then be raked over again, to cover the seed, that if the weather should be windy, it may not be blown away. Where grass is sown in gardens, either for lawns or walks, there should always be a good quantity of the white trefoil or Dutch clover sown with it; for this will make a fine turf much sooner than any other sown grass, and will retain a better verdure than any other of the grass tribe. To keep grass walks handsome, and in good order, sow in autumn fresh seed over any places that are not well filled, or where the grass is dead: but nothing improves grass so much as mowing and constant rolling. When turf is laid in gardens, it is a general practice to cover the surface of the ground under the turf, either with sand or very poor earth, in order to keep the grass fine, by preventing its growing too rank. This is proper for very rich ground, but not for middling or poor land; for, when this is practised in such places, the grass will soon wear out and decay in patches. When turf is taken from a common or down, such ought to be chosen as is free from weeds: and, when it is designed to remain for years without renewing, a dressing should be laid upon it every other year, either of very rotten dung, ashes, or, where it can easily be procured, rotten tan; but these dressings should be laid on early in the winter, that the rain may wash them into the ground, otherwise they occasion the grass to burn when the warmth of the summer begins. When grass is thus dressed, and well rolled and mowed, it may be kept very beautiful for many years; but where it is not dressed, or fed with sheep, it will rarely continue handsome more than eight or ten years.

GRASS WRACK. See **ZOSTERA**.

GRASS, a river of the state of New York, North America, which enters the St. Lawrence near St. Reges Island. It has a course of 120 miles through St. Lawrence county.

GRASSE, a well-built town of the department of the Var, France, standing in a natural amphitheatre surrounded with orangeries, and flower gardens, particularly those devoted to the culture of roses. Vines and olives also add to the attractions of its charming scenery. It is a good trading town in wine, liquors, silk, leather, and soap. Population 12,500. It is nine miles W. N. W. of Antibes, and nineteen W. S. W. of Nice.

GRASSMERE WATER, a beautiful lake in Westmoreland, near Ambleside and Rydal. Its banks are formed into small bays, by bold projecting eminences, some of rock and some of turf.

GRATAROLUS (William), a learned physician of the sixteenth century, born at Bergamo in Italy. He taught medicine with reputation at Padua; but, having embraced the Protestant religion, he retired to Switzerland, where he was made professor of physic. He died at Basil in 1568, aged fifty-two. He wrote several curious works in Latin; amongst which are, 1. The Manner of Preserving and Improving the Me-

mery. 2. Of Preserving in Health Travellers, Men of Letters, Magistrates, and Studious Persons, &c.

GRATE, *v. a. & v. n.* } Fr. *gratter*; old Fr. *grater*; Ital. *grattare*,
 GRATER, *n. s.* } of Lat. *rado*, to chafe.
 GRATINGLY, *adv.* }
 To rub or wear by attrition; to form a sound by means of grating hard bodies together; figuratively to offend the ear by harsh and discordant notes. Grater, a coarse file with which soft bodies are pulverised.

The pure fetters on his shinnies *grete*.

Chaucer. *The Knights Tale*.

Thereat enraged, soon he 'gan upstart,
 Grinding his teeth, and *grating* his great heart.

Spenser.

Thereat the fiend his gnashing teeth did *grate*.

Id.

We are not so nice as to cast away a sharp knife,
 because the edge of it may sometimes *grate*.

Hooker.

Blind oblivion swallowed cities up,
 And mighty states characterless are *grated*.
 To dusty nothing.

Shakspeare. *Troilus and Cressida*.

Wherein have you been galled by the king?
 What peer hath been suborned to *grate* on you,
 That you should seal this lawless bloody book
 Of forged rebellion with a seal divine?

Shakspeare.

The *grating* stock of wrathful iron arms. Id.
 I have *grated* upon my good friends for three re-
 prievs for you, or else you had looked through the
 grates. Id.

On a sudden open fly
 With impetuous recoil, and jarring sound,
 The infernal doors, and on their hinges *grate*
 Harsh thunder, that the lowest bottom shook
 Of Erebus. Milton's *Paradise Lost*.

Just resentment and hard usage coined

The unwilling word, and *grating* as it is,
 Take it for 'tis thy due. Dryden's *Dun Sebastian*.

Paradoxing is of great use; but the faculty must
 be so tenderly managed as not to *grate* upon the truth
 and reason of things. L'Estrange.

I never heard him make the least complaint, in
 a case that would have *grated* sorely on some men's
 patience, and have filled their lives with discontent.

Locke.

This *grated* harder upon the hearts of men.

South.

If the particles of the putty were not made to
 stick fast in the pitch, they would, by rolling up
 and down, *grate* and fret the object metal, and fill it full
 of little holes. Newton's *Opticks*.

This habit of writing and discoursing, wherein I
 unfortunately differ from almost the whole kingdom,
 and am apt to *grate* the ears of more than I could
 wish, was acquired during my apprenticeship in Lon-
 don. Swift.

They have been partial in the gospel, culled and
 chosen out those softer and more gentle dictates
 which would less *grate* and disturb them.

Decay of *Picty*.

Tender handed touch a nettle,
 And it stings you for your pains,
 Grasp it like a man of mettle,
 And it soft as silk remains.

So it is with common natures,
 Treat them gently, they rebel,

But be rough as nutmeg-graters,
 And the rogues obey you well. A. Hill.

GRATE, *n. s.* Ital. *grata*, Lat. *crates*. A
 partition made with bars placed near to one ano-
 ther, or crossing each other, such as in cloysters
 or prisons; the range of bars within which fires
 are made.

And so befell, by aventure or cas,
 That thurgh a window thikke of many a barre
 Of yren *gret*, and square as any spane,
 He cast his eye upon Emilia.

Chaucer. *The Knights Tale*.

I have *grated* upon my good friends for three re-
 prievs for you, and your couch fellow, Nim: or else
 you had looked through the *grates*, like a geminy of
 baboons. Shakspeare.

Out of a little *grate* his eyes he cast
 Upon those bordering hills, and open plain.

Daniel.

A fan has on it a nunnery of lively black-eyed
 vestals, who are endeavoring to creep out at the *grates*.

Addison.

My dear is of opinion that an old-fashioned *grate*
 consumes coals, but gives no heat. Id. *Spectator*.

GRATES FOR FIRES are composed of ribs of
 iron placed at small distances from one another,
 so that the air may have sufficient access to the
 fuel, and the accumulation of the ashes, which
 would choke the fire, may be prevented. Grates
 seem peculiarly adapted to the use of pit-coal,
 which requires a greater quantity of air to make
 it burn more freely than other kinds of fuel. The
 hearths of the Britons seem to have been
 fixed in the centre of their halls, as is yet prac-
 tised in some parts of Scotland, where the fire is
 nearly in the middle of the house, and the family
 sit all around it. Their fire-place was perhaps
 nothing more than a large stone, depressed a
 little below the level of the ground, and thereby
 adapted to receive the ashes. About a century
 ago, it was only the floor of the room, with the
 addition of a bank of clay. But it was now
 changed among the gentlemen for a portable fire
 pan, raised upon low supporters, and fitted with
 a circular grating of bars. Such were in use
 among the Gauls in the first century, and among
 the Welsh in the tenth. See FIRE-PLACES.

GRATEFUL, *adj.*

GRATEFULLY, *adv.*

GRATEFULNESS, *n. s.*

GRATIFICATION, *n. s.*

GRATIFY, *v. a.*

GRAT'ITY, *adj.*

GRATITUDE, *n. s.*

GRATUITOUS, *adj.*

GRATUITY, *n. s.*

GRATUITOUSLY, *adv.*

GRATULATE, *v. a.*

GRATULATION, *n. s.*

GRATULATORY, *adj.*

Fr. *gratuit*; Lat. *gratus*, *gratificor*, *gratu-
 tulo*, *gratuitus*.
 Gratefulness implies
 a due sense and esti-
 mation of favors re-
 ceived: the quality of
 being acceptable and
 pleasing. To gratify
 is to afford indul-
 gence or pleasure. A
 gratuitous act is volun-
 tary as opposed to
 compulsion. A gratuity, a free gift. To gratu-
 late is to salute with expressions of joy.

They are the first *gratulations* wherewith our Lord
 and Saviour was joyfully received at his entrance into
 the world, by such as in their hearts, arms, and how-
 els embraced him. Hooker.

Forbidden

That our renowned Rome, whose *gratitude*

Tow'rs her deserving children is enrolled,

Should now eat up her own! Shakspeare.

The people cry you mock them; and, of late,
 When corn was given them *gratis*, you repined.

Id.

They sold themselves, but thou, like a kind fellow,
gav'st thyself away *gratis*, and I thank thee for thee.
Shakspeare.

To gratify the good Andronicus,
And *gratulate* his safe return to Rome,
The people will accept whom he admires. *Id.*
Whither away so fast?

— No farther than the tower,
To *gratulate* the gentle princes there. *Id.*
Whatever is ingrate at first, is made *grateful* by
custom; but whatsoever is too pleasing at first, grow-
eth quickly to satiate. *Bacon.*

Yet give thy jealous subjects leave to doubt,
Who this thy 'scape from rumour *gratulate*,
No less than if from peril; and devout,
Do beg thy care unto thy after state. *Ben Jonson.*
Blessings beforehand, ties of *gratefulness*,
The sound of glory ringing in our ears.
Herbert.

A man will endure the pain of hunger and thirst,
and refuse such meats and drinks as are most *grateful*
to his appetite, if he be persuaded that they will en-
danger his health. *Wilkins.*

The debt immense of endless *gratitude*.
Milton.

The earth
Gave signs of *gratulation*, and each hill. *Id.*
He, as new waked, thus *gratefully* replied. *Id.*

A *grateful* mind
By owing owes not, but still pays. *Id.*
Now night her course began, and over Heaven
Inducing darkness, *grateful* truce imposed
Her silence on the odious din of war;
Under her cloudy covert both retired,
Victor and vanquished. *Id. Paradise Lost.*
This place is the more *grateful* to strangers, in re-
spect that it being a frontier town, and bordering upon
divers nations, many languages are understood here.
Brown's Travels.

A Laconian knight having sometime served him
with more *gratefulness* than good courage defended
him. *Sidney.*

The taking of use, though he judged lawful, yet
never approved by practice, but lent still *gratis* both
to friends and strangers. *Fell.*

You steer between the country and the court,
Nor *gratify* whate'er the great desire,
Nor grudging give what publick needs require.
Dryden.

Years of service past,
From *grateful* souls exact reward at last. *Id.*
Since nature could behold so dire a crime,
I *gratulate* at least my native clime,
That such a land, which such a monster bore,
So far is distant from our Thracian shore. *Id.*
Enough remains for household charge beside,
His wife and tender children to sustain,
And *gratefully* to feed his dumb deserving train.
Id. Virgil.

But pride stood ready to prevent the blow;
For who would die to *gratify* a foe? *Id. Fables.*
Kindred are no welcome clients, where relation
gives them a title to have advice *gratis*. *L'Estrange.*

We mistake the *gratuitous* blessings of heaven for
the fruits of our own industry. *Id.*

The second motive they had to introduce this *gra-
tuitous* declination of atons, the same poet gives us.

Ray.
A palled appetite is humorous, and must be *grati-
fied* with sauces rather than food. *Tatler.*

A thousand little impertinences are very *gratifying*
to curiosity, though not improving to the understand-
ing. *Addison.*

They are incapable of any design above the present
gratification of their palates. *South.*

The captive generals to his car are tied;
The joyful citizens tumultuous tide
Echoing his glory, *gratify* his pride. *Prior.*

'Tis not the rural sports alone invite,
But all the *grateful* country breathes delight;
Here blooming Health exerts her gentle reign,
And strings the sinews of th' industrious swain.
Gay.

What happiness the rural maid attends
In cheerful labour while each day she spends;
She *gratefully* receives what Heaven has sent,
And rich in poverty enjoys content. *Id.*
I scorned to take my degree at Utrecht or Leyden,
though offered it *gratis* by those universities.
Arbuthnot.

In Cyprus long by men and gods obeyed,
The lovers toil she *gratefully* repaid. *Granville.*

I would know whence came this obliquity of direc-
tion, which they *gratuitously* tack to matter: this is to
ascribe will and choice to these particles.

Cheyne's Philosophical Principles.
He used every year to present us with his almanack,
upon the score of some little *gratuity* we gave him.
Swift.

From loveless youth to unrespected age,
No passions *gratified* except her rage;
So much the fury still out-ran the wit,
The pleasure missed her, and the scandal hit.
Pope.

Now golden fruits on loaded branches shine,
And *grateful* clusters swell with floods of wine.
Id.

At once they *gratify* their scent and taste,
While frequent cups prolong the rich renast.
Id.

They might have pretended to comply with Ulys-
ses, and dismissed him with a small *gratuity*.
Broome on the Odyssey.

Study detains the mind by the perpetual occurrence
of something new, which may *gratefully* strike the
imagination. *Watts.*

Suspicious thoughts his pensive mind employ,
A *lullen* *gratitude*, and clouded joy. *Harte.*

The bright tear starting in the impassioned eyes
Of silent *gratitude*; the smiling gaze
Of *gratulation*, faltering while he tries
With voice of transport to proclaim thy praise.
Beattie's Judgment of Paris.

I saw thee—loved thee—owe thee all—would save,
If but to shew how *grateful* is a slave.
Byron. Corsair.

GRATITUDE, in ethics, is a virtue disposing
the mind to an inward sense and outward ac-
knowledgegment of benefits received. Examples
of ingratitude, Paley observes, check and dis-
courage voluntary beneficence; hence the culti-
vation of a grateful temper is a consideration
of public importance. A second reason for
cultivating in ourselves that temper is, That the
same principle which is touched with the kind-
ness of a human benefactor is capable of being
affected by the divine goodness, and of becom-
ing, under the influence of that affection, a source
of the purest and most exalted virtue. The love
of God is the sublimest gratitude. It is a mis-
take, therefore, to imagine, that this virtue is
omitted in the Scriptures; for every precept
which commands us 'to love God, because he
first loved us,' presupposes the principle of gra-
titude, and directs it to its proper object.

GRATIAN, the son of Valentinian I. by his first wife, was associated in the empire by his father, at Amiens, in 365, and succeeded him in 367; a prince equally extolled for his eloquence and modesty. He associated Theodosius with him in the empire, and advanced the poet Ausonius to the consulate. He made a great slaughter of the Germans at Strasburg, and hence was surnamed Alemannicus. He was the first emperor who refused the title of Pontifex Maximus, on account of its being a Pagan dignity. He was assassinated by Andragathus in 375, in the twenty-fourth year of his age.

GRATIAN, a British soldier in the Roman army, who was crowned emperor by the legions in Britain, about A.D. 407, but was murdered by them within four months.

GRATIAN, a famous Benedictine monk, in the twelfth century, born at Chiousi. He was employed nearly twenty-four years in composing a work, entitled *Decretum*, or *Concordantia Discordantium Canonum*, because he there endeavoured to reconcile the canons which seemed contradictory to each other. This work was published in 1151. As he is frequently mistaken, in taking one canon of one council, or one passage of one father, for another, and has often cited false decretals, several authors have endeavoured to correct his faults; and chiefly Anthony Augustine, in his excellent work entitled *De Emendatione Gratiani*.

GRATINGS, in a ship, are small edges of sawed plank, framed one into another like a lattice or prison grate, lying on the upper deck, between the main-mast and fore-mast, serving for a defence in a close fight, and also for the coolness, light, and convenience of the ship's company.

GRATIOLA, hedge hyssop, a genus of the monogynia order, and diandria class of plants; natural order fortieth, personate: cor. is irregular: there are two barren stamina: caps. is bilocular: cal. seven leaves, with the two exterior ones patulous. There are fifteen species; the most remarkable of which, the *G. officinalis*, the common hedge hyssop, grows naturally on the Alps, and other mountainous parts of Europe. It has a thick, fleshy, fibrous creeping root, which propagates very much, when planted in a proper soil and situation. From this arise several upright square stalks, garnished with narrow spear-shaped leaves, placed opposite. The flowers are produced on the side of the stalks at each joint: they are shaped like those of the fox-glove, but are small, and of a pale yellowish color. This herb has an emetic and purgative virtue; to answer which intentions, it was formerly used by the common people in England, but was never much prescribed by the physicians, and at last fell totally into disuse. It is the subject of a dissertation by Dr. James Kostzewski of Warsaw, in Poland; who gives some remarkable accounts of its effects in mania and obstinate venereal cases. It was given in powder, or in extract, to the quantity of half a drachm of the first, and a whole drachm of the second, at each dose.

GRATIOSA, a beautiful and fertile island of the Azore cluster, about twenty miles in circum-

ference. The chief town is Santa Cruz, where, however, there is no harbour, but only an open roadstead. Long. $27^{\circ} 56' W.$, lat. $39^{\circ} 2' N.$

GRATIOSA, a small rocky and barren island, situated to the north of Lanzerota, one of the Canaries. Long. $13^{\circ} 17' W.$, lat. $29^{\circ} 15' N.$

GRATTAN (Henry), a celebrated Irish statesman, was born about 1750, in Dublin, of which city his father was recorder. Having studied at Trinity College, Dublin, and in one of the inns of court, he was called to the bar; but, being elected into the Irish parliament in 1775, gave himself up to public business, and, by his powerful remonstrances, obtained for his country the concessions of 1782, for which he was rewarded by the Irish parliament with a vote of £50,000. In 1790 he was returned for the city of Dublin, principally to oppose the union; but when it was effected he accepted a seat in the imperial parliament for Malton. He now supported the war policy of the government, but his principal exertions were called forth in advocating the Catholic claims, to which cause indeed he fell a martyr by leaving Ireland in an exhausted state to bring their petition to England. He died soon after his arrival, May 14th 1820, and was interred in Westminster Abbey.

GRATZ, a respectable old town, the capital of one of the five circles of Styria, situated on the Muhr. The ancient part is small, enclosed by a wall and ditch. The citadel stands on a very steep hill on the banks of the river, and the town has been gradually accumulated round it. Since 1787 it has been the see of a bishop, and was the seat of a university from 1585 to 1782; but the place of that seminary is now supplied by a lyceum, or academy, and a large school. The houses in general are of stone, and it has twenty-two churches and chapels, including the cathedral, once the parish church. The emperor Ferdinand II., who was a native of Gratz, has a mausoleum here, remarkable for its internal ornamental sculpture. Here is also a library said to contain from 3000 to 4000 MSS., besides the theatre and barracks, which are said to be entitled to attention; as is also the Johanneum, a museum for the antiquities of Styria. Gratz contains manufactures of hardware, saltpetre, cotton, and silk. The environs are very fertile, the hills being covered with plantations and vineyards, intermingled with villages and detached cottages. It is fifty-six miles N. N. E. of Cilly, and 100 south-west of Vienna.

GRATZ, one of the circles of the duchy of Styria, comprises the northern part of Lower Styria, lying on both sides of the Muhr, and has an area of 2100 square miles. The surface is hilly, but there are few high mountains; and the valleys are fertile and picturesque, particularly between Gratz and Bruck. The pasturage is the chief agricultural object of attention, and the cattle, milk, butter, and cheese, are in repute. The steep grounds of the hills contain large forests of pine, but the chief riches of this circle, as of Styria in general, arise from its mines, and the manufactures connected with them. It contains a large number of villages. Population 300,000.

GRAUDENTZ, or **GRUDZIADZ**, a town of West Prussia, at the confluence of the Ossa and Vistula. It conducts manufactures of cloth and extensive breweries, with some trade in corn and tobacco. The inhabitants are chiefly German Lutherans, but the Catholics have a church and a public school. Near this place a strong fort was erected on the bank of the Vistula in 1776, and in 1798 a bridge of boats was laid across that river. It is fourteen miles N. N. E. of Culm, and fifty-five south of Dantzic. Population 6700.

GRAVE, *n. s.* & *adj.* } Sax. *græf*; Goth. *græuf*, *grāv*; Belg. and *grave*-clothes, *n. s.* } *græuf*, *grāv*; Belg. and *grave*-stone, *n. s.* } Swed. *graf*; Fr. *grave*, *gravité*; Latin *gravis*, *graveolens*, *gravidus*, *gravitas*. The place in which the dead are deposited; the dress of the dead; the monumental stone; solemn; serious; weighty; atrocious: tendency to centre of attraction. Gravity is a word used to denote a state of pregnancy. Graveless, without a grave; unburied. Grave, a final syllable in the names of places, is from the Saxon *græf*, a grove or cave.—*Gibson's Cymden.*

Sche goith to the *græue*, to wepe there.

Wielcl. Jon. xi.

And he that was dead came forth, bound hand and foot with *grave-cloaths*. *John xi. 44.*

The frosty *grave* and colde must be my bedde, Without ye list your grace and mercy sheve.

Chaucer. The Court of Love.

Therefore to ground he would him cast no more, Ne him commit to *grave* terrestrial, But beare him far from hope of comfort usuel.

Spenser. Faerie Queene.

But of such subtle substance and unsound, That like a ghost he seemed, whose *grave-cloaths* were unbound. *Spenser.*

No man could ever have thought this reasonable, that had intended thereby only to punish the injury committed, according to the *gravity* of the fact.

Hooker.

Now it is the time of night,
That the *graves*, all gaping wide,
Every one lets forth his spright,
In the church-way paths to glide.

Shakespeare.

There is not a white hair on your face but should have his effect of *gravity*. *Id. Henry IV.*

Our youths and wildness shall no whit appear, But all be buried in his *gravity*. *Shakespeare.*

Timon, presently prepare thy *grave*;

Lye where the light foam of the sea may beat

Thy *grave-stone* daily. *Id. Timon.*

There's more gold:

Do you damn others, and let this damn you:

And ditches *grave* you all! *Id.*

My brave Egyptians all,

By the discarding of this pelleted storm,

Lie *graveless*. *Id. Antony and Cleopatra.*

Than settled age his sables and his weeds

Importing health and *graveless*. *Shakespeare.*

To the more mature,

A glass that featured them; and to the *grave*,

A child that guided dotards. *Id. Cymbeline.*

We should have else desired

Your good advice, which still hath been both *grave* And prosperous in this day's council. *Shakespeare.*

For the advocates and council that plead, patience and *gravity* of hearing is an essential part of justice.

Bacon.

The Roman state was of all others the most celebrated for their virtue, as the *gravest* of their own writers, and of strangers, do bear them witness.

Grew's Cosmologia.

Ah yet, ere I descend to the *grave*,

May I a small house and large garden have.

Cowley.

After death I nothing crave,

Let me alive my pleasures have,

All are stoics in the *grave*. *Id.*

Some, therefore, thought those goblins which appear To haunt old *graves* and tombs, are souls of such Who to these loathesome places doomed were Because they doted on the flesh too much.

Geo. Withers.

Great men sometime, will *gravely* undertake To teach how bromes and mortar should be made.

Id.

To walk upon the *graves* of our dead masters,

Is our own security. *Denham's Sophy.*

But yet beware of counsels when too full;

Number makes long disputes and *graviness* dull.

Denham.

Thou standest

Gravely in doubt when to hold them wise.

Milton.

Thou wilt not leave me in the loathsome *grave*.

Id.

Upon its crest this mountain *grave*,

A plume of aged trees does wave.

Marvell.

Bodies do swim or sink in different liquors, according to the tenacity or *gravity* of those liquors which are to support them.

Broune.

Accent, in the Greek names and usage, seems to have regarded the tone of the voice, the acute accent raising the voice, in some syllables, to a higher, i. e. more acute pitch or tone, and the *grave* depressing it lower, and both having some emphasis, i. e. more vigorous pronunciation.

Holder.

Even the *grave* and serious characters are distinguished by their several sorts of *gravity*.

Dryden.

They were wont once a year to meet at the *graves* of the martyrs; there solemnly to recite their sufferings and triumphs, to praise their virtues, to bless God for their pious examples, for their holy lives, and their happy deaths.

Nelson.

A flood of waters would overwhelm all those fragments which the earth broke into, and bury in one common *grave* all the inhabitants of the earth.

Burnet.

The emperors often jested on their rivals or predecessors, but their mints still maintained their *gravity*.

Addison.

A girl longs to tell her confidant that she hopes to be married in a little time, and asks her very *gravely* what she would have her to do.

Id. Spectator.

Youth on silent wings is flown;

Graver years come rolling on.

Prior.

That quality by which all heavy bodies tend towards the centre, accelerating their motion the nearer they approach towards it, true philosophy has shewn to be unsolvable by any hypothesis, and resolved it into the immediate will of the Creator. Of all bodies, considered within the confines of any fluid, there is a twofold *gravity*, true and absolute, and vulgar or comparative; absolute *gravity* is the whole force by which any body tends downwards; but the relative or vulgar is the excess of *gravity* in one body above the specific *gravity* of the fluid, whereby it tends downwards more than the ambient fluid doth.

Quincy.

Though this increase of density may at great dis-

tances be exceeding slow, yet if the elastic tone of this medium be exceeding great, it may suffice to impel bodies from the denser parts of the medium towards the rarer, with all that power which we call *gravity*. *Newton's Opticks.*

Those who have nature's steps with care pursued,
That matter is with active force endued,
That all its parts magnetick power exert,
And to each other *gravitate*, assert. *Blackmore.*

Women, obstructed, have not always the forementioned symptoms : in those the signs of *gravidity* and obstructions are hard to be distinguished in the beginning. *Arbuthnot on Diet.*

That subtle matter must be of the same substance with all other matter, and as much as is comprehended within a particular body must *gravitate* jointly with that body. *Bentley.*

To laugh, were want of goodness and of grace ;
And to be *grave* exceeds all power of face. *Pope.*

When the loose mountain trembles from on high,
Shall *gravitation* cease, if you go by ? *Id.*

A tomb, indeed, with fewer sculptures graced
Than that Mausolus' pious widow placed,
Or where, enshrined, the great Darius lay ;
But cost on *graves* is merely thrown away. *Id.*

That rest they wished for grant them in the *grave* ;
And bless those souls my conduct helped to save. *Id.*

Catius is ever moral, ever *grave*,
Thinks who endures a knave is next a knave,
Save just at dinner—then prefers, no doubt,
A rogue with ven'son to a saint without. *Id.*

Wisdom's above suspecting wiles ;
The queen of learning *gravely* smiles. *Swift.*
A formal story was very *gravely* carried to his excellency, by some zealous members. *Id.*

They have as much reason to pretend to, and as much necessity to aspire after, the highest accomplishments of a Christian and solid virtue, as the *gravest* and wisest among Christian philosophers. *Law.*

He will tell you, with great *gravity*, that it is a dangerous thing for a man that has been used to get money, ever to leave it off. *Id.*

Is't not enough the blockhead scarce can read,
But must he wisely look, and *gravely* plead ? *Young.*

There would he dream of *graves* and corpses pale.
Beattie's Minstrel.

Checked by the scoff of Pride, by Envy's frown,
And Poverty's unconquerable bar ;
In life's low vale, remote, has pined alone,
Then dropt into the *grave* unpitied, and unknown. *Id.*

And there—oh ! sweet and sacred be the name !—
Julia—the daughter, the devoted—gave
Her youth to Heaven ; her heart, beneath a claim,
Nearest to Heaven's, broke o'er a father's *grave*. *Byron. Child Harold.*

GRAVE, *v. a. & v. n.* } Sax. *grapan* ; Goth.
GRAVER, *n. s.* } *grafa* ; Belg. *grauven* ;
GRAVING, *n. s.* } Fr. *graver*, *graveur* ; Gr.
γραφω. To insculp or carve figures out of stone, iron, or any hard substance ; to write upon or delineate ; to clean, caulk, and sheath a ship : graver is one who copies pictures upon wood or metal to be impressed on paper ; the style or tool used in *graving* : *graving* is carved work.

Thou shalt make a plate of pure gold, and *grave* upon it, *Exodus xxviii. 36.*

Skilfu. to work in gold ; also to *grave* any manner of *graving*, and to find out every device which shall be put to him. *2 Chron. ii. 14.*

What profiteth the *graven* image, that the make thereof hath *graven* it. *Hebrews ii. 18.*

Go, sell it them that small seles *grave* ;
We wol the not. *Chaucer. Troilus and Greseide.*
Eke some men *grave* in tre, some in stone wal,
As it betide : out sith I have begonne,
Mine author shall I folow as I konne. *Id.*

And afir this was *graved*, alas !
How Ilions castill assailed was,
And won, and kyng Priamus slain,
And Polites his sonne certain,
Dispitously of Dan Pyrrhus. *Chaucer.*

Later vows, oaths, or leagues, can never blot out those former *gravings* or characters, which by just and lawful oaths were made upon their souls.

King Charles.
Cornice with bossy sculptures *graven*. *Milton.*
With all the care wherewith I tried upon it the known ways of softening *gravers*, I could not soften this. *Boyle.*

The *gravers* can, and ought, to imitate the bodies of the colours by the degrees of the lights and shadows : 'tis impossible to give much strength to what they *grave*, after the works of the schools, without imitating in some sort the colour of the objects.

Dryden's Dufresnoy.
If he makes a design to be *graved*, he is to remember that the *gravers* dispose not their colours as the painters do ; and that, by consequence, he must take occasion to find the reason of his design in the natural shadows of the figures, which he has disposed to cause the effect. *Id.*

Thy sum of duty let two words contain ;
O ! may they *graven* in thy heart remain !
Be humble and be just. *Prior.*
The toilsome hours in different labour slide,
Some work the file, and some the *graver* guide.

Gay's Fables.

GRAVE, in grammar, a species of accent opposite to acute. The grave accent is expressed thus (`) ; and shows that the voice is to be depressed, and the syllable over which it is placed pronounced in a low deep tone.

GRAVE, in music, is applied to a sound which is in a low or deep tone. The thicker the chord or string, the more grave the tone or note, and the smaller the acuter. Notes are supposed to be the more grave, in proportion as the vibrations of the chord are less quick.

GRAVE, a town of North Brabant, in the Netherlands, on the left bank of the Maese : it is fortified, and made a gallant defence against the French in the winter of 1794-5. Population 1600. Nine miles south by west of Nimeguen and eighteen north-east of Bois le Duc.

GRAVER. See ENGRAVING.
GRAVEL, *n. s. & v. a.* } Fr. *gravelle*, *grave* ;
GRAVELLY, *adj.* } *leur* ; Belg. *gravel* ;
Gothic *griv* ; Ital. *gravella*. Hard sand ; sandy concretions in the kidneys : to pave or cover with gravel ; to stick in the sand : figuratively to puzzle ; to perplex ; to disquiet. A gravelly soil is one in which gravel abounds.

————— I sawe a little well,
That had his course, as I could wele beholde,
Under an hill with quicke stremes and cold,
The *gravell* gold, the water pure os glasse,
The bankes roundet the well enviroing ;
And soft as velvet was the yonge grasse.

Chaucer. Complaint of the Blacke Knight.
The martiall mayd stayd not him to lament,
But forward rode, and kept her steady way

Along the strand; which as she overwent
 She saw bestrowed all with rich array
 Of perles and pretious stones of great assay,
 And all the gravel mixt with golden owre,
 Whereat she wondered much.

Spenser's Faerie Queene.

Proofs as clear as founts in July, when

We see each grain of gravel. *Shakespeare.*

—Nay, you were better speak first, and when you
 were gravelled for lack of matter you might take oc-
 casion to kiss. *Id.*

There are some natural spring waters that will in-
 lapidate wood; so that you shall see one piece of
 wood, whereof the part above the water shall conti-
 nue wood, and the part under the water shall be
 turned into a gravelly stone.

Bacon's Natural History.

Moss groweth upon alleys, especially such as lie
 cold, and upon the north, as in divers terrasses; and
 again, if they be much trodden, or if they were at
 the first gravelled. *Bacon.*

If you live in a consumptive air, make choice of
 the more open, high, dry, and gravelly part of it.

Harvey on Consumptions.

The disease itself will gravel him to judge of it;
 nor can there be any prediction made of it, it is so
 sharp. *H. vel.*

What work do our imaginations make with eternity
 and immensity? and how are we gravelled by their
 cutting dilemmas? *Glauville's Scep sis.*

So deep and yet so clear, we might behold

The gravel bottom, and that bottom gold. *Dryden.*

Gravel walks are best for fruit-trees. *Mortimer.*

The upper garden at Kensington was at first
 nothing but a gravel pit. *Spectator.*

Mat, who was here a little gravelled,

Tossed up his nose, and would have cavilled. *Prior.*

Gravel consists of flints of all the usual sizes and
 colours; of the several sorts of pebbles; sometimes
 with a few pyrites, and other mineral bodies, confused-
 ly intermixed, and common sand. *Woodward.*

If the stone is brittle it will often crumble, and
 pass in the form of gravel: if the stone is too big to
 pass, the best method is to come to a sort of a compo-
 sition or truce with it. *Arbutnot.*

Providence permitted not the earth to spend itself
 in basy gravels and pebbles, instead of quarries of
 stones. *Mor.*

GRAVEL, in gardening, a congeries of pebbles,
 which, mixed with a stiff loam, makes lasting and
 elegant gravel walks; an ornament peculiar to
 our gardens, and which gives them an advantage
 over those of other nations.

GRAVEL, in medicine. See MEDICINE.

GRAVEL WALKS. To make these properly,
 the bottom should be laid with lime rubbish,
 large flint stones, or any other hard matter, for
 eight or ten inches thick, to keep weeds from
 growing through, and over this the gravel is to
 be laid six or eight inches thick. This should
 be laid rounding up in the middle, by which
 means the larger stones will run off to the sides,
 and may be raked away; for the gravel should
 never be screened before it is laid on. It is an
 error to lay these walks too round, which not
 only makes them uneasy to walk upon, but takes
 off from their apparent breadth. One inch in
 five feet is a sufficient rise in the middle; so that
 a walk of twenty feet wide should be only four
 inches higher at the middle than at the edges,
 and so in proportion. As soon as the gravel is

laid, it should be raked, and the large stones
 thrown back again: then the whole should be
 rolled both lengthwise and crosswise; and the
 person who draws the roller should wear shoes
 with flat heels, that he may make no holes; be-
 cause holes made in a new walk are not easily
 remedied. The walks should always be rolled
 three or four times in very hard showers, after
 which they will bind more firmly than otherwise
 they could ever be made to do. Gravel, with
 some loam among it, binds more firmly than the
 rarer kinds; and, when gravel is naturally very
 harsh and sharp, it is proper to add a mixture of
 loam to it. The best gravel for walks is such as
 abounds with smooth round pebbles, which, being
 mixed with a little loam, are bound so firmly
 together that they are never afterwards injured,
 either by wet or dry weather. These are not so
 liable to be turned up by the feet in walking, as
 the more irregularly shaped pebbles and remain
 much more firmly in their places after rolling.

GRAVES (Richard), an English divine and
 poet, was born at Mickleton, in Gloucestershire in
 1715. He was a student of Pembroke College, Ox-
 ford, and afterwards obtained a fellows'hip of All
 Souls. In 1750 he was presented to the rectory of
 Claverton near Bath; and Mr. Allen, of Prior
 park, aided to it, in 1663, that of Kilmersdon.
 He died in 1804. His works are, 1. The Tes-
 toon, or Epigrams, 12mo. 2. Lucubrations in
 prose and rhyme. 3. The Spiritual Quixote, a
 novel, in 3 vols. 4. Columella, or the distressed
 Anchorite, 2 vols. 5. Euphrosyne, a collection
 of poems, 2 vols. 6. Eugenius, or the Golden
 Vale, 2 vols. 7. Recollections of particulars in
 the life of Shenstone. 8. Plexippus, or the as-
 piring Plebeian, 2 vols. 9. The Reveries of
 Solitude. 10. The Coalition, a comedy. 11.
 Sermons, 8vo. 12. The Farmer's Son, a moral
 tale. 13. The Invalid, with the Means of enjoy-
 ing long Life. 14. Scenilities. Besides these
 publications, he translated Marcus Antoninus'
 Meditations, and other books, from the Greek.

GRAVES, among the Jews, were generally out
 of the city, though there are instances of their
 interring the dead in towns. Frequent mention
 is made of graves upon mountains, in highways,
 in gardens, and private houses; so that nothing
 on this head seems to have been determined.
 The same may be observed with respect to the
 Greeks. The Thebans had a law that every
 person who built a house should provide a burial
 ground. Men who had distinguished themselves
 were frequently buried in the public forum. The
 most general custom was, however, to bury out of
 the city, chiefly by the highway side. The Romans
 were forbidden by the law of the twelve tables
 to bury or burn the dead in the city; but some
 had their sepulchres in Rome, though they paid
 a fine for the indulgence. See JEWS.

GRAVESANDE (William James), LL.D.
 and F.R.S., an eminent mathematician, born of
 an ancient family at Delft, in Holland, in 1688.
 He studied the civil law at Leyden, but mathe-
 matical learning was his favorite amusement.
 When he had taken his degree, in 1707, he set-
 tled at the Hague, and practised at the bar, in
 which situation he cultivated an acquaintance
 with learned men; with a society of whom he

published a periodical review, entitled *Le Journal Litteraire*, which was continued without interruption from 1713 to 1742, when he died. The most considerable of his works are, 1. A Treatise on Perspective; 2. An Introduction to the Newtonian Philosophy, or A Treatise on the Elements of Physics, confirmed by Experiments. 3. A Treatise on the Elements of Algebra for the use of Young Students; and, 4. A Course of Logic and Metaphysics. The ministers of the republic consulted him on many occasions, and his skill in calculation was often of service to them; as well as his address in decyphering the secret correspondence of their enemies. In 1715 he was sent to the states to congratulate George I. on his accession; and, on his return, was appointed professor of mathematics and astronomy at Leyden, where he was the first that taught the Newtonian philosophy. He was intimately acquainted with Sir Isaac Newton.

GRAVESEND, a town of England, in Kent, situated on the banks of the Thames. It is twenty-three miles from London, and has a blockhouse mounted with cannon, to command the ships and river, opposite to Tilbury fort in Essex. This town was plundered and burnt by the French and Spaniards in the reign of Richard II., to compensate which, the king vested it and Milton with the sole privilege of carrying passengers by water to London, at 4s. the whole fare, or 2*l.* a-head, which was confirmed by Henry VIII. Coaches ply here at the landing of people from London, &c., to carry them to Rochester. This town and Milton were incorporated by queen Elizabeth, and granted some peculiar privileges. All outward-bound ships were formerly obliged to anchor in this road till they had been visited by the custom-house officers; but those homeward-bound always passed by without notice, unless to put waiters on board, if they are not supplied before. The town being burnt down in 1727, £6000 was granted by the parliament in 1731, to rebuild its church. In 1621 one Mr. Pinnock gave twenty-one dwelling houses, besides one for a master weaver, to employ the poor; and there is a charity school for twenty-four boys, who are both taught and clothed. The town-house was erected in 1764; and in 1772 an act was passed for paving and lighting the streets. Steam boats start for this town from the tower stairs every morning at eight o'clock, and return the same night.

GRAVINA (John Vincent), an eminent scholar and illustrious lawyer of Italy, born at Roggiano in 1604. He was professor of the canon law in the college of Sapienzi at Rome; where he died in 1718. His chief work is *De ortu et progressu Juris Civilis*.

GRAVINA, a considerable town and bishop's see of Naples, in the province of Bari, contains nine churches, and a population of 8800. Ten miles west of Matera, and twenty-seven south of Trani.

GRAYNA'S ISLANDS, three islands on the coast of North-West America, from twenty to fifty miles in circumference, separated by narrow channels, covered with innumerable rocky islets. They lie between Clarence's Strait and the canal de Revilla Gigedo, and extend about forty

miles from north-west to south-east. Long. 228° 24' to 229° 5' E., lat. 54° 52' to 55° 27' N.

GRAVITY, or GRAVITATION (for they are most commonly used synonymously), signifies either the force by which bodies are pressed towards the surface of the earth, or the manifest effect of that force; in which last sense the word has the same signification with weight or heaviness. Concerning gravity in the first sense of the word, or that active power by which all bodies are impelled towards the earth, there have been great disputes. Many eminent philosophers, and among the rest Sir Isaac Newton himself, have considered it as the first of all second causes; an incorporeal or spiritual substance, which never can be perceived any other way than by its effects: a universal property of matter, &c. Others have attempted to explain the phenomena of gravitation by the action of a very subtle ethereal fluid; and to this explanation Sir Isaac, in the latter part of his life, seems not to have been averse. He has even given a conjecture concerning the matter in which this fluid might occur on these phenomena. But for a full account of the discoveries of this great philosopher concerning the laws of gravitation, the conjectures made by him and others concerning its cause, the various objections that have been made to its doctrine, and the state of the dispute at present, see the articles ASTRONOMY, ATMOSPHERE, ATTRACTION, EARTH, ELECTRICITY, FIRE, LIGHT, NEWTONIAN PHILOSOPHY, REPELSION, PLENUM, VACUUM, &c.

GRAVITY, SPECIFIC, denotes the weight belonging to an equal bulk of every different substance. Thus the exact weight of a cubic inch of gold, compared with a cubic inch of water, tin, lead, &c., is called its specific gravity.

GRAUNT (Edward), an eminent English grammarian of the sixteenth century. He was head master of Westminster school, and published a work entitled *Græcæ Linguae Speciegium, et Institutio Græcæ Grammaticæ*. He died in 1601.

GRAUNT (John), F.R.S., author of a curious and celebrated book, entitled *Natural and Political Observations made upon the Bills of Mortality*. He was a haberdasher, but gave up his trade, and all public employments, on account of his religion. He was educated a Puritan; afterwards professed himself a Socinian; but at last died a Roman Catholic in 1674.

GRAVY, *n.s.* From Sax. *græpa*, a pan, and *græt*, fat, i. e. the fat of the pan. The serous juice that runs from flesh at the fire.

Meat we love half raw, with the blood trickling down from it, delicately terming it the *gravy*, which in truth looks more like an ichorous or raw bloody matter.

Harvey on Consumptions.

There may be stronger broth made of vegetables than of any *gravy* soup. *Arbuthnot on Aliments.*

GRAY, *adj.* & *n.s.* } Sax. *græg*; Teut. *grau*;
GRAY-BEARD, *n.s.* } Dut. *grauw*. A word
GRAY'LING, *n.s.* } generally descriptive of
GRAY'NESS, *n.s.* } color, as white with a mixture of black; the color of ashes; twilight; hoary with age. Gray-beard is a contemptuous term applied to old men. Grayling, a fish.

And hertes hevie for to recomforte,
From derelied of hevie nightes sorowe,—
Nature bad hem rise, and hem disporte
Ayen the godelie and they greie morowe.

Chaucer. Complaint of the Blache Knight.

His stede was all dapple gray,
It goth an aumble on the way.

Id. The Rime of Sire Thopas.

All musick sleepes, where death doth lead the
daunce,

And shepheards wonted solace is extinct.

The blew in black, the greene in gray, is tinted.

Spenser. The Shepheard's Calender.

Have I in conquest stretcht mine arm so far,
To be afraid to tell graybeards the truth?

Shakspeare.

Youngling, thou canst not love so dear as I.

—Graybeard, thy love doth freeze.

Id.

The gray-eyed morn shines on the frowning night,
Cherquering the eastern clouds with streaks of light.

Id.

I'll say yon gray is not the morning's eye;

'Tis but the pale reflex of Cynthia's brow.

Id.

Our women's names are more gracions than their
Cesilia, that is, gray-eyed.

Camden's Remains.

Living creatures generally do change their hair
with age, turning to be gray; as is seen in men,
though some earlier and some later; in horses, that
are dappled and turn white; in old squirrels that turn
grisly, and many others.

Bacon's Natural History.

Anon,
Gray-headed men and grave, with warriors mixed
Assemble.

Milton's Paradise Lost.

They left me then, when the gray headed even,
Like a sad votarist in palmer's weed,
Rose from the hindmost wheels of Phœbus' wain.

Milton.

The restoration of gray hairs to juvenility, and re-
newing the exhausted marrow, may be effected.

Glanville's Scepis.

The grayling lives in such rivers as the trout does,
and is usually taken with the same baits and after the
same manner: he is of a fine shape, his flesh white,
and his teeth, those little ones that he has, are in his
throat. He is not so general a fish as the trout, nor
so good to eat.

Walton's Angler.

Thou hast neither forsaken me now I am become
gray-headed, nor suffered me to forsake thee in the
late days of temptation.

Walton.

Gray-headed infant! and in vain grown old:

Art thou to learn that in another's gold

Lie charms resistless?

Dryden's Juvenal.

Down sunk the sun, the closing hour of day

Came onward, mantled o'er with dusky gray.

Parnell.

We most of us are grown gray-headed in our dear

master's service.

Addison's Spectator.

These gray and dun colours may be also produced
by mixing whites and blacks, and by consequence
differ from perfect whites, not in species of colours,
but only in degree of luminousness.

Newton.

Soon as the gray-eyed morning streaks the skies,

And in the doubtful day the woodcock flies.

Gay.

Her gray-haired synods damning books unread,

And Bacon trembling for his brazen head.

Pope.

Afar, a dwarf buffoon stood telling tales

To a sedate gray circle of old smokers,

Of secret treasures found in hidden vales,

Of wonderful replies from Arab jokers.

Byron. Don Juan.

GRAY (Thomas), a celebrated English poet,

was born in Cornhill, in 1716. He was edu-

cated at Eton, where he contracted a friendship

with Horace Walpole, and with Mr. Richard

West, son of the lord chancellor of Ireland.
Mr. West and Mr. Gray were both intended for
the bar; but the latter was diverted from that
pursuit by an invitation to accompany Mr. Wal-
pole in his travels; which he accepted without
any determined plan for his future life. When
he returned, finding himself in narrow circum-
stances, yet with a mind not disposed for active
employment, he retired to Cambridge, and de-
voted himself to study. Soon after his return,
his friend West died: and the melancholy im-
pressed on him by this event may be traced in
his admired Elegy written in a country church-
yard, which is thought to have been written at
this time. The first impulse of his sorrow for
the death of his friend gave birth also to a
Sonnet, on the Model of Petrarch; and to an
Apostrophe in Hexameters, with which he in-
tended to begin one of his books *De Principiis*
Cogitandi. From the winter of 1742 to his
death his residence was at Cambridge; except
between 1759 and 1762; when, on the opening
of the British Museum, he took lodgings in
Southampton-Row, in order to have recourse to
the Harleian, and other MSS. About 1747
Mr. Mason, the editor of Mr. Gray's poems,
was introduced to him. Mason had written
some imitations of Milton's Juvenile Poems viz.
A Monody on the death of Mr. Pope, and two
pieces, entitled *Il Billicoso* and *Il Pacifico*, on
the peace of Aix-la-Chapelle; and Mr. Gray
revised them. This laid the foundation of an
intimacy which continued without interruption
till Mr. Gray's death. About 1760 Mr. Gray
finally revised his celebrated Elegy written in a
country church-yard, and communicated it to
his friend Mr. Walpole, and it was shown about
for some time in MS. At last the publisher of
one of the magazines having obtained a sur-
reptitious copy of it, Gray wrote to Walpole,
desiring that he would put his own MS. into
the hands of Mr. Dodsley, and order him to
print it immediately. This was the most po-
pular of all our author's publications. It ran
through eleven editions in a very short time;
and was finally translated into Latin by Messrs
Ansty and Roberts, and by Mr. Lloyd. From
1759 to 1762, he generally resided in London.
In July, 1768, the duke of Grafton wrote him,
that his majesty had been pleased to offer to
him the professorship of Modern History in the
university of Cambridge, then vacant. This
place was valuable, the salary being £400 a-year;
and was the more acceptable to Mr. Gray that
it was given him without solicitation.

He seems early in life to have had an inten-
tion of publishing an edition of Strabo; for his
papers contain a great number of notes and geo-
graphical disquisitions on that author, particu-
larly with respect to that part of Asia which
comprehends Persia and India. Another work,
on which he bestowed uncommon labor, was
the Anthologia. In an interleaved copy of that
collection of Greek epigrams, he has transcribed
several additional ones, which he selected in his ex-
tensive reading; and has inserted a great number
of critical notes and emendations, and subjoined
a copious index. But whether he intended this
performance for the press or not, is uncertain.

The only work which he undertook with this direct view from the beginning, was A History of English Poetry, upon a plan sketched out by Pope. He has mentioned this himself in an advertisement to those three fine imitations of Norse and Welsh poetry, which he gave the world in the last edition of his poems. But, after he had made some preparations for the execution of this design, being informed that Mr. Warton, of Trinity College, Oxford, was engaged in a work of the same kind, he relinquished the undertaking; and soon after, on that gentleman's desiring a sight of his plan, our author readily sent him a copy of it. Mr. Gray had acquired a great knowledge of Gothic architecture. He had seen and studied in his youth, while abroad, the Roman proportions, both in ancient times, and in the works of Palladio. In his later years he applied himself to consider those stupendous structures of more modern date that adorn our own country; which, if they have not the same grace, have undoubtedly equal dignity. He endeavoured to trace this mode of building from the time it commenced through its various changes, till it arrived at its perfection in the reign of Henry VIII. and ended in that of Elizabeth. But his favorite study for the last ten years of his life was natural history. The marginal notes which he has left on Linnæus and other writers on the vegetable, animal, and fossile kingdoms, are numerous; but the most considerable are on Hudson's Flora Anglica, and the tenth edition of the Systema Naturæ. He died in 1771; and an edition of his poems, with memoirs of his life and writings, was published in 4to., in 1775, by Mr. Mason.

GRAY (Edward Whitaker), F.R.S., an English physician and naturalist, was several years senior secretary to the Royal Society, and keeper of the department of natural history and antiquities at the British Museum. He was the author of an Account of the Epidemic Catarrh of the year 1782, in the first volume of Dr. Duncan's Medical Commentaries; Observations on the Manner in which Glass is charged with the Electric Fluid and discharged; and Observations on the Class of Animals called, by Linnæus, Amphibia; both published in the Philosophical Transactions. Dr. Gray died in January, 1807, aged fifty-nine.

GRAY'S HARBOUR, a bay on the west coast of North America, examined by Vancouver. The entrance, about a mile wide, has a bar directly across, after passing which, the channel appears to be uninterrupted, the northern side being deepest. Long. 236° 7' E., lat. 47° N.

GREASE, *n. s. & v. a.* } Fr. *graisse*; Ital. *grassa, grasso*; of Lat. *crassus*. — Minshew.

GREASY, *adj.* }
The soft part of animal fat; a disease in the legs of horses: oily; fat; unctuous: to smear with grease; and, figuratively, to bribe or corrupt with presents.

*Grease, that's sweaten
From the murder'er's gibbet, throw
Into the flame.*

Shakspeare. Macbeth.
Let's consult together against this greasy knight.
Shakspeare.

The fragments, scraps, the bits and greasy reliques
Of her o'reaten faith. *Id.*

To take out a spot of grease they use a coal upon
brown paper. *Bacon's Natural History.*

Even the lewd rabble
Governed their roaring throats, and grumbled pity:
I could have hugged the greasy rogues; they pleased
me. *Otway.*

Upon the most of these stones, after they are cut,
there appears always, as it were, a kind of greasiness
or unctuousity. *Boyle.*

Thou hopest, with sacrifice of oxen slain,
To compass wealth, and bribe the god of gain
To give thee flocks and herds, with large increase;
Fool! to expect them from a bullock's grease.

Dryden's Juvenal.
A girdle, foul with grease, binds his obscene attire.
Dryden.

Envy not the store
Of the greased advocate that grinds the poor. *Id.*

Buy sheep, and see that they be big-boned, and
have a soft, greasy, well curled close wool.

Mortimer
Or Sappho at her toilette's greasy task,
With Sappho fragrant at an evening mask.
Pope.

GREAT, *adj.* Sax. *gæat*; Dut. *groot*; Swed. *grot*. Large in bulk or number.

All these cities were fenced with high walls, gates,
and bars, besides unwall'd towns a great many.

Deut. iii. 5.
Judas one of the twelve came, and with him a
great multitude with swords and staves. *Matt. xxvi.*
Gret was the feste in Athenes thilke day.

Chaucer. The Knights Tale.
Elemental air diffused

In circuit to the uttermost convex
Of this great round. *Milton.*
And God created the great whales. *Id.*

A dungeon horrible, on all sides round,
As one great furnace flamed. *Id.*

The tallest pine
Hewn on Norwegian hills, to be the mast
Of some great admiral. *Id.*

Having any quality in a high degree.
There were they in great fear. *Psalm xiv. 5.*

All sodainly, I was right glad,
That *gretir* joy, as mote I thrive,
I trow had never man alive.

Chaucer. Dreame.
Their power was great. *Milton.*
Great triumph and rejoicing was in heaven. *Id.*

Charms such as thine, inimitably great,
He only could express. *Broome.*
Having number or bulk, relative or comparative.

The idea of so much is positive and clear: the idea
of greater is so clear, but it is but a comparative idea.
Locke.

Considerable in extent or duration.
Thou hast spoken of thy servant's house for a great
while to come. *2 Sam. vii. 19.*

Important; weighty.
Many

Have broke their backs with laying manors on them,
For this great journey. *Shakspeare. Henry VIII.*

Make sure
Her favors to thee, and the great oath take
With which the blessed gods assurance make.
Chapman.

—— the muses are in all things free:
Fit subject of their verse all creatures be;

And there is nothing named so meane, or great,
Whereof they have not liberty to treat.

Geo. Withers.

What is low raise and support,
That to the height of this *great* argument
I may assert eternal Providence,
And vindicate the ways of God to men. *Milton.*

On some *great* charge employed
He seemed, or fixed in cogitation deep *Id.*

By experience of this *great* event,
In arms not worse. *Id.*

After silence then,
And summons read, the *great* consult began. *Id.*
And though this be a *great* truth, if it be impar-
tially considered, yet it is also a *great* paradox to
men of corrupt minds and vicious practices. *Tillotson.*

Chief; principal.

Hear the king's pleasure, cardinal, who commands
you

To render up the *great* seal presently.

Shakspeare. Henry VIII.

For, still, one line another draweth on,
And line by line *great* workes at last are done.

Geo. Withers.

Venerable; adorable; awful.

Thou first art wont God's *great* authentick will,
Interpreter, through highest heaven to bring.

Milton.

Wonderful; marvellous.

Great things, and full of wonder. *Milton.*

Of high rank; of large power.

It is not long since these two eyes beheld
A mighty prince, of most renowned race,
Whom England high in count of honour held,
And *greatest* ones did sue to gaine his grace;
Of *greatest* ones he *greatest* in his place.

Spenser. Faerie Queene.

Such men as he be never at heart's ease,
Whilst they behold a *greater* than themselves.

Shakspeare.

Worthiest by being good,

Farmer than *great* or high. *Milton.*

Mistake me made the throne her seat,
And none could be unhappy but the great.

Rowe.

The marble tombs that rise on high,
Whose dead in vaulted arches lie;
These, all the poor remains of state,
Adorn the rich, or praise the *great*. *Parnell.*

Of all the *great* how few
Are just to heaven, and to their promise true!
Pope.

Despise the farce of state,
The sober follies of the wise and *great*. *Id.*
General; extensive in consequence or influ-
ence.

Prolifick humour soft'ning all her globe,
Fermented the *great* mother to conceive.
Milton.

Illustrious; eminent; noble; excellent.
O Lord, thou art *great*, and thy name is *great* in
might. *Jer. x. 6.*

The *great* Creator thus replied. *Milton.*

The *great* Son returned *Id.*
Victorious with his saints.
Fair angel, thy desire that tends to know
The works of God, thereby to glorify
The *great* work-master, tends to no excess
That reaches blame. *Id.*

The *great* luminary
Aloof the vulgar constellations thick,
That from this lordly eye keep distance due,
Dispenses light from far. *Id.*

When Dutch invade and parliament prepare,
How can he engines so convenient spare?
Let no man touch them, or demand his own,
Pain of displeasure of *great* Clarendon. *Marvell.*
Under this attic cope I move,

Like some *great* prelate of the grove. *Id.*

Here Cesar graced with both Minervas shone,
Cesar, the world's *great* master, and his own. *Pope.*

Scipio,

Great in his triumphs, in retirement *great*. *Id.*
Grand of aspect; of elevated mien.

Such Dido was; with such becoming state,
Amidst the crowd, she walks serenely *great*. *Dryden.*

Magnanimous; generous; high-minded.

In her every thing was goodly and stately; yet so,
that it might seem that *great* mindedness was but the
ancient bearer to the humbleness. *Sidney.*

Great men have always scorned *great* recompenses:
Epaminondas saved his Thebes, and died
Not leaving even his funeral expenses. *Byron.*

Opulent; sumptuous; magnificent.

Not Babylon,

Nor *great* Alcairo, such magnificence

Equalled in all their glories. *Milton.*

He disdained not to appear at *great* tables and fes-
tival entertainments. *Atterbury.*

Intellectually *great*; sublime.

This new created world, how good, how fair,
Answering his *great* idea. *Milton.*

Alas! could she but fully truly know
How her *great* name is now throughout abhorred;
How eager all the earth is for the blow
Which shall lay bare her bosom to the sword!
Byron.

Swelling; proud.

Solyman perceived that Vienna was not to be won
with words, nor the defendants to be discouraged with
great looks; wherefore he began to batter the walls.
Knolles.

Familiar; much acquainted. A low word.

Those that would not censure, or speak ill of a
man immediately, will talk more boldly of those that
are *great* with them, and thereby wound their honour.
Bacon.

Pregnant; teeming.

Their bellies *great*

With swelling vanity, bring forth deceit.

Sendys.

His eyes sometimes even *great* with tears.
Sidney.

This fly, for most he stings in heat of day,
From cattle *great* with young keep thou away.
May.

It is added in every step of ascending or de-
scending consanguinity: as *great* grandson is
the son of my grandson.

I dare not yet affirm for the antiquity of our lan-
guage, that our *great-great* grandsires' tongue
came out of Persia. *Camden.*

What we call *great great* grandfather they called
forthafader. *Id. Remains.*

Their holy-day-cloaths go from father to son, and
are seldom worn out till the second or third genera-
tion; so that 'tis common enough to see a country-
man in the doublet and breeches of his *great* grand-
father. *Addison.*

Hard; difficult; grievous. A proverbial ex-
pression.
It is no *great* matter to live lovingly with good-na-
tured and meek persons. *Taylor's Devotion.*

GREAT, *n. s.* [from the adjective]. The whole ; the gross ; the whole in a lump.

To let out thy harvest by *great* or by day,
Let this by experience lead thee the way :
By *great* will deceive thee with lingering it out,
By day will dispatch. *Tusser's Husbandry.*

It were behoveful, for the strength of the navy,
that no ships should be builded by the *great* ; for by
daily experience they are found to be weak and im-
perfect. *Raleigh's Essays.*

He did at length so many slain forget,
And lost the tale, and took them by the *great*.

Dryden.
Carpenters build an house by the *great*, and are
agreed for the sum of money.

Moron's Mechanical Exercises.
I set aside one day in a week for lovers, and inter-
pret by the *great* for any gentlewoman who is turned
off sixty. *Addison.*

GREAT'BELLIED, *adj.* Great and belly. Preg-
nant ; teeming.

Greatbellied women
That had not half a week to go, like rams
In the old time of war, would shake the press.

Shakespeare.
A *greatbellied* woman, walking through the city in
the day-time, had her child struck out of her womb,
and carried half a furlong from her. *Wilkins.*

GREATEN, *v. a.* From great. To *aggran-
dize* ; to enlarge ; to magnify. A word little
used.

After they sought to *greaten* themselves in Italy
itself, using strangers for the commanders of their ar-
mies, the Turks by degrees beat them out of all their
goodly countries. *Raleigh.*

A favourite's business is to please his king, a mi-
nister's to *greaten* and exalt him. *Kenyon.*

GREATHEARTED, *adj.* Great and heart. High-
spirited ; undejected.

The earl, as *greathearted* as he, declared that he
neither cared for his friendship, nor feared his hatred.
Clarendon.

GREATLY, *adv.* From great.
In a great degree.

Thy sorrow will I *greatly* multiply. *Milton.*
Nobly ; illustriously.

Yet London, empress of the northern clime,
By an high fate thou *greatly* didst expire. *Dryden.*

Magnanimously ; generously ; bravely.

Where are these bold intrepid sons of war,
That *greatly* turn their backs upon the foe,
And to their general send a brave defiance ? *Addison.*

GREATNESS, *n. s.* From great.
Largeness of quantity and number.
Comparative quantity.

We can have no positive idea of any space or dura-
tion, which is not made up of and commensurate to
repeated numbers of feet or yards, or days or years,
and whereby we judge of the *greatness* of these sort
of quantities. *Locke.*

All absent good does not, according to the *greatness*
it has, or is acknowledged to have, cause pain equal
to that *greatness*, as all pain causes desire equal to it-
self ; because the absence of good is not always a
pain, as the presence of pain is. *id.*

High degree of any quality.
Zeal in duties, should be proportioned to the *great-
ness* of the reward, and the certainty. *Rogers.*

High place ; dignity ; power ; influence ;
empire.

The most servile flattery is lodged most easily in
the grossest capacity ; for their ordinary conceit
draweth a yielding to *greatness*, and then have they
not wit to discern the right degrees of duty. *Subey.*

Farewell, a longing farewell to all my *greatness*.
Shakespeare.

So many
As will to *greatness* dedicate themselves. *Id.*
I beg your *greatness* not to give the law
In other realms ; but beaten, to withdraw. *Dryden.*

Approaching *greatness* met him with her charms
Of power and future state ;
He shook her from his arms. *Id.*
Themistocles raised the Athenians to their *greatness*
at sea, which he thought to be the true and constant
interest of that commonwealth. *Scipj.*

Swelling pride ; affected state.
My lord would have you know, that it is not of
pride or *greatness* that he cometh not aboard your
ships. *Bacon.*

Merit ; magnanimity ; nobleness of mind.
Greatness of mind and nobleness their seat
Build in her loveliest. *Milton.*

Grandeur ; state ; magnificence.
Greatness with Timon dwells in such a draught,
As brings all Brobdingnag before your thought. *Pope.*

G R E A T B R I T A I N .

GREAT BRITAIN. In the article BRITAIN we
shall be found to have introduced a general
description of this important island, and to have
traced its history from the remotest ages with
which we are acquainted, to the period of the
establishment of the Saxon kingdom of England,
under Egbert. The article ENGLAND pursues
the history of that country until the kingdoms of
England and Scotland were united under the
dominion of one sovereign, James I., and fur-
nishes also the general statistical details, a state-
ment of the rise and progress of the manufactures,
present commerce, government, income, &c. of
Great Britain. We have undertaken in the pre-
sent article to complete the history of Great
Britain, and to add a few statistical and mis-

cellaneous details necessary for completing our
picture of the existing state of the empire.

PART I.

HISTORY OF GREAT BRITAIN.

1. *Of the reigns of the House of Stuart to the
death of Charles I.*—Queen Elizabeth, as we
have stated, had expressly recognised the claim
of her 'cousin of Scotland' to succeed to the
throne ; and few sovereigns ever assumed the
regal authority with more general approbation, or
greater hopes of a peaceable and happy reign.
These hopes, however, were soon blasted ; and the
history of this monarch's reign consists of little
more than a detail of his disputes with parlia-
ment. A minute account of these we cannot

here enter upon ; it would afford but little gratification or instruction to our readers ; but it is of importance to know their origin, as they were the primary causes of those events which were soon so conspicuous in the history of Great Britain, and which resulted in our ever memorable Revolution.

In the semi-barbarous ages, which preceded this period, the human mind, enervated by superstition and obscured by ignorance, seems to have resigned all pretensions to liberty, either religious or civil. Unlimited and uncontrolled despotism prevailed every where ; and though in England some gleams of better principles of government, and of the dawn of better times appeared, the many examples of arbitrary power exerted by her sovereigns, queen Elizabeth herself not excepted, show that the English were very far from being a free people. An incontestable proof of this, and an evidence how little restraint the people could then lay upon the authority of the sovereign, is, that the proceedings of parliament were accounted, even by the members, of so little consequence, that they did not keep any records of them. It was not till the year 1607, four years after the accession of James, that parliamentary journals began to be regularly compiled, on the motion of Sir Edwin Sandys. Neither were the sessions of parliament regular, and little attention was paid to the choice or continuance of the members. In the reign of Elizabeth, and her predecessors, the sessions did not continue above the twelfth part so long as the vacations. It was then usual, after a parliament had been prolonged beyond one session, for the chancellor to exert a discretionary power of issuing new writs to supply the place of any members whom he judged incapable of attending ; and, so late as the 23rd of Elizabeth, the commons, of their own accord, without the smallest court influence, and contrary to some former votes of their own, confirmed the chancellor's power in this respect. Nor did they farther assert their privileges, than to vote, that 'during the sitting of parliament there do not, at any time, any writ go out for the choosing or returning any member without the warrant of the house.'

Towards the end of the sixteenth or beginning of the seventeenth century, a great, but gradual mental revolution took place throughout all Europe. Arts and sciences beginning to flourish, commerce and navigation were greatly extended, and learning of all kinds began to diffuse itself. By more enlarged views, the love of freedom began, in Britain especially, to take place in the breasts of most people of education ; and this was greatly promoted by an acquaintance with the ancient Greek and Latin historians. A patriotic spirit arose, and a desire of circumscribing the excessive prerogatives and arbitrary proceedings of the crown rapidly spread throughout the nation. Nor was this desire unreasonable, or ill-founded. During the last years of queen Elizabeth's reign, the commerce, navigation, and number of seamen in England, had sensibly decayed. A remonstrance from the Trinity House in 1602 says, that since 1588, the number of seamen and shipping had decreased about a third part. Every species of domestic industry was

fettered by monopolists ; all foreign trade, except that to France, was brought by exclusive companies into the hands of a few rapacious engrossers ; and all prospect of future improvement in commerce was sacrificed to a little temporary advantage of the sovereign. These companies, arbitrarily erected, had carried their privileges so far, that almost all the trade of England centered in London ; the customs of that port alone amounting to £110,000 a-year, while those of all the rest of the kingdom were only £17,000. And this trade of London was confined to about 200 citizens, who were easily enabled, by combining among themselves, to fix whatever price they pleased both on the exports and imports of the nation. The country was also burdened with wardships and purveyances. The latter arose from an old prerogative of the crown, by which the officers of the household were empowered to take, without consent of the owners, provisions for the king's family, and carts and horses for the removal of his baggage, upon paying a stated price for them. The king had also a power of sending any person, without his consent, on whatever message he pleased ; and thus he could easily force any individual to pay him whatever money he chose, rather than be sent out of the country on a disagreeable errand. Money extorted from individuals, by this or any other method, was called a benevolence. The rising spirit of patriotism, which claimed a redress of these grievances, the severe government of Elizabeth had confined within very narrow bounds : but when James succeeded, being a foreign prince, less dreaded and less beloved, symptoms of a more free and independent spirit immediately appeared. Happily James neither perceived the alteration, nor had sufficient capacity to check its early advances. He had established in his own mind a speculative system of absolute government, which few of his subjects, and none but traitors and rebels, he thought, would make any scruple to admit ; and considered himself as entitled to equal prerogatives with other European sovereigns. In his person he imagined all legal power to be centered by an hereditary and a divine right ; nay, so fully was he persuaded that he was the absolute proprietor of his subjects, that in his speech to the parliament in 1621, he told them, that he 'wished them to have said, that, their privileges were derived from the grace and permission of him and his ancestors.' And when the same parliament protested that 'the liberties, franchises, privileges, and jurisdictions of parliament, are the ancient and undoubted birth-right and inheritance of the subjects of England,' he was so enraged, that, sending for the journals of the commons, he, with his own hand, before the council, tore out this protest, and ordered his reasons to be inserted in the council book. Such were the opposite dispositions of the prince and parliament, at the commencement of the Scottish line ; dispositions just beginning to exist and to appear in parliament, but thoroughly established, and openly avowed on the part of the king, throughout his whole reign. The consequence was, that during this reign the prerogatives of the crown were violently and openly attacked ; chiefly on the grounds of money and religion. The king's high

notions of the royal prerogative made him imagine he had a right to whatever sums he pleased to demand; and his profusion dissipated in a short time the scanty supplies he could extort from the parliament. With regard to religion, the nation was at this time greatly divided between the rival claims of episcopalianism and puritanism. Though the severities of Elizabeth had almost totally suppressed the Papists, it had been otherwise with the Puritans. So much had they increased, by the very means which had diminished the number of Catholics, that no fewer than 750 clergymen of that persuasion signed an address to James on his accession. They hoped that the new king, having received his education in Scotland, and having always professed an attachment to the church established there, would at least abate the rigor of the laws enacted against them, and perhaps advance them to equal favor with their rivals. But in this they were mistaken. He had observed in their Scottish brethren a great inclination towards republicanism, and a zealous attachment to civil liberty. In the capacities both of monarch and theologian, he had experienced the little complaisance they were disposed to show him. They controlled his commands; disputed his tenets; and to his face, before the whole people, censured his conduct and behaviour. Though he had been obliged, therefore, while in Scotland, to court their favor, he treasured up on that account the stronger resentment against their principles, and was now determined to resist them with the whole weight of his authority. Hence he not only rejected their petition, but throughout his whole reign refused to relax in the least the severity of the laws against Protestant nonconformists.

The same feelings which occasioned in James such an aversion to the Puritans, prompted him to favor even the Papists, as being greater friends to despotism. In his youth he had been suspected of a bias towards the religion of the latter; when he ascended the throne of England, it is certain he often endeavoured to procure some mitigation of the laws against them. But in this he was constantly opposed by the parliament; and, indeed, the strong inclination shown by James to establish episcopacy in every corner of his dominions, tended much to alienate from him the minds of many of his subjects, especially in Scotland. In May, 1617, the king set out for that country expressly with the design of establishing episcopacy there. He did not, however, design to abolish presbytery entirely. He only proposed at first to establish the royal authority above the ecclesiastical, and to introduce some ceremonies into the public worship, such as kneeling at the sacrament, private communion, and baptism, confirmation, the observance of Christmas, &c. But he as little knew his own countrymen, on these points, as the English: every advance towards episcopacy gave the greatest discontent, and these trivial ceremonies were at once rejected as if they involved mortal sins. We cannot on the whole wonder that James should have been desirous of subjugating the rebellious and turbulent spirit of the Scottish clergy; and, on the other hand, considering the extreme weakness of this monarch's understand-

ing, and that he imagined himself able to manage not only furious religionists, but even the most powerful foreign nations, with no other weapon than mere argumentation, we can as little wonder at his want of success.—In short, so far was James from being able to establish his royal authority above the ecclesiastical, that he found himself unable to introduce a single ceremony. He returned therefore with the mortification, not only of seeing his schemes entirely baffled with regard to Scotland, but of having disgusted even the few of that nation over whom religious prejudice did not prevail; and who, regarding the ceremonies so much insisted on by the king as trivial and insignificant, considered the national honor sacrificed in this attempt at a servile imitation of the worship practised in England. Equally bad success attended James when he attempted some opposition to the puritanical innovations in the latter country. He had observed, in his progress through the kingdom, that a Judaical observance of the Sunday gained ground; and that the people were thus debarred from recreations which contributed, as he thought, to their health and amusement. He now, therefore, issued a proclamation to allow, after divine service, all kinds of 'lawful games and exercises.' But this his subjects considered as an effort to introduce the utmost profaneness. In 1620 a bill was brought in by the commons for the more strict observance of the Sunday or 'sabbath,' and when one Shepherd opposed this bill, objecting to the appellation sabbath as puritanical, he was expelled the house by the suggestion of Mr. Pym. Such was the situation of religious affairs during this reign.

The first thing of political consequence, which transpired in it, was a conspiracy formed in the year of the king's accession to displace him, and bestow the kingdom on Arabella Stuart. Sir Walter Raleigh was said to have been concerned in this mysterious affair; for which he was tried, condemned without sufficient proof, and, after suffering thirteen years imprisonment in the tower, was executed out of complaisance to the Spaniards. Lord Gardenstone remarks, that 'James I. butchered Sir Walter without the form of a trial,' and censures Mr. Hume for attempting to vindicate James. See RALEIGH. In 1605 was discovered the famous gun-powder plot, the anniversary of which discovery has ever since been celebrated. Its origin is thus stated:—On the accession of James great expectations had been formed by the Catholics, that he would prove favorable to their religion; but, their hopes, as well as those of the Puritans, were disappointed. James expressed his intention of executing strictly the laws against them, and of persevering in all the rigorous measures of queen Elizabeth. A plan of revenge was now, therefore, thought of by Robert Catesby, a gentleman of good parts, and of an ancient family. He communicated his mind to Percy, a descendant of the house of Northumberland, when the latter proposed to assassinate the king: but this seemed to Catesby a very inadequate object. He told Percy, that the king would be succeeded by his children, who would also inherit his maxims of government, and urged that if even the whole royal family

were destroyed, the parliament, nobility, and gentry, who were infected with the same heresy, would raise another protestant prince to the throne. To serve any good purpose they must he insisted destroy, at one blow, the king, the royal family, the lords and commons; and bury all their enemies in a common ruin. This terrible scheme being approved of, it was resolved to effect it by springing a mine under both houses of parliament. Thomas Winter was sent over to Flanders in quest of Fawkes, an officer in the Spanish service. All the conspirators were bound to secrecy by the most solemn oaths, accompanied with the sacrament; and, so completely had superstition effaced every principle of humanity from their minds, that not one of them seems to have entertained the smallest compunction for the cruel massacre they intended. Some indeed were startled at the thoughts of destroying a number of Catholics, who must necessarily be present as spectators, or attendants on the king. But Tesmond a Jesuit, and Garnet superior of that order in England, are said to have removed these scruples, by showing that the interests of religion required in this case the sacrifice of the innocent with the guilty. This was in the spring and summer of 1604; when the conspirators hired a house in Percy's name, adjoining to that in which the parliament was to assemble. Towards the end of that year they began to pierce the wall of the house, in order to get in below that where the parliament was to sit; but found, while in the midst of their task, that a magazine of coals had been kept in a vault immediately under the house; and that the coals were then selling off, after which the vault would be let. It was therefore hired by Percy; thirty-six barrels of powder lodged in it; the whole covered up with faggots and billets; the doors of the cellar boldly flung open; and every body admitted as if it contained nothing dangerous. Being now, as they thought, assured of success, the conspirators began to plan the remaining part of their enterprise. The king, the queen, and prince Henry, were expected to be present at the opening of the parliament: and the duke of Albany it was resolved that Percy should seize or murder. The princess Elizabeth, likewise a child, was kept at lord Harrington's house in Warwickshire; and some others of the conspirators engaged to assemble their friends on pretence of a hunting match, when they were to seize that princess, and immediately proclaim her queen. The day so long wished for at last approached; the dreadful scheme, though communicated to more than twenty persons, had been religiously kept for nearly a year and a half; and nothing could be foreseen which could possibly prevent its success. Ten days before the meeting of parliament, however, lord Montague, a Catholic, son to lord Morley, received the following letter, which had been delivered to his servant by an unknown hand:—'My lord, out of the love I bear to some of your friends, I have a care for your preservation. Therefore I would advise you, as you tender your life, to devise some excuse to shift off your attendance on this parliament. For God and man have determined to punish the wicked-

ness of the times. And think not slightly of this advertisement; but retire yourself into the country, where you may expect the event in safety. For, though there be no appearance of any stir, yet I say, they will receive a terrible blow this parliament; and yet they shall not see who hurts them. This counsel is not to be contemned, because it may do you good, and can do you no harm; for the danger is over as soon as you have burned this letter. And I hope God will give you the grace to make use of it, to whose holy protection I commend you.' Though Montague imagined this letter to be only designed to frighten him, he carried it to lord Salisbury, secretary of state; who laid it before the king. James regarded it in a more serious light. He at once concluded that a design was entertained of blowing up the parliament house with gunpowder, and it was thought advisable to search the vaults below. This, however, was wisely delayed till the day before the meeting of parliament; when the lord chamberlain, observing the great piles of wood and faggots which lay in the vault under the upper house, resolved to make a further search. About midnight, Sir Thomas Knevit, a justice of peace, arrived with proper attendants; and, finding Fawkes arrived at the door of the vault, he immediately seized him, and, turning over the faggots, discovered the gunpowder. Matches and every thing necessary for setting fire to the train were also taken on the person of Fawkes, who, now in despair, expressed the utmost regret, that he had lost the opportunity of firing the powder at once, and of sweetening his own death by that of his enemies. For two or three days he manifested the same obstinacy, but, being confined in the tower, and the rack shown to him, his courage failed, and he made a full discovery of the conspirators. Catesby, Percy, and others of them, however, on hearing that Fawkes was arrested, hurried into Warwickshire; where Sir Everard Digby, imagining that the confederates had succeeded, was already in arms to seize the princess Elizabeth. But the country people raised by the sheriffs soon surrounded the conspirators and their attendants to the number of about eighty; and, though they resolved to sell their lives as dearly as possible, some of their powder took fire, and disabled them from defending themselves. The people then rushed in upon them. Percy and Catesby were killed with one shot. Digby, Rookwood, Winter, and others, being taken prisoners, were tried, confessed their guilt, and died, together with Garnet, by the hands of the common executioner. The lords Stourton and Mordaunt, two Catholics, were fined, in the sums of £4000, and £10,000 respectively, by the star-chamber; their absence from parliament having occasioned a suspicion of their being acquainted with the conspiracy: and the earl of Northumberland detained several years a prisoner in the tower; because, among other grounds of suspicion, he had admitted Percy into the number of gentlemen pensioners, without his taking the requisite oaths. He also was condemned to pay a fine of £30,000.

In 1612 James appears in his most advantageous point of view, namely, as a legislator of

Ireland In this work he proceeded by a steady, regular, and well-concerted plan. He began with abolishing the ancient Irish customs, which supplied the place of laws, and which were exceedingly barbarous and absurd. By the Brehon laws every crime, however enormous, was punished, not with death, but by a fine. Murder itself was compensated in this way. Every one had a value affixed to him, called his *eric*; and whoever was able to pay this, might kill him when he pleased. To the slight offences of oppression, extortion, &c., no penalty was affixed, nor could any redress for them be obtained. By the custom of *Gavelkind*, upon the death of any person, his land was divided among all the males of the sept or family, both legitimate and illegitimate; and after partition was made, if any of the sept died, his portion was not shared out among his sons, but the chieftain at his discretion made a new partition of the lands. As no man, by this custom, enjoyed a fixed property in land; to build, cultivate, or improve, was considered as lost labor. Their chieftains were established by election, or rather by force. Their authority was absolute; and, notwithstanding certain lands were assigned to the office, its chief profit resulted from exaction and assessments, for which there was no fixed law. After abolishing these customs, and substituting English laws in their place, James took the natives under his protection, declared them free citizens, and proceeded to govern them by a regular administration. A sufficient army was maintained, its discipline inspected, and its pay transmitted from England. When O'Doghartie raised an insurrection, a reinforcement was sent over, and the rebellion immediately extinguished. All minds being first quieted by a universal indemnity, circuits were now established, justice administered, and crimes of every kind severely punished. As the Irish had been universally engaged in a rebellion against Elizabeth, a resignation of all the separate jurisdictions formerly granted them was rigorously exacted; a resignation of private estates was even required; and, when they were restored, the proprietors received them under such conditions as might prevent future tyranny and oppression. The whole province of Ulster having fallen to the crown, by the attainer of rebels, a company was established in London for planting new colonies in that fertile country. The land being divided into shares, of which the largest did not exceed 2000 acres: tenants were brought over from England and Scotland: the Irish were removed from the hills, and settled in the open country; husbandry and the arts were taught them; and thus Ulster, from being the most wild and disorderly province in Ireland, soon became the most civilised and best cultivated.

This year Henry, prince of Wales, died suddenly on the 6th of November, not without strong suspicions of poison. On opening his body, however, no symptoms of poison appeared; but his death diffused a universal grief throughout the nation, as he was reckoned a prince of extraordinary accomplishments. But the marriage of the princess Elizabeth with Frederic elector palatine, which was celebrated February 14th,

1613, served to dissipate the national grief. This marriage, however, in the event, proved unhappy to the king, as well as to his son-in-law. The elector, trusting to so great an alliance, engaged in enterprises beyond his strength; and James, not being able, and perhaps not willing, to assist him, lost entirely the affections of his people. This particularly appeared in the year 1619. At this time the states of Bohemia having taken arms against the emperor Matthias, in defence of the Protestant religion, continued their revolt against his successor Ferdinand II., and, being alarmed at his preparations against them, made an offer of their crown to the elector palatine, who, stimulated by ambition, at once accepted the offer, and marched all his forces into Bohemia. But his affairs soon drew to an unfortunate crisis. Being defeated, in the great and decisive battle of Prague, he fled with his family into Holland; and Spinola the Spanish general invested and reduced the palatinate, every new conquest of the Catholics being attended with persecutions against the Protestants. At this news the religious zeal of the English was inflamed to the highest degree. The sufferings of their Protestant brethren, in Germany, excited their sympathy and resentment; and the inactive spirit shown by James was loudly exclaimed against.

Not having been, however, consulted by his son-in-law, James from the very first had denied his title of king of Bohemia, and forbade him to be prayed for in the churches under that appellation. He was also on other accounts extremely averse to come to a rupture with the king of Spain. The eldest daughter of that monarch had been indirectly offered to prince Henry; and even after James, in consequence of his alliance with the Dutch, had marched 4000 men to the assistance of the Protestants, the Spanish ambassador, Gondomar, made, in 1613, an offer of the king's second daughter to prince Charles. Of this match James had entertained great hopes, not only as a means of relieving his own necessities, but of recovering the palatinate for his son-in-law. But on the 14th November, 1621, the commons framed a remonstrance with him upon these subjects. They represented, that the enormous growth of the Austrian power threatened the liberties of Europe; that the progress of the Catholic religion in England bred the most melancholy apprehensions, lest it should again acquire an ascendancy; the indulgence of his majesty towards the professors of that religion having encouraged their insolence; and, above all, that the Spanish match elevated them so far as to hope for an entire toleration, if not a final re-establishment. They therefore entreated his majesty, that he would immediately undertake the defence of the palatinate, and maintain it by force of arms; that he would turn his sword against Spain, whose armies and treasures were the chief support of the Catholic interest in Europe; that he would enter into no negotiation for the marriage of his son but with a Protestant princess; that the children of popish recusants should be taken from their parents, and committed to the care of Protestant teachers and schoolmasters; and that the fines and con-

fiscations to which the Catholics by law were liable, should be levied with the utmost severity. The king, who was then at Newmarket, hearing of the intended remonstrance, wrote a letter to the speaker, in which he sharply rebuked the house for debating on matters far above their reach and capacity; and strictly forbade them to meddle with any thing that regarded his government or deep matters of state, and especially not to touch on his son's marriage with the Spanish princess. Upon this the commons framed a new remonstrance, in which they asserted their right of debating on all matters of government, and that they possessed entire freedom of speech in their debates. The king replied, that their remonstrance was more like a denunciation of war, than an address of dutiful subjects; and their pretension to enquire into all state affairs, without exception, was such a plenipotency as none of their predecessors, even during the reigns of the weakest princes, had ever pretended to; that public transactions depended on a complication of views and intelligence, with which they were entirely unacquainted; that they could not show their wisdom better, as well as duty, than by keeping within their proper sphere; and that in any business which depended on his prerogative, they had no title to interpose with their advice, unless when he pleased to ask it, &c. In return, the commons framed the protestation already mentioned, which the king tore out of their journals, and soon after dissolved the parliament.

The leading members of the house, Sir Edward Coke and Sir Robert Phillips, were now committed to the tower: three others, Selden, Pym, and Mallory, to other prisons; and some others, as a lighter punishment, were sent on business into Ireland. Sir John Saville, however, a powerful man in the house of commons, and a zealous opposer of the court, was made the comptroller of the household, a privy counsellor, and soon after a baron. This event is memorable, being the first instance of an English king advancing a man on account of his parliamentary interest. But in vain did James, by reiterated proclamations, forbid his subjects to discuss the public affairs and measures. His proclamations served rather to inflame the curiosity of the public. In every company and society the late transactions became the subject of argument and debate.

For five years James continued the dupe of the court of Spain. At last he resolved, if possible, to remove every obstacle to the Spanish alliance. He issued orders for discharging all popish recusants who were imprisoned; and it was daily apprehended, that he would forbid, for the future, the execution of the penal laws against them: apologising for this conduct, by pretending that it would procure for foreign princes a toleration for Protestants. At any rate it forwarded, for a while, James's end with regard to the marriage. The earl of Bristol, ambassador at the court of Spain, being fully convinced of the Spanish sincerity, wrote him word that the Spanish princess was to bring with her a fortune of £600,000; and that he considered this match as an infallible prelude to the palatine's

restoration. Nothing was now therefore wanting but a dispensation from Rome; and the duke of Buckingham, a new favorite at court, persuaded the prince to undertake a journey to Madrid. They travelled through France in disguise; and, under the assumed names of John and Thomas Smith, were introduced at the French court, where Charles first saw his future wife Henrietta. On their arrival at Madrid, every body was surprised by a step so little usual among princes. The Spanish monarch, however, expressed the utmost gratification at the visit; gave the prince a golden key which opened all his apartments, that he might, without introduction, have access to him at all hours; ordered his prime minister, Olivarez, never to be covered in his presence; and proclaimed a general gaol delivery as an expression of the public joy. The infanta, however, was only seen by her lover in public; and the pope, hearing of Charles's arrival, tacked some new clauses to the dispensation, which it became necessary to transmit to London. The treaty which was made public, chiefly regarded the exercise of the Catholic religion by the infanta; and stipulated that the children of the marriage should be educated by the princess till they were ten years of age. There were also some private articles sworn to by James, which could not have been made public without violent murmurs. A suspension of the penal laws against the English Catholics was promised, as likewise a repeal of them in parliament, and a toleration for the exercise of that religion in private.

Meanwhile, pope Gregory XV., who granted the dispensation, died; and Urban VIII. succeeded him. Upon this event, the nuncio refused to deliver the dispensation till it should be renewed by Urban. This the pontiff delayed, in hopes that, during the prince's residence in Spain, some method might be found of effecting his conversion. But the king of England, as well as the prince, had become impatient at the delay: Charles obtained leave to return; and Philip graced his departure with all the circumstances of civility and respect which had attended his arrival.

Buckingham, however, before their departure from Madrid, is said to have decided the prince's mind against the match. On their arrival in London, therefore, the former assumed the entire direction of the negociation; and made it his business to seek pretences for a breach of treaty. At last, after many artifices to delay or prevent the espousals, Bristol received positive orders not to deliver the proxy which had been left in his hands, till security was given for the full restitution of the palatinate. Philip understood this language: but, being determined to throw the whole blame of the rupture on the English, he delivered into Bristol's hand a written promise, by which he bound himself to procure the restoration of the palatinate, either by persuasion or by every other possible means; and, when he found that this concession gave no satisfaction, he ordered the infanta to lay aside the title of Princess of Wales, which she bore after the arrival of the dispensation from Rome, and to drop the study of the English language. As he knew that the counsels, which now governed the court of England, would not stop at the breach of the

marriage treaty, he also immediately ordered preparations for war. A more successful match for prince Charles was soon after negotiated with Henrietta, daughter of Henry IV.; the king of France demanding only the same terms that had been offered to the court of Spain. In an article of this treaty of marriage, it was, however, stipulated, that the education of the children till the age of thirteen should belong to the princess; a concession which gave ultimately to the house of Stuart that unfortunate bias towards popery, which afterwards proved their ruin.

James, being now deprived of every other hope of relieving his son-in-law but by force of arms, declared war against Spain and the emperor, for the recovery of the palatinate : 6000 men were sent over into Holland to assist prince Maurice against those powers; the people were every where elated at the courage of their king, and were satisfied with any war which was to exterminate the papists. This army was followed by another consisting of 12,000 men, commanded by count Mansfeldt; and the court of France promised its assistance. But the English were disappointed in all their views : the troops, being embarked at Dover, upon sailing to Calais, found no orders for their admission. They were obliged, after waiting for some time, to sail towards Zealand, where no proper measures were yet consulted for their disembarkation; and, meanwhile, a pestilential disorder crept in among them, of which half the army died. Whether this failure of his most cherished plans had any effect on the king's constitution, is uncertain; but he was soon after seized with a tertian ague, which put an end to his life on the 27th of March, 1625, after having lived fifty-nine years, and reigned over England twenty-two.

James was succeeded by his son Charles I., who was exceedingly popular with his subjects, for breaking off the match with the Spanish princess, and procuring the rupture with the house of Austria. Young and inexperienced, he regarded these praises as sincere; and was so impatient, therefore, to assemble the great council of the nation, that he would gladly, for the sake of despatch, have called together the same parliament which sat under his father. But, being told that such a measure was unusual, he issued writs for summoning a new parliament on the 7th of May; and it was not without regret that the arrival of the princess Henrietta, whom he had espoused by proxy, obliged him to delay, by repeated prorogations, their meeting till the 18th of June. Charles inherited his father's great pecuniary necessities, his high notions of the royal prerogative, and a violent attachment to episcopacy. At his accession, believing his subjects to be in perfect friendship with him, he resolved that their bounty should be entirely unasked, and the entire effect of mutual confidence. Accordingly, his first speech to the parliament was full of simplicity and cordiality. He lightly mentioned the occasion he had for supply. He employed no intrigue to influence the suffrages of the members. He would not even allow the officers of the crown, who had seats in the house, to mention any particular sum

which he had occasion for; but trusted entirely to the wisdom and affection of his parliament, 'who perfectly well knew his circumstances.' The return made by the commons was by no means suitable to this generous behaviour. They knew that all the money granted by the last parliament had been spent on military and naval preparations; and that great anticipations were likewise made of the revenues of the crown. They were not ignorant that Charles was loaded with a debt contracted by his father, who had borrowed money both from foreign princes and from his own subjects. They were sensible that the war was the result of their own importunate intreaties, and that they had solemnly engaged to support their sovereign in carrying it on. Nor were they unacquainted with the difficulty of military enterprises directed against the whole house of Austria; against the king of Spain, the richest prince in Europe; and against the emperor Ferdinand, hitherto the most fortunate monarch of the age. But, to answer all these important ends, they thought proper only to confer on the king a supply of £112,000. When Charles, with great moderation, represented, in the most explicit manner, the necessity there was for a larger supply, urging, among other pleas, that, if he now met with kind and dutiful usage, it would endear him to the use of parliaments, and for ever preserve an entire harmony between him and his people, the commons remained inexorable; they even refused the addition of $\frac{2}{3}$ ths to the former supply. Instead of this they renewed their complaints against the growth of popery; demanding a strict execution of the penal laws against the Catholics; remonstrated against some late pardons granted to priests; and attacked Montague, one of the king's chaplains, on account of a book which he had lately composed. Charles gave them a gracious and complaisant answer; but was firmly resolved to abate somewhat of the rigorous laws against that unfortunate party, which his engagements with France absolutely required.

No measure could be more disgusting to his subjects than this resolution. The Puritans had continued to gain ground during the whole reign of James, and now formed the majority of the house of commons; in consequence of which, petitions were presented to the king for replacing such able clergymen as had been silenced for want of conformity to the ceremonies. They also enacted laws for the strict observance of Sunday. In consequence of this behaviour in Charles's first parliament, it was dissolved on the 12th of August, 1625, and a new one called, February 6th, 1626. During this interval, Charles had been obliged to borrow from his subjects on privy seals; the advantage of which was but a small compensation for the disgust it occasioned. By means, however, of that supply, and some other expedients, he was enabled to equip his fleet, though with difficulty. It was designed against Spain, but performed nothing worth notice, and its bad success increased the clamors against the court. Charles's second parliament adopted the same views with the former. They, however, voted a supply of three subsidies (£168,000), and $\frac{2}{3}$ ths; but the passing

this vote into a law was reserved until the end of the session, that they might have an opportunity of forcing the king to make concessions. This harsh conduct was greatly resented by Charles; but he found himself obliged to submit. In the mean time they attacked the duke of Buckingham, who was become generally obnoxious; and was impeached by the earl of Bristol, on account of his conduct with respect to the Spanish negotiation. The earl's impeachment, however, was entirely overlooked, and the commons were able to prove nothing otherwise of any consequence against him. The king, imagining that Buckingham's greatest crime was the having been so much in favor with his sovereign, commanded the house expressly not to meddle with his minister, but to finish, in a few days, the bill they had begun for the subsidies; otherwise they must expect to sit no longer. Suggestions of this kind had a bad effect; and, when the king proceeded further to throw into prison two members of the house who had managed the impeachment against Buckingham, the commons declared that they would proceed no farther till they had satisfaction in their privileges. Charles alleged, as the reason of this measure, certain seditious expressions, which, he said, had, in their accusation of the duke, dropped from these members. Upon enquiry it appeared that no such expressions had been used, and the members were released. Soon after, the house of lords, moved by the example of the commons, claimed liberty for the earl of Arundel, who had been lately confined in the tower, and, after many fruitless evasions, the king was obliged, however ungraciously, to comply. The next attack made by the commons, had it succeeded, would have reduced the king to an absolute dependence on parliament. They were preparing a remonstrance against the levying of tonnage and poundage. This article, together with the new impositions laid on merchandise by James, constituted nearly one-half of the crown revenues; and, after having gained this point, they were to petition, or rather to have commanded the king to remove Buckingham from his presence and councils. The king, however, being alarmed at the yoke they were preparing for him, dissolved this second parliament, June 15th, 1626.

Charles, having now made such a breach with his parliament as there was no hope of repairing, was obliged to exercise every branch of his prerogative to supply himself with money. A commission was granted to compound with the Catholics, and agree for dispensing with the penal laws. By this expedient the king, indeed, filled his coffers, but gave general disgust. From the nobility he desired assistance; from the city he required a loan of £100,000. The former contributed slowly; but the latter, after many excuses, gave, at last, a flat denial. To equip a fleet, a distribution, by order of the council, was made to all the maritime towns, and each of them was required, with the assistance of the adjacent counties, to arm so many vessels. London was rated at twenty ships; and this is the first appearance, in Charles's reign, of ship-money; a taxation which had once been imposed

by Elizabeth, but which, when carried some steps farther by Charles, produced the most violent discontents. These methods of supply were carried on with some moderation, till news arrived of the king of Denmark being totally defeated by count Tilly the imperial general; but, supplies having then become more than ever necessary, it was suggested in council, that the most equal and convenient method of obtaining them was by a general loan from the subject, according as every man was assessed in the rolls of the last subsidy. That precise sum was required which each would have paid, had the vote of four subsidies been passed into a law: care, however, was taken that the sums thus exacted were not to be called subsidies but loans. Many throughout England now refused these loans, and some were even active in encouraging their neighbours to insist upon their common rights and privileges. By warrant of the council, these were thrown into prison. Most of them patiently submitted to confinement, or applied by petition to the king, who commonly released them. Five gentlemen, however, Sir Thomas Daniel, Sir John Corbet, Sir Walter Earl, Sir John Haveningham, and Sir Edward Hampden, demanded release, not as a favor from the court, but as their due by the laws of their country. No particular cause was assigned for their commitment. The special command of the king and council was alone pleaded. And it was alleged that, by law, this was not sufficient reason for refusing bail or releasement to the prisoners. The question was brought to a solemn trial before the court of king's bench; and the whole kingdom was attentive to the issue. By the debates on this subject it appeared, that personal liberty had been secured by no less than six different statutes, and by an article in magna charta itself. It appeared, that, in times of turbulence and sedition, the kings had infringed these laws; and of this also many examples were produced. The difficulty then lay to determine when such violent measures were necessary; but of that the court pretended to be the supreme judge. As it was legal, therefore, that these five gentlemen should plead the statute, by which they might demand bail, so it was expedient in the court to remand them to prison, without determining on the necessity of taking bail for the present. This was a cruel evasion of justice, and, in fact, satisfied neither party. The court insisted that no bail could be taken; the country exclaimed that the prisoners ought to be set free.

While the king was thus embroiled at home, he rashly engaged in a war with France, a kingdom with which he had but lately formed the most natural alliance. Historians generally agree that this war proceeded from the rivalry of the duke of Buckingham and cardinal Richelieu; both of whom aspired at the affections of the queen of France. However this may be, war was declared against France; and Charles was taught to hope, that hostilities with that kingdom would be the surest means of procuring tranquillity at home. The success of this war was proportionable to the wisdom with which it was commenced. Buckingham was appointed com-

mander; and, being entirely unacquainted both with the sea and land service, he managed to lose two-thirds of his army, and returned in total discredit both as an admiral and general. The discontents in England now rose to such a height, that there was reason to apprehend an insurrection. Charles was also reduced to the greatest distress for want of money. That which he had levied by virtue of his prerogative came in very slowly, and it was dangerous to renew the experiment, on account of the ill-humor of the nation. A third parliament was therefore called, March 17th, 1628; whom Charles told, at the beginning of the session, that 'if they should not do their duties, in contributing to the necessities of the state, he must, in discharge of his conscience, use those other means which God had put into his hands, in order to save that which the follies of some particular men might otherwise put in danger.' They began with voting against arbitrary imprisonments and forced loans; after which five subsidies (£280,000) were voted to the king; a sum with which Charles, though much inferior to his wants, declared himself well satisfied. The commons, however, resolved not to pass this vote into a law, before they had obtained from the king a sufficient security, that their liberties should be no longer violated. They resolved upon a petition of right, in which they recapitulated all the unlawful exertions of the prerogative. The chief grievances complained of were forced loans, benevolences, taxes without consent of parliament, arbitrary imprisonments, billeting soldiers, and martial law. They pretended not to any unusual power or privileges; nor did they intend to infringe the royal prerogative, they said, in any respect: they aimed only at securing those rights and privileges derived from their ancestors. But the king now began plainly to aim at nothing less than absolute power. This petition he did his utmost to evade, by repeated messages to the house, in which he always offered his royal word, that there should be no more infringements of the liberty of the subject. These messages, however, had no effect on the commons: they knew how insufficient such promises were, without further security. The petition, therefore, at last passed both houses, as embodying the law of those questions, and nothing was wanting but the royal assent to give it legal force. The king accordingly came to the house of peers, sent for the commons, and, being seated in the chair of state, the petition was read to him. In answer to it, he said, 'The king willeth that right be done according to the laws and customs of the realm, and that the statutes be put into execution; that his subjects may have no cause to complain of any wrong or oppression contrary to their just rights and liberties, to the preservation whereof he holds himself in conscience as much obliged as of his own prerogative.' This equivocal answer was highly resented by the commons. They first directed their indignation against a Dr. Manwaring, who had preached a sermon, and at the special command of the king, which was found to contain doctrines subversive of civil liberty. It taught, that though property

was commonly lodged in the subject, yet, whenever any exigency required supply, all property was transferred to the sovereign; that the consent of parliament was not necessary for the imposition of taxes; and that the divine laws required compliance with every demand, however irregular, which the prince should make upon his subjects. For these doctrines Manwaring was sentenced to be imprisoned during the pleasure of the house; to be fined £1000 to the king; make submission and acknowledgement for his offence; be suspended three years; be incapable of holding any ecclesiastical dignity or secular office; and that his book be called in and burnt. No sooner, however, was the session ended, than Manwaring received a pardon, and was promoted to a living of considerable value. Some years afterwards he was advanced to the see of St. Asaph. At last, the king, seeing it was impossible to carry his point, yielded to the importunities of parliament. He came to the house of peers, and pronouncing the usual form of words, 'Let it be law as is desired,' gave full sanction and authority to the petition. The house resounded with acclamations, and the bill for five subsidies was immediately passed.

The commons, however, were not yet satisfied; they began to attack the duke of Buckingham, against whom they were implacable; they also asserted, that the levying of tonnage and poundage without consent of parliament was a palpable violation of the ancient liberties of the people, and an open infringement of the petition of right so lately granted. The king, to prevent a remonstrance on that subject, suddenly prorogued the parliament, June 26th, 1628.

The commons were soon delivered from their enemy Buckingham; who was murdered on the 23d of August following, by one Felton who had formerly served under him. The king did not appear much concerned at his death, but retained an affection for his family. He desired also that Felton might be tortured, in order to extort from him a discovery of his accomplices; but the judges very properly declared, that, though that practice had been once common, it was altogether illegal. In 1629 the contentions between the king and his parliament were renewed. The great article on which the commons broke with their sovereign, and which finally created in him a disgust at all parliaments, was their claim with regard to tonnage and poundage. The dispute was, whether this tax could be levied without consent of parliament or not. Charles, supported by multitudes of precedents, maintained that it might; and the parliament, in consequence of their petition of right, asserted that it could not, and were resolved to support their rights. They began with summoning before them the officers of the custom-house, to give an account by what authority they had seized the goods of those merchants, who had refused to pay the duties. The barons of exchequer were questioned with regard to their decrees on that head; and the sheriff of London was committed to the Tower for supporting the officers of the custom-house. The goods of Rolles, a merchant, and member of the house, being seized for his refusal to pay

the duties, complaints were made of this violence, as a flagrant breach of privilege. Charles, on the other hand, supported his officers; and the quarrel between him and the commons became every day more virulent. Sir John Elliot framed a remonstrance against tonnage and poundage, which he offered to the clerk to read; but it was refused, and he then read it himself. The question being called for, the speaker Sir John Finch said, that he had a command from the king to adjourn, and to put no question; upon which he rose and left the chair. The whole house was in an uproar; the speaker was pushed back into the chair, and forcibly held in it, till a short remonstrance was formed, which was instantaneously passed by acclamation. Religious feelings and controversies also mingled with all this. Papists and Armínians were declared capital enemies to the commonwealth, and those who levied tonnage and poundage were branded with the same epithet. Even the merchants, who should voluntarily pay these duties, were called betrayers of English liberty, and public enemies. The doors being locked, the gentleman usher of the house of lords, who was sent by the king, could get no admittance till this remonstrance was finished. By the king's order he took the mace from the table, which put an end to their proceedings, and on the 10th of March the parliament was dissolved, and some of the members imprisoned.

Charles, being now disgusted with parliaments, firmly resolved to call no more; but, finding himself destitute of resources, was obliged to make peace with the two powers with whom he was at war. A treaty was signed with France on the 14th of April, and another with Spain on the 5th of November, 1630. As if, however, resolved on his own ruin, and to lose the small degree of affection towards him which remained among his subjects, Charles now began to make innovations in religion. Archbishop Laud had obtained a prodigious ascendancy over him; and, by his superstitious attachment to foolish ceremonies, led him into a conduct that proved fatal to himself and to the kingdom. He chose this time, of all others the most inauspicious, for attempting to renew the ceremonies of the fourth and fifth centuries, and so openly were many of the Popish tenets espoused, that not only the Puritans believed the church of England to be relapsing fast into that superstition, but the court of Rome itself entertained hopes of regaining its authority. Laud was actually offered, it is said, a cardinal's hat. See LAUD. He exacted the old and superstitious veneration for the sacerdotal character, and implicit submission to the creeds and decrees of synods and councils; and enjoined great pomp and ceremony in worship. Orders were given, that the communion table should be removed from the middle of the area, where it had hitherto stood in all churches except cathedrals, to the east end; and that it should be railed in, and denominated an altar. All kinds of ornaments, especially pictures, were introduced. The crucifix, too, was not omitted. In return for Charles's favor, Laud and his followers took care to magnify on every occasion the regal authority, and to treat with the utmost

disdain all puritanical pretensions to civil and religious liberty. In the star chamber and high commission both the church and king found a ready instrument to suppress the rising spirit of liberty. Tonnage and poundage were continued to be levied by royal authority alone. The former arbitrary impositions were still exacted, and new impositions laid upon different kinds of merchandise. The custom-house officers received orders from the council to enter into any house, warehouse, or cellar; to search any trunk or chest; and to break any bulk whatever, in default of the payment of customs. In order to exercise the militia, each county by an edict of the council was assessed in a certain sum for maintaining a muster-master appointed for that service. Compositions were now again openly made with recusants, and the Popish religion afforded a regular branch of revenue. A commission was also granted for compounding with such as possessed crown lands on defective titles; and on this pretence considerable sums of money were exacted of the people.

While the English were thus driven to the utmost discontent, and almost ready to break out into rebellion, Charles thought proper to attempt the establishment of episcopacy in Scotland. The canons for erecting a new ecclesiastical jurisdiction were promulgated in 1635, and received without much outward opposition; but when the first reading of the liturgy was attempted in the cathedral church of St. Giles, Edinburgh, in 1637, such a tumult was produced, that it was not thought safe to repeat the experiment. A universal combination against the religious innovations began immediately to take place; and to the proclamation of Charles, the nobility, gentry, and ministers, opposed the celebrated production of the Covenant. This consisted of a renunciation of Popery, formerly signed by James in his youth, and filled with many virulent invectives against that party. A bond of union followed, by which the subscribers obliged themselves to resist all religious innovations, and to defend each other against all opposition. It was subscribed by people of all ranks and conditions. The king now began to be alarmed. He sent the marquis of Hamilton, as commissioner, to treat with the covenanters; and he required that obligation to be renounced and recalled. In answer to this demand the covenanters told him, they would sooner renounce their baptism! and invited the commissioner himself to sign it. Hamilton returned to London; made another fruitless journey with new concessions to Edinburgh; returned again to London, and was immediately sent back with still greater concessions. The king was now willing to abolish entirely the canons, the liturgy, and the high commission court; he even resolved to limit extremely the power of the bishops, and was content if on any terms he could retain that order in the church of Scotland. To ensure all these gracious offers, he gave Hamilton authority to summon first an assembly, and then a parliament, where every grievance should be redressed. The offer of an assembly and a parliament, in which they expected to be entirely masters, was very willingly embraced by the

covenanters. When they found, however, that Charles's proposal of a new covenant was only meant to weaken and divide them, they received it with the utmost detestation; and proceeded in their own way to model the assembly. It met at Glasgow in 1638. A firm determination had been entered into of utterly abolishing episcopacy; and, as a preparative to it, there was laid before the presbytery of Edinburgh, and solemnly read in all the churches of the kingdom, an accusation against the bishops, as guilty of heresy, simony, bribery, perjury, cheating, adultery, &c. &c. The bishops sent in a protest, declining the authority of the assembly; the commissioner too protested against that court, as illegally constituted and elected; and, in his majesty's name, dissolved it. This measure was foreseen, and little regarded. The court still continued to sit; and all the acts of assembly, from the accession of James VI. to the crown of England, were declared null and invalid. Thus the whole fabric which James and Charles, in a long course of years, had been rearing with much care and policy, fell at once to the ground. The covenant likewise was ordered to be signed by every one, under pain of excommunication.

In 1639 the covenanters prepared in earnest for war. The earl of Argyll, though he long seemed to temporise, at last embraced their party, which the earls of Rothes, Cassilis, Montrose, Lothian, the lords Lindesay, Loudon, Yester, and Balmerino, also joined. Charles, on the other hand, was not deficient in his endeavours to oppose this formidable combination. By a system of rigid economy he had not only paid all the debts contracted in the French and Spanish wars, but had amassed a sum of £200,000, which he had reserved for any sudden exigency. The queen had great interest with the Catholics; and she easily persuaded them to give large contributions, as a mark of their duty to the king. Thus a considerably supply was gained, and the king's fleet became formidable. Having put 5000 land forces on board, he intrusted it to the marquis of Hamilton, who had orders to sail to the frith of Forth, while an army was levied of nearly 20,000 foot and 3000 horse; and put under the command of the earl of Arundel. The earl of Essex, a man of strict honor, and extremely popular, especially among the soldiery, was appointed lieutenant general; and the earl of Holland was general of the horse. The king himself joined the army, and summoned all the peers of England to attend him. The whole had the appearance of a splendid court rather than a military armament, and in this array the camp arrived at Berwick.

So prudent were the Scottish leaders that they immediately sent very submissive messages to the king, and craved leave to be admitted to a treaty. Charles, as usual, took the worst course. He concluded a sudden pacification, in which it was stipulated that he should withdraw his fleet and army; that within forty-eight hours the Scots should dismiss their forces; that the king's forts should be restored to him; his authority be acknowledged; and a general assembly and parliament be immediately summoned, to settle all differences. The peace, however, was not of

long duration. Charles could not prevail on himself to abandon the cause of episcopacy: the assembly, on the other hand, proceeded with zeal and firmness, and voted it to be unlawful in the church of Scotland. The parliament also, which sat after the assembly, adopted measures which tended to diminish the civil power of the monarch; and, what probably affected Charles still more, they were proceeding to ratify the acts of assembly, when, by the king's orders, Traquair the commissioner prorogued them. On account of these proceedings, which might have been easily foreseen, war was recommenced the same year.

No sooner had Charles concluded the peace than he found himself obliged to disband his army, on account of his want of money; and, as the soldiers had been held together merely by mercenary views, it was not possible, without great trouble, expense, and loss of time, to reassemble them. On the contrary, the covenanters, in dismissing their troops, had been careful to preserve nothing but the appearance of a pacification. The soldiers were warned not to think the nation secure from an English invasion; and the religious zeal which animated all ranks of men made them immediately fly to their standards, as soon as the trumpet was sounded by their spiritual and temporal leaders. When, in 1640, the king drew an army together, finding himself unable to support them, he was obliged to call a parliament, after an intermission of about eleven years. He pressed them for money, and they insisted on their grievances, till a dissolution ensued. To add to the unpopularity of this measure, the king, notwithstanding his dissolving the parliament, allowed the convocation to sit; a practice of which, since the Reformation, there had been very few examples. Besides granting to the king a supply from the spirituality, the convocation, jealous of innovations similar to those which had taken place in Scotland, imposed an oath on the clergy and the graduates in the universities, by which every one swore to maintain the established government of the church, by archbishops, bishops, deans, chapters, &c. These steps were deemed illegal, because not ratified by consent of parliament; and the oath, containing an &c. in the middle of it, became a subject of general ridicule.

The king, disappointed of parliamentary subsidies, was again obliged to have recourse to expedients. He borrowed money from his ministers and courtiers: who subscribed above £300,000 in a few days. Some vain attempts were made towards forcing a loan from the citizens; but £40,000 was extorted from the Spanish merchants who had bullion in the tower. Coat and conduct money for the soldiery was levied on the counties: an ancient practice, but supposed to be abolished by the petition of right. All the pepper was bought from the East India Company upon trust; and sold, at a great discount, for ready money. A scheme was proposed for coining £200,000 or £300,000 of base money. Such were the extremities to which Charles was reduced. These expedients, however, enabled the king, though with great difficulty, to march his army to the north, consisting of 19,000

foot and 2000 horse. The earl of Northumberland was appointed general, and the earl of Strafford lieutenant-general. A small fleet was thought sufficient for the purposes of this expedition. The Scots, superior in numbers, now marched to the borders of England; but still preserved the most submissive language to the king. At Newburn upon Tyne they were opposed by a detachment of 4500 men under lord Conway, whom they first intreated, with great civility, not to stop them in their march to their gracious sovereign; then attacked them with great bravery, killed several, and routed the rest. Such a panic seized the whole English army, that the forces at Newcastle fled immediately to Durham, and ultimately into Yorkshire. The Scots, continuing to advance, despatched submissive messengers to the king, who was now arrived at York. They even made apologies, full of sorrow and contrition, for their late victory.

Charles was in a very distressed condition; and, to prevent the further advance of the Scots, agreed to a treaty, naming sixteen English noblemen to meet with eleven Scots commissioners at Rippon. Strafford, upon whom, during Northumberland's sickness, the command of the army had devolved, advised Charles rather to put all to hazard than to submit to such unworthy terms as the Scottish chiefs urged. He advised him to push forward and attack them. But this salutary advice Charles had not resolution to follow. He therefore resolved to call a council of the peers; and, as he foresaw that they would advise him to call a parliament, he told them in his first speech that he had already taken that resolution. In order to subvert both armies (for the king was obliged to pay his enemies, in order to preserve the northern counties from pillage), Charles wrote to the city, desiring a loan of £200,000; and the peers at York, whose authority was now much greater than that of their sovereign, joined in the request. The parliament met November 3d, 1640.

Never had the house of commons been observed to be so numerous. That they might strike at once a decisive blow against the court, they began the session with the impeachment of the earl of Strafford. He had governed Ireland, first as deputy and then as lord lieutenant, during eight years, with great vigilance, activity, and prudence, but with very little popularity. His deportment was haughty, rigid, and severe; and the universal discontent of the nation was pointed against him. He had been a leader of opposition, before he became the favorite of the king; and his former associates, finding that he owed his advancement to the desertion of their cause, represented him as the great apostate of the commonwealth, whom it behoved them to sacrifice to public justice. 'You have left us,' said the famous Pym, 'but we shall not leave you while your head is on your shoulders.' From so formidable a combination no individual could be expected to escape. Strafford was impeached, condemned, and at last executed, in 1641. It was not without extreme difficulty that the king could be brought to consent to his execution. He came to the house of lords, where he expressed

his resolution never to employ Strafford again in any public business; but with regard to the treason, for which he was arraigned, he professed himself unable to discover any proofs of it. The commons on this voted it a breach of privilege for the king to take notice of a bill pending before the house; and the house of lords were intimidated, by popular violence, into passing it. The same means were employed to force the king's assent. The populace flocked about Whitehall, and accompanied their demand of justice with the loudest clamors and menaces. Reports of conspiracies, insurrections, and invasions, were spread abroad. On whatever side the king cast his eyes, he saw no resource nor security. All his servants, consulting their own safety rather than their master's honor, declined interposing with their advice between him and his parliament. The queen, terrified at the appearance of so great danger, pressed Charles, with tears, to satisfy his people in this demand, which it was hoped would finally content them. Archbishop Juxon alone had the courage to advise him, if he did not approve of the bill, by no means to consent to it. At last the unfortunate earl, hearing of the king's irresolution and anxiety, wrote to him a letter, in which he desired his own execution in order to give peace to the nation: and Charles granted a commission to four noblemen, in his name, to give the royal assent to the bill. These commissioners he empowered at the same time to give his assent to a bill yet more fatal to himself, viz.: That the present parliament should not be dissolved, prorogued, or adjourned, without their own consent.

By this last act, Charles rendered the power of his enemies perpetual, as it was already uncontrollable. The reason assigned for this extraordinary step was, that the commons, from policy, more than necessity, had embraced the expedient of paying the two armies by borrowing money from the city. These loans they repaid by taxes levied on the people. At last the citizens, either of themselves, or by suggestion, began to mention difficulties with regard to a farther loan. 'We should make no scruple of trusting the parliament,' said they, 'were we certain that the parliament was to continue till our repayment. But, in the present precarious situation of affairs, what security can be given us for our money?' To obviate this, the above-mentioned bill was suddenly brought in, and, having passed both houses with great rapidity, was at last brought to the king; who, being oppressed with grief on account of the unhappy fate of Strafford, did not perceive the pernicious consequence of the bill. All this time the commons had ruled in other respects with uncontrollable sway. Soon after the impeachment of Strafford, Laud was accused of high treason, and committed to custody. To avoid the like fate, lord keeper Finch and secretary Windebank fled, the one into Holland, the other into France. The house now instituted a new species of guilt, termed delinquency: a term first applied to those who had exercised the powers necessary for the defence of the nation during the late military operations. All the magistrates and sheriffs

who had formerly exacted ship-money, though by the king's express command, were now also declared delinquents, as well as the farmers and officers of the customs who had been employed during so many years in levying tonnage, poundage, &c. They were afterwards glad to compound for a pardon, by paying £150,000. Every discretionary or arbitrary sentence of the star-chamber and high commission courts underwent a severe scrutiny; and all those who had concurred in such sentences were voted to be liable to the penalties of law. No minister of the king, no member of the council, but found himself exposed by this determination. The judges who had formerly given sentence against the celebrated Hampden, for refusing to pay ship-money, were accused before the peers, and obliged to find security for their appearance. Berkley, a judge of the king's bench, was seized by order of the house, even when sitting in his tribunal. The sanction of the lords and commons, as well as that of the king, was declared necessary for the confirmation of ecclesiastical canons. Monopolists and projectors, if of the king's party, were now expelled the house; but one Mildmay, a notorious monopolist, was allowed to keep his seat, because he was of the popular party. In short, the constitution was completely new-modelled; and during the first period of the transactions of this remarkable parliament, if we except Strafford's attainder, their merits in other respects so much overbalance their mistakes as to entitle them to very ample praises from all lovers of liberty. Not only were former abuses remedied, and grievances redressed; great provision for the future was made by excellent laws. And if the means by which they obtained such mighty advantages savoured often of artifice, sometimes of violence, it is to be considered, that revolutions of government cannot be effected by mere force of argument and reasoning; and that, factions being once excited, men can neither so firmly regulate the tempers of others, nor their own, as to secure themselves against all excesses. The king had promised to pay a visit this summer to his subjects in Scotland, in order to settle their government; and, though the English parliament was very importunate with him to lay aside the journey, they could not prevail with him so much as to delay it. Having failed in this, they appointed a small committee of both houses to attend him, in order, as was pretended, to see the articles of pacification executed, but really to act as spies upon the king. Endeavours were even used, before Charles's departure, to have a protectorate of the kingdom appointed, with a power to pass laws without having recourse to the royal assent. About this time the king communicated to parliament his intention of concluding the marriage of the princess Mary with William prince of Orange, and the houses adjourned from September 9th to October 20th, 1641.

Charles arrived in Scotland August 14th, 1641, with a design to give full satisfaction, if possible, to this restless kingdom. The bench of bishops and lords of articles were at once abolished; it was ordained that no man should be created a Scottish peer who did not possess

10,000 merks (above £500) annual rent in the kingdom; a law for triennial parliaments was likewise enacted; and it was ordained, that the last act of every parliament should be to appoint the time and place for holding the parliament next ensuing: the king was also deprived of the power, formerly exercised, of issuing proclamations which enjoined obedience under the penalty of treason. But the most fatal blow to the royal authority, and what in a manner dethroned the king, was an article, that no member of the privy council, in whose hands, during the king's absence, the whole administration lay, no officer of state, nor any of the judges, should be appointed but by advice and approbation of parliament. Charles even agreed to deprive of their seats four judges who had adhered to his interests; and their place was supplied by others more agreeable to the ruling party. Several of the covenanters were also sworn of the privy council, and all the ministers of state, counsellors, and judges, were, by law, to hold their places during life or good behaviour. The king, while in Scotland, conformed himself to the established church; he bestowed pensions and preferments on Henderson, Gillespy, and other popular preachers; and practised every art to soften, if not to gain, his greatest enemies. But, though Charles was thus obliged to heap favors on his enemies and overlook his friends, the former were not satisfied, believing all he did to proceed from artifice and necessity; while some of the latter were disgusted, and thought themselves ill rewarded for their past services. Argyle and Hamilton, being seized with an apprehension, real or apprehended, that the earl of Crawford and others meant to assassinate them, left the parliament suddenly, and retired into the country: but, upon invitation and assurances of safety, returned in a few days. This event, which in Scotland had no visible consequence, was commonly denominated the incident; which, though it had no particular effect in Scotland, was attended with very serious consequences in England. The English parliament insinuated to the people, that the malignants (so they called the king's party) had laid a plot at once to murder them and all the godly in both kingdoms. They applied therefore to Essex, whom the king had left general of the south of England; and ordered a guard to attend them. In the mean time a most dangerous rebellion broke out in Ireland, with circumstances of unparalleled horror and bloodshed. The native Irish, by the wise conduct of James, had been fully subdued, and proper means taken for securing their dependence and subjection; but their animosity against the English still remained, and only wanted an opportunity to exert itself. This they obtained from the weak condition to which Charles was reduced, and it was made use of in the following manner:—More, a gentleman descended from an ancient Irish family, but of narrow fortune, having formed the project of expelling the English, and asserting the independency of his native country, went secretly from chieftain to chieftain, to rouse up the principles of discontent. He maintained a close correspondence with lord Macguire and Sir Phelim

O'Neale, the most powerful of the old Irish; and by his persuasions soon engaged not only them, but the most considerable persons of the nation, in a conspiracy; in which it was hoped the English of the pale, as they were called, or the English planters, being all Catholics, would afterwards join. Their plan was, that Sir Phelim O'Neale, and the other conspirators, should proclaim the independence of Ireland on a given day throughout the provinces, and that, on the same day, lord Macguire and Roger More should surprise the castle of Dublin. They fixed on the beginning of winter for the commencement of this revolt; that there might be more difficulty in transporting forces from England. Succours to themselves, and supplies of arms, they expected from France, in consequence of a promise made them by cardinal Richelieu; and many Irish officers, who had served in the Spanish army, had given assurances of their concurrence, as soon as they saw an insurrection entered upon by their Catholic brethren. News, which every day arrived from England, of the measures of the commons against all papists, stimulated the conspirators to execute their fatal purpose, and assured them of the concurrence of their countrymen. Such a propensity was discovered in all the Irish to revolt, that it was deemed unnecessary as well as dangerous to trust the secret in many hands; and, though the day appointed drew nigh, no discovery had yet been made to government. The king, indeed, had received information from his ambassadors, that something was in agitation among the Irish in foreign parts; but, though he gave warning to the administration in Ireland, the intelligence was discredited. The English were awakened from their security only the day before the commencement of hostilities. The castle of Dublin, by which the capital was commanded, contained arms for 10,000 men, with thirty-five pieces of cannon, and a proportionable quantity of ammunition. Yet was this important place guarded by no greater force than fifty men. Macguire and More were already in town with a numerous band of their retainers; others were expected that night; and next morning they were to enter upon what they esteemed the easiest of all enterprises, the surprisal of the castle. O'Connellly, however, an Irish protestant, discovered the conspiracy. The justices and council fled immediately to the castle, and reinforced the guards: the city was alarmed, and all the Protestants prepared for defence. More escaped, but Macguire was taken; and Mahon, one of the conspirators, being likewise seized, first discovered to the justices the project of a general insurrection. But though O'Connellly's discovery saved the castle, Mahon's confession came too late to prevent the insurrection. O'Neale and his confederates had already taken arms in Ulster. The houses, cattle, and goods of the English were first seized. Those who heard of the commotions in their neighbourhood, instead of deserting their habitations, and assembling together for mutual protection, remained at home in hopes of defending their property: and thus fell separately into the hands of their enemies. A universal massacre now commenced, accompanied with circumstances of un-

equalled barbarity. No age, sex, or condition, was spared. All connexions were dissolved, and death was often dealt by that hand from which protection was implored and expected. The tortures which wanton cruelty only could devise, the most lingering pains of body, and anguish of mind, could not satiate revenge the most extreme, excited without injury, and active without intermission. Such enormities, in short, were committed, that, if not attested by undoubted evidence, they would appear incredible. If any where a number assembled together, and resolved to oppose the assassins, they were disarmed by capitulations and promises of safety, confirmed by the most solemn oaths. But no sooner had they surrendered than the rebels, with a perfidy equal to their cruelty, made them share the fate of their unhappy countrymen. Others tempted their prisoners, by the fond love of life, to imbrue their hands in the blood of friends, brothers, or parents; and, having thus rendered them accomplices in their own guilt, gave them that death which they sought to shun by deserving it. Such were the barbarities by which Sir Phelim O'Neale, and the Irish in Ulster signalled their rebellion. More, shocked at the recital of these enormities, flew to O'Neale's camp; but found that his authority, which was sufficient to excite the Irish to a rebellion, was too feeble to restrain their inhumanity. Soon after, he abandoned the cause, and retired to Flanders. From Ulster the flames of discord spread over the other three provinces. In all places death and slaughter were common; though the Irish in the other provinces pretended to act with moderation and humanity. But even here cruel and barbarous was their humanity! Not content with expelling the English from their houses, they often stripped them of their clothes, and turned them out naked and defenceless to all the severities of the season. By some computations, those who perished by these various cruelties amounted to 150,000, or 200,000; but, by the most moderate, they could not have been less than 50,000. The English of the pale at first condemned the insurrection, and appeared to detest the barbarity with which it was accompanied. By their protestations and declarations they engaged the justices to supply them with arms, which they promised to employ in defence of government. But the interests of their intolerant religion were soon found to be more prevalent over them than duty to their country. They chose lord Gormonstone their leader; and, joining the Irish, rivalled them in every act of cruelty towards the English Protestants. Besides many smaller bodies, dispersed over the kingdom, the rebels had a main army amounting to 20,000 men, which now threatened Dublin with immediate siege; and both the English and Irish rebels pretended authority from the king and queen, but especially the latter, for their insurrection. They affirmed that the cause of their taking arms was to vindicate the royal prerogative, invaded by the puritanical parliament: and Sir Phelim O'Neale, having found a royal patent in the house of lord Caulfield, whom he had murdered, tore off the seal, and affixed it to a commission which he had forged.

Charles received intelligence of this insurrection while in Scotland, and immediately acquainted the parliament with it. He hoped, as there had all along been such an outcry against Popery, that now, when that religion was appearing in its blackest colors, the nation would vigorously support him in the suppression of it. But here he found himself mistaken. The Scots already considering themselves as a republic, and conceiving hopes from the present distresses of Ireland, resolved to make an advantageous bargain for the succours with which they should supply. Except, therefore, despatching a small body of forces, to support their colonies in Ulster, they would go no farther than to send commissioners to London, in order to treat with the parliament. The king, too, sensible of his utter inability to subdue the Irish rebels, found himself obliged, in this exigency, to have recourse to the English parliament, and depend on their assistance. He told them that the insurrection was not, in his opinion, the result of any rash enterprise, but of a formed conspiracy against the crown. To their care and wisdom, therefore, he said, he committed the conduct and prosecution of the war, which, in a cause so important to national and religious interests, must of necessity be immediately entered upon. But the parliament, now re-assembled, discovered in every vote the same dispositions in which they had separated. Nothing less than a total abolition of monarchy seemed resolved upon. This project, however, it had not been in the power of the popular leaders to have executed, had it not been for the ardor of the nation for the presbyterian discipline. By the difficulties and distresses of the crown, the commons, who alone possessed the power of supply, had aggrandised themselves; and it seemed fortunate for their interests that the Irish rebellion had succeeded, at such a critical juncture, to the pacification in Scotland. The concession of the king, by which he committed to them the care of Ireland, they immediately laid hold of, and interpreted in the most unlimited sense: assuming the sovereignty of that country fully and entirely. While they pretended the utmost zeal against the insurgents, however, they took no steps for their suppression, but such as likewise gave them the superiority in those commotions, which they foresaw must be soon excited in England. They levied money under pretence of the Irish expedition, but reserved it for purposes which concerned them more nearly: they took arms from the king's magazines, but still kept them with a secret intention of making use of them against himself: whatever law they deemed necessary, for aggrandising themselves, they voted, under color of enabling them to recover Ireland; and, if Charles withheld his royal assent, the refusal was imputed to those pernicious counsels, which at first excited to Popish rebellion, and which still threatened total ruin, as they declared, to the Protestant interest. So strong was the people's attachment to the commons, that no fault was imputed to those pious zealots, whose votes breathed nothing but death and destruction to the Irish rebels. The conduct of the parliament towards the king himself became in the mean time

exceedingly cruel. It was thought proper to frame a general remonstrance on the state of the kingdom; and accordingly the committee, which at the first meeting of the parliament had been chosen for that purpose, were commanded to finish their undertaking. The king returned from Scotland, November 25th, 1641. He was received in London with the shouts of the populace, and every demonstration of public regard. Sir Richard Gournay, lord mayor, a man of great merit and influence, had promoted these dispositions. But the remonstrance of the commons soon awoke him to their bold designs. The bad counsels which he followed were complained of; his concurrence in the Irish rebellion plainly insinuated; 'the scheme laid for the introduction of popery and superstition' was inveighed against; and, for a remedy to all these evils, the king was desired to entrust important offices and commands to persons in whom his parliament should have cause to confide. To this remonstrance Charles was obliged to make a civil reply, notwithstanding his subjects had transgressed all bounds of respect in their treatment of him. It would be tedious to point out every invasion of the prerogative, now attempted and carried by the commons. Finding themselves at last likely to be opposed by the peerage, they openly told the upper house, that 'they themselves were the representatives of the great body of the kingdom, and that the peers were nothing but individuals, who held their seats in a particular capacity; and, therefore, if their lordships would not consent to acts necessary for the preservation of the people, the commons, together with such of the lords as were more sensible of the danger, must join together, and represent the matter to his majesty.' Every method of alarming the people was now put in practice. The commons affected continual fears of destruction. They excited the people by never ceasing enquiries after conspiracies, reports of insurrections, and feigned intelligence from abroad, against Papists and their adherents. When Charles dismissed the guard, which they had ordered during his absence, they complained; and, upon his promising them a new one, under the command of the earl of Lindesay, they absolutely refused the offer: on the other hand, they ordered halberds to be brought into the hall where they assembled, and thus armed themselves against those conspiracies with which they said they were hourly threatened. Several reduced officers, and young gentlemen of the inns of court, during this time of distress and danger, offered their service to the king. Between them and the populace there often passed skirmishes, which ended not without bloodshed. By way of reproach, these gentlemen gave the populace the name of Round-heads, on account of their short cropt hair; while they distinguished the others by the name of Cavaliers. And thus the nation, which was before sufficiently provided with religious as well as civil causes of quarrel, was also supplied with party names, under which the factions might signalise their mutual hatred. These tumults continued to increase about Westminster and Whitehall. The cry continually resounded against bishops and

rotten-hearted lords. The former, especially, being easily distinguishable by their habit; and being the object of violent hatred to all the secretaries, were exposed to the most dangerous insults. The archbishop of York, having been abused by the populace, hastily called a meeting of his brethren. By his advice a protestation was drawn up, and addressed to the king and the house of lords. The bishops there set forth, that though they had an undoubted right to sit and vote in parliament, yet, in coming thither they had been menaced, assaulted, and affronted, by the unruly multitude, and could no longer with safety attend their duty in the house. For this reason they protested against all laws, votes, and resolutions, as null and invalid, which should pass during the time of their forced absence. This protestation, which, though just and legal, was certainly ill-timed, was signed by twelve bishops, and communicated to the king, who hastily approved it. As soon as it was presented to the lords, that house desired a conference with the commons, whom they informed of this unexpected protestation. The opportunity was seized with joy and triumph. An impeachment of high treason was immediately sent up against the bishops, as endeavouring to subvert the fundamental laws, and to invalidate the authority of the legislature. They were now, therefore, dismissed from parliament, and committed to custody; no man in either house venturing to speak a word in their vindication. This was a fatal blow to the royal interest; but it was soon to receive a much greater from the imprudence of the king himself. Charles had long suppressed his resentment, and strove earnestly to gratify the commons by the greatness of his concessions; but, finding that all this had but increased their demands, he could no longer bow to them. He gave orders to Herbert, the attorney-general, to enter an accusation of high treason, in the house of peers, against lord Kimbolton, one of the most popular men of his party, together with five commoners, Sir Arthur Haslerig, Hollis, Hampden, Pym, and Strode. The articles were, that they had traitorously endeavoured to subvert the fundamental laws and government of the kingdom, to deprive the king of his regal power, and to impose on his subjects an arbitrary and tyrannical authority; that they had invited a foreign army to invade the kingdom; that they had aimed at subverting the very right and being of parliaments; and actually raised and countenanced tumults against the king. Men had scarcely leisure to wonder at the precipitancy and imprudence of this impeachment, when they were astonished by another measure still more rash and unsupported. A serjeant at arms, in the king's name, demanded of the house the five members, and was sent back without any positive answer. This was followed by a conduct still more extraordinary. The next day the king himself entered the house of commons alone, advancing through the hall, while all the members stood up to receive him. The speaker withdrew from his chair, and the king took possession of it. Having seated himself, and looked round him for some time, he told the house, that he was sorry for the occasion that

forced him thither; that he was come in person to seize the members whom he had accused of high treason, seeing they would not deliver them up to his serjeant at arms. Then addressing himself to the speaker, he desired to know whether any of them were in the house; but the speaker falling on his knees, replied, that he had neither eyes to see, nor tongue to speak, in that place, but as the house was pleased to direct him; and he asked pardon for being able to give no other answer. The king sat for some time, to see if the accused were present; but they had escaped a few minutes before his entry. Thus disappointed, perplexed, and not knowing on whom to rely, he next proceeded amidst the invectives of the populace, who continued to cry out, 'Privilege! privilege!' to the common council of the city, and made his complaint to them. The common council answered his complaints by a contemptuous silence; and, on his return, one of the populace, more insolent than the rest, cried out, 'To your tents, O Israel!' a watch word among the Jews, when they intended to abandon their princes. The commons assembled the next day, when they professed the greatest alarm: and passed a unanimous vote, that the king had violated their privileges, and that they could not assemble again in the same place, till they should obtain satisfaction. The king had retired to Windsor, and thence he wrote to the parliament, making every concession, and promising every satisfaction in his power. But they were resolved to accept of nothing, unless he would discover his advisers in that illegal measure; a condition to which, they knew, that, without rendering himself for ever contemptible, he could not possibly submit. The commons had already stripped the king of almost all his privileges; the bishops were fled, the judges were intimidated; it now only remained, after securing the church and the law, that they should get possession of the sword also. The power of appointing governors and generals, and of levying armies, was still a remaining prerogative of the crown. Having therefore first magnified their terrors of Popery, which perhaps they actually dreaded, they proceeded to petition that the tower might be put into their hands; and that Hull, Portsmouth, and the fleet, should be intrusted to persons of their choosing:—requests, the complying with which subverted what remained of the constitution; however, such was the necessity of the times, that they were first contested, and then granted. At last the commons desired to have a militia, raised and governed by such officers and commanders as they should nominate, under pretence of securing them from the Irish Papists, of whom they were under great apprehension. Charles now ventured to put a stop to his concessions. He was then at Dover, attending the queen and the princess of Orange, who thought it prudent to leave the kingdom. He replied to the petition, that he had not now leisure to consider a matter of such great importance; and therefore would defer an answer till his return. But the commons alleged, that the dangers and distempers of the nation were such as could endure no longer delay; and unless the king should speedily comply with

their demands, they would be obliged, both for his safety, and that of the kingdom, to embody a militia by the authority of both houses. In their remonstrances to the king, they desired even to be permitted to command the army for an appointed time; which so exasperated him, that he exclaimed, 'No, not for an hour.' This answer broke off the treaty; and both sides resolved to have recourse to arms. Charles, taking the prince of Wales with him, retired to York, where he found the people more loyal, and his cause supported by a more numerous party than he had expected. The queen, who was in Holland, was also making successful levies of men and ammunition, by selling the crown jewels. But, before war was openly declared, a negotiation was carried on, with a design to please the people. The parliament sent the king the conditions on which they were willing to come to an agreement. Their demands were contained in nineteen propositions, and amounted to almost a total surrender of monarchical authority. They required that no man should remain in the council who was not agreeable to parliament; that no deed of the king's should have validity unless it passed the council, and was attested under their hand; and that all the officers of state should be chosen with consent of parliament; that none of the royal family should marry without consent of parliament or council; that the laws should be executed against Catholics; that the votes of popish lords should be excluded; that the reformation of the liturgy and church government should take place according to the advice of parliament; that the ordinance with regard to the militia should be submitted to; that the justice of parliament should pass upon all delinquents; that a general pardon should be granted, with such exceptions as should be advised by parliament; that the forts and castles should be disposed of by consent of parliament; and no peer made but with consent of both houses. War on any terms was esteemed by the king, and all his counsellors, preferable to so ignominious a peace. Charles accordingly resolved to support his authority by force of arms. 'His towns,' he said, 'were taken from him; his ships, his army, and his money: but there still remained to him a good cause, and the hearts of his loyal subjects; which, with God's blessing, he doubted not, would recover all the rest.' Collecting, therefore, some forces, he advanced southwards, and erected the royal standard at Nottingham.

The king found himself supported in the civil war, which now ensued, by the nobility and principal gentry; who, dreading a total confusion of rank, from the fury of the populace, enlisted themselves under the banner of the monarch. The concurrence of the bishops and the church also increased the adherents of the king; but, it must be added, that the high monarchical doctrine so much inculcated by the clergy, had done him much ill. The majority of the nobility and gentry, who now attended him, breathed the spirit of liberty as well as of loyalty: and, in the hopes of his submitting to a limited and legal government, they were willing to sacrifice their lives and fortunes. On the

other hand, the city of London, and most of the great corporations, took part with the parliament; and adopted with zeal those democratical principles on which these assemblies were founded. The example of the Dutch commonwealth too, where liberty had so happily supported industry, made the commercial part of the nation desirous to see a similar form of government in England. At first every advantage seemed to lie against the royal cause. The king was totally destitute of money. London, and all the sea-ports, except Newcastle, being in the hands of parliament, they were secure of a considerable revenue; and, the seamen naturally following the disposition of the ports to which they belonged, they had also the entire dominion of the sea. All the magazines of arms and ammunition they also seized; and their fleet intercepted the greatest part of those sent by the queen from Holland.

The king, in order to arm his followers, was obliged to borrow the weapons of the trained bands, under promise of restoring them as soon as peace should be settled; and the rank and quality of his adherents gave the king some hopes of compensation for all the advantages possessed by his adversaries. More bravery and activity were expected from the nobles and gentry, than from the multitude. And as the landed gentlemen, at their own expense, levied and armed their tenants, besides their attachment to their masters, greater courage and exertions were to be expected from these rustic troops, than from the vicious and enervated populace of cities. Had the parliamentary forces, however, exerted themselves at first, they might have easily dissipated the small number the king had been able to collect, and which amounted to no more than 800 horse, and 300 foot; while his enemies were within a few days' march of him with 6000 men. In a short time the parliamentary army were ordered to march to Northampton; and the earl of Essex, who had joined them, found the whole to amount to 15,000. The king's army too was increased from all quarters; but still, having no force capable of coping with the parliamentarians, he thought it prudent to retire to Derby, and thence to Shrewsbury, to countenance the levies which his friends were making in those parts. At Wellington, a day's march from Shrewsbury, he caused his orders to be read at the head of every regiment. He here protested solemnly before his whole army, that he would maintain the Protestant religion according to the church of England; that he would govern according to the known statutes and customs of the kingdom; and, particularly, that he would observe inviolably the laws to which he had given his consent during this parliament, &c. While Charles lay at Shrewsbury, he received the news of an action, the first which had happened in this contest, and wherein his party was victorious. On the appearance of commotions in England, the princes Rupert and Maurice, sons of the unfortunate elector-palatine, had offered their services to the king; and the former at that time commanded a body of horse which had been sent to Worcester to watch the motions of Essex, who was marching towards that city. No sooner

had the prince arrived, than he saw some cavalry of the enemy approaching the gates. Without delay he briskly attacked them, as they were defiling from a lane, and forming themselves. Colonel Sandys, their commander, was killed, the whole party routed, and pursued above a mile.

In 1642, October 23d, a general engagement took place at Edgehill, in which, though the royalists were at first victorious, their impetuosity lost the advantage they had gained; and 5000 men were found dead on the field of battle. Soon after the king took Banbury and Reading; and defeated two regiments of the enemy at Brentford, taking 500 prisoners. Thus ended the campaign of 1642; in which, though the king had the advantage, yet the parliamentary army had increased to 24,000 men, and was much superior to his; notwithstanding which they offered terms of peace.

In 1643, the treaty was carried on, but without any cessation of hostilities; and indeed the negotiation went no farther than the first demand on each side; for the parliament, finding no probability of coming to an accommodation, suddenly recalled their commissioners. On the 27th April, Reading surrendered to the parliamentary forces under the earl of Essex, who commanded a body of 18,000 men. The earl of Northumberland united in a league for the king the counties of Northumberland, Cumberland, Westmoreland, and the bishopric; and some time after engaged other counties in the same association. He also took possession of York, and dislodged the forces of the parliament at Tadcaster, but his victory was not decisive. Other advantages were also gained by the royalists; the most important of which was in the battle of Stratton, where the poet Waller, who commanded the parliamentary army, was entirely defeated, and forced to fly with only a few horse to Bristol. This happened on the 13th July; and was followed by the siege of that city, which surrendered to prince Rupert on the 25th of the same month. Such a tide of success on the part of the royalists had greatly dispirited the opposite party; and such confusion now prevailed at London, that some proposed to the king to march directly to that city, and thus put an end to the civil disorders at once. This advice, however, was rejected, and it was resolved first to reduce Gloucester, in consequence of which the king would have the whole course of the Severn under his command. The siege of that city commenced August 10; but being defended by Massey, a resolute governor, and well garrisoned, it made a vigorous defence. The consternation in London, however, was as great as if the enemy had been already at their gates; and, in the midst of the general confusion, a design was formed by Waller of forcing the parliament to accept of some reasonable conditions of peace. This design he imparted to some others; but, a discovery being made of their proceedings, he and two of his coadjutors were condemned to death. Waller, however, escaped with a fine of £10,000. The city of Gloucester in the mean time was reduced to the utmost extremity; and the parliament, as their last resource, despatched Essex with an army of 14,000 men, in order to raise the siege. This he accomplished; and when he

entered, found only one barrel of gunpowder left and other provisions in the same proportion. On his return to London, he was intercepted by the king's army, with whom a desperate battle ensued at Newbury, which lasted till night. Though the victory was left undecided, Essex next morning proceeded on his march, and reached London in safety. The king followed him; and having taken possession of Reading after the earl left it, he there established a garrison. During this summer, the earl, now marquis of Newcastle, had raised a considerable force for the king in the north; and great hopes of success were entertained from that quarter. There appeared, however, in opposition to him, two men on whom the event of the war finally depended, and who began about this time to be remarked for their valor and military conduct. These were Sir Thomas Fairfax, son to the lord of that name; and Oliver Cromwell. The former gained a considerable advantage over the royalists at Wakefield, and took general Goring prisoner; the latter obtained a victory at Gainsborough over a party commanded by the gallant Cavendish, who perished in the action. But both these defeats were more than compensated by the total rout of lord Fairfax at Atherton Moor, and the dispersion of his army, which happened on the 31st of July. After this victory the marquis of Newcastle sat down before Hull, with an army of 15,000 men; but afterwards thought proper to raise the siege. About the same time, Manchester, who advanced from the eastern associated counties, having joined Cromwell and young Fairfax, obtained a considerable victory over the royalists at Horn Castle. See CROMWELL. The king's party, however, still remained much superior in those parts of England; and had it not been for the garrison of Hull, which kept Yorkshire in awe, a conjunction of the northern forces with the army in the south, might have been made.

The battle of Newbury was attended with such loss on both sides, that it put an end to the campaign of 1643, by obliging both parties to retire into winter quarters. The event of the war being now very doubtful, both the king and parliament began to look for assistance from other nations. The former cast his eyes on Ireland, the latter looked to Scotland. At the commencement of the dissensions, the parliament of England had invited the Scots to interpose their mediation, which they knew would be very little favorable to the king, and which for that reason he had declined. Early in the spring of 1643 this offer of mediation had been renewed, with no better success. The parliament, being now in great distress, sent commissioners to Edinburgh, to treat of a more close confederacy with the Scottish nation. The person they principally trusted to on this occasion was the eloquent and able Sir Henry Vane. By his advice was framed at Edinburgh the solemn league and covenant: which exceeded all former protestations and vows taken in both kingdoms, and long maintained its credit and authority. See COVENANT.

Great were the rejoicings among the Scots, that they should be the happy instruments of extending their mode of religion, and dissipating the profound darkness in which the neighbouring

ations were involved. Being determined that the sword should carry conviction to all refractory minds, they acceded to the English proposals; and prepared with great vigilance and activity for military enterprises; so that, having added to their other forces the troops which they had recalled from Ireland, they were ready about the end of the year to enter England, under their old general the earl of Leven, with an army of above 20,000 men. The king, in the interim, concluded a cessation of arms with the Irish rebels, and recalled a considerable part of his army from Ireland. Some Irish Catholics came over with these troops, and joined the royal army, where they continued the same cruelties and disorders to which they had been accustomed. The parliament now voted, therefore, that no quarter in any action should be given them. But prince Rupert, by making some reprisals, soon repressed this inhumanity.

The campaign of 1644 proved at first favorable to the royal cause, though afterwards quite the reverse. The Irish forces besieged and took the castles of Ilwarden, Beeston, Acton, and Deddington House. No place in Cheshire or the neighbourhood now adhered to the parliament, except Nantwich; and to this place Biron laid siege in the depth of winter. Sir Thomas Fairfax, alarmed at his progress, assembled an army of 4000 men in Yorkshire; and, having joined Sir William Brereton, attacked the camp of the royalists:—when the swelling of the river by a thaw divided their army. That part exposed to Fairfax, being beat from their post, retired into the church of Acton, where they were all taken prisoners. The other retreated with precipitation; and thus was dissipated the whole body of forces which had come from Ireland. This happened on the 25th of January; and, on the 11th of April, colonel Bellasis was totally defeated at Selby in Yorkshire, by Sir Thomas Fairfax, who had returned from Cheshire. Being afterwards joined by lord Leven, the two generals sat down before York; but, being unable to invest that city completely, they contented themselves with incommoding it by a loose blockade. Hopeton, having assembled a body of 14,000 men, endeavoured to break into Sussex and Kent, but was defeated by Waller at Cheriton. At Newark, however, prince Rupert totally defeated the parliamentary army which besieged that place; and thus preserved the communication open between the king's northern and southern forces. Manchester on the other hand, having taken Lincoln, had united his army to that of Leven and Fairfax; and reduced York to the last extremity. At this time prince Rupert, having joined Sir Charles Lucas who commanded Newcastle's horse, hastened to its relief with an army of 20,000 men; when the Scots and parliamentary generals raised the siege, and drew up on Marston Moor. The prince, hurried on by his natural impetuosity, gave immediate orders for fighting. The battle it is well known (see CROMWELL) was lost, the royal army entirely pushed off the field, and the train of artillery taken. Immediately after this, the marquis of Newcastle left the kingdom, prince Rupert retired into Lancashire, York was surrendered in a few days, and Newcastle taken by storm.

On the 27th of October another battle was fought at Newbury, in which the royalists were worsted, but soon after retrieved their honor at Dennington Castle, which finished the campaign of 1644.

In 1645 a negotiation was again set on foot, and the commissioners met at Uxbridge on the 30th of January; but it was soon found impossible to come to any agreement. The demands of the parliament were exorbitant; and even these their commissioners owned to be nothing but preliminaries. The king was required to attain, and except from a general pardon, forty of the most considerable of his English subjects, and nineteen of his Scots, together with all the popish recusants who had borne arms for him. It was insisted that forty-eight more, with all the members of either house who had sat in the parliament called by the king at Oxford, and all lawyers and divines who had embraced the king's party, should be rendered incapable of any office, be prohibited from coming within the verge of the court, and forfeit the third of their estates to the parliament. Whoever had borne arms for the king was also to forfeit the tenth of their estates, or, if that did not suffice, the sixth, for the payment of the public debts. It was also demanded that the court of wards should be abolished; that all the considerable officers of the crown, and all the judges should be appointed by parliament; and that the right of peace and war should not be exercised without their consent. A little before the commencement of this fruitless treaty, the parliament, to show their determined resolution to proceed in the same haughty method in which they had begun, brought archbishop Laud to the block.

While the king's affairs thus went to ruin in England, they seemed to revive a little in Scotland, through the conduct and valor of the earl of Montrose, a young nobleman newly returned from his travels. He had been introduced to the king, but, not meeting with an agreeable reception, had gone over to the covenanters, and been active in forwarding all their violence. Being commissioned, however, by the Tables, to wait upon king Charles, while the army lay at Berwick, he was so gained by the caresses of that monarch, that he thenceforth devoted himself entirely, though secretly, to his service. For attempting to form an association in favor of the royal cause, Montrose was quickly thrown into prison; but, being again released, he found the king ready to give ear to his counsels, which were of the boldest and most daring kind. The defeat at Marston Moor had left him no hopes of any succours from England; he was therefore obliged to stipulate with the earl of Artrium, a nobleman of Ireland, for some supply of men from that country. And he himself having used various disguises, and passed through many dangers, arrived in Scotland, where he lay for some time concealed in the borders of the Highlands. The Irish did not exceed 1100 foot, very ill armed. Montrose immediately put himself at their head; and, being joined by 1300 Highlanders, attacked lord Elcho, who lay at Perth with 6000 men, utterly defeated him, and killed 2000 of the covenanters. He next marched northwards, to rouse again the marquis of Huntly

and the Gordons, who had taken arms before, but had been suppressed by the covenanters. For other particulars of his brilliant career, see *Montrose*.

We need here only add that having prevailed in many battles, which his vigor always rendered as decisive as they were successful, he prepared for marching into the southern provinces, in order to put a total period to the power of the covenanters, and disperse the parliament, which with great pomp and solemnity they had ordered to meet at St. Johnstone's.

Fairfax, or rather Oliver Cromwell under his name, employed himself meanwhile in bringing in a new model into the parliamentary army, and never surely was a more singular army established. To the greatest number of the regiments chaplains were not appointed. The officers assumed the spiritual duty, and united it with their military functions. During the intervals of action, they occupied themselves in sermons, prayers, and exhortations. Rapturous ecstasies supplied the place of study and reflection; and, while the zealous devotees poured out their thoughts in unpremeditated harangues, they mistook that eloquence, which to their own surprise, as well as that of others, flowed in upon them, for divine illuminations. Wherever they were quartered, they excluded the minister from his pulpit, and conveyed their sentiments to the audience with all the authority that followed their power, their valor, and their military exploits. Even private soldiers were seized with the same spirit: and an army of devotees paraded the country. The parliament also greatly increased their popularity at this time, passing an act called the self-denying ordinance, viz. that no member of their house should have a command in the army. The royalists ridiculed this fanaticism of the parliamentary armies, without being sensible how much reason they had to dread it. They were at this time equal, if not superior, in numbers to their enemies; but so licentious, that they were become as formidable to their friends as their foes. The natural consequence was, that equal numbers of the king's forces, could no longer maintain their ground against those of the parliament. This appeared in the decisive battle of Naseby, June 4th, 1645, where the forces were nearly equal; but, after an obstinate engagement, Charles was entirely defeated; 500 of his officers and 4000 private men made prisoners; all his artillery and ammunition taken, and his infantry totally dispersed; so that no victory could be more complete.

Charles, after this battle, retired first to Hereford, then to Abergavenny; and remained some time in Wales, in the vain hope of raising a body of infantry. Fairfax on the 17th of June retook Leicester. On the 10th of July he raised the siege of Taunton; and the royalists retired to Lampport, an open town in the county of Somerset. Here they were attacked by Fairfax, and beat from their post, with the loss of 300 killed and 1400 prisoners. This was followed by the loss of Bridgewater, which that commander took three days after; making the garrison, to the number of 2600 men, prisoners

of war. He then reduced Bath and Sherborne; and, on the 11th of September, Bristol was surrendered by prince Rupert, though a few days before he had boasted in a letter to Charles, that he would defend the place for four months. This so enraged the king, that he immediately recalled all the prince's commissions, and sent him a pass to go beyond sea. The Scots in the mean time, having made themselves masters of Carlisle after an obstinate siege, marched southwards and invested Hereford; but were obliged to raise the siege on the king's approach; and this was the last glimpse of success that attended his arms. Having marched to the relief of Chester, which was anew besieged by the parliamentary forces under colonel Jones, his rear was attacked by Pointz, and an engagement immediately ensued. While the fight was continued with great obstinacy, and victory seemed to incline to the royalists, Jones fell upon them from the other side, and defeated them with the loss of 600 killed and 1000 taken prisoners. The king with the remains of his army fled to Newark; and thence to Oxford, where he shut himself up during the winter. After the surrender of Bristol, Fairfax and Cromwell having divided their forces, the former marched westwards to complete the conquest of Devonshire and Cornwall; the latter attacked the king's garrisons east of Bristol. At last news arrived that Montrose himself, after some more successes, was defeated; and thus the last hope of the royal party was destroyed. Nothing could be more affecting than the situation in which the king now found himself. He resolved to grant the parliament their own terms, and sent them repeated messages to this purpose, but they did not deign to make him any reply. At last, after reproaching him with the blood spilt during the war, they told him that they were preparing some bills, to which, if he would consent, they would then be able to judge of his pacific inclinations. Fairfax, in the meantime, was advancing with a victorious army to lay siege to Oxford; and Charles, rather than submit to be taken captive and led in triumph by his insolent English subjects, resolved to give himself up to the Scots, who had never testified such implacable animosity against him, and to confide himself to their loyalty. Passing by various cross-roads, he arrived in company with only two persons, Dr. Hudson and Mr. Ashburnham, at the Scots camp before Newark, and discovered himself to lord Leven their general. The reception he met with was such as might be expected from a set of men more influenced by bigotry, than the principles of honor or humanity. Instead of endeavouring to alleviate the distresses of their sovereign, they suffered him to be insulted by their clergymen, and immediately sent an account of his arrival to the English parliament. The Scots thought this a proper time for the recovery of the arrears due to them by the English. A considerable sum of money was really due to them, and they probably claimed more. At last, after various debates between them and the parliament, it was agreed, that, upon payment of £400,000, the Scots, to their everlasting disgrace, should deliver up the king to his enemies. The

general assembly piously pronounced, that as he refused to take the covenant which was pressed on him, it became not the godly to concern themselves about his fortune. The king, therefore, being delivered over to the English commissioners, was conducted under a guard to Holdenby in the county of Northampton; his ancient servants being dismissed, and he himself debarred from all visits, and communications with his family and friends.

But when the civil war was thus terminated, the parliament soon found themselves in the same situation to which they had reduced the king. The majority of the house were Presbyterians, but the majority of the army were Independents. The former, soon after the retreat of the Scots, seeing every enemy reduced, proposed to disband a considerable part of the army, and send the rest over to Ireland. This was by no means relished, and Cromwell took care to heighten the disaffection. Instead of preparing to disband, therefore, the soldiers resolved to petition; and they began by desiring an indemnity, ratified by the king, for any illegal actions which they might have committed during the war. The commons voted that this petition tended to introduce mutiny, &c.; and threatened to proceed against the promoters of it as enemies to the state. The army, therefore, began to set up for themselves. In opposition to the parliament at Westminster, a military parliament was formed. The principal officers formed a council to represent the body of peers; the soldiers elected two men out of each company to represent the commons, and thus was formed the celebrated body of agitators of the army. See AGITATORS and CROMWELL. The new parliament soon found many grievances to be redressed; and specified some of the most considerable. The commons were obliged to yield to every request, and the demands of the agitators rose in proportion. The commons accused the army of mutiny and sedition; the army retorted the charge, and alleged that the king had been deposed only to make way for their usurpations. Cromwell, in the mean time, who secretly conducted all the measures of the army, while he exclaimed against their violence, resolved to seize the king's person. Accordingly a party of 500 horse appeared at Holmby Castle, under the command of one Joyce, originally a tailor, but now a cornet; and by this man was the king conducted to the army, who were hastening to their rendezvous at Triplo Heath near Cambridge. Next day Cromwell arrived among them, where he was received with acclamations of joy, and immediately invested with the supreme command. The commons now saw the design of the army; but it was too late: resistance was become vain: Cromwell advanced with precipitation, and was in a few days at St. Alban's. Even submission was now useless; the army still rose in their demands, in proportion as these demands were gratified, till at last they claimed a right of modelling the whole government, and settling the nation. Cromwell began with accusing eleven members of the house, the leaders of the presbyterian party, as guilty of high treason. The commons were willing to protect them; but

the army insisting on their dismissal, they voluntarily left the house. At last the citizens of London, finding the constitution totally overturned, and a military despotism commencing, began to think seriously of repressing the insolence of the troops. The common council assembled the militia of the city; the works were manned; and a manifesto published, aggravating the hostile intentions of the army. Finding that the commons, in compliance with the request of the army, had voted that the city militia should be disbanded, the citizens besieged the door of the house, and obliged them to reverse that vote. The assembly was, of consequence, divided into two parties; the greater part siding with the citizens; but the minority, with the two speakers at their head, were for encouraging the army. Accordingly the two speakers, with sixty-two of the members, secretly retired from the house, and threw themselves under the protection of the army, then at Hounslow Heath. They were received with shouts and acclamations; their integrity was extolled; and a force of 20,000 men moved forward to reinstate them in the house. In the mean time the party which was left resolved to resist the encroachments of the army. They chose new speakers, gave orders for enlisting troops, ordered the trained bands to man the lines; and the whole city boldly resolved to resist the approaching force. But this resolution only held while the enemy was at a distance: for, when Cromwell appeared, all was obedience and submission: the gates were opened to him; the eleven impeached members were expelled; the mayor, sheriff, and three aldermen, were sent to the tower: several citizens, and officers of the militia, were committed to prison; the lines about the city levelled to the ground; and the command of the Tower given to Fairfax.

It now only remained to dispose of the king, who remained a prisoner at Hampton Court. The independent army, at the head of whom was Cromwell, on one hand, and the Presbyterians, in the name of both houses, on the other, treated with him separately in private. He had sometimes even hopes, that, in these struggles for power, he might have been chosen mediator in the dispute; and he expected that the kingdom at last, being sensible of the miseries of anarchy, would of its own accord be hushed into tranquillity. At this time he was treated with some marks of distinction; he was permitted to converse with his old servants; his chaplains were directed to attend him, and he celebrated divine service in his own way. But the most exquisite pleasure he enjoyed was in the company of his children, with whom he had several interviews. The effect of one of these interviews on the stern heart of CROMWELL, we have adverted to in that article. But these instances of respect were of no long continuance. As soon as the army had gained a complete victory over the house of commons, the king was treated not only with the greatest contumely, but was kept in continual alarms for his personal safety. The consequence of this was, that Charles at last resolved to withdraw from the kingdom. Accordingly, on the 11th of November 1647,

attended only by Sir John Berkeley, Ashburnham, and Leg, he privately left Hampton Court; and his escape was not discovered till nearly an hour after; when those who entered his chamber, found on the table some letters directed to the parliament, to the general, and to the officer who had attended him. Travelling all night he arrived next day at Titchfield, a seat of the earl of Southampton, where he knew he could entrust himself with the countess dowager. Before alighting at this place, he had gone to the sea-coast; and expressed great anxiety that a ship which he looked for had not arrived. The question now was, what measure should be next embraced. In the neighbourhood was the Isle of Wight, of which one Hammond was governor, a man entirely dependent on Cromwell, but the nephew of Dr. Hammond, the king's favorite chaplain, and of good general character. It was too promptly determined to have recourse to him in the present exigence: Ashburnham and Berkely were therefore despatched to the island, with orders not to inform Hammond of the place where the king lay concealed, till they had first obtained his promise not to deliver up his majesty, but restore him to his liberty, if he could not protect him. The promise would have been but a slender security: yet, even without exacting it, Ashburnham imprudently, if not treacherously, brought Hammond to Titchfield; and the king was obliged to put himself into his hands, and to attend him to Carisbrooke Castle in the Isle of Wight; where, though he was received with great demonstrations of respect and kindness, he was in reality a prisoner.

Cromwell now found himself upon the point of losing all the fruits of his former schemes, by having his own principles turned against himself. Among the Independents, who in general were averse to ecclesiastical subordination, a set of men grew up, called Levellers, who disallowed all subordination whatsoever, and declared that they would have no other chaplain, king, or captain, but Jesus Christ. So long as this was only directed against his enemies, Cromwell could tolerate and even applaud it; but he did not approve of it when applied to himself. Having intimation that the levellers were to meet, he unexpectedly appeared before them at the head of his red regiment, which had hitherto been deemed invincible. He demanded, in the name of God, what these meetings and murmurings meant. He expostulated with them upon the danger and consequence of their precipitant schemes, and desired them immediately to depart. Instead of obeying, however, they returned an insolent answer; when, rushing on them in great anger, he laid two of them dead at his feet: several others he caused to be hanged upon the spot, his guards dispersing the rest; and thus dissipated a faction, no otherwise criminal than in having followed his own example. Cromwell's authority soon after became irresistible, in consequence of a new and unexpected addition to his successes. The Scots, ashamed of the reproach of having sold their king, raised an army in his favor, the chief command of which was given to the earl of Hamilton: while Langdale, who professed himself at the head of the more

bigoted party who had taken the covenant, marched at the head of his separate body, and both invaded the north of England. Though these two armies amounted to above 20,000 men, Cromwell hesitated not, at the head of his 8000 hardy veterans, to give them battle. He attacked them one after another; routed and dispersed them; took Hamilton prisoner; and, following the blow, entered Scotland, the government of which he settled entirely to his satisfaction. See CROMWELL. An insurrection in Kent was quelled by Fairfax with the same ease.

During these events, the king, who was kept a prisoner at Carisbrooke Castle, continued to negotiate with the parliament, who now saw no other method of destroying the military power, but to bring into conflict again with that of the king. Frequent proposals for accommodation passed between them; but the great obstacle which stood in the way was the king's refusal to abolish episcopacy, though he consented to alter the liturgy. However, the treaty was still carried on with vigor, and the parliament for the first time seemed in earnest to conclude their negotiations amicably. The army saw through their designs, and began to demand vengeance on the king. The unhappy monarch had been lately sent under confinement to Windsor; whence he was now conveyed to Hurst Castle in Hampshire. The parliament in the mean time began to issue ordinances for an effectual opposition to certain military encroachments, when they were astonished by a message from Cromwell, that he intended paying them a visit next day with his whole army; and in the mean time ordering them to raise him £40,000 on the city of London. The commons, though destitute of all hopes of prevailing, had still the courage to resist, and to attempt, in the face of the whole army, to finish the treaty they had begun with the king. They had taken into consideration the whole of his concessions; and, though they had formerly voted them unsatisfactory, they now renewed the consultation with great vigor. After a violent debate, which lasted three days, it was carried by a majority of 129 against eighty-three, that his concessions were a foundation for the houses to proceed upon in settling the affairs of the nation. This was the last attempt in his favor; for the next day colonel Pride, at the head of two regiments, blockaded the house; and seizing in the passage forty-one members, of the presbyterian party, sent them to a low room belonging to the house, that passed by the denomination of Hell. Above 160 members more were excluded; and none were allowed to enter but the most furious and determined of the Independents, in all not exceeding sixty. This atrocious invasion of parliamentary rights commonly passed by the name of Pride's purge, and the remaining members were called the Rump. These soon voted, that the transactions of the house a few days before were entirely illegal, and that their general's conduct was just and necessary. Nothing remained, to complete the wickedness of this Rump parliament, but to murder the king.

In this assembly, therefore, composed of the most obscure citizens, and officers of the army, a committee was appointed to bring in the

charges against the unhappy monarch; and, on their report, a vote passed declaring it treason in a king to levy war against his parliament. It was resolved, that a high court of justice should be appointed, to try the king on the charge of this newly invented treason. For form's sake, they desired the concurrence of the few remaining lords in the upper house; but there was virtue enough left in that body unanimously to reject the proposal. The commons, however, were not to be stopped by so small an obstacle. They voted that the concurrence of the house of lords was unnecessary, and that the people were the origin of all just power. To add to their zeal, a woman of Herefordshire, illuminated by prophetic visions, desired admittance, and communicated a revelation she pretended to have received from heaven. She assured them, that their measures were consecrated from above, and ratified by the sanction of the Holy Ghost; intelligence which gave them, it is said, great comfort. Colonel Harrison, the son of a butcher, was commanded to conduct the king from Hurst Castle to Windsor, and thence to London. Many who saw him on this journey were greatly affected at the change that appeared in his face and person. He had permitted his beard to grow; his hair was become venerably gray, rather by the pressure of anxiety than the hand of time; while the rest of his apparel bore the marks of misfortune and decay. All the exterior symbols of sovereignty were now withdrawn, and his attendants had orders to serve him without ceremony. He could not, however, be persuaded that his adversaries would bring him to a formal trial; but he every moment expected to be despatched by private assassination. From the 6th to the 20th of January was spent in making preparations for this extraordinary trial.

The court consisted of 133 persons named by the commons; but of these never above seventy met upon the trial. The members were chiefly composed of the principal officers of the army, most of them of very mean birth, together with some of the lower house, and a few citizens of London. Bradshaw, a lawyer, was chosen president; Coke was appointed solicitor for the people of England; Dorislaus, Steele, and Aske, were named assistants. The court sat in Westminster Hall. When the king was brought forward he was conducted by the mace-bearer to a chair placed within the bar. Though long detained a prisoner, and now produced as a criminal, he still maintained the dignity of a king. The charges being read by the solicitor, accusing him of having been the cause of all the bloodshed since the commencement of the war, Bradshaw told him that the court expected his answer, when the king began his defence with declining the authority of the court. He stated, that, having been engaged in treaty with his two houses of parliament, and having finished almost every article, he expected a different treatment from what he had now received. He perceived, he said, no appearance of an upper house, which was necessary to constitute a just tribunal. He insisted that he was himself the king and fountain of law, and consequently could not be tried by laws to which he had never given his assent;

that, having been intrusted with the liberties of the people, he would not now betray them by recognising a power founded in usurpation; that he was willing, before a proper tribunal, to enter into the particulars of his defence; but that before them he must decline any apology for his innocence, lest he should be considered as the betrayer of, and not a martyr for, the constitution. Bradshaw, in order to support the authority of the court, insisted that they had received their authority from the people, the source of all right. He pressed the king not to decline the authority of a court that was delegated by the commons of England, and interrupted and overruled him in his attempts to reply. In this manner the king was three times produced before the court, and as often persisted in declining its jurisdiction. The fourth and last time he was brought before this self-created tribunal, as he was proceeding thither, he was insulted by the soldiers and the mob, who cried out, 'Justice! justice! Execution! execution!' but he continued undaunted. His judges having now examined some witnesses, by whom it was proved that the king had appeared in arms against the forces commissioned by parliament, they pronounced sentence against him. He seemed very anxious at this time to be admitted to a conference with the two houses, and it was supposed that he intended to resign the crown to his son; but the court refused compliance, and considered his request as an artifice to delay justice.

The behaviour of Charles under all these instances of low-bred malice was great, firm, and equal. In going through the hall from this execrable tribunal, the soldiers and rabble were again instigated to cry out, Justice and execution! They reviled him with the most bitter reproaches. Among other insults, one miscreant presumed to spit in the face of his sovereign. He patiently bore their insolence: 'Poor souls,' cried he, they would treat their generals in the same manner for sixpence.' Those of the populace, who still retained the feelings of humanity, expressed their sorrow in sighs and tears. A soldier more compassionate than the rest could not help imploring a blessing on his royal head: when an officer, overhearing him, struck the honest sentinel to the ground before the king: the latter only remarked 'that the punishment seemed to exceed the offence.' At his return to Whitehall, Charles desired permission to see his children, and to be attended in his private devotions by Dr. Juxon, late bishop of London. These requests were granted, and three days allowed him to prepare for execution. Every night between his sentence and execution, the king slept sound as usual:—the fatal morning being at last arrived, he arose early, and, calling one of his attendants, he had him employ more than usual care in dressing him, for so great a solemnity. The street before Whitehall was the place destined for his execution. He was led through the banqueting house to the scaffold adjoining to that edifice, attended by his friend and servant, bishop Juxon, a man of the same mild and steady virtues with himself. The scaffold, which was covered with black, was guarded by a regiment of soldiers under the command of colo-

nel Tomlinson; and on it were to be seen the block, the axe, and two executioners in masks. The people, in crowds, stood at a distance. Surveying all these preparations with calm composure, the king, as he could not expect to be heard by the people at a distance, now addressed himself to the few persons who stood around him. He justified his own innocence in the late fatal wars; and observed, that he had not taken arms till after the parliament had shown him the example; and had no other object in his warlike preparations but to preserve that authority entire, which had been transmitted to him by his ancestors. But, though innocent towards his people, he acknowledged the equity of his execution, in the eyes of his Maker: he owned that he was justly punished for having consented to the execution of an unjust sentence against the earl of Strafford. He forgave all his enemies; exhorted the people to return to their obedience, and acknowledged his son as his successor; and signified his attachment to the Protestant religion as professed by the church of England. So strong was the impression made by his dying words, on those who could hear him, that colonel Tomlinson himself, to whose care he had been committed, acknowledged himself a convert. At one blow his head was severed from his body. The assistant executioner then, holding up the head, exclaimed, 'This is the head of a traitor.' Grief, indignation, and astonishment, are said to have been strongly expressed, not only among the spectators, but throughout a great part of the nation, at this unparalleled execution. Each blamed himself either with active disloyalty to the king, or a passive compliance with his destroyers: many of those very pulpits that used to resound with insolence and sedition were now bedewed with tears of unfeigned repentance; and great numbers expressed their detestation of those dark hypocrites, who, to satisfy their own ambition, involved the whole nation in their guilt. Charles was executed fifty-two minutes after one, P. M. on the 30th of January, 1649, in the forty-ninth year of his age, and twenty-fourth of his reign. He was of a middling stature, robust, and well-proportioned. His visage was pleasant, but melancholy; and it is probable, that the continual troubles in which he was involved might have made that impression on his countenance. The king, the moment before he stretched out his neck to the executioner, having said to Juxon, with a very earnest accent, 'Remember,' great mysteries were supposed to be concealed under that word: and the generals vehemently insisted that the prelate should inform them of the king's meaning. Juxon told them, that the king, having frequently charged him to inculcate on his son the forgiveness of his enemies, had taken this opportunity in the last moment of his life, when his commands, he supposed, would be regarded as sacred and inviolable, to reiterate that desire.

2. *Of Great Britain under the Commonwealth.*—The dissolution of the monarchy of England soon followed the death of the monarch. When the peers met, on the day appointed in their adjournment, they entered upon business; and sent down some votes to the commons, of which the

latter deigned not to take the least notice. On the 6th of February the commons voted, that the house of lords was 'useless and dangerous, and the kingly office unnecessary and burdensome.' They also voted it high treason to acknowledge Charles Stuart, son of the late king, as successor to the throne. A great seal was made; on one side of which were engraven the arms of England and Ireland, with this inscription, 'The great seal of England.' On the reverse was represented the house of commons sitting, with this motto: 'On the first year of freedom, by God's blessing restored, 1649.' The forms of all public business were changed from being transacted in the king's name, to that of the keepers of the liberties of England. The court of King's Bench was called the court of Public Bench. The king's statue in the exchange was thrown down; and on the pedestal these words were inscribed: *Exit tyrannus, regum ultimus*; 'The tyrant is gone, the last of the kings.' The commons, it is said, intended to bind the princess Elizabeth apprentice to a button-maker; the duke of Gloucester was to be taught some other mechanical employment: but the former soon died of grief, as is supposed, for her father's tragical end; the latter was sent beyond sea by Cromwell. The commons next proceeded to punish those who had been most remarkable for their attachment to their late sovereign. The duke of Hamilton, lord Capel, and the earl of Holland, were condemned and executed; the earl of Norwich and Sir John Owen were also condemned, but afterwards pardoned. These proceedings irritated the Scots: their loyalty began to return; and the insolence of the Independents, with their victories, inflamed them still more. They determined, therefore, to acknowledge prince Charles for their king, but at the same time to abridge his power, by every limitation which they had attempted to impose on his father. Charles, after the death of his father, having passed some time at Paris, and seeing no prospect of assistance from that quarter, was glad to accept of their conditions; and had the mortification to enter the gate of Edinburgh, while the limbs of his faithful adherent, Montrose, were still exposed there. He soon found himself little better than a prisoner, being surrounded and incessantly importuned by the clergy, from whom, and his other tormentors, he at first attempted to escape: but was overtaken and brought back; when he testified his repentance for what he had done. Cromwell, in the mean time, who had been appointed by the parliament to command the army in Ireland, prosecuted the war in that kingdom with his usual success. He had to encounter the royalists, commanded by the duke of Ormond, and the native Irish led on by O'Neal. These he quickly overcame; and most of the towns, intimidated by his successes, opened their gates at his approach. He was on the point of reducing the whole kingdom, when he was recalled by the parliament, as we have seen in his life, to defend England against the Scots; and fought the celebrated battles of Dunbar and Worcester.

After the battle of Worcester, Charles entered upon a series of the most romantic adventures. His hair being cut off, the better to disguise his

To the high court of Justice for the County and City of Charles
Stewart King of England January 22th 1648 /

Whereas Charles Stewart King of England is and standeth convicted attainted and condemned of high Treason
and other high Crimes & misdemeanours upon Saturday last 30th presented against him by this Court to be pulled out with by the
servants of his head from his body Of which sentence execution yet remaineth to be done Therefore this Court doth now and
requires you to see the said sentence executed forthwith upon the said Charles Stewart the said King of England
this instant month of January between the hours of Ten in the morning and five in the afternoon of the said
day next full next And so to do you this shall be sufficient warrant And there are to require all Officers and Soldiers
and other the good people of this Nation of England to be assisting unto you in this service (Given under the hand and
Seal)

person, he worked for some days in the habit of a peasant, cutting faggots. He next made an attempt to retire into Wales, under the conduct of one Pendrel, a poor farmer, who was sincerely attached to his cause. In this attempt, however, he was disappointed; every pass being guarded to prevent his escape. Being obliged to return, he met one colonel Careless, who had escaped the carnage at Worcester. In his company the king was obliged to climb a spreading oak; among the thick branches of which they spent the day together, while they heard the soldiers of the enemy in pursuit of them below. Thence he passed with imminent danger, and through all the varieties of hunger, fatigue, and personal suffering, to the house of colonel Lane, a zealous royalist in Staffordshire. There he deliberated about the means of escaping into France; and, it being decided that he should endeavour to reach the port of Bristol, he rode thither before this gentleman's sister, on a visit to a Mrs. Norton. During this journey, he every day met with persons whose faces he knew; and at one time passed through a whole regiment of the enemy's army. On his arrival the butler, being sent to his chamber with refreshments, recollected his features; and, falling on his knees, exclaimed, 'I am rejoiced to see your majesty.' The king was alarmed; but, strictly enjoining the man to keep the secret from his master, the honest fellow kept his word: and, no ship being found that would sail for France for a month, the king now passed on to the house of colonel Wyndham in Dorsetshire. Pursuing from thence his journey to the sea side, he had once more a very narrow escape. The day had been appointed for a solemn fast; and a fanatical weaver, who had been a soldier in the army, was preaching against royalty in a chapel fronting the inn where the king had stopped. Charles, to avoid suspicion, was himself among the audience. It happened that a smith, of the same principles with the weaver, had been examining the horses belonging to the passengers, and came to assure the preacher that he knew by the fashion of the shoes that one of the strangers' horses came from the north. The preacher immediately affirmed that this horse could belong to no other than Charles Stuart, and instantly went with a constable to search the inn. But Charles had in the mean time taken the alarm, and left the inn before the constable's arrival. He at last embarked at Shoreham in Sussex; and, after forty-one days concealment, arrived safely at Feschamp in Normandy.

Cromwell in the mean time returned in triumph; and his first care was to depress the Scots, on account of their having withstood the work of the gospel, as he called it. An act was passed for abolishing royalty in Scotland, and annexing that kingdom as a conquered province to the English commonwealth. It was empowered, however, to send some members to the English parliament. Judges were appointed to distribute justice; and the people of that country, now freed from the tyranny of the ecclesiastics, were not much dissatisfied with the new government. All parts of the British dominions being thus reduced under perfect subjection to the parlia-

ment, he next resolved to chastise the Dutch, who had given some slight causes of complaint. Dr. Dorilaus, who had been one of the late king's judges, being sent by the parliament as their envoy to Holland, was assassinated by one of the royal party who had taken refuge there. Some time after, Mr. Stephen John, their ambassador, was insulted by the friends of the prince of Orange. These were thought sufficient reasons for a declaration of war against that republic by the commonwealth of England.

The parliament greatly depended at this time on the activity and courage of Blake, their admiral. On the other hand, the Dutch opposed to him their famous admiral Van Tromp, to whom their republic has never since produced an equal. Many were the engagements between these celebrated admirals. At last the Dutch, who felt great disadvantages by the loss of their trade, and by the total suspension of their fisheries, were willing to treat for peace. The parliament, however, gave them an evasive answer. They seem studiously to have kept their navy in exercise as long as they could; judging, that, while the force of the nation was exerted by sea, it would diminish the formidable power of Cromwell by land. But terms were not long kept between them. He persuaded the officers to present a petition for payment of arrears, and redress of grievances; desiring the parliament also to consider how many years they had sat, and what pretensions they had formerly made of their designs to new model the house. They alleged that it was now full time to give place to others; and however meritorious their actions might have been, yet, the rest of the nation had some right, in their turn, to manifest their patriotism in defence of their country. The house was highly offended: they appointed a committee to prepare an act ordaining that all persons who presented such petitions for the future should be deemed guilty of high treason. To this the officers made a very warm remonstrance, and the parliament as angry a reply. We once more refer to the article CROMWELL, for the result of these disputes, and the history of his final exaltation.

At last the Dutch, having been humbled by repeated defeats, were forced to sue for peace. Cromwell obliged them on this occasion to abandon the interest of the king's son, to pay £85,000 as an indemnification for former expenses, and to restore, to the English East India Company, a part of those dominions of which they had been dispossessed by the Dutch, during the former reign. The ministry of France also paid the utmost deference to the protector: and he having lent that court a body of 6000 men, to attack the Spanish dominions in the Netherlands, the French put Dunkirk into his hands as a reward for his attachment. By the heroic exertions of the celebrated admiral Blake, he also humbled Spain; as well as the Algerines and Tunisians. Penn and Venables, two other admirals, made an attempt on the island of Hispaniola; but, failing of this, they steered to Jamaica, which was surrendered to them without a blow.

It is not to be supposed, that a numerous

standing army could be maintained, and so many foreign wars carried on, without incurring extraordinary expenses. The protector therefore called his first and second parliaments, guards being placed at the door of the latter, that none might be admitted but such as produced a warrant from his council. The principal design of convening this assembly was, that they should offer him the crown. His creatures, therefore, took care to insinuate the confusion that arose in legal proceedings without the name of a king; that no man was acquainted with the extent or limits of the present magistrate's authority, but those of a king had been well ascertained by the experience of ages. On the motion being at last formally made in the house, it was easily carried, and nothing was wanting but Cromwell's own consent to have his name enrolled among the sovereigns of England. This consent, however, he avoided to give. The conference carried on with the members, who made him the offer, seems to argue that he was desirous of being compelled to accept it, but it ended in his total refusal. With all these proffered honors, and all his real despotic power, the situation of Cromwell, we have seen, was far from being enviable. Conspiracies were formed against him, and it was finally taught upon principle, that not only was his death desirable, but his assassination would be meritorious. Cromwell is said to have read the celebrated pamphlet of colonel Titus, *Killing no Murder*, and never to have smiled afterwards. At last he was delivered from a life of horror and anxiety by a tertian ague, of which he died September 3rd, 1658, after having usurped the government nine years. For other particulars of the life and character of this extraordinary man, see CROMWELL.

Oliver Cromwell was nominally succeeded in his office of protector by his son Richard, who immediately called a parliament. To this assembly the army presented a remonstrance, desiring some person for their general in whom they could confide. The house voted such meetings and remonstrances unlawful: upon which the officers, surrounding Richard's house, forced him to dissolve the parliament; and soon after he signed an abdication of the government. His younger brother Henry, who had been appointed to the command in Ireland, followed Richard's example, and resigned his commission also without striking a blow.

The officers, left at liberty, resolved to restore the Rump parliament, as it was called, consisting of that remnant of the commons which had condemned Charles. They were no sooner reinstated in their authority, however, than they began to humble the army by cashiering some of the officers, and appointing others on whom they could have more dependence. The officers at last resolved to dissolve the assembly. Lambert, one of the generals, drew up a body of troops, in the streets which led to Westminster Hall; and, when the speaker Lenthall proceeded in his carriage to the house, he ordered the horses to be turned, and very civilly conducted him home. The other members were likewise intercepted; and the army returned to their quarters to observe a solemn fast, which gene-

rally either preceded or attended their outrages. A committee was then elected, of twenty-three persons, of whom seven were officers. These they pretended to invest with sovereign authority.

But a stronger influence was at work in the north. Upon hearing that the officers had by their own authority dissolved the parliament, general Monk, then in Scotland with 8000 veteran troops, protested against the measure, and resolved to defend the national privileges. As soon as he put his army in motion, he found himself eagerly sought after by all parties; but so cautious was he of declaring his mind, that, to the very last, it was impossible to know on which side he designed to appear. A remarkable instance of this was, that, when his own brother came to him, with a message from lord Granville in the name of the king, he refused all intercourse with him. On the other hand, hearing that the officers were preparing an army to oppose him, Monk amused them with negotiations; and the people, finding themselves not entirely defenceless, began to declare for a free parliament. The Rump, now also finding themselves invited to sit by the navy and part of the army, again ventured to resume their seats, and to thunder votes against the officers, by whom they had been ejected. Without taking any notice of Lambert, they sent orders to the troops to repair immediately to the garrisons appointed for them. The soldiers obeyed; and Lambert found himself deserted by his whole army. Monk, in the mean time, proceeded with his troops to London; the gentry, on his march, flocked round him with addresses, and expressing their desire for a new parliament. At St. Albans, within a few miles of the capital, he sent the parliament a message, desiring them to remove such forces as remained in London to country quarters. Some of the regiments willingly obeyed this order; and such as did not Monk ejected by force: after which he quartered his army in Westminster. The house now voted him thanks for his services: when he desired them to call a free parliament; which soon led the citizens to refuse submission to the existing government. They resolved to pay no taxes until the members formerly excluded by colonel Pride should be replaced. On this Monk arrested eleven of the most obnoxious of the common council; broke the gates and portcullises; and, having exposed the city to contempt, returned in triumph to Westminster. The next day, however, he made an apology for this conduct, and promised for the future to co-operate with the mayor and common council. The commons were now greatly alarmed. They tried every method to draw off the general from his new alliance. Some of them even promised to invest him with the dignity of supreme magistrate. But Monk was too just, or too wise, to hearken to such wild proposals: he resolved to restore the secluded members, and by their means to bring about a new election. The restoration of the expelled members was easily effected; and their number was so much superior to that of the Rump, that the chiefs of this last party now thought proper in their turn to

withdraw. The restored members began with repealing all those orders by which they had been expelled. They renewed and enlarged the general's commission; fixed a proper stipend for the support of the fleet and army; and, having passed these votes, dissolved themselves, and gave orders for the immediate assembling a new parliament. Mean while, Monk remodelled the army to his purposes. Some officers, by his direction, having presented him with an address, in which they promised to obey implicitly the orders of the ensuing parliament, he ordered it to be signed by all the different regiments; and this furnished him with a pretence for dismissing those by whom it was rejected. In the midst of these transactions, Lambert, who had been arrested, escaped from the Tower, and began to raise forces; Monk therefore despatched against him colonel Ingoldsby, with his own regiment; and, though Lambert had taken possession of Daventry with four troops of horse, the greater part of them joined Ingoldsby; to whom he himself surrendered. Monk persisted all this time in his reserve; and referred all the communications of the king to one Morrice, a gentleman of Devonshire. At last however he disclosed his favorable intentions towards the exiled monarch to Sir John Granville, who held a commission from him. In consequence of this, the king left the Spanish territories, where he narrowly escaped being detained, and retired to Holland, to wait the issue of his overtures. The new parliament being assembled, Sir Harbottle Grimstone, a well-known royalist, was chosen speaker; and Monk gave directions to Annesly, president of the council, to inform them, that one Sir John Granville, a servant of the king's, had been sent over by his majesty, and was now at the door with a letter to the house. This message was received with the utmost joy. Granville was called in, the letter read, and the king's proposals immediately accepted. He offered a general amnesty to all persons, and without any exceptions, but what should be made by parliament. He promised to indulge scrupulous consciences with liberty in matters of religion; to leave to the examination of parliament the claims of all such as possessed lands with contested titles; to satisfy the army under general Monk with respect to their arrears, and to give the same rank to his officers when they should be enlisted in the king's army; and to confirm all these concessions by act of parliament. In consequence of this agreement between the king and parliament, Montague the English admiral waited on king Charles, to inform him that the fleet expected his orders at Scheveling. The duke of York immediately went on board, and took the command as lord high admiral. The king embarked, and, landing at Dover, was received by the general, whom he tenderly embraced. He entered London in 1660, on the 29th of May, which was his birth-day; and was attended by an innumerable multitude of people, who testified their joy by the loudest acclamations.

3. *Of the Stuart dynasty, from the Restoration to the expulsion of James II.*—Charles II. was

only thirty years of age at the Restoration. Being naturally of an engaging disposition, he soon became the favorite of all ranks, and his first measures were calculated to give universal satisfaction. He seemed desirous of losing the memory of past animosities, and of uniting every party in affection for their prince and country. In his council were found the most eminent men of the nation, without regard to former distinctions. The presbyterians shared this honor equally with the royalists. Calamy and Baxter, presbyterian clergymen, were even made chaplains to the king. Admiral Montague was created earl of Sandwich, and Monk duke of Albemarle. Morrice, the general's friend, was appointed a secretary of state. The parliament, having been summoned without the king's consent, received at first only the title of a convention; and it was not till after an act passed for that purpose, that they were acknowledged by the former title. Both houses now owned the guilt of the late rebellion, and gratefully received in their own name, and in that of all his subjects, his majesty's gracious pardon and indemnity. The king, as we have seen, had promised an indemnity to all criminals, but such as should be excepted by parliament: he now issued a proclamation, declaring, that such of the late king's judges as did not surrender themselves within fourteen days should receive no pardon. Nineteen surrendered; some were taken in their flight; others escaped beyond sea. The peers seemed inclined to great severity on this occasion; but were restrained by the king, who in the most earnest terms it is said pressed the act of general indemnity. After repeated solicitations, the act of indemnity passed both houses, with the exception of those who had an immediate hand in the king's death. Even Cromwell, Ireton, and Bradshaw, though dead, were considered as proper objects of resentment: their bodies were dug from their graves; dragged to the place of execution; and, after hanging some time, buried under the gallows. Of the rest who sat in judgment on the late monarch's trial, some were dead, and some thought worthy of pardon. Ten only, out of eighty, were adjudged to suffer death; and these were enthusiasts who had all along acted from principle, and who, in the general spirit of rage excited against them, showed a fortitude that would have done honor to any cause. The army was disbanded, that had for so many years governed the nation; at this time prelacy, tithes, and all the ceremonies of the church of England, were restored; the king at the same time endeavouring to preserve the air of moderation and neutrality. In fact, with regard to religion, Charles in his gayer hours was a professed deist; but in the latter part of his life he evidently inclined to the Catholic persuasion, and is known to have died a Catholic. On the 13th of September died the young duke of Gloucester, a prince of great hopes. The king was never so deeply affected by any incident in his life. The princess of Orange, having come to England to partake of the joy attending the restoration of her family, with whom she lived in great friendship, soon after also sickened and died. The queen mother now

paid a visit to her son, and obtained his consent to the marriage of the princess Henrietta with the duke of Orleans, brother to the French king.

Parliament having met on the 6th November, and carried on business with the greatest unanimity and dispatch, was dissolved by the king on the 29th of December, 1660. During the reign of this prince the spirit of the people took a direction totally opposite to that of the time of Charles I. The latter found his subjects animated with a ferocious though ignorant zeal for liberty. They knew not what it was to be free, and therefore imagined that liberty must at once result from throwing off the royal authority. They gained their point: the unhappy monarch was dethroned and murdered; but instead of liberty they found themselves oppressed by greater tyranny than ever. Being freed from this by the Restoration, nothing now prevailed but as unbounded a spirit of submission; and Charles rendered himself at last almost an absolute monarch. A revolution equally great took place with regard to religious matters. During the former reigns a spirit of the most gloomy enthusiasm had overspread the land, and men imagined the Deity was only to be pleased by their denying themselves every social pleasure. The extreme hypocrisy of Cromwell, and the absurd conduct of many of his associates, showed that this was not religion; but, in avoiding this error, they ran into one equally dangerous; and every thing religious or serious was discountenanced. Nothing but riot and dissipation succeeded. The court set the example; scenes of gallantry and festivity were the order of the day; the horrors of the late war became the subject of ridicule; the formality of the sectaries was displayed on the stage, and even laughed at from the pulpit. In short, the best mode of religion now was to have as little as possible; and to lay aside not only the enthusiasm of the sectaries, but even the common duties of morality. In the midst of this boundless licentiousness, the old and faithful adherents of the royal family were left unrewarded; and the act of indemnity was justly said to have been an act of forgiveness to the king's enemies, and of oblivion to his friends. In 1661 the Scottish and English parliaments seemed to vie with each other in their prostrations to the king. In England monarchy and episcopacy were raised to the greatest splendor. The bishops were permitted to resume their seats in the house of peers; all military authority was acknowledged to be vested in the king. He was empowered to appoint commissioners for regulating corporations, and expelling such members as had intruded themselves by violence, or professed principles dangerous to the constitution: and an act of uniformity was passed, by which it was required, that every clergyman should be re-ordained, if he had not before received episcopal ordination; that he should declare his assent to every thing contained in the book of Common Prayer, and should take the oath of canonical obedience. In consequence of this law, above 2000 of the presbyterian clergy resigned their cures at once. In Scotland the right of the king was asserted in the fullest and most positive terms to be here-

ditary, divine, and indefeasible. His power was extended to the lives and possessions of his subjects, and from his original grant was said to come all that they enjoyed. They voted him an additional revenue of £40,000; and all their former violences were spoken of with the utmost detestation. This intoxication of loyalty, however, at last began to wear off. The king's profusion and extravagance in his pleasures, together with his indolence in government, furnished opportunities of making very disadvantageous comparisons between him and Cromwell. These animosities were heightened by the ejected clergy, especially when they saw Dunkirk, which had been acquired during the usurper's vigorous administration, sold to the French, and that merely to supply the king's extravagance. From this time (August 17th 1662) Charles found himself perpetually opposed, and his parliaments granted supplies much more reluctantly than before. A few months previously the continual exigencies of the king had forced him to conclude a marriage with the Infanta of Portugal for the sake of her portion, which was £500,000 in money, together with the fortress of Tangier in Africa, and Bombay in the East Indies. The chancellor Clarendon, the dukes of Ormond and Southampton, urged many reasons against this match, particularly the likelihood of her never having any children; but all their objections could not prevail, and Clarendon, therefore, set himself to promote it. Still, however, the king's necessities were greater than his supplies. He therefore resolved to sacrifice his minister, the great Clarendon, to the resentment of the parliament, to whom he was become obnoxious, in order to procure more supplies. On the 12th June, 1663, he sent for the commons to Whitehall; complained of their inattention to him, and acquainted them with a conspiracy to seize the castle of Dublin. Four subsidies were immediately granted, and the clergy in convocation followed the example of the commons. On this occasion the earl of Bristol ventured to impeach the chancellor in the house of peers; but, as he did not support his charge, the affair was dropped for the present. With a view probably of having the money to be employed for that purpose in his hands, Charles was induced to declare war against the Dutch in 1664.

In this contest the English, under the command of Sir Robert Holmes, expelled the Dutch from Cape Corse Castle on the coast of Africa, and seized on their settlements of Cape Verd and the Isle of Goree. Sailing thence to America, the admiral possessed himself of Nova Belgia, since called New York; and which continued subject to Britain, till the American revolution. On the other hand, De Ruyter, the Dutch admiral, dispossessed the English of all their settlements in Guinea except Cape Corse. He afterwards sailed to America, where he attacked Barbadoes and Long Island, but was repulsed. Soon after, the two most considerable fleets of each nation met; the one under the duke of York, to the number of 114 sail; the other commanded by Opdam, admiral of the Dutch navy, of nearly equal force. The engagement began at four in the morning, and both sides fought with

equal intrepidity. The duke was in the hottest part of the engagement, and behaved with great spirit, while many of his lords and attendants were killed around him. In the heat of the action the Dutch admiral's ship blew up; which so discouraged and disheartened the enemy, that they fled towards their own coast, having thirty ships sunk and taken, while the victors lost only one. This success so much excited the jealousy of the neighbouring states, that France and Denmark immediately resolved to protect the Dutch republic. Admiral De Ruyter, on his return from Guinea, was appointed, at the head of seventy-six sail, to join the duke of Beaufort the French admiral, who it was supposed was then entering the British Channel from Toulon. The duke of Albemarle and prince Rupert now commanded the British fleet, of seventy-four sail. Albemarle detached the prince with twenty ships to oppose the duke of Beaufort; against which piece of rashness Sir George Ayscue in vain protested. The fleets thus engaging, upon unequal terms, a memorable battle ensued, in which the Dutch admiral Evertzen was killed by a cannon ball, one of their ships was blown up, and three of the English ships taken. The combatants were parted by darkness. The next day they renewed the battle with incredible fury. Sixteen fresh ships joined the Dutch; and the English were so shattered, that their fighting ships were reduced to twenty-eight. Upon retreating towards their own coast the Dutch followed them; where another dreadful conflict was beginning, but closed by the darkness of the night. The morning of the third day the English continued their retreat, and Albemarle came to the desperate resolution of blowing up his own ship rather than submit to the enemy, when he found himself happily reinforced by prince Rupert with sixteen ships of the line. By this time it was night; the next day the fleets came once more to a close combat, which was continued with great violence, till they were parted by a mist. Both sides claimed the victory, but the Dutch certainly had the advantage. Another bloody engagement happened soon after, with larger fleets on both sides, commanded by the same admirals. In this the Dutch were vanquished; but they were soon in a condition to face their enemies, by the junction of Beaufort the French admiral. The Dutch fleet now appeared in the Thames, and the whole British nation was thrown into the utmost consternation: a chain had been drawn across the river Medway; and some fortifications added to the forts along the bank. But all these were unequal to the present force: Sheerness was soon taken; the Dutch passed forward and broke the chain, though fortified by some ships sunk by Albemarle's orders, destroying the shipping in their passage, and advanced, with six men of war and five fire-ships, as far as Upnore Castle, where they burned three men of war. It was now expected that the Dutch might sail up next tide to London bridge, and destroy not only the shipping, but even the buildings of the metropolis. The Dutch, however, were unable to effect this, from the failure of the French, who had promised them assistance.

Spreading, therefore, an alarm along the coast, and having insulted Norwich, they returned to their own shores. During these transactions the plague raged in London, and destroyed 100,000 of the inhabitants. This calamity was soon followed by another equally dreadful. A fire broke out in a baker's house in Pudding Lane, near the bridge, and spread with such rapidity that no efforts could extinguish it, till it laid in ashes the most considerable part of the city; but not a single life, it is said, was lost. These complicated misfortunes did not fail to excite many murmurs among the people: the blame of the fire was laid on the Papists: the Dutch war was exclaimed against as unsuccessful and unnecessary; and Charles himself began to be sensible that all the ends for which he had undertaken the war were likely to be entirely frustrated. Instead of being able to lay up money for himself, the supplies of parliament had hitherto been so scanty that he found himself considerably in debt. A treaty, therefore, was set on foot, which was concluded at Breda on the 21st of July, 1667, by which the only advantage gained for the country was, the cession of the colony of New York. It was therefore judged disgraceful, and the blame of it thrown entirely upon the earl of Clarendon. Along with this, he was charged with the sale of Dunkirk; the bad payment of the seamen; the disgrace by the Dutch fleet; and his own ambition. His daughter, while yet in Paris, had commenced an amour with the duke of York; and, under a solemn promise of marriage, had admitted him to her bed. Her lover, however, afterwards married her; but this act of virtue in the prince was imputed as a crime to Clarendon. Clarendon was soon therefore deprived of the seals, and impeached; and thought proper to withdraw into France. Soon after the king formed an alliance with Holland and Sweden, to prevent the French king from completing his conquest of the Netherlands. The king now began to act in a very arbitrary manner. He had long wished to extend his prerogative, and to be able to furnish himself with whatever sums he might want for his pleasures, and therefore was most likely to be pleased with those ministers who could flatter both his wishes. These he found in Clifford, Ashley, Buckingham, Arlington, and Lauderdale, a junto distinguished by the name of the Cabal; a word formed by the initials of their names. The first effect of their advice was, a secret alliance with France, and a rupture with Holland. Soon after this the duke of York declared himself a Papist; and liberty of conscience was proclaimed to all sectaries, whether dissenters or papists: a proclamation was also issued containing very rigorous orders for the impressment of seamen; and another full of menaces against those who should speak undutifully of his majesty's measures, &c. These measures, however, gave very great and just offence to the people; but they were especially alarmed at an alliance with France, and justly afraid of the treachery of that court. On the 28th of May, 1672, the English fleet under the duke of York was surprised by the Dutch in Southwold Bay. About 8 A. M. began a most furious engagement. The gallant Sandwich, who commanded the

English van, drove his ship into the midst of the enemy, beat off the admiral that ventured to attack him, sunk another ship that attempted to board him, and three fire-ships that offered to grapple with him. Though his vessel was torn with shot, and out of 1000 men there only remained 400, he still continued to fight. At last a fire-ship, more fortunate than the rest, having laid hold of his vessel, her destruction became inevitable, and the earl himself was drowned in attempting to escape. Night parted the combatants; the Dutch retired and were not followed by the English. The loss sustained by the two maritime powers was nearly equal; but the French suffered very little, not having entered into the heat of the engagement. It was even supposed that they had orders for this conduct, and to spare their own ships, while the Dutch and English should weaken each other by their mutual exertions. The combined powers were much more successful against the Dutch by land. Louis XIV. conquered all before him, crossed the Rhine, took the frontier towns of the enemy, and threatened the new republic with a final dissolution. Terms were proposed to them by the conquerors, which would have deprived them of all power of resisting an invasion from France by land. Those of Charles exposed them equally to every invasion by sea. At last the murmurs of the English at seeing this brave and industrious people, the supporters of the protestant cause, totally sunk and on the brink of destruction, were too loud not to reach the king. He was obliged to call a parliament, to take the sense of the nation upon his conduct; and he soon saw how his subjects stood affected. Parliament began business with repressing some of the king's extraordinary exertions of his prerogative, and establishing uniformity in religious matters. The celebrated Test act was passed: which, besides taking the oaths of allegiance and supremacy, imposed the receiving of the sacrament once a year in the established church, on all persons in place or power. As the dissenters also had seconded the efforts of the commons, against the king's declaration of indulgence to Roman Catholics, a bill was passed for their ease and relief; which, however, went with difficulty through the house of peers. The Dutch, in the mean time, continued to defend themselves with such valor that the commons began to despair of success. They therefore resolved that the standing army was a grievance: they next declared that they would grant no more supplies to carry on the Dutch war, unless it appeared that the enemy were so obstinate as to refuse all reasonable conditions. To cut short these altercations, the king resolved to prorogue the parliament; and, with that intention, went to the house of peers, whence he sent the usher of the black rod to summons the commons to attend. It happened that the usher and the speaker met at the door of the house; but, the speaker being within, some of the members suddenly shut the door, and cried 'To the chair.' Upon which the following motions were carried in a tumultuous manner:—That the alliance with France was a grievance; that the evil counsellors of the king were a grievance; that the earl of Lauderdale

was a grievance: and then the house rose in great confusion. The king, finding that he could expect no supply from the commons for carrying on the war, resolved to make a separate peace with the Dutch, on terms which they had proposed by the Spanish ambassador. For form's sake he asked the advice of parliament, who concurring heartily in his intention, a peace was accordingly concluded.

The prepossession which Charles had all along shown for France, and his manifest inclination upon all occasions to attach himself to that court, had given great offence. Other circumstances also co-operated to produce general discontent. The toleration of Catholics, so much wished for by the king; the bigotry of the duke of York, the heir apparent to the crown, and his zeal for the propagation of the Catholic religion; excited a general and just apprehension that the Protestant religion was in danger. These discontents were increased and fomented by designing men, who, to promote their own interests, did not scruple to advance the grossest falsehoods. In 1678 an account of a plot formed by the Papists, for destroying the king and the Protestant religion, was given in by one Kirby a chemist, Dr. Tong, a weak credulous clergyman, and Titus Oates, who had likewise been a clergyman, but was a most abandoned miscreant. The circumstances attending this pretended discovery were so perfectly incredible, that it appears amazing how any person of common sense could give ear to them. Nevertheless, so much were the minds of the nation in general inflamed against the Catholics, at this time, that it produced the destruction of several individuals of the Romish persuasion, and a universal massacre of that sect was apprehended. The parliament, who ought to have repressed these falsehoods, and brought back the people to calm enquiry, were found more credulous than even the people themselves. The cry of plot was echoed from one house to the other; the country party could not slip so favorable an opportunity of managing the passions of the people; and the courtiers were afraid of being thought disloyal if they should doubt the guilt of those who were accused of designs against the king's person. Danby, the prime minister himself, persisted in his enquiries, notwithstanding the king's desire to the contrary. Charles himself, who was the person that ought to have been most concerned, was the only one who treated it with contempt. Nothing, however, could stop the popular fury; and for a time the king was obliged to give way to it. During this uproar, the lord treasurer Danby was impeached in the house of commons, by Seymour the speaker. The principal charge against him was, his having written a letter to Montagu, the English ambassador at Paris, directing him to sell the king's good offices at the treaty of Nimwegen, to the king of France, for a sum of money. Though the charge was just, Danby had the happiness to find the king resolved to defend him. Charles assured the parliament, that, as he had acted in every thing by his orders, he held him entirely blameless; and, though he would deprive him of all his employments, yet he would positively insist on his personal safety. The lords were

obliged to submit; though they continued to impeach him, till Danby was sent to the Tower. These proceedings were carried on by the house of commons that had continued undissolved for above seventeen years.

Charles at last called a new parliament, which, however, proved as unmanageable as the preceding. The members, resolved to check the growth of popery by striking at the root of the evil, brought in a bill for the total exclusion of the duke of York from the crown of England and Ireland, which passed the lower house by a majority of seventy-nine; they next voted the king's standing army and guards to be illegal; they proceeded to establish limits to the king's power of imprisoning delinquents; and had the great merit of passing the celebrated statute called the Habeas Corpus Act, which confirms the subject in an absolute security from oppressive power.

During these commotions the duke of York had retired to Brussels; but an indisposition of the king brought him back to England, to be ready in case of any sinister accident to assert his right to the throne. After prevailing upon his brother to disgrace his natural son the duke of Monmouth, who was now become very popular, he himself retired to Scotland, to strengthen his interests in that part of the empire. This secession still more inflamed the country party, who were strongly attached to the duke of Monmouth, and were resolved to support him against the duke of York. Mobs, petitions, pope-burnings, &c., followed, and were employed to keep up the terror of popery, and alarm the court. The parliament had encouraged various tribes of informers, which increased the number of these miscreants, conspiracies were more numerous; plot was set up against plot; and the people were kept suspended in the most dreadful apprehensions. The nation now came to be distinguished into petitioners and abhorriers, and Whig and Tory were at this time first used as terms of reproach.

Being apprised of the tendency of presbyterian principles to a republican form of government, Charles, like his predecessors, had long endeavoured to introduce episcopacy into Scotland. The rights of patrons had for some years been abolished; and the power of electing ministers had been vested in the kirk sessions and lay elders: but it had of late been enacted, that all incumbents who had been admitted upon this title should receive a presentation, and be instituted anew by the bishop, under the penalty of deprivation. In consequence of this, 350 parishes were at once declared vacant. New ministers were sought for all over the kingdom, and none, however vicious or ignorant, were rejected. The people, as might have been expected, were displeased to the highest degree; they resolved, however, to give no sign of mutiny or sedition, notwithstanding their discontent. This submission made it foolishly imagined that they would submit altogether if they were worse treated. In 1661 a severe act was passed in England against conventicles, and this severity was imitated by the Scottish parliament. Military force was next let loose. Wherever the people had generally forsaken their churches,

the guards were quartered throughout the country, who, without any proof, or legal conviction, demanded fines from the people for being absent from church; and quartered soldiers on the supposed criminals till they received payment. An insurrection being dreaded during the Dutch war, new forces were levied, and entrusted to the command of Dalziel and Drummond, men of very cruel dispositions. Representations were now made to the king, who promised some redress. But his lenity came too late. In 1668 the people rose in arms. They surprised Turner, the English commander, in Dumfries, and resolved to have put him to death; but, finding his orders to be more violent than his execution of them, they spared his life. At Lanark they renewed the covenant, and published their manifesto; professing at the same time their submission to the king. Their force did not exceed 2000 men; and, though the country in general bore them great favor, men's spirits were so subdued, that the insurgents could expect no great increase of numbers. Dalziel took the field to oppose them. The number of the covenanters was now reduced to 800, and these no way capable of contending with regular forces. Having advanced near Edinburgh, they attempted to find their way back into the west by the Pentland hills; but were here attacked by the king's troops, and received the first charge very resolutely; but this was all the action. Immediately they fell into confusion and fled. About forty were killed on the spot, and 130 taken prisoners. So early as the year 1661, the presbyterians had deputed one Sharp, to lay their grievances before the king. Instead of this, their deputy abandoned their cause altogether, became their violent enemy, and as a reward of his treachery was made archbishop of St. Andrew's. After the battle of Pentland hills, this renegade, as the Scottish historians call him, was the foremost to take vengeance on the unhappy insurgents, whose oppressed state and inoffensive behavior had made them objects of universal compassion. Ten were hanged on one gibbet in Edinburgh; thirty-five before their own doors: they might all have saved their lives, if they would have renounced the covenant; but this they absolutely refused. The executions were going on, when the king wrote a letter to the privy council, in which he ordered that such of the prisoners as should simply promise to obey the laws for the future should be set at liberty, and that the incorrigible should be sent to the plantations. This letter was brought to the council by Burnet, but was not immediately delivered by Sharp. It had been customary to put these poor creatures to very severe tortures, to make them confess. By Sharp's delay, one Hugh Maccaill had been tortured, who would otherwise have escaped; and so violent were the torments he endured that he expired under them. Yet he seemed to die in an ecstasy of joy. His last words were uttered with an accent which struck the by-standers with astonishment. 'Farewell,' said he, 'sun, moon, and stars; farewell world and time; farewell weak frail body; welcome eternity; welcome angels and saints; welcome Saviour of the world; and welcome God the judge of all.'

In 1670 an act against conventicles was passed, seemingly with a design of mitigating the former persecuting laws; though even this was severe enough. By this act, the hearer in a conventicle (that is, in a dissenting meeting, where more than five besides the family were present) was fined 5s. for the first offence, and 10s. for the second; the preacher £20 for the first offence, and £40 for the second. The person in whose house the conventicle met was fined a like sum with the preacher. One remarkable clause was, that, if any dispute should arise with regard to the interpretation of any part of the act, the judges should always explain the doubt in the sense least favorable to conventicles, it being the intention of parliament entirely to suppress them. As the violent methods used by the king were found ineffectual to obtain the purpose in Scotland, a scheme of comprehension was tried in 1678, by which it was proposed to diminish the authority of the bishops, to abolish their negative voice in the ecclesiastical courts, and to leave them little more than the right of precedence among the presbyters: but this too was rejected by the people, who well knew its tendency. The next scheme was an indulgence; by which the most popular of the expelled preachers, without requiring any terms of submission to the established religion, were settled in vacant churches; and small salaries of about £20 a-year were offered to the rest, till they should be otherwise established: but conventicles multiplied, and the covenanters continually met at them in arms. A renewal of the persecutions now therefore commenced under the administration of the duke of Lauderdale and archbishop Sharp. It was an old law, but seldom put in execution, that a man who was accused of any crime, and did not appear to take his trial, might be inter-communed; that is, he might be publicly outlawed; and whoever afterwards, either on account of business, relation, or charity, had the least intercourse with him, was subjected to the same penalties which the law could inflict on the criminal himself. Great numbers of writs of intercommuning were now issued against the covenanters; by which crimes and punishments were vastly multiplied. Application was made to Charles for some redress of these grievances; but he was too much taken up with his pleasures to take any effectual means of putting a stop to them; nay, even while he retracted them, he was persuaded to avow and praise them in a letter to the privy council. The consequence of all this was, that the covenanters were at last so much enraged against Sharp, whom they considered as an apostate, and experienced to be an unrelenting persecutor, that on the 3d of May, 1679, he was waylaid and murdered. See SHARP. This gave rise to a persecution still more violent, which at last brought on another insurrection. The covenanters finding themselves obliged to meet in large bodies, and bring arms along with them for their own security, set forth a declaration against prelacy, which they published at Rutherglen, a small borough near Glasgow; and burned in the market place several acts of parliament, which had established that mode of church government. For this purpose they

chose the 29th of May, the anniversary of the Restoration; having previously extinguished the bon-fires that had been kindled on that occasion. Count Graham, afterwards viscount Dundee, an active and enterprising officer, attacked at this time a conventicle upon London Hill, but was repulsed with the loss of about thirty men. The covenanters, then finding themselves unwarily engaged in rebellion, were obliged to persevere; and pushed on to Glasgow, which, though repulsed at first, they afterwards made themselves masters of. Here they dispossessed the established clergy, and issued proclamations, in which they declared that they fought against the king's supremacy, against popery and prelacy, and a popish successor. Charles, being now alarmed, despatched against the covenanters a small body of English cavalry under the duke of Monmouth. He joined the Scottish guards, and some regiments of militia levied from the well affected counties; and with great celerity marched in quest of the insurgents. They had taken post at Bothwell-bridge between Hamilton and Glasgow; where there was no access but by the bridge; and where a small body was able to defend it against the king's army. The whole army of the covenanters never exceeded 8000 men, and they had in reality no other generals than their clergymen. Monmouth attacked the bridge, and the covenanters maintained it, as long as their ammunition lasted. When they sent for more, they received orders to quit their post and retire; and this imprudent measure occasioned an immediate defeat. Monmouth passed the bridge without opposition, and drew up his forces opposite the enemy. His cannon alone put them to the rout; about 700 were killed in the pursuit, and 1200 taken prisoners, who were treated with great humanity. Such as promised to live peaceably under the government were dismissed; and about 300 who refused this condition were shipped for Barbadoes, but unfortunately perished by the way. Two of their clergymen were hanged. Soon after, an act of indemnity was passed: but Lauderdale took care that it should afford little protection to the unhappy covenanters; for, though orders were given to connive thenceforward at all conventicles, he found means under a variety of pretences to elude the execution of them.

It is now known, that Charles II. had formed a scheme of overturning the established religion, and substituting Popery in its place; as well as of rendering himself absolute. In this, however, he met with violent opposition from his parliament; and, as the one of 1679 even surpassed their predecessors in this respect, the king dissolved them and called another in 1680. By this step, however, he gained nothing. They voted the legality of petitioning the king; and fell with extreme violence on the abhorers, who were seized by their order in all parts of England, and committed to close custody; the liberty of the subject, which had been so carefully guarded by their own recent law, was every day violated by their arbitrary and capricious imprisonments. But one Stowel of Exeter put a stop to their proceedings: he refused to obey the serjeant at arms, and said he knew no law by which the

house of commons pretended to commit him. The house, finding it equally dangerous to proceed or recede, now voted that Stowel was indisposed; and a month's time was allowed him for his recovery. The chief point aimed at by this parliament, was to obtain the enactment of the exclusion bill into a law. It passed by a great majority in the commons, but was thrown out by the house of peers; all the bishops except three voting against it. The commons on this, mortified at the rejection of their favorite bill, resolved, That, till the exclusion bill was passed, they could not, consistently with the trust reposed in them, grant the king any manner of supply; and that whoever should hereafter lend, by way of advance, any money upon the branches of the king's revenue, should be responsible to parliament for his conduct. Charles, therefore, finding that there were no hopes of extorting either money or obedience from them, came to a resolution of once more dissolving the parliament. It was for some time a doubt whether the king would ever call another; his necessities, however, surmounted all his fears of their violence; and, in 1681, he summoned a new parliament to meet him at Oxford. In this, as in all former parliaments, the popular party predominated; and they trod exactly in the same paths with their predecessors. The same speaker was chosen, and the exclusion bill urged more fiercely than ever. Ernelly, one of the king's ministers, proposed that the duke should be banished 500 miles from England; and that on the king's decease the next heir should be constituted regent with regal power. Yet even this expedient, which left the duke only the bare title of king, could not obtain the attention of the house. Nothing but a total exclusion would satisfy them. Each party had now for some time reviled and ridiculed each other in pamphlets and libels; and this practice at last was attended with an incident that deserves notice. Fitzharris, an Irish papist, employed a Scotchman, named Everhard, to write a libel against the king and the duke of York. Everhard was actually a spy for the contrary party; and, supposing this a trick to entrap him, he discovered the whole to Sir William Waller, a justice of the peace. The libel was replete with the utmost rancour and scurrility; and Waller, having carried the intelligence to the king, seized Fitzharris, with a copy of it in his pocket. Seeing himself in the hands of a party from whom he expected no mercy, the latter now threw the odium of the libel upon the court, who, he said, were desirous to impute it to the exclusioners, to render them hateful to the people. He also enhanced his services to the country party by a new popish plot, in which he charged the duke of York as a principal accomplice. The king imprisoned Fitzharris: the commons avowed his cause. They voted that he should be impeached by themselves, to screen him from the ordinary forms of justice: the lords rejected the impeachment; the commons asserted their right to prosecute it: a commotion was likely to ensue; and the king, to break off the contest, went to the house and dissolved the parliament, with a fixed resolution never to call another.

From this moment the king ruled with despotic power. His temper, which had hitherto been easy and merciful, now became cruel and arbitrary; he entertained spies and informers round the throne, and imprisoned all such as he thought most daring in their designs. Resolving to humble the presbyterians, he divested them of their employments and places; and gave their offices to such as approved the doctrine of non-resistance. The clergy began to testify their zeal and their principles by their writings and sermons; but, though among these the partizans of the king were the most numerous, those of the opposite faction were the most enterprising. The king openly espoused the cause of the former; and, placing himself at the head of a faction, deprived the city of London, which had long headed the popular party, of their charter. Fitzharris was now brought to a trial before a jury, and condemned and executed. The whole gang of spies, witnesses, informers, and suborners, who had long been encouraged and supported by the leading patriots, finding that the king was entirely master, turned short upon their old employers, and offered their evidence against those who first put them in motion. The king's ministers gave them encouragement; and in a short time the same injustice and the same cruelties were practised against presbyterian schemes, that had formerly been practised against Catholic treasons. But the king's chief resentment was levelled against the earl of Shaftesbury. No sums were spared to seek for evidence, or even to suborn witnesses, against this intriguing and formidable peer. A bill of indictment being presented to the grand jury, witnesses were examined, who swore to such incredible circumstances as must in all ordinary cases have invalidated their testimony. Among his papers, indeed, a draught of an association was found, which might have been construed into treason; but it was not in the earl's hand writing, nor could it be proved that he had ever communicated this scheme to any body, or signified his approbation of it. The sheriffs, however, had summoned a jury whose principles coincided with those of the earl; and that probably, more than want of proof, procured his safety. The other corporations of England soon began to fear that they should experience the same treatment as that of London, and were successively induced to surrender their charters to the king. Considerable sums were exacted for restoring these charters; and all the offices of power and profit were left at the disposal of the crown. There was a party, however, in England, that still cherished their former ideas of freedom, and resolved to restore liberty to their country, by dethroning the king who acted in such a despotic manner. The principal conspirators were Monmouth, Shaftesbury, Russel, Essex, Howard, Algernon Sidney, and John Hampden, grandson to the great man of that name. Monmouth engaged in their plans the earl of Macclesfield, lord Brandon, Sir Gilbert Gerard, and other gentlemen in Cheshire. Lord Russel entered into a correspondence with Sir William Courtney, Sir Francis Knowles, and Sir Francis Drake, who promised to raise the west: and Shaftesbury, with one Ferguson, an Independent clergyman,

and a restless plotter, managed the city, upon which the confederates chiefly relied. These schemes had been laid in 1681: but the caution of lord Russel, who induced the duke of Monmouth to put off the enterprise, saved the kingdom from the horrors of a civil war; while Shaftesbury, after some vain efforts to induce the citizens to revolt, retired in disgust to Holland. The remaining formed a council; which corresponded with Argyle and the malcontents in Scotland; but they widely differed in their plans. Monmouth aspired at the crown; Russel and Hampden proposed to exclude the duke of York from the succession, and redress the grievances of the nation; while Sidney and Essex were for restoring the republic. Lord Howard was an abandoned man, who, having no principles, sought to embroil the nation, to gratify his private interests. Besides these, there was a set of subordinate conspirators, who frequently met, and carried on projects quite unknown to Monmouth, and his council. These men undertook the desperate resolution of assassinating the king in his way to Newmarket; Rumbold, one of the party, possessing a farm upon that road, called the Rye-house, whence the conspiracy was called the Rye-house plot. But the house in which the king resided at Newmarket accidentally took fire, and he was obliged to leave that place eight days sooner than he was expected, a circumstance to which he owed his safety. Soon after this the conspiracy was discovered; Russel, Sidney, and Walcot, were tried on the charge of being connected with it, convicted, and executed; Essex cut his own throat; Hampden was fined £40,000, and scarcely one escaped who had been in any manner concerned, except the duke of Monmouth, the most culpable of all. Severe punishments, however, were inflicted on many who treated the duke of York disrespectfully. The famous Titus Oates was fined £100,000 for calling him a popish traitor; and he was sentenced to be imprisoned till he should pay it. A similar sentence was passed upon Dutton Colt. Sir Samuel Barnardiston was fined £10,000 for having in some private letters reflected on the government. At last, to please his subjects by an act of popularity, the king married the lady Anne, his niece, to prince George brother to the king of Denmark. This was the last remarkable transaction of this extraordinary reign. On February 2d, 1685, about 8 A.M., the king was seized with a fit of apoplexy; but, being blooded, he was restored perfectly to his senses; and there were great hopes of his recovery. On the fourth day, however, the physicians despaired of his life, and sent for the queen. He was in his perfect senses when she arrived. She threw herself on her knees, and asked his pardon for all her offences. He replied that she had offended in nothing; but that he had been guilty of offences against her, and asked her pardon. He spoke with great affection to the duke of York, and gave him excellent counsel for his future conduct. He advised him to adhere strictly to the laws, and to support the church of England invariably. The duke seemed anxious to convince him before he died how little he intended to follow his advice. Having re-

moved the bishops and several of the lords who attended, he sent for Huddleston, a Romish priest, and in the presence of the duke, the earl of Bath, and Trevanion a captain in the guards, Huddleston gave the extreme unction to the king, and administered to him the sacrament according to the rites of the church of Rome. All this was accomplished in the space of half an hour. The doors were then thrown open. Six prelates, who had before attended the king, were sent for to give him the sacrament. Kenn, bishop of Bath and Wells, read the visitation for the sick; and, after he said that he repented of his sins, the absolution. The king assisted with seeming devotion at the service; but his mouth being distorted with fits, and his throat contracted, he could not swallow the elements. He professed, however, his satisfaction in the church of England; and expired on the 6th February between eleven and twelve o'clock; having reigned twenty-five years, and lived fifty-five.

The first act of James II.'s reign was to assemble a privy council: where, after some praises bestowed on the memory of his brother, he made professions of his resolution to maintain the established government both in church and state; and, as he had heretofore ventured his life in defence of the nation, he would still go as far as any man in maintaining all its just rights and privileges. This speech was received with great applause, not only by the council, but by the whole nation. Addresses came from all quarters, full of duty, nay of the most servile adulation. The address of the Quakers, however, was remarkable for its good sense and simplicity. 'We are come,' said they, 'to testify our sorrow for the death of our good friend Charles, and our joy for thy being made our governor. We are told that thou art not of the persuasion of the church of England no more than we; wherefore we hope that thou wilt grant us the same liberty which thou allowest thyself. Which doing, we wish thee all manner of happiness.' The king, soon showed, that he either was not sincere in his promises, or that he entertained so lofty an idea of his own regal power, that even his utmost sincerity could tend very little to the security of the people. All the customs, and the greater part of the excise, which had been voted to the late king for his life only, were levied by James without a new act of parliament. He went openly to mass with all the ensigns of his dignity; and even sent one Caryl as his agent to Rome, to make submissions to the pope, and pave the way for the re-admission of England into the bosom of the Catholic church. From the suggestions of these men all his measures were undertaken. One day, when the Spanish ambassador ventured to advise his majesty against putting too much confidence in such kind of people, 'Is it not the custom in Spain,' said James, 'for the king to consult with his confessor?' 'Yes,' answered the ambassador, 'and that is the reason our affairs succeed so ill.' James's first parliament, which was composed mostly of zealous Tories, was strongly inclined to comply with the measures of the crown. They voted unanimously, that they should settle on the present king, during life, all the revenue enjoyed

by the late king. For this favor, James assured them that he would secure them in the full enjoyment of their laws; but, with regard to religion, no answer could be extorted, for that he resolved to alter. In every thing, however, religion excepted, James merited praise. He applied himself to business with unremitting attention. He managed his revenue with the strictest economy. He retrenched superfluous expenses, and showed himself zealous for the glory of the nation. He endeavoured to expel from court the vice which had prevailed so much during the former reign, and to restore decency and morality. Presiding daily at the council, and at the boards of admiralty and treasury, he entered into the whole detail of the concerns of the state. But his bigotry for the Romish religion sullied all his good qualities, and rendered him feared for his violence, where he was not despised for his weakness; and a storm was now seen gathering to disturb his repose. The duke of Monmouth, under the auspices, as it is said, of the prince of Orange, resolved to invade England, from the shores of Holland. He was seconded by the duke of Argyle, who formed the scheme of an insurrection in Scotland; and, while Monmouth attempted a rising in the west, it was resolved that Argyle should also make a descent in the north. The generosity of the prince of Orange, however, did not correspond with the warmth of his professions. The unfortunate duke derived from his own plate and jewels his whole supply for the undertaking; and the enthusiasm of a rich widow supplied Argyle with £10,000. Argyle was the first who landed. He appeared in Scotland at the head of 2500 men, and strove to influence the people by various addresses in his favor. But, a formidable body of the king's forces coming against them, his army fell away; and he himself, after being wounded in attempting to escape, was taken prisoner by a peasant. After suffering many indignities, he was tried and publicly executed at Edinburgh.

By this time Monmouth had landed in Dorsetshire with scarcely 100 followers. His name, however, was so popular, and so great was the hatred of the people to James on account of his religion, that in four days he had assembled a body of above 2000 men. They were indeed all of them the lowest of the people, and his declarations were suited entirely to their prejudices. He called the king the duke of York; and denominated him a traitor, a tyrant, a murderer, and a popish usurper. He imputed to him the fire of London, and even affirmed that he had poisoned the late king. He soon found himself at the head of 6000 men; and was daily obliged to dismiss great numbers for want of arms. The king was not a little alarmed at his invasion. Six regiments of British troops were called over from Holland; and a body of regulars, to the number of 3000, were sent, under the command of the earl of Feversham and Churchill, to check the progress of the rebels. They took post at Sedgemore, a village near Bridgewater, and were joined by considerable numbers of the country militia. Here Monmouth resolved, by a desperate effort, to gain the kingdom or lose his life. He drove the royal infantry from their ground,

and was on the point of gaining a complete victory, when the cowardice of Gray, who commanded the horse, brought all to ruin. This nobleman fled at the first onset; and the rebels, being charged in flank, gave way after a contest of three hours. About 300 were killed in the engagement, and 1000 in the pursuit. Monmouth fled about twenty miles from the field of battle, till his horse sunk under him. He then alighted; and, exchanging clothes with a shepherd, fled on foot, attended by a German count who had accompanied him from Holland. Being quite exhausted with hunger and fatigue, they both lay down in a field, and covered themselves with fern. The shepherd being found in Monmouth's clothes by the pursuers, increased the diligence of the search; and by means of bloodhounds he was detected in this miserable situation, with raw peas in his pocket, on which he had lived for some days. He burst into tears when seized by his enemies; and petitioned, with the most abject submission, for his life. On his way to London, he wrote a submissive letter to the king, promising discoveries, should he be admitted into his presence. The curiosity of James being excited by the letter, he sent Sheldon, a gentleman of the bed chamber, to meet Monmouth. In his conversation with Sheldon, he asked who was in chief confidence with the king; and being answered that it was Sunderland, Monmouth knocked his breast in surprise, and said, 'Why then, as I hope for salvation, he promised to meet me.' He desired Sheldon to inform the king, that several of his accomplices in rebellion were in the confidence of his majesty; and he gave him a particular account of the part which the prince of Orange had acted in this whole affair. Sheldon, on his return from the duke of Monmouth, began to give an account to the king of what he had learned from the unhappy prisoner. Sunderland, pretending business, came into the room. Sheldon stopped, and signified his desire to speak in private with the king. James told him that he might say any thing before that lord. Sheldon was in great perplexity; but, being urged, he told all that Monmouth had asserted. Sunderland appeared for some time confused; at length he said, with a laugh, 'If that is all he can discover to save his life, he will derive little good from his information.' Monmouth himself was soon after brought before the king. Sunderland, to save himself, and the other adherents of the prince of Orange, advised the duke, that, as he could assure him of the certainty of a pardon, he ought to deny what he had said in prejudice of his friends, who could serve him on some other more favorable occasion. The credulous duke, swayed by this advice, suppressed what he had said to Sheldon, when he was examined by the king. He mentioned nothing of the concern which the prince of Orange had taken in the invasion; though James was already sufficiently informed of this. D'Avaux, the French minister to the States, had given a circumstantial account of the whole conduct of the prince to Louis XIV., who had ordered it to be privately communicated to the king of England.

The minister who had been sent from Holland, to congratulate James on the suppression of Ar-

gyle's rebellion, was in great perturbation when he heard that the king was resolved to see Monmouth. 'Though he found that he said nothing of his master,' said James, 'he was never quiet till Monmouth was dead.' The unfortunate duke made various attempts to obtain mercy. He wrote to the queen dowager, and to the queen, as well as to the king himself. When admitted to the royal presence, Monmouth begged his life, with a meanness unsuitable to his rank and pretensions. But all his entreaties and submissions were of no avail. James told him that he was much affected with his misfortunes, but that his crime was too dangerous in its example to be left unpunished. In his last moments he behaved with a magnanimity worthy of his former courage. When he came to the scaffold, he behaved with decency and even with dignity. He spoke little; made no confession; nor did he accuse any of his friends. Circumstances are said to have attended his death that created a horror among the spectators. The executioner missed his blow, and struck him slightly on the shoulder. Monmouth raised his head from the block, and looked him full in the face, as if reproaching him for his mistake. He struck him twice again, but with feeble strokes; and then threw the axe from his hands. The sheriff forced him to renew his attempt; and the head of the duke was at last severed from his body. Those concerned in this conspiracy were punished with the utmost severity. Immediately after the battle of Sedgemoor, Feversham hanged up above twenty prisoners; and was proceeding in his executions, when the bishop of Bath and Wells informed him, that these unhappy men were now by law entitled to a trial, and that their execution would be deemed a real murder. Nineteen were put to death in the same manner at Bridgewater by colonel Kirk, a man of a savage and bloody disposition. This vile fellow, practised in the arts of slaughter at Tangiers, where he served in garrison, took pleasure in committing instances of wanton barbarity. He ravaged the whole country, without making any distinction between friend and foe; and his regiment, for their peculiar barbarity, went under the ironical title of Kirk's lambs. It does not, however, appear, that these cruelties were committed by the direction, or even with the approbation, of James; any more than the legal slaughters that were committed by judge Jefferies, who was sent down to try the delinquents. The brutality of this man's temper was inflamed by continual intoxication. No fewer than eighty were executed by his orders at Dorsetshire; and on the whole, at Exeter, Taunton, and Wells, 251 are computed to have fallen by the hand of justice, as it was called; nor were women exempted from the general severity, but suffered for harboring their nearest kindred. Jefferies on his return was immediately created a peer, and soon after vested with the dignity of chancellor. In justice to the king, however, it must be owned, that he complains, in his Memoirs, with apparent indignation, of 'the strange havoc made by Jefferies and Kirk in the west;' and that he attributed the unpopularity, which afterwards deprived him of the crown, to the violence and barbarity of those

pretended friends of his authority. He even ascribes their severities, in some degree, to a formed design of rendering his government odious to his subjects.

James now began in earnest to endeavour to establish popery. He told the house of commons that the militia were found by experience to be of no use; that it was necessary to augment the standing army; and that he had employed many Catholic officers, in whose favor he had thought proper to dispense with the test. He found them useful, he said, and he was determined to keep them employed. These stretches of power naturally led the lords and commons into some degree of opposition: but they soon acquiesced in the king's measures, and the parliament was then dissolved. James's next step was to secure a Catholic interest in the privy council. Accordingly four Catholic lords were admitted, viz. Powis, Arundel, Belasis, and Dover. Sunderland, who saw that the only way to gain preferment was by popery, became a convert. Rochester, the treasurer, was turned out of his office, because he refused to conform. In Ireland, even the duke of Ormond, who had long supported the royal cause, was displaced as being a protestant; and lord Tyrconnel, a furious Roman Catholic, succeeded him. In his zeal for popery, it is said, that James stooped so low as even to attempt the conversion of the bloody colonel Kirk; but the daring soldier told him that he was pre-engaged; for he had promised the king of Morocco, when he was quartered at Tangiers, that, if ever he changed his religion, he would turn Mahommedan. At last the clergy of the church of England began to take the alarm, and commenced an opposition to court measures. The pulpits thundered with their warnings against popery; more formidable, it was urged, from the support granted it by the king. It was in vain that James attempted to impose silence on these topics; instead of avoiding the controversy, the Protestant preachers pursued it with greater warmth. To effect his designs, the king determined to revive the high commission court, which had formerly given the nation so much disgust, and which had been abolished by act of parliament for ever. An ecclesiastical commission was issued, by which seven commissioners were invested with a full and unlimited authority over the whole church of England.—The next step was to allow a liberty of conscience to all sectaries; he being taught to believe that the truth of the Catholic religion would then, upon a fair trial, gain the victory. In such a case, the same power that granted liberty of conscience might restrain it, and the Catholic religion alone be allowed to predominate. He therefore issued a declaration of general indulgence, and asserted that non-conformity to the established religion was no longer penal. But in Scotland he ordered the parliament to grant a toleration only to the Catholics, without interceding in the least for the other dissenters, who were much more numerous. In Ireland the Protestants were totally expelled from all offices of trust and profit, and Catholics put in their places. These measures sufficiently disgusted every part of the

British empire; but, to complete the work, James publicly sent the earl of Castlemain ambassador extraordinary to Rome, in order to express his obedience to the pope, and reconcile his kingdoms to the holy see. This proceeding was too precipitate to be relished even by the pope himself; and the only return he made to this embassy was the sending a nuncio into England. This officer made a public and solemn entry into Windsor; which did not fail to add to the general discontent; and, because the duke of Somerset refused to attend the ceremony, he was dismissed from his employment of one of the lords of the bed-chamber. Soon after the Jesuits were permitted to erect colleges in different parts of the kingdom, and to exercise the Catholic worship publicly. Father Francis, a Benedictine monk, was recommended by the king to the university of Cambridge for the degree of M.A. The university rejected him on account of his religion; and presented a petition to the king, beseeching him to recall his mandate. James disregarded their petition, and denied their deputies a hearing; the vice-chancellor himself was summoned to appear before the high-commission court, and deprived of his office; yet the university persisted, and father Francis was refused. With the university of Oxford he also now embroiled himself. The place of president of Magdalen College being vacant, the king sent a mandate in favor of one Farmer, a new convert, and a man of bad character in other respects. The fellows made very submissive applications for recalling his mandate; but, the election day coming on before they received an answer, they chose Dr. Hough, a man of learning, integrity, and resolution. The king was incensed at their presumption; an inferior ecclesiastical court was sent down, who, finding Farmer a man of scandalous character, issued a mandate for a new election. The man now recommended by the king was Dr. Parker; also a man of loose character, but willing to embrace the Catholic religion. The fellows refused to comply with this injunction; which so irritated the king, that he went down to Oxford in person; ordered them to be brought before him; and reproached them with their insolence and disobedience; commanding them to choose Parker without delay. Another refusal on their part still more exasperated him; and, finding them resolute in the defence of their privileges, he ejected all of them, except two, from their benefices, and Parker was put in possession of the college. The college, upon this, was soon filled with Catholics; and Charnock, one of the two that remained, was made vice-president.

In 1688 a second declaration for liberty of conscience was published, almost in the same terms with the former; but with this injunction, that all divines should read it after service in their churches. The clergy resolved to disobey this order. Lloyd bishop of St. Asaph, Kenn of Bath and Wells, Turner of Ely, Lake of Chichester, White of Peterborough, and Trelawney of Bristol, together with Sancroft the primate, concerted an address, in form of a petition, to the king, which, with the warmest expressions of zeal and submission, stated that they could

not read his declaration consistently with their consciences, or the respect they owed the protestant religion. The king received this petition with great marks of surprise and displeasure. He said he did not expect such an address from the church of England, particularly from some amongst them; and persisted in his orders for their obeying his mandate. As the petition was delivered in private, the king summoned the bishops before the council, and there questioned them whether they would acknowledge it. They for some time declined giving an answer; but, being urged, they at last owned it. On their refusal to give bail, an order was immediately drawn up for their commitment to the Tower, and the crown lawyers received directions to prosecute them for a seditious libel. Being conveyed to the Tower by water, the whole city was in commotion in their favor, and the people ran to the river side in multitudes, craving their blessing; calling upon heaven to protect them, &c. The very soldiers, by whom they were guarded, knelt down before them, and implored their forgiveness.

The 29th of June, 1688, was fixed for the trial of the bishops; and their return to Westminster was still more splendidly attended than their imprisonment. Twenty-nine peers, a great number of gentlemen, and an immense crowd of people, waited upon them to Westminster-hall. The dispute was learnedly managed by the lawyers on both sides. The jury withdrew into a chamber, where they passed the whole night; but next morning they returned in court, and pronounced the bishops not guilty. Westminster-hall instantly rang with loud acclamations, which were communicated to the whole extent of the city. They even reached the camp at Hounslow, where the king was at dinner in lord Feversham's tent. James demanding the cause of those rejoicings, and being informed that it was nothing but the soldiers shouting for the delivery of the bishops; 'Call you that nothing?' cried he, 'but so much the worse for them.' Immediately after this the king dismissed two of the judges, Powel and Holloway, who had appeared to favor the bishops; and issued orders to prosecute all those clergymen who had not read his declaration. It was found that all had refused it except 200. He also sent a mandate to the new fellows whom he had obtruded on Magdalen College, to elect for president, in the room of Parker, lately deceased, one Gifford, a doctor of the Sorbonne, and titular bishop of Madura. As the king found the clergy every where averse to his measures, he tried next what he could do with the army. He thought if one regiment should promise implicit obedience, their example would soon induce others to comply. He therefore ordered one of the regiments to be drawn up in his presence, and desired that such as were against his late declaration of liberty of conscience should lay down their arms. He was surprised to see the whole battalion ground their arms, except two officers and a few Roman Catholic soldiers.—A circumstance occurred about this period, in his family, which would have served, if any thing could at that time, to establish him on the throne. A few

days before the acquittal of the bishops, the queen was brought to bed of a son, who was baptized by the name of James : but so great was the animosity against him, that a story was propagated that the child was supposititious ; and so great was the monarch's pride, that he scorned to take any precautions to refute the calumny. Though James's own enthusiasm bordered on madness, some of the most wild of his religious projects seem to have been suggested by others. The earl of Sunderland, whom he chiefly trusted, was a man of abandoned principles, and insatiable avarice. To such a degree was he mercenary, that he became at once the pensioner of the prince of Orange and of the king of France. The former, who had long fixed his eye on the English throne, watched James's motions, and took every advantage of his errors. He had laid his schemes so extensively, that nothing but the birth of a male heir to the crown of England could possibly prevent him from an almost immediate possession of the kingdom. He had the address to render two-thirds of the powers of Europe interested in his success. The treaty of Augsburg, formed to break the power of France, could not accomplish its object without the accession of England. The house of Austria, in both its branches, preferred their political views to their zeal for the Romish faith, and promoted the dethronement of James as the only means to humble Louis XIV. Even the pope himself, Innocent XI., was gained over to the measures of the prince of Orange by other considerations, as well as through his fixed aversion to France. He explained to his holiness, that the Catholic princes were in the wrong to expect any advantage to their faith from James, as his being a declared papist rendered his people averse to all his measures. As for himself, should he have the good fortune to mount the throne of England, he might take any step in favor of the Roman Catholics without jealousy : and he promised to procure a toleration for the papists, should the pope, the emperor, and the king of Spain, favor his attempt. This negociation procured the desired effect. The pope contributed, with the money of the church, it is said, to expel a Roman Catholic prince from his throne.

Though the contest with the bishops had completed the king's unpopularity, the crisis of his ruin was brought on by the birth of the prince of Wales. This circumstance increased the fears of his subjects in proportion as it raised his hopes and security. In the reign of a prince to be educated under the prejudices of such a father, nothing but a continuance of the same unconstitutional measures could be expected. The prince of Orange, seeing the national discontent now raised to the highest pitch, resolved to take advantage of it. He began by giving Dykevelt, his envoy, instructions to apply in his name to the different religious sects. To the church party he sent assurances of favor and regard ; and protested, that his education in Holland had no way prejudiced him against episcopacy. To the non-conformists he sent exhortations not to be deceived by the insidious caresses of their known enemy, but to wait for a real and sincere protector, &c. In conse-

quence of these insinuations, the prince soon received invitations from the most considerable persons in the kingdom. Admirals Herbert and Russel assured him in person of their own and the national attachment. Lord Dumblane, son to the earl of Danby, being master of a frigate, made several voyages to Holland, and carried from many of the nobility tenders of duty, and even considerable sums of money to the prince of Orange. Henry Sidney, brother to Algernon, and uncle to the earl of Sunderland, came over to him with assurances of a universal combination against the king. Soon after the bishop of London, the earls of Danby, Nottingham, Devonshire, Dorset, and several other lords, gentlemen, and principal citizens, united in their addresses to him, and intreated his speedy descent. The people, though long divided between whig and tory, now joined against their unhappy sovereign as a common enemy. William therefore determined to accept their invitations ; and the more readily, as he perceived the malcontents had conducted themselves with prudence and secrecy. Having the principal servants of James in pay, he was minutely informed of the most secret actions and even designs of that prince. The prince had a fleet ready to sail, and troops provided for action, before the beginning of June, 1688. Louis XIV. was the first who gave James any warning of his danger, and offered to assist him in repelling it. But he declined this friendly offer, lest it should be said that he had entered into a private treaty with that monarch, to the prejudice of the protestant religion. Being also deceived and betrayed by Sunderland, he had the weakness to believe, that the reports of an invasion were invented to frighten him into a strict connexion with France. He gave credit to the repeated assurances of the States, that the armament prepared in their ports was not designed against England. Nay, he even believed the assertion of the prince himself, whose interest it was to deceive. Sunderland descended against the possibility of an invasion, and turned to ridicule all who believed the report. Having by the prior consent of James taken possession of all the foreign correspondence, he suppressed every species of intelligence that might alarm him. Louis, finding his first offers rejected, next proposed to march down his army to the frontiers of the Dutch provinces, and thus detain their forces at home for their own defence : this proposal, however, met with no better reception than the former. Louis still unwilling to abandon a friend and an ally, whose interest he regarded as closely connected with his own, ventured to remonstrate with the Dutch against the preparations they were making to invade England. But the republic treated this remonstrance as an officious interference, and James himself declined his mediation. The king of England having thus rejected the assistance of his friends, and being left to face the danger alone, was astonished by advice from his minister in Holland, that an invasion was not only projected but avowed. When he first read the letter containing this information, he grew pale, and it dropped from his hand. He saw himself on the brink of destruction, and knew

not to whom to apply for protection. In this emergency Louis wrote, that, to divert the Dutch from the intended invasion of England, he would lay siege to Maestricht with a French army of 30,000 men. James communicated this intelligence to Sunderland, and he to the prince of Orange. 6000 men were thrown into Maestricht; and the design of Louis, as being impracticable, was laid aside. On this the latter, disgusted with James, turned his arms towards Germany. James had now no resource but in attempting to retreat from his late precipitate measures. He paid court to the Dutch, and offered to enter into any alliance with them for their common security. He replaced in all the counties of England the deputy lieutenants and justices, who had been deprived of their commissions. He restored the charters of such corporations as he had withdrawn; annulled the high commission court; reinstated the expelled president and fellows of Magdalen College; and was even reduced to caress those bishops, whom he had so lately persecuted and insulted. All these concessions, however, were now too late; they were regarded as the effects of fear and not of repentance. Indeed, it is said, he very soon gave proofs of his insincerity: for, hearing that the Dutch fleet was dispersed, he recalled those he had made in favor of Magdalen College; and, to show his attachment to the Romish church, he appointed the pope one of the sponsors at the baptism of the prince of Wales. In the mean time, William set sail from Helvoetsluys with a fleet of nearly 500 vessels, and an army of above 14,000 men. Fortune, however, seemed at first unfavorable to his enterprise. He was driven back by a dreadful storm; but soon refitted his fleet, and passed over again to England. It was given out that this invasion was designed for the coasts of France; and many of the English, who saw the fleet pass along their shores, little suspected the place of its destination. The same wind which brought out the Dutch, detained the English fleet in their harbours, so that the Dutch passed the straits of Dover without molestation; and, after a voyage of two days, landed at Broxholme in Torbay, on the 5th of November, the anniversary of the gun-powder treason. But, though the invitation from the English was very general, the prince for some time had the mortification to find himself joined by few. For ten days he continued in vain expectation of being joined by the malcontents; but at last, when deliberating about reembarking his forces, he was joined by several persons of consequence; and the whole country soon after flocked to his standard. Among the first who joined the prince was major Burrington, and the gentry of the counties of Devon and Somerset. Sir Edward Seymour made proposals for an association, which was signed by great numbers; and every day produced instances of that universal combination into which the nation had entered against the measures to the king. This was followed by the defection of the army. Lord Colchester, son to the earl of Rivers, first deserted to the prince. Lord Cornbury, son of the earl of Clarendon, carried off the greatest part of three regiments of cavalry at once; and several officers

of distinction informed Feversham, their general, that they could not in honor fight against the prince of Orange. Soon after this, the unhappy monarch found himself deserted by his own immediate servants and dependents. Lord Churchill had been raised from the rank of a page, and had been invested with a high command in the army; he had been created a peer, and owed his whole fortune to the king's bounty: yet even he deserted among the rest; and carried with him the duke of Grafton, natural son to the late king, colonel Berkley, and some others. In this universal defection, James, not knowing where to turn, began to think, when it was too late, of requesting assistance from France. He wrote to Leopold emperor of Germany, but in vain; that monarch only returning for answer, that what he had foreseen had happened. James had some dependence on his fleet, but they were entirely disaffected. In a word, his interests were deserted by all, for he had long deserted them himself. He still found his army, however, to amount to 20,000 men; and, had he led them immediately to battle, it is possible they might then have fought in his favor; but James's misfortunes had deprived him of his natural firmness and resolution. In the extremity of his distress, the prince of Denmark, and Anne his favorite daughter, perceiving the desperation of his circumstances, cruelly resolved to take part with the prince of Orange. When the king was informed of this, he was stung with the most bitter anguish. 'God help me,' cried he, 'my own children have forsaken me.' To add to his distress as a parent, he was accused of being accessory to the death of his own child. Her nurse, and her uncle the earl of Clarendon, affirmed that the papists had murdered the princess; and publicly asked the queen's servants whither they had conveyed her. It was, however, soon known that she had fled, under the conduct of the bishop of London, to Northampton. On the 30th James sent three noblemen to treat with the prince of Orange. But though the latter knew very well that the king's commissioners were in his interest, his behaviour showed plainly, that he now thought the time of treating was past. For some time he would not admit them to an audience; and, when he did, would give no satisfactory answer. James now began to be alarmed for his personal safety, and resolved to send the queen and her infant son abroad. On a stormy and rainy day they crossed the river in a boat; and were taken to Gravesend in a coach, under the conduct of the count de Lauzun. A yacht, commanded by captain Gray, which lay there ready for the purpose, soon transported them in safety to Calais. The king was now so dispirited and distracted, that he soon resolved to follow them. He threw the great seal into the Thames; left none with any authority to conduct affairs in his absence; vainly hoping to derive advantage to his affairs from anarchy. On the 10th of December, about twelve o'clock at night, he disguised himself, took a boat at Whitehall, and crossed the river. Sir Edward Hales, with another friend, met him at Vauxhall with horses. He mounted, and, being conducted through by-ways by a guide, passed in the night-time to the Medway, which he

crossed by Ailesford bridge. At Woolpeck he took fresh horses, sent thither before by Sheldon, one of his equerries, who was in the secret of his flight, and arrived at 10 o'clock at Emby ferry near Feversham, where a custom-house hoy, hired by Sir Edward, lay ready to receive them. But the wind blew fresh, and the vessel had no ballast. The master, therefore, easily persuaded the king to permit him to wait for ballast. It being half ebb when they ran on shore, they designed to sail as soon as the vessel should be afloat. But she was now boarded by three fisher boats belonging to Feversham, containing fifty men. They seized the king and his two companions, under pretence of their being papists, that wanted to escape from the kingdom, and returned up Feversham water with the tide : but still the king remained unknown. Sir Edward Hales placed privately fifty guineas in the hands of the captain, as an earnest of more, should he permit them to escape. He promised ; but was so far from keeping his word, that he took what money they had, under pretence of securing it from the seamen, and then left them to their fate. The unfortunate fugitives were at length taken in a coach to Feversham, amidst the insults, clamors, and shouts of the sailors. When the king was brought to the inn, a seaman who had served under him knew him, and melted into tears. The other fishermen who had treated him with indignity also now relented ; and, as he gradually became known, the inhabitants of the whole village gathered round him, whilst those of higher rank fled from his presence.

On the flight of the king, the confusion he had anticipated ensued in London, and the prince of Orange exercised in his own person all the functions of royalty. He issued a declaration to the disbanded army to re-assemble themselves. He ordered the secretary at war to bring him a list of the king's troops, and commanded lord Churchill to collect the horse guards. The duke of Grafton he sent to take possession, in his name, of Tilbury Fort. The assembly of peers adjourned to the council chamber at Whitehall ; and, to give the appearance of legality to their meeting, chose the marquis of Halifax for their president. While this assembly was sitting, on the 13th December, a poor countryman, who had been engaged by James, brought an open letter from that unfortunate prince to London. It had no superscription, and it was addressed to no one. It described, in one sentence only, his deplorable condition in the hands of a desperate rabble. This messenger of their fallen sovereign had long waited at the council door, without being able to attract the notice of any who passed. The earl of Mulgrave at length, apprised of his business, had the courage to introduce him to the council. He delivered his open letter, and told the situation of the king with tears. The assembly were so much moved, that they sent the earl of Feversham with 200 of the guards to protect him. His instructions were to rescue him from danger, and afterwards to attend him to the sea coast, should he choose to retire abroad. He decided, however, to return to London ; when the prince of Orange sent a messenger to

him, desiring him to advance no nearer the capital than Rochester. The message missed James by the way, and the king sent Feversham with a letter to the prince, requesting his presence in London to settle the nation. He himself proceeded to that place, and arrived on the 16th of December. Doubting the fidelity of the troops who were quartered at Westminster, he chose to pass through the city to Whitehall. Never prince returning with victory to his capital was received with louder acclamations. The streets were covered with bonfires. The bells were rung, and the air was rent with repeated shouts of gladness. All orders of men crowded to his coach ; and, when he arrived at Whitehall, his apartments were crowded with people who came to express their joy at his return. The prince of Orange received the news of that event with a haughty air. His aim from the beginning was to induce him to relinquish the throne. The Dutch guards were ordered to take possession of Whitehall, and to displace the English ; and the king was soon after desired, by a message which he received in bed at midnight, to leave his palace next morning, and depart for Ham, a seat of the duchess of Lauderdale's. He desired, however, permission to retire to Rochester, a town near the sea coast, and opposite to France. This was readily granted, it being now perceived that the harsh measures of the prince had taken effect, and that the king meditated an escape to France. King James, surrounded by the Dutch guards, arrived at Rochester on the 19th of December. This restraint put upon his person, and the manner in which he had been forced from London, raised the indignation of some, and the compassion of many. The English army, both officers and soldiers, began to murmur ; and, had it not been for the timidity of James himself, the nation would, perhaps, have returned to their allegiance. He remained three nights at Rochester in the midst of a few faithful friends. The earls of Arran, Dumbarton, Ailesbury, Litchfield, and Middleton were there ; with the gallant lord Dundee, and other officers of merit. They argued against his flight with united efforts. Several bishops, some peers, and many officers, entreated his stay in some part of England. Message followed message from London. They represented that the opinions of men began to change, and that events would daily arise in favor of his authority. Dundee added his native ardor to his advice. ' The question, Sir,' said he, ' is, Whether you shall stay in England or fly to France ? Whether you shall trust the returning zeal of your native subjects, or rely on a foreign power ? Here you ought to stand. Keep possession of a part, and the whole will submit by degrees. Resume the spirit of a king. Summon your subjects to their allegiance. Your army, though disbanded, is not dispersed. Give me your commission, and I will carry your standard through England, and drive before you the Dutch and their prince.' The king replied ' that he believed it might be done : but that it would raise a civil war, and he would not do so much mischief to a nation, that would so soon come to their senses again.' Middleton urged

his sray, though in the remotest part of the kingdom. 'Your majesty,' said he, 'may throw things into confusion by your departure; but it will be but the anarchy of a month: a new government will soon be settled, and you and your family will be ruined.' These spirited remonstrances had no effect upon James. He resolved to quit the kingdom; and, having communicated his design to a few of his friends, he passed, at midnight, through the back door of the house where he lodged, and with his son the duke of Berwick, and Biddulph one of his servants, went in a boat to a smack which lay waiting for him without the fort of Sheerness. A hard gale compelled them to bear up toward Leigh, and to anchor on the Essex side of the coast, under the lee of the land. When the gale slackened, they passed through seven ships at anchor in the Downs; but, unable to fetch Calais, she bore away for Boulogne, and anchored before Ambleteuse. The king landed at three o'clock in the morning of Tuesday, December 25th; and, taking post, soon joined his queen at St. Germain.

James having thus abandoned his dominions, the prince of Orange, by the advice of the house of lords, the only remaining branch of the legislature, was desired to summon a parliament; but, unwilling to act upon so imperfect an authority, he convened all the members who had sat in the house of commons during any parliament of Charles II. To these were added the mayor, aldermen, and fifty of the common council of London. The prince, thus supported, wrote circular letters to the counties and corporations of England to call a new parliament. The house being met, which was mostly composed of the Whig party, thanks were given to the prince of Orange for the deliverance he had brought them; after which they proceeded to settle the kingdom. A vote soon passed both houses, that king James II., having endeavoured to subvert the constitution of the kingdom, by breaking the original contract between the king and his people, and having, by the advice of Jesuits, and other wicked persons, violated the fundamental laws, and withdrawn himself out of the kingdom, had abdicated the government, and that the throne was thereby vacant. The king being thus deposed, William, after some discussion, was appointed his successor. Proposals were made for electing a regent. Others were for investing the princess of Orange with regal power, and declaring the young prince supposititious. To each of these propositions little inclined, however, opposed a decided negative. 'He had been called over,' he said, 'to defend the liberties of the British nation, and had happily effected his purpose; he had heard of several schemes proposed for the establishment of their government: and, if they chose a regent, he thought it incumbent upon him to inform them, that he would not be that regent; also that he would not accept of the crown under the princess his wife, though he was convinced of her merits; that therefore, if either of these schemes was adopted, he could give them no assistance in the settlement of the nation; but would return home to his own country, satisfied with his aims to secure the freedom of

theirs.' Upon this, after a long debate of both houses, a new sovereign was preferred to a regent, by a majority of two voices. It was agreed, that the prince and princess of Orange should reign jointly as king and queen of England; while the administration of government should be placed in the hands of the prince only. The marquis of Halifax, as speaker of the house of lords, made a solemn tender of the crown to their highnesses, in the name of the peers and commons of England. The prince accepted the offer; and that very day, February 13th, 1689, William and Mary were proclaimed king and queen of England.

4. *The history of Great Britain from the Revolution to the accession of the house of Brunswick.*—Though Mary had a share of the royal title, and her name and effigy were impressed on the coin, she never possessed either the authority of a queen, or the influence of a wife. Her easy temper had long been subdued by the stern severity of a husband who had very few amiable qualities. Being brought up almost under his tuition, and confined in every thing to his orders, she was accustomed to adopt implicitly his political maxims and even his thoughts: she therefore soon ceased to be an object of consequence in the eyes of the nation. William III. began his reign with issuing a proclamation for continuing all Protestants that had been in place on the first of the preceding December. On the 17th he formed his privy council, and, to gratify as many as possible of his friends, the several public boards, and even the chancery, were put into commission. The earl of Nottingham who had violently opposed the elevation of William, and the earl of Shrewsbury, who had adhered to his views, were made secretaries of state. The marquis of Halifax, and the earl of Danby, though rivals in policy, were admitted into the cabinet; the first as lord privy seal, the second as president of the council. His Dutch friends, in the mean time, were not forgotten by the king. Bentinck, his favorite, was made a privy counselor, groom of the stole, and privy purse. Auverquerque was appointed master of the horse; Zuylstein received the office of master of the robes; and Schomberg was placed at the head of the ordnance. Though these instances of gratitude were, no doubt, necessary to William, the nation was displeased at them. The king, who had been bred a Calvinist, was also very strongly inclined to favor that sect. Finding, therefore, the clergy of the church of England little inclined to take the oaths to the new government, he began openly to indulge his prejudices in favor of the dissenters. Having come to the house of lords, to pass some bills, on the 16th March, he made a speech, urging the necessity of admitting all Protestants indiscriminately into the public service. He informed them, that he was employed in filling up the vacancies in offices of trust; and he hoped that they were sensible of the necessity of a law, to settle the oaths to be taken by such persons as should be admitted into place. As he doubted not, he said, that they would sufficiently provide against Papists, so he hoped that they would leave room for the admission of all Protestants that were able

and willing to serve. This equitable proposal was rejected with vehemence. The adherents of the church complained that the ruin which they feared from the Papists, in the preceding reign, was now to be dreaded from the Protestant dissenters. They affirmed that, if the established religion was to be destroyed, it mattered little by whose hands it must fall. A bill, brought in by the ministry for abrogating the former oaths of supremacy and allegiance, was therefore rejected. An attempt to dispense with the sacramental test was also made without success. The court party proposed that any man should be sufficiently qualified for any office, by producing a certificate of his having received the sacrament in any Protestant congregation. But this proposition was rejected in the house of lords by a great majority. William repeated his attempts of a comprehension; but he was ultimately unsuccessful, and, in the coronation oath, the church party inserted a clause binding the king to maintain the Protestant religion 'as established by law.' To this clause William is said to have discovered an apparent unwillingness to swear, and his government was, for some time, but in a very tottering condition. Either through want of health, or inclination, the king interfered but little in the affairs of the nation. Ireland was strangely neglected. Halifax and Danby, who had, in a manner, raised the king to the throne, caballed with his enemies. They perceived that the people were beginning to be discontented; and that every thing seemed to indicate another change. Halifax himself declared, that, were James to conform, he could not be kept four months from re-ascending his throne. From these apparent discontents of the nation, the friends and emissaries of James assumed more boldness. They tampered with the servants of the crown, and inflamed the army. The former they alarmed with the prospect of a sudden change; the latter they roused into indignation by the manifest preference given by William to his countrymen the Dutch.

Though the kingdom of Scotland did not at first recognise the authority of William, yet the party of James never attained sufficient strength to be of any effectual service to him in that kingdom. Thirty Scotch peers, and nearly eighty gentlemen, then in London, had waited, in the beginning of January, on the prince of Orange. Without any authority from the regency still subsisting in Edinburgh, they formed themselves into a kind of convention, and the prince of Orange, in a formal manner, asked their advice. He withdrew, and they adjourned to the council chamber at Whitehall. The duke of Hamilton, being chosen president, explained the distracted state of Scotland. He represented that disorders, anarchy, and confusion, prevailed; and he urged the necessity of placing power somewhere, till a convention of the states should be called to form a lasting and solid settlement. When the heads of their address to the prince of Orange were settled, and ordered to be ingrossed, the earl of Arran unexpectedly arose, and proposed to invite back the king. The meeting, however, adhered to the prince of Orange; and waited on him in a body, requesting him to take the administration into his hands. He thanked them for the trust

they had reposed in him, and a convention was ordered to meet at Edinburgh on the 14th of March: in which it was provided that no exception or limitation whatever should be made as to religion, except that the members should be Protestants. A secession, however, was made from this convention, in favor of James. The archbishop of Glasgow, the earl of Balcarras, and the viscount Dundee, were authorised by an instrument signed by the late king, at that time in Ireland, to call a convention of the states at Stirling. But this measure was defeated, first by the wavering disposition of the marquis of Athol, and afterwards by the delay and folly of the rest of the party. At last Dundee, being alarmed by information of a design formed by the convenanters to assassinate him, left Edinburgh at the head of fifty horse. When he passed under the walls of the castle, the duke of Gordon, who held that place, and favored the cause of James, called him to a conference. He scrambled up the precipice, and informed the duke of his designs in favor of the late king. He conjured him to hold out the castle, under a certainty of being relieved. The novelty of the sight collected multitudes of spectators. The convention was alarmed. The president ordered the doors to be locked, and the keys to be laid upon the table. The drums were beat to alarm the town. A number of ill armed retainers were gathered together in the street by the earl of Leven. Dundee, in the mean time, rode off with his party; but, when they found themselves secure, the duke of Hamilton adjourned the convention; which relieved the adherents of James from apprehensions for their own safety. Fifty members retired from Edinburgh; and that circumstance procured a unanimity in all the succeeding resolutions of the convention. Soon after this it was determined, in a committee, that James had 'forfeited' his right to the throne, which was thereby become vacant. This resolution was approved by the convention, and another was drawn up for raising William and Mary to the vacant throne; in consequence of which they were proclaimed at Edinburgh on the 11th of April, 1689.

The castle of Edinburgh was still retained for king James, by the duke of Gordon; but despairing of any relief, and pressed by a siege, he surrendered it on the 13th of June; and the adherents of James, greatly disconcerted at this misfortune, now turned their eyes to the viscount Dundee. That nobleman, having been in vain urged by the convention to return, they had declared a fugitive, an out-law, and a rebel; and general Mackay had been sent to Scotland by William, with four regiments of foot, and one of dragoons, to support his interests. Dundee, being apprised of his design to surprise him, retired to the Grampian Mountains with a few horse: thence he marched to Gordon Castle, where he was joined by the earl of Dunfermline with fifty gentlemen. He then passed through the county of Murray to Inverness. He now (8th May) wrote letters, from Badenoch, to the chiefs of all the clans, appointing them to meet at a general rendezvous in Lochaber, on the 18th of the same month. In the mean time, passing

suddenly through Athol, he surprised the town of Perth, and, in hopes of gaining to his party the two troops of Scotch dragoons who lay at Dundee, he marched suddenly to that place; but the fidelity of captain Balfour, who commanded them, disappointed his views. Having raised the land-tax as he passed, Dundee returned through Athol and Rannoch to hold the diet of rendezvous at Lochaber. Here he was reinforced by several Highland chieftains, so that his army amounted to 1500 men. With this force he pursued Mackay for four days. Soon after, however, Dundee found himself surrounded with many difficulties. The officers of the Scotch dragoons, who held a secret correspondence with him, wrote him false intelligence, as an excuse for their own fears; and the natives of the low country, who served in his army, quitted him without leave. At last, he himself fell sick, while Mackay hovered on his rear. A slight skirmish happened, in which the Highlanders prevailed; but they lost their baggage during the action. Dundee at length arrived at Ruthven; but Mackay, being reinforced with a body of 1200 men, advanced against him, and other regiments had arrived at Perth and Dumblain. The Highlanders now deserted every night by hundreds; their gallant leader himself was forced to retire to Lochaber, where only 200 of his whole force remained with him; and, to complete his misfortunes, he received at the same time news of the surrender of the castle of Edinburgh.

On the 23rd of June letters arrived from king James, with a promise of immediate succours from Ireland; upon which Dundee ordered the neighbouring clans to assemble round his standard. But still he had scarcely any thing but the mere bodies of his men with which he could prosecute the war. The Highlanders were armed only with their own weapons, and he had not more than forty pounds of powder in his whole army. All difficulties, however, were surmounted by the active spirit of the general, for whom the army entertained an enthusiastic zeal. On the 17th July he met the king's forces under general Mackay, near the pass of Killcranky. An engagement ensued, in which the Highlanders were victorious: 2000 of Mackay's men were lost either in the field or in the pursuit; but the victory cost the Highlanders dear, for their brave general was mortally wounded. He survived the battle however, and wrote an account of the victory to king James: he even imagined his wound was not mortal; but he died the next morning at Blair. With him ended all the hopes of James in Scotland. Colonel Cannon, who succeeded Dundee in the command, possessed neither his popularity nor his abilities. After some insignificant actions, in which the valor of the soldiers was more conspicuous than the conduct of their leader, the Highlanders deserted in disgust; and the war soon after ended favorably for William, without any repulse given to his enemies.

During the troubles, which had terminated in placing William on the throne of England, the two parties in Ireland were kept in a kind of tranquillity by their mutual fears. The Protestants were terrified at the prospect of another

massacre; and the Papists expected every day to be invaded by the joint forces of the English and Dutch. Their terrors, however, were ill founded; for though Tyrconnel sent several messages to the prince, that he was ready to deliver up the kingdom to any force that might make a surrender decent, his offers were always rejected. William was persuaded by the marquis of Halifax, that, should Ireland yield, no pretence could remain for keeping an army in pay; that then, having no force to compel allegiance, he might as easily be turned out as he had been brought into the country; that the English nation could never remain long in a state of good humor; and that he might perceive they already began to be discontented. These insidious arguments induced William to neglect Ireland until Tyrconnel affected to adhere to James. The whole military force of the kingdom at that time amounted only to 4000 men, and of these only 600 were in Dublin. But an half-armed rabble, rather than an army, was now suddenly raised in various parts of the kingdom. Having no pay from the king, they regarded no discipline, and subsisted by depredation. The Protestants in the north armed themselves in their own defence; and the city of Londonderry, relying on its situation, and a slight wall, shut its gates against the newly raised army. Protestant parties in the mean time rose every where, declaring their resolution to unite in self-defence, to preserve the Protestant religion, to continue their dependence on England, and to promote the meeting of a free parliament. To preserve appearances, William sent general Hamilton, an Irishman and a Roman Catholic, to treat with Tyrconnel; but, instead of persuading that lord to yield to William, this messenger advised him to adhere to James. In the mean time James himself assured the lord deputy that he was ready to sail from Brest with a powerful armament; and Hamilton, assuming spirit from the hopes of this aid, marched against the northern insurgents. They were routed with considerable slaughter at Drumore; and Hillsborough, where they had fixed their head quarters, was taken without resistance: the city of Londonderry, however, resolved to hold out to the last extremity. On the 7th of March, 1689, James embarked at Brest. The expedition consisted of fourteen ships of war, six frigates, and three fire-ships: 1260 of his native subjects in the pay of France, and 100 French officers. He landed at Kinsale without opposition on the 12th of the month, and was received with the utmost demonstrations of joy. His first care was to secure, in the fort of Kinsale, the money, arms, and ammunition, which he brought from France; and put the town in some posture of defence: he then advanced to Cork. Tyrconnel arrived at this place soon after, and brought intelligence of the route at Drumore. The king was so much pleased with his attachment and services, that he created him a duke; after which he himself advanced towards Dublin. The condition of the multitude, who poured round him under the name of an army, was not calculated however to raise his hopes of success. Most of them were only provided with clubs; some had sticks up

with iron; and, even of those who were best armed, scarcely two in 100 had muskets fit for service. Their very numbers distressed their sovereign, and ruined the country. James, in fact, resolved to disband the greatest part of them. He reserved only fourteen regiments of horse and dragoons, and thirty-five regiments of foot; the rest he ordered to their respective homes. Being received at Dublin, with an appearance of universal joy, James proceeded immediately to business. He ordered, by proclamation, all Protestants who had abandoned the kingdom to return; and, in a second proclamation, commanded all Papists, except those in his army, to lay up their arms, and put an end to the robberies and depredations which they had committed. He raised the value of the currency by a proclamation; and summoned a parliament to meet on the 7th of May. The Protestant clergy represented their grievances in an address; and the university of Dublin appeared with complaints and congratulations. He assured the first of his absolute protection, and a full redress; and he promised the latter not only to defend, but even to enlarge their privileges. On the 8th of April James left Dublin, resolved to lead his army against the insurgents in person. They returned before him, and the king laid siege to Londonderry. The besieged made such a vigorous resistance as has made the place ever since remarkable (see LONDONDERRY); but, being reduced to the last extremity, they would have been obliged to surrender, had they not been relieved, on the 28th of July, by seven ships laden with provisions: on which the siege was immediately raised.

The distressed situation of James, and his absolute dependence upon France, now drove him into the wildest measures. He resolved to coin pieces of copper, which should be received for silver, and the people received this fictitious coin in hopes of being repaid in a more favorable state of affairs. A tax of £20,000 a month was granted for thirteen months by the parliament; and in the mean time the king endeavoured to support the former revenue. He opened a trade with France to supply the want of commerce with England. But the French, knowing their own importance, and the necessity of the unfortunate monarch's affairs, claimed and obtained advantages in traffic which offended his subjects. To add to the distress of James, Ireland was now invaded by 10,000 men under the command of the duke of Schomberg. They appeared on the 12th of August, 1689, in ninety transports, on the coast of Donaghadee. Next day Schomberg landed without opposition his army, horses, and train of artillery. Having marched to Belfast, on the 15th, he continued in that place four days to refresh his troops. He then invested Carrickfergus, and threw into it 1000 bombs, which laid the houses in ashes. The garrison, having spent their powder to the last barrel, marched out with all the honors of war. But Schomberg's soldiers broke the capitulation. They disarmed and stripped the inhabitants, without regard to sex or quality; even women, stark naked, were publicly whipped between the lines; and all this under pretence

of cruelties of the same kind having been committed by the Papists. Though Schomberg was an experienced general, who had passed a life of eighty years almost continually in the field, he found himself at a loss how to carry on the war in Ireland. He did not consider the dangers that threatened the health of his troops by confining them too long in one place; and he kept them in a low moist camp near Dundalk, almost without firing of any kind; so that the men fell into fevers and fluxes, and died in great numbers. The enemy were not less afflicted with similar disorders. Both camps remained for some time in sight of each other; and at last, the rainy season approaching, both armies quitted their camps at the same time, and retired into winter quarters. The bad success of the campaign, and the miserable state of the Protestants in Ireland, at length induced William to attempt their relief in person. Accordingly he left London on the 4th of June 1690, and arrived at Carrickfergus on the 14th of that month. Thence he passed to Lisburn, the head quarters of the duke of Schomberg, and reviewed his army at Lough-Britland, consisting of 36,000 men, English, Dutch, German, Danes, and French. Being supplied with every necessary, and in high health and spirits, they seemed absolutely certain of victory. The Irish army, having abandoned Ardee at their approach, fell back to the south of the Boyne. On the bank of that river they were joined by James, who had marched from Dublin at the head of his French auxiliaries. The banks of the Boyne were steep; the south side hilly, and fortified with ditches. The river itself was deep, and it rose very high with the tide. These advantages induced James, contrary to the opinion of his officers, to keep possession of this post. His army was inferior to his opponent's in numbers, and discipline; but flight, he thought, would dispirit his troops, and tarnish his own reputation; he therefore resolved to put the fate of Ireland to the issue; and the celebrated battle of the BOYNE (see that article) was fought on the 30th of June. While his troops were yet fighting, he quitted his station; and, leaving orders to guard the pass at Duleek, made the best of his way to Dublin. He advised the magistrates of that city to make the best terms they could with the victors; and he himself set out for Waterford, where he immediately embarked for France. When he first deserted his troops at the Boyne, O'Regan, an old Irish captain, was heard to say, 'That, if the English would exchange generals, the conquered army would fight them over again.' The victory at the Boyne was by no means decisive, however, and the friends of James resolved to continue their opposition to William. Sarsfield, a popular and experienced general, put himself at the head of the army that had been routed at the Boyne, and went farther into the country to defend the banks of the Shannon. James appointed at this time a French officer, M. St. Ruth, to a superior command over Sarsfield, which gave the Irish universal discontent. On the other hand, general Ginkle, who had been appointed to command the English army in the absence of William, advanced towards the Shannon to meet the

enemy. The only place where it was fordable was at Athlone, a strong walled town built on both sides of the river, and in the hands of Jarres's friends. The English soon made themselves masters of one side of the river: but the opposite bank, being vigorously defended, was long thought impregnable. At length it was resolved in a council of war, that a body of troops should ford the stream in the face of the enemy: who were driven from their works. St. Ruth marched his army to their relief, but he came too late; and his own guns were turned against him: upon which he instantly marched to Aughrim, at ten miles distance, where he determined to wait the English army. Ginkle did not decline the combat, though he had only 18,000 men, while the Irish were above 25,000 strong. A desperate engagement ensued; but at last, St. Ruth being killed, his troops gave way on all sides, and retreated to Limerick, where they made a brave and final stand, after having lost nearly 5000 of their best men.

The siege of Limerick commenced August 25th, 1691; and six weeks were spent before the place without any decisive effect. The garrison was well supplied with provisions, and provided with all the means of defence. The winter approaching, Ginkle had orders to finish the war upon any terms: he therefore offered such conditions, as the Irish, had they been victors, could scarcely have refused with prudence. He agreed, that all in arms should receive their pardon: that their estates should be restored, their attainders annulled, and their outlawries reversed: that none should be liable for debts incurred through deeds done in the course of hostilities: that all Roman Catholics should enjoy the same toleration with regard to their religion, as in the reign of Charles II.; that no oaths but that of allegiance should be required of high or low: and that should the troops, or any number of them, choose to retire into any foreign service, they should be conveyed to the continent at the expense of king William. The lords justices had arrived from Dublin on the 1st of October. They signed the articles together with Ginkle; and thus the Irish Papists put a happy period to a war which threatened their party with absolute ruin. In consequence of this, about 14,000 of those who had fought for king James went over to France, having transports provided by government for conveying them thither. When they arrived, James thanked them for their loyalty, and told them that they should still fight for their old master; and that he had obtained an order from the king of France for their being new clothed, and put into quarters of refreshment. In this manner all James's expectations from Ireland were entirely frustrated, and the kingdom submitted quietly to the English government.

In the beginning of 1692 an action of unexampled barbarity disgraced the government of William in Scotland. In consequence of a pacification with the Highlanders, in the preceding August, a proclamation of indemnity had been issued to such insurgents as should take the oaths to the king and queen, on or before the last day of December. The chiefs of the few tribes who had been in arms for James com-

plied soon after with the proclamation: but Macdonald of Glenco failed in submitting within the limited time; more, however, from accident than design. In the end of December he came to colonel Hill, who commanded the garrison in Fort William, to take the oaths of allegiance to the government. Hill having furnished Macdonald with a letter to Sir Colin Campbell, sheriff of the county of Argyle, directed him to repair immediately to Inverary, to make his submission in a legal manner. The way to Inverary lay through almost impassable mountains; the season was extremely rigorous, and the whole country covered with a deep snow. So eager, however, was Macdonald to take the oaths, before the limited time should expire, that, though the road lay within half a mile of his own house, he would not stop to visit his family. After various obstructions he arrived at Inverary. The time was elapsed, and the sheriff hesitated to receive his submission; until Macdonald prevailed upon him by his importunities, and even tears. But Sir John Dalrymple, afterwards earl of Stair, king William's secretary of State for Scotland, meanly took advantage of Macdonald's neglecting to take the oaths within the time prescribed; and procured from the king a warrant of military execution against him and his whole tribe. As a mark of his own eagerness, or to save Dalrymple, William signed the warrant, both above and below, with his own hand. The secretary, in letters expressive of a brutal ferocity of mind, urged the officers who commanded in the Highlands to execute their orders with the utmost rigor. Campbell of Glenlyon, a captain in Argyle's regiment, and two subalterns, were ordered with 120 men to repair to Glenco on the 1st of February. Campbell, being uncle to young Macdonald's wife, was received by the father with great friendship and hospitality. The men were treated in the houses of his tenants with free quarters and kind entertainment. Till the 13th of the month, the troops lived in good humor and familiarity with the people. The officers on the very night of the massacre passed the evening, and played at cards in Macdonald's house. In the night, however, lieutenant Lindsay, with a party of soldiers, called in a friendly manner at the door. He was instantly admitted: when Macdonald, as he was rising, was shot dead through his back. His wife had already put on her clothes; but was stripped naked by the soldiers, who tore the rings off her fingers with their teeth. The slaughter was now general. To prevent the pity of the soldiers to their hosts, their quarters had been changed the night before. Neither age nor infirmity was spared. Some women, in defending their children, were killed; boys, imploring mercy, were shot by officers, on whose knees they hung. In one place nine persons, as they sat enjoying themselves at table, were shot dead by the soldiers. At Inveriggen, in Campbell's own quarters, nine men were first bound by the soldiers, and then shot at intervals, one by one. Nearly forty persons were massacred by the troops. Several who fled to the mountains perished by famine and the inclemency of the season: those who escaped owed their lives to a tempestuous night. Lieutenant colonel

Hamilton, who had the charge of the execution from Dalrymple, was on his march with 400 men, to guard all the passes from the valley of Glenco; but was obliged to stop by the severity of the weather, which proved the safety of the rest of the tribe. He entered the valley next day; laid the houses in ashes; and carried away all the cattle and spoil, which were divided among the officers and soldiers.

It has been supposed, that it was partly to efface the remembrance of this massacre, and the superficial enquiry which afterwards took place respecting it, above-mentioned, that the king caused his commissioner to declare in the Scots parliament, 'That if the members found it would tend to the advancement of trade, that an act should be passed for the encouragement of such as should acquire and establish a plantation in Africa, America, or any other part of the world where plantations might be lawfully acquired, his majesty was willing to declare he would grant to the subjects of this kingdom, in favor of these plantations, such rights and privileges as he granted, in like cases, to the subjects of his other dominions.' Relying on this, and other flattering promises, the nobility and gentry of Scotland advanced £400,000 towards the establishment of a company for carrying on an East and West India trade; and 1200 veterans, who had served in king William's wars, were sent to effect a settlement on the peninsula of DARIEN. See that article. But the new settlers were soon abandoned to their fate, though many of them had been covered with wounds in fighting his battles. The disappointment of the people, upon receiving authentic accounts of the ruin of their colony, was great and universal. The whole nation seemed to join in the clamor that was raised against their new sovereign.

The reduction of Ireland, and the dispersion of the Highland chieftains who favored his cause, did not entirely exterminate the hopes of James. His chief expectations were now founded on a conspiracy among his English adherents, and in the succours promised by the French king. A plot was first formed in Scotland by Sir James Montgomery; a person, who, from being an adherent to William, now turned against him: but the project was ill contrived, and altogether an abortion. To this another succeeded, which seemed to threaten more serious consequences, as it was managed by the Whig party, who were the most formidable in the state. A number of these joined themselves to the Tories, and both made advances to the adherents of the late king. They assembled together: and the result of their deliberations was, that the restoration of James was to be effected entirely by foreign forces; that he should sail for Scotland, and be there joined by 5000 Swedes; who, because they were of the protestant religion, would, it was thought, remove a part of the odium which attended an invasion by foreigners; it was concerted that assistance should at the same time be sent from France, and that full liberty of conscience should be proclaimed throughout the kingdom. To save time, it was resolved to send over to France two

trusty persons to consult with the banished monarch; and lord Preston and Mr. Ashton were appointed for this embassy. Both of them, however, were seized when they least expected it, by order of lord Caermarthen. Both were condemned: Ashton being executed without making any confession; but lord Preston had not the same resolution. Upon an offer of pardon, he discovered a great number of his associates; among whom were the duke of Ormond, lord Dartmouth, and lord Clarendon. The French at last became sensible of their bad policy in not having better supported the cause of James, and therefore resolved to make a descent upon England in his favor. In pursuance of this scheme, the French king supplied James with an army consisting of a body of French troops, some English and Scots refugees, and the Irish regiments which had been transported into France from Limerick. This army was assembled between Cherbourg and La Hogue, and commanded by king James in person. More than 300 transports were provided for landing it on the opposite coast; and Tourville, the French admiral, at the head of sixty-three ships of the line, was appointed to favor the attempt. His orders were, at all events, to attack the enemy, in case they should oppose him; so that every thing promised the banished king a change of fortune. These preparations were soon known at the English court, and every precaution taken for a vigorous opposition. The machinations of the banished king's adherents were discovered to the English ministry. The duke of Marlborough, lord Godolphin, and even the princess Anne herself, were violently suspected of disaffection; preparations, however, were made with great tranquillity and resolution, to resist the growing storm. Admiral Russel was ordered to put to sea with all possible expedition; and he soon appeared with ninety-nine ships of the line, besides frigates and fire-ships. At the head of this formidable fleet, he set sail for the coast of France; and near La Hogue discovered the enemy, who prepared to give him battle. The engagement began between the two admirals, with great fury, on Thursday morning, May 19th, 1692; and the rest of the fleet soon followed their example. The battle lasted for ten hours; but at last victory declared on the side of numbers; the French fled for Conquet road, having lost four ships in the first day's action. The pursuit continued for two days; three French ships of the line were destroyed the next day; and eighteen more, which had taken refuge in the bay of La Hogue, were burnt by Sir George Rooke. Thus were all the French preparations frustrated; and so decisive was the blow, that from this time France long relinquished all claims to the sovereignty of the ocean.

This decisive victory over the French fleet also put an end to the hopes of James. No further attempts were made in his favor, except some plots to assassinate king William, which ended only in the destruction of those who formed them. But it was never fairly proved that James countenanced these plots. In 1697 the abbé de Polignac, ambassador from France

in Poland, informed his court, that thoughts were entertained of electing the late king of Great Britain, king of Poland. Louis XIV. eagerly recommended this honor to James, but he himself steadily refused it. He told them, that 'he should ever retain a grateful remembrance of his friends in Poland. But that his acceptance of any other sceptre would amount to an abdication of that which he deemed his right. That therefore he was resolved to remain in his present forlorn condition, possessing less hopes than ever of being restored, rather than to do the least act of prejudice to his family.' The same year, at an interview between king William and Louis, the latter proposed that the prince of Wales, James's son, should succeed to the throne of England, after the death of William. The king with some hesitation agreed to this request. He even engaged to procure the repeal of the act of settlement; and to declare, by another, the prince of Wales successor to the throne. Even this proposal, however, was rejected by the high-minded James. He told the king of France, that, though he could suffer with patience the usurpation of his nephew upon his right, he would never permit his own son to be guilty of the same injustice. He urged, that, should the son reign in his father's lifetime, that circumstance would amount to a formal renunciation. That the prince of Wales, by succeeding to the prince of Orange, would yield his sole right which was that of his father, &c. From this time James seems to have relinquished every hope of his restoration, and to have resigned himself entirely to the austerities of religious enthusiasm, and that melancholy which superstition, as well as his uncommon misfortunes, had impressed on his mind. In the beginning of September, 1701, when he was, according to his daily custom, at public prayers, he fell suddenly into a lethargy; and, though he recovered his senses soon after, he languished but for a few days, and expired on the 6th of that month. The French king, with great humanity, paid him several visits during his sickness; and exhibited every symptom of compassion, affection, and respect. On the last occasion of this kind he said to the dying James, 'I come to acquaint you, Sir, that when God shall please to call your majesty from this world, I shall take your family under my protection, and acknowledge your son, as he then will certainly be, king of Great Britain and Ireland.'

Though the defeat of the French fleet at La Hogue had put king William out of all danger from any further attempts from that quarter, he by no means possessed his throne with tranquillity. The want of a common enemy produced dissensions among the people, and William began to find as much uneasiness from his parliament at home as from an enemy in the field. This uneasiness was not a little heightened by the death of his queen, who was taken off by the small pox on the 23th December, 1694. For some time he was under a sincere concern for her loss; but he soon lost all other anxieties in the greatness of his apprehension for the balance of power, and the fluctuating interests of Europe.

One of his chief motives for accepting the crown had been to engage England more deeply in the concerns of Europe; and all his policy consisted in forming alliances against France. But many of the English had no such animosity against the French. These, therefore, considered the interest of the nation as sacrificed to foreign connexions; and complained that the continental war fell most heavily on them. At last William became fatigued with the opposition and bickerings of his parliament. He admitted every restraint upon the prerogative in England, upon condition of being properly supplied with the means of humbling France. For the prosecution of the French war, the sums granted were indeed incredible. Now began the operations of the never-terminable national debt. The parliament, not contented with furnishing such sums of money as they were capable of raising by the taxes of the year, mortgaged those taxes; first irregularly and temporarily, then in a more systematic and permanent manner. The war with France continued during the greatest part of this reign; but at length the treaty of Ryswick, in 1697, put an end to those contentions, in which England had engaged without policy, and came off without advantage. In the general pacification, her interest seemed entirely deserted; and for all the treasures she had sent to the continent, and all the blood which had been shed there, the only equivalent received was an acknowledgment of William's title from the king of France. The king, however, being freed from a foreign war, now set himself to strengthen his authority at home. He at first earnestly wished to keep up those forces which had been granted him during the time of danger. The commons however, to his great mortification, passed a vote, that all soldiers in the English pay, exceeding 7000 men, should be forthwith disbanded; and that those retained should be natural born subjects of England. With this vote the king was so exceedingly displeased, that he is said at one time to have formed a design of abandoning the government. From this, however, his ministers diverted him, and even persuaded him to pass the bill. These altercations continued during the remainder of king William's reign. He considered the commons as a body of men ambitious of power, and bent upon obstructing all his projects to secure the liberties of Europe: he veered to Whigs and Tories indiscriminately, as interest or the immediate exigence demanded; and evidently considered England as a place of labor, anxiety, and altercation. When he had any time for relaxation, he retired to Loo in Holland, where, among a few friends, he indulged in those festivities which he relished. Here he planned the different successions of the princes of Europe, and labored to undermine the schemes and the power of Louis, his rival in politics and fame. William indeed could scarcely live without being at variance with the French court.

Peace had hardly been concluded with that nation, when he began to think of resources for carrying on a new war, and for instilling his English subjects in a continental confederacy. Several arts were used for inducing the people to second his aims; and the whole

nation seemed at last to join in desiring a new French war. He had been in Holland concerting with his allies operations for a new campaign. He had engaged in a negotiation with the prince of Hesse; who assured him, that, if he would besiege and take Cadiz, the admiral of Castile and several other grandes of Spain would declare for the house of Austria. The elector of Hanover had resolved to concur in the same measures; the king of the Romans, and prince Louis of Baden, undertook to invest Landau, while the emperor promised to send a powerful reinforcement into Italy: but death put a period to these mighty projects. William was naturally of a feeble constitution: and it was by this time almost exhausted. He had endeavoured to repair his health, or at least to conceal its decays, by exercise and riding. On the 21st February, 1702, in passing to Hampton Court from Kensington, his horse fell under him; and he was thrown with such violence, that his collar-bone was fractured. Being nearest the palace at Hampton, the fracture was reduced there; but in the evening, as he returned to Kensington in a coach, the motion of the carriage disunited the fracture. This proved a fatal miscarriage of the case. For some time he appeared in a fair way of recovery; but, falling asleep on his couch, he was seized with a shivering, which terminated in a fever and diarrhoea. Perceiving his end approaching, the subjects of his former care lay next his heart; and the fate of Europe seemed to remove the sensations he might feel for his own. The earl of Albermarle arriving from Holland, he conferred with him in private on the posture of affairs abroad. Two days after, having received the sacrament from archbishop Tennison, he expired on Sunday, March 8th; having lived fifty-two years, and reigned thirteen.—He was in his person of a middle stature, and thin habit. He had an aquiline Roman nose, sparkling eyes, a large forehead, and a grave solemn aspect. He left behind him the character of a great politician, though he had never been popular; and of a formidable general though he had seldom been victorious. Cunningham, his panegyrist, adds that of sincere piety. He was succeeded by the princess Anne, daughter of James II. and younger sister of his deceased queen Mary II.

Anne ascended the throne in the thirty-eighth year of her age, to the general satisfaction of all parties. William had died at the eve of a war with France; and the new queen, who generally took the advice of her ministry on every important occasion, was now urged by opposite counsels; part of her ministry being inclined to war, and another part to peace. At the head of those who opposed a war with France, was the earl of Rochester, lord lieutenant of Ireland, first cousin to the queen, and the chief of the Tory faction. At the head of the opposite party was the earl, afterwards duke, of Marlborough. That of Marlborough preponderated; the queen resolved to declare war; and communicating her intentions to the house of commons, by whom it was approved, war was accordingly proclaimed. In the declaration that announced hostilities, Louis was charged with having taken

possession of a great part of the Spanish dominions; with designing to invade the liberties of Europe, to obstruct the freedom of navigation and commerce; and with having offered an unpardonable insult to the queen and her throne, by acknowledging the title of the pretender. This declaration of war on the part of England was seconded by similar declarations of the Dutch and Germans. Louis XIV., whose power had been greatly circumscribed by William, expected on the death of the latter to enter on a field open for new conquests and fame. At the news of the English monarch's death, he could not suppress his rapture; the people of Paris, and indeed through the whole kingdom, testified their joy in the most public manner. At seeing, therefore, such a combination against him, the French monarch was filled with indignation; but his resentment fell chiefly on the Dutch. He declared with great emotion, that as for those gentlemen pedlars, the Dutch, they should one day repent their insolence and presumption, in declaring war against him whose power they had formerly felt and dreaded. By these threats, however, the affairs of the allies were no way influenced. Marlborough was appointed general of the British forces, and by the Dutch he was chosen generalissimo of the allied army. He had learned the first rudiments of war under the famous marshal Turenne, having been a volunteer in his army; and by that general his future greatness was prognosticated. The first attempt that Marlborough made, to deviate from the general practice of the army, was to advance the subaltern officers, whose merits had been hitherto neglected. Regardless of seniority, wherever he found abilities, he was sure to promote the possessor; and thus he had all the upper ranks of commanders, rather remarkable for their skill and talents, than for their age and experience. In his first campaign, in the beginning of July 1702, he repaired to the camp at Nimeguen, where he found himself at the head of 60,000 men, well provided with all necessaries, and long disciplined by the best officers of the age. He was opposed on the part of France by the duke of Burgundy, a youth of very little experience in the art of war; but the real acting general was the marshal Boufflers, an officer of courage and activity. Wherever Marlborough, however, advanced, the French were obliged to retire before him, leaving all Spanish Guelderland at his discretion. The duke of Burgundy, thus finding himself obliged to retreat before the allies, returned to Versailles, leaving Boufflers to command alone. Boufflers retired to Brabant; and Marlborough ended the campaign by taking the city of Liege; in which he found an immense sum of money, and a vast number of prisoners. This good fortune consoled the nation for some unsuccessful expeditions at sea. Sir John Munden had permitted a French squadron of fourteen ships to escape him by taking shelter in the harbour of Corunna; for which he was dismissed the service by prince George. An attempt was made upon Cadiz by sea and land, Sir George Rooke commanding the navy, and the duke of

Ormonde the land forces : but this also miscarried. At Vigo, however, the British arms were attended with better success. The duke of Ormonde landed with 2500 men, six miles from the city, while, the fleet forcing their way into the harbour, the French fleet that had taken refuge there were burnt by the enemy, to prevent their falling into the hands of the English. Eight ships were thus burnt and run ashore; and ten ships of war were taken, with eleven galleons, and above a million of money in silver. In the West Indies, admiral Benbow had been stationed with ten ships to distress the enemy's trade. Being informed that Du Casse, the French admiral, was in those seas with a force equal to his own, he resolved to attack him; and soon after discovered the enemy's squadron, near St. Martha, steering along the shore. He quickly gave orders to his captains, formed the line of battle, and the engagement began. He found, however, that the rest of the fleet had taken some disgust at his conduct; and they permitted him to sustain, almost alone, the whole fire of the enemy. Nevertheless, the engagement continued till night, and he determined to renew it next morning. But he now had the mortification to perceive, that all the rest of his ships had fallen back, except one, which joined him in urging the pursuit of the enemy. Four days this intrepid seaman, assisted by only one ship, pursued and engaged the enemy, while his cowardly officers remained at a distance behind. His last day's battle was more furious than any of the former; alone, and unsupported by any of the rest, he engaged the whole French squadron; when his leg was shattered by a cannon ball, and he himself died soon after of his wounds. Two of his cowardly associates were shot on their arrival in England; one died in his passage thither; the rest were disgraced.

The next parliament, which was convened by the queen, was highly pleased with the success of the British arms on the continent. The house of commons, composed chiefly of Tories, voted 40,000 seamen, and the same number of land forces, to act in conjunction with those of the allies. Soon after, the queen informed the parliament, that she was pressed by the allies to augment her forces, and upon this it was resolved that 10,000 more men should be added to the continental army, but on condition that the Dutch should immediately break off all commerce with France and Spain; a condition which was readily complied with. In the beginning of April, 1703, the duke of Marlborough, assembling the allied army, opened the campaign with the siege of Bonn, the residence of the elector of Cologne. This held out but a short time. He next retook Huy; the garrison of which, after a vigorous defence, surrendered prisoners of war. Limburgh was next besieged, and surrendered in two days, and thus the campaign concluded; the allies having secured the country of Liege and the electorate of Cologne from the designs of the enemy. In the campaign of 1704 the duke of Marlborough informed the Dutch that it was his intention to march to the relief of the empire, which had been for some time oppressed by the French forces;

and the states gave him full powers to act as he thought proper, with assurances of their assistance in all his endeavours. The French king, finding Boufflers no longer capable of opposing Marlborough, appointed the marshal de Villeroy in his place. But Marlborough, who, like Hannibal of old, was remarkable for studying the disposition of his antagonists, having no great fears from Villeroy, still proceeded to the assistance of the empire. Taking with him about 13,000 British troops, he advanced by hasty marches to the banks of the Danube; defeated a body of French and Bavarians stationed at Donavert; then passed the river, and laid under contribution the dukedom of Bavaria which had sided with the enemy. Villeroy, who at first attempted to follow his motions, seemed all at once to have lost sight of the enemy; nor was he apprized of his route till informed of his successes. But, in the mean time, marshal Tallard prepared, by another route, to obstruct Marlborough's retreat with an army of 30,000 men. He was soon after joined by the duke of Bavaria's forces; so that the French army in that part of the continent amounted to 60,000 veterans, commanded by the two best generals then in France. To oppose these, the duke of Marlborough was joined by a body of 30,000 men, under the celebrated prince Eugene. The allied army, with this reinforcement, amounted to about 52,000. After various marches, and countermatches, the two armies met at Blenheim. A terrible engagement ensued, in which the French were entirely defeated, and a country of 100 leagues in extent, fell into the hands of the conquerors. See *BLENNHEIM*.

Soon after finishing the campaign of 1704, the duke of Marlborough repaired to Berlin, where he procured a reinforcement of 8000 Prussians, to serve under prince Eugene in Italy. Thence he proceeded to negotiate for succours at the court of Hanover; and soon after returned to England, where he was received with every possible demonstration of joy. The arms of Britain, in the mean time, were no less fortunate by sea than by land. Gibraltar was taken by the prince of Hesse and Sir George Rooke: but so little was the value of this conquest then understood, that it was for some time in debate whether it was a capture worth thanking the admiral for; and at last it was considered as unworthy of public gratitude! Perhaps it has been since estimated as much above its value, as it was then doubtless estimated below it. Be that as it may, the British fleet, to the number of fifty-three ships of the line, soon after came up with that of France, consisting of fifty-two men of war, commanded by the count of Thoulouse, off the coast of Malaga; and this was the last great naval engagement in which the French for many years ventured to face the British on equal terms. The battle began at 10 A. M. and continued with great fury for six hours; when the van of the French began to give way. The British admiral for two days attempted to renew the engagement; but this was as cautiously declined by the French, who at last disappeared. Both sides claimed the victory, but the consequences decided it in favor of the British. In the mean time, the

Spaniards, alarmed at the taking of Gibraltar, sent the marquis of Villadurias with a large army to reduce it. France also sent a fleet of thirteen ships of the line : but part of them were dispersed by a tempest, and part taken by the British. Nor was the land army more successful. The siege continued for four months ; during which time the prince of Hesse, who commanded the town for the English, gave many proofs of valor. At length the Spaniards, having attempted to scale the rock in vain, and finding no hopes of taking the place, drew off their men, and abandoned the enterprise. While the British were thus victorious by land and sea, a new scene of contention was opened on the side of Spain. Philip V., grandson of Louis XIV., had been placed on the throne of that kingdom, and received with the joyful concurrence of the greatest part of his subjects. He had also been nominated successor to the crown, by the late king of Spain's will. But, in a former treaty among the powers of Europe, Charles, son of the emperor of Germany, was appointed heir to that crown ; and this treaty had been guaranteed by France herself, though she now resolved to reverse that consent in favor of a descendant of the house of Bourbon. Charles was still farther led on to contend for the crown of Spain, by the invitation of the Catalonians, who declared in his favor ; and, with the assistance of the British and Portuguese, promised to arm in his cause. Upon his way to his newly assumed dominion, he landed in England ; where he was received on shore by the dukes of Somerset and Marlborough, who conducted him to Windsor. Here he was kindly received by the queen ; and furnished with 200 transports, thirty ships of war, and 9000 men. The earl of Peterborough, a man of romantic bravery, offered to conduct them ; and his single service was rendered equivalent to armies. The first attempt of this general was on the city of Barcelona, at that time defended by a garrison of 5000 men. The fort Monjué, situated on a hill that commanded the city, was attacked ; the outworks were taken by storm, and the powder magazine was blown up by a shell ; upon which the fort immediately surrendered, and the city soon after. The conquest of all Valencia succeeded the taking of Barcelona. Charles became master of Arragon, Carthagena, Grenada, and Madrid. The British general entered the capital in triumph, and there proclaimed Charles III. king of Spain without opposition. To these successes, however, very little regard was paid in Britain. The victories of the duke of Marlborough alone engrossed the public attention. In 1706 he opened the campaign with an army of 80,000 men. He was met by the French under Villeroi near the village of Ramillies. An engagement ensued, in which the duke gained a victory almost as complete as that of Blenheim had been ; and the whole country of Brabant was the reward of the victors. See RAMILLIES.

The French troops were now dispirited ; the city of Paris was in confusion ; and Louis XIV., who had long been flattered with conquest, was now humbled to such a degree as almost to excite the compassion of his enemies. He intreated

for peace, but in vain ; the allies carried all before them ; and his very capital began to dread the approach of the conquerors. But what neither his arms nor his politics could effect, was brought about by a party in England. The dissension between the whigs and Tories saved France, now tottering on the brink of ruin. The councils of the queen had hitherto been governed by a whig ministry ; for, though the duke of Marlborough started in the interest of the opposite party, he soon joined the whigs, as he found them most sincere in the design of humbling France. The people, however, were in fact beginning to change, and a general spirit of Toryism to take place. The queen's personal virtues, her successes, her deference for the clergy, and their great veneration for her, began to have a prevailing influence over the nation. People of every rank were not ashamed to defend the most servile tenets, when they tended to flatter the sovereign, or increase her power. They argued in favor of strict hereditary succession, divine right, and non-resistance to the monarch. The Tories, though they joined in vigorous measures against France, were never ardently her enemies : they rather secretly hated the Dutch, as of principles very opposite to their own ; and longed for an opportunity of withdrawing from their friendship. They began to form plans of opposition to the duke of Marlborough. Him they considered and described as a self-interested partisan, who sacrificed the real advantages of the nation, in protracting a ruinous war, for his own private emolument and glory. They depicted the country as oppressed with an increasing load of taxes, which, by a continuance of the war, must become an intolerable burden. In the mean time, a succession of losses began to dissipate the conquering frenzy that had seized the nation, and to incline them to wish for peace. The earl of Galway, who commanded the army in Spain, was utterly defeated at Almanza, by the duke of Berwick ; and, in consequence of this victory, all Spain, except the province of Catalonia, reverted to the power of Philip V. An attempt was made upon Toulon, by the duke of Savoy and prince Eugene by land, and an English fleet by sea ; but to no purpose. The fleet under Sir Cloudesly Shovel, having set sail for England, was driven by a violent storm on the rocks of Scilly. His own ship was lost, and every person on board perished. Three more ships met with the same fate ; while three or four others were saved with the utmost difficulty. In Germany, marshal Villars carried all before him, and was upon the point of restoring the elector of Bavaria. The only hopes of the people lay in the activity and conduct of the duke of Marlborough, who opened the campaign of 1707, about the middle of May ; but even here they were disappointed. The duke declined an engagement ; and, after several marchings and countermarchings, both armies retired into winter quarters about the end of October. The French made vigorous preparations for the next campaign ; and the duke returned to England, to meet with a reception which he neither expected nor deserved.

The most remarkable transaction, however, of this year, and indeed of this whole reign, was

the union between the two kingdoms of Scotland and England. Though governed by one sovereign, since the accession of James to the throne of England, yet each nation continued to be ruled by its respective parliament; and often pursued opposite interests to those of its neighbour. A union had been unsuccessfully attempted more than once, and had indeed been the cause of bloody wars so long back as the time of Edward I. and III. In all the former proposals on that subject, however, both nations were supposed to remain free and independent; each having its own parliament, and subject only to such taxes, and other commercial regulations, as those parliaments should respectively judge expedient. After the destruction of the Darien colony, king William had endeavoured to allay the national ferment by resuming the affair of a union, with as much assiduity as his warlike disposition would allow. The terms proposed were the same with those formerly held out, viz. a federal union, somewhat like that of the states of Holland. With this view the Scots were prevailed on to send twenty commissioners to London; who, with twenty-three on the part of England, met at Whitehall in October 1702. Here they were honored with a visit from the queen; but the treaty was entirely broken off at this time, by the Scottish commissioners insisting, that the rights and privileges of their countrymen trading to Africa and the Indies should be preserved and maintained. It was, however, resumed in 1706, when the commissioners again met on the 16th of April. The Scottish commissioners still proposed a federal union; but the English were determined on an incorporation, which should not afterwards be dissolved by a Scottish parliament. Nothing but this, they said, could settle a perfect and lasting friendship betwixt the two nations. The commissioners from Scotland, however, resisted this; but the queen, being persuaded to pay two visits in person to the commissioners, exerted herself so vigorously, that a majority was at last gained; and all the rest yielded, though with reluctance, excepting Lockhart of Carnwarth, who could by no means be persuaded either to sign or seal the treaty. The articles being fully prepared on the 22nd of July, they were presented next day to the queen by the lord keeper, in the name of the English commissioners; and a sealed copy of the instrument was likewise delivered by the lord chancellor of Scotland. They were most graciously received; and the queen the same day dictated an order of council, threatening with prosecution such as should be concerned in any discourse or libel, or in laying wagers with regard to the union! The treaty, however, was regarded in Scotland with very different feelings. The terms had been carefully concealed, so that nothing transpired, till the whole was at once laid before parliament. The ferment was then so general, that all ranks of people, however divided in other respects, united against this detested treaty. The nobility and gentry were exasperated at the annihilation of their parliament, and the consequent loss of their influence and credit. The body of the people cried out, that the independence of the nation was sacri-

ficed to treachery and corruption. They insisted that the obligation laid on their members to stay in London, attending on the British parliament, would drain the country of its money, impoverish the members themselves, and subject them to the temptation of being corrupted. Nor was the commercial part of the people better satisfied. The dissolution of the India company, the taxes laid on the necessities of life, the vast number of duties, customs, and restrictions, upon trade, &c., were all matters of complaint. The most violent disputes took place in the parliament. Lord Belhaven made a most pathetic speech, enumerating the miseries that would attend this treaty; almost every article of it was the subject of a protest; addresses against it were presented to parliament by the convention of royal boroughs, the commissioners of the general assembly, the company trading to Africa and the Indies, as well as from shires, stewartries, boroughs, towns and parishes, without distinction of whig, tory or presbytery. Nor was the resentment of the people without doors less than that of the members within. A coalition was formed between the presbyterians and cavaliers; and to such a height did the resentment of the people arrive, that they chose officers, formed themselves into regiments, provided horses and ammunition, burnt the articles of union, justified their conduct by a public declaration, and prepared by force to dissolve the parliament. The duke of Queensberry, the chief promoter of the union, was obliged to move through the capital guarded by double lines of horse and foot.

The articles of the treaty were, however, ratified by parliament, with some trifling variations, on the 25th of March, 1707; when the duke of Queensberry dissolved that ancient assembly, and Scotland ceased to be a separate kingdom. The queen now informed the English parliament, that the treaty of union, with some additions and alterations, was ratified by an act of the parliament of Scotland: that she had ordered it to be laid before them, and hoped it would meet their approbation. She observed, that they had now an opportunity of putting the last hand to a happy union of the two kingdoms: and that she should look upon it as a particular happiness, if this great work, so often attempted before without success, could be brought to perfection in her reign. This important measure was completed on the 1st of May, 1707; and the island took the name of 'The United Kingdom of GREAT BRITAIN.' The queen again expressed her satisfaction when it received the royal assent.—'She did not doubt,' she said, 'but the whole business would be remembered and spoke of hereafter, to the honor of those who had been instrumental in bringing it to such a happy conclusion. She desired that her subjects of both kingdoms would from henceforward behave with all possible respect and kindness towards one another; that so it might appear to all the world they had hearts disposed to become one people.' The 1st of May was appointed a day of public thanksgiving; and congratulatory addresses were sent up from all parts of England, excepting the university of Oxford. The Scots however, were totally silent on the occasion. In

the treaty of union, the English commissioners were not only able statesmen, but, for the most part, well skilled in commercial affairs, which gave them an evident advantage over those of Scotland. Hence they were overmatched by the former, in the great objects which were to give the turn to national prosperity; though they were very careful to preserve all their heritable offices, superiorities, jurisdictions, and other privileges and trappings of the feudal aristocracy.

In 1708 there was a warm debate in a committee of the house of lords, occasioned by a bill passed by the commons, for rendering the union of the two kingdoms more entire and complete; whereby it was enacted, that, 'from the 1st of May, 1708, there should be but one privy council in the kingdom of Britain.' Of this affair Mr. Cunningham gives a particular account, and informs us, that he himself had a hand in it, and that he had 'from his youth borne a just hate to the privy council of Scotland.' The arguments for the dissolution were its enormous stretches of power and acts of cruelty; that it could now be of no other use in Scotland, than that the court might thereby govern every thing at pleasure, and procure such members of parliament as they thought proper; against which both Scots and English ought carefully to guard themselves. On the other hand, it was argued, that the abuse of the power complained of was no argument for the entire dissolution of the council, though it was for a restriction and limitation of it; that it was necessary that a privy council should remain in Scotland, out of regard to the ancient customs of the country, and to restrain the rage of the people, which was then ready to break out beyond all bounds. The dissolution, however, was carried by fifty against forty; after which, the nation being deprived of this last fragment of their ancient government, the opposers of the union raised the animosities of the people to a dangerous height; but the ferment abated, after an ineffectual attempt in favor of the pretender.

We now return to the duke of Marlborough, who had gone over to Flanders, where he resolved to push his good fortune. Peace had been offered more than once; treaties entered upon, and as often frustrated. After the battle of Ramillies, the king of France had employed the elector of Bavaria to write letters in his name to the duke of Marlborough, containing proposals for opening a congress. He offered to resign either Spain and its dominions, or the kingdoms of Naples and Sicily, to Charles of Austria, and to give a barrier to the Dutch in the Netherlands. But these terms were rejected. The two armies once more met, in numbers nearly equal, at Oudenarde. See OUDENARDE. In this engagement the electoral prince of Hanover, afterwards George II. of Britain, greatly distinguished himself, and gained the whole glory of the first attack. His horse was killed under him, and colonel Luschki close by his side. An engagement ensued in which the French were defeated, and Lisle, Ghent, Bruges, and all the other towns in Flanders soon after fell into the hands of the victors. The campaign ended with fixing a barrier to the Dutch provinces, and it now only remained to force a way into the provinces

of the enemy. The French king, being now in a manner reduced to despair, again sued for peace: but the demands of the allies were so high, that he was obliged to prepare for another campaign, in 1709. The first attempt of the allies was on the city of Tournay, garrisoned by 12,000 men, and exceedingly strong both by nature and art. After a siege, of twenty-one days, the town capitulated; and a month afterwards the citadel, which was still stronger than the town. Next followed the bloody battle of Malplaquet; where the allied army, consisting of 110,600 men, attacked the French consisting of 120,000, strongly posted and fortified in such a manner that they seemed quite inaccessible. See MALPLAQUET. The allied army, however, drove the French from their fortifications: but their victory cost them 20,000 of their best troops. The consequence of this victory was the surrender of the city of Mons, which ended the campaign.

The last campaign of the duke of Marlborough, in 1711, excelled, perhaps, all his former exploits. He was opposed to marshal Villars, who had commanded the French in the battle of Malplaquet, and he so contrived his measures, that, by marching and countermarching, he induced the enemy to quit a strong line of entrenchments, without striking a blow. He then took possession of the enemy's line. This was followed by the taking of Bouchain, which was the last military achievement of this great general. By a continuance of successive and almost unparalleled victories, he had gained the allies a prodigious extent of country; had perpetually advanced, and never retreated before his enemies, nor lost an advantage he had obtained over them. He more frequently gained the enemy's posts without fighting; but, where he was obliged to attack, no fortifications were able to resist him. He had never besieged a city which he did not take, nor engaged in a battle in which he did not come off victorious. Thus the allies had reduced Spanish Guelderland, Limbourg, Brabant, Flanders, and Hainault; they were masters of the Scarpe; the capture of Bouchain had opened for them a way into the heart of France, and another campaign might have made them masters of Paris; but, on the duke's return from this campaign, he was accused of having taken a bribe of £6000 a-year from a contractor, and the queen thought proper to dismiss him from all his employments.

On his removal, the command of the British forces was given to the duke of Ormond. Prince Eugene complained much of the inactivity of this general, though he seemed to be unacquainted with his treachery; while the whole army loaded him with execrations, calling him 'a stupid tool, and a general of straw.' All this, however, was in vain; the duke continued to prefer the queen's commands to every other consideration. The disgrace of the duke of Marlborough had been owing to the prevalence of the Tory party, who had now ejected the Whig ministry; the consequence was, that in spite of all the remonstrances, memorials, &c., of the allies, the British army in Flanders was ordered not to act offensively. The operations of the allies therefore languished; a considerable body was cut off at Denain, and the French retook some towns. At last, in 1713,

a peace was concluded. In the treaty it was stipulated, that Philip V., now acknowledged king of Spain, should renounce all right to the crown of France; that the duke of Berry, Philip's brother, and after him in succession, should also renounce his right to the crown of Spain, in case he became king of France; and that the duke of Savoy should possess the island of Sicily with the title of king, together with Fenestrelles, and other places on the continent. The Dutch had the barrier granted them which they so much desired; and the house of Austria was taxed to supply the wants of the Hollanders, who were put in possession of the strongest towns of Flanders. The fortifications of Dunkirk were demolished. Spain gave up Gibraltar and the island of Minorca. France resigned her pretensions to Hudson's Bay, Nova Scotia, and Newfoundland; but was left in possession of Cape-Breton, and the liberty of drying fish upon the shore. Among the articles glorious to the British nation, their setting free the French Protestants, confined in the prisons and galleys for their religion, was not the least meritorious. For the emperor it was stipulated, that he should possess the kingdom of Naples, the duchy of Milan, and the Spanish Netherlands. The king of Prussia was to have Upper Guelder; and a time was fixed for the emperor's acceding to these articles, as he had for some time refused to assist at the negociation. This famous treaty was signed at Utrecht on the last day of March, 1713.

The year 1713 was also remarkable for an attempt of the Scottish peers and commons to dissolve the union. During the debates on this subject, the earl of Peterborough endeavoured to prove the impossibility of dissolving the treaty, which he compared to a marriage, that, being once contracted, could not be dissolved by any power on earth. He observed, that though England, who in the national marriage, must be supposed to represent the husband, had in some instances been unkind to the lady, she ought not so speedily to sue for a divorce; and added, when the union was termed a mere political expedient, that it could not have been made more solemnly, unless, like the ten commandments, it had come from heaven. The duke of Argyll declared that, unless it were dissolved, he did not long expect to have either property left in Scotland, or liberty in England. The motion, however, was overruled in the house: but the discontent of the people continued. Whether, indeed, the ministry at this time did not wish to alter the line of succession, cannot be clearly made out; but certain it is, that the Whigs firmly believed it, and the Tories but faintly denied the charge. The suspicions of the former became every day stronger, when they saw a total removal of the Whigs from all places of trust and confidence, and their employments bestowed on the professed advocates of an unbroken hereditary succession. The violent dissensions between these two parties, their unbounded licentiousness, cabals, and tumults, made the queen's situation a very perplexing one; her health visibly declined; and, on the 28th of July 1714, she fell into a lethargic insensibility. The next day the physicians de-

spaired of her life. All the members of the privy council, without distinction, were now summoned from the different parts of the kingdom; and they began to provide for the security of the constitution. A letter was sent to the elector of Hanover, informing him of the queen's situation, and desiring him to repair to Holland, where he would be attended by a British squadron to convey him to England. At the same time they despatched instructions to the earl of Stafford at the Hague, to desire the States General to be ready to perform the guarantee of the protestant succession. Precautions were also taken to secure the sea-ports and the fleet. On the 30th of July the queen seemed to be somewhat relieved by the medicines which had been given her. She arose from her bed about 8 A. M. and walked a little. She was soon after, however, seized with an apoplectic fit; and, continuing all night in a state of stupefaction, expired the following morning, a little after seven o'clock, in the fiftieth year of her age, and thirteenth of her reign. This princess seemed rather fitted for the duties of private life than a public station: being a pattern of conjugal fidelity, a good mother, a warm friend, and an indulgent mistress. To her honor it must be recorded, that during her reign none suffered for high treason.

5. *The history of Great Britain from the accession of the house of Hanover to the death of George II.*—With the foregoing reign ended the line of the Stuarts: a family equally remarkable for their misfortunes and misconduct. The queen had no sooner resigned her breath than the privy council met, and three instruments were produced by which the elector of Hanover appointed several of his known friends to be added as lords justices to the seven great officers of the kingdom. Orders were also immediately issued for proclaiming George king of England, Scotland, and Ireland. The regency appointed the earl of Dorset to carry him the intimation of his accession, to the crown, and to attend him in his journey to England. They sent the general officers, in whom they could confide, to their posts: reinforced the garrison of Portsmouth, and appointed the celebrated Mr. Addison secretary of state: but no tumult, no commotion, rose against the accession of the new king. King George I. landed at Greenwich, where he was received by the duke of Northumberland, captain of the lifeguards, and the lords of the regency. He was fifty-four years old when he ascended the British throne. His mature age, his sagacity and experience, his numerous alliances, and the general tranquillity of Europe, all contributed to establish his interests, and promise him a peaceable and happy reign. Soon after his arrival in England, he was heard to say, 'My maxim is, never to abandon my friends, to do justice to all the world, and to fear no man.' To the qualities of resolution and perseverance, he joined great application to business. He, however, studied the interests of the people he had ruled, more than those of Great Britain. When he retired to his bed chamber, after his first landing, he sent for such of the nobility as had distinguished themselves by their zeal for his succession, and expressed the greatest regard for

the duke of Marlborough, just then arrived from the continent. He professed the same friendship for the other leaders of the Whigs; but the Tories found themselves at once excluded from favor. An instantaneous change was made in all the offices of trust, honor, or advantage. The Hanoverians, as they were called, governed the senate and court, oppressed whom they would, and bound the lower orders of people by severe laws: against this the Tories or Jacobites raised the most terrible outcries; and, had the pretender been a man of any judgment or abilities, a fair opportunity was now offered him of striking a decisive blow. They affirmed that, under a Whig administration, heresy and impiety were daily gaining ground. The lower orders of the clergy joined in these complaints, and pointed out several tracts published in favor of Arianism and Socinianism. The ministry, however, not only refused to silence the delinquents, but silenced the clergy themselves, and forbade their future disputations on these topics.

The parliament was now dissolved, and another called by a very extraordinary proclamation. In this the king complained of the evil designs of men disaffected to his succession; and of their having misrepresented his conduct and principles. He expressed his hopes, that his subjects would send up to parliament the fittest persons to redress the present disorders. He intreated that they would elect such in particular, as had expressed a firm attachment to the protestant succession, when it was in danger. In the election that ensued, uncommon vigor was exerted on both sides; but by dint of the monied interest that prevailed in corporations, and the activity of the ministry, a great majority of Whigs was returned both in England and Scotland. Upon the first meeting of parliament, the most rigorous measures were resolved upon against the late ministry. A committee was appointed to inspect the papers relative to the treaty of Utrecht, and to select such as might afford grounds of accusation against the negotiators. The earl of Oxford was impeached of high-treason, and sent to the Tower. The violence of the house of commons produced equal violence without doors. Tumults became every day more frequent, and served only to increase the severity of the legislature. An act was now passed, declaring that if any persons to the number of twelve, unlawfully assembled, should continue together one hour after being required to disperse by a justice of peace or other officer, and after hearing the acts against riots read in public, they should be deemed guilty of felony without benefit of clergy. These proceedings excited the indignation of the people, who perceived that the avenues of royal favor were closed to all but a faction. Great discontent arose in Scotland, where, to their other grievances, they joined that of the union, which they were taught to consider as an oppression, and the malcontents of that country found active friends in England. Some of the Tory party, who were attached to the Protestant religion, and of moderate principles in government, began to associate with the Jacobites, and to wish in earnest for a revolution. Scotland first reared the standard of revolt. The

earl of Mar, assembling 300 of his vassals in the Highlands, proclaimed James III. at Castleton; and assumed the title of lieutenant general of his majesty's forces. To second these attempts, two vessels arrived from France, with arms, ammunition, and officers, together with assurances to the earl, that the pretender himself would shortly follow. In consequence of this, the earl soon found himself at the head of 10,000 men well armed and provided. He secured the pass of Tay at Perth, made himself master of the whole province of Fife and of the sea-coast on that side of the frith of Forth; and marched thence to Dumblain, as if he had intended to cross the Forth at Stirling bridge. But here he was informed, that the duke of Argyle, who on this occasion was appointed commander in chief of all the forces in North Britain, was advancing against him, and he retreated. Soon after, however, being joined by some of the clans under the earl of Seaforth, and general Gordon, he resolved to face the enemy, and directed his march towards the south. The duke of Argyle resolved to give him battle near Dumblain. In the morning, therefore, he drew up his army, which did not exceed 3500 men, in order of battle; and, when the earl attempted to surround him, he received on his left wing the centre of the enemy. Though much inferior in strength and numbers, the royal forces seemed for a while victorious, and the earl of Clanronald was killed. But Glengary, who was second in command, undertook to inspire his intimidated companions with courage; and waving his bonnet cried out several times *Revenge!* This animated the rebel troops to such a degree, that they followed him to the point of the enemy's bayonets, and got within their guard. A total rout of this wing of the royal army began now to ensue. In the mean time the duke of Argyle, who commanded in person on the right, attacked the left of the rebels; and drove them before him for two miles. Having entirely broken that wing of the enemy, and driven them over the river Allan, he returned to the field of battle; where, to his great mortification, he found the enemy as decidedly victorious, and patiently waiting for the assault. Neither party, however, cared to begin the attack. In the evening both drew off, and each claimed the victory. All the advantages of a victory, however, belonged to Argyle. He had interrupted the progress of the rebels; and in their circumstances delay was defeat. The earl of Mar, in fact, soon found it so. The castle of Inverness was delivered up by lord Lovat, who had hitherto professed to act in the interest of the pretender; the marquis of Tullibardine forsook the earl, in order to defend his own part of the country; and many of the clans, seeing no likelihood of coming to a second engagement, returned at once home.

In the mean time, the cause of the rebels was still more unsuccessfully prosecuted in England. James had undertaken so heedlessly the project, in which the duke of Ormond and lord Bolingbroke were engaged, that lord Stair, the English ambassador at Paris, penetrated all his designs, and sent faithful accounts of all his measures to the ministry at home. Upon the first rumor,

therefore, of an insurrection, several lords and gentlemen were imprisoned. But these precautions were not able to prevent an attempt of the Jacobites in the western counties. All their preparations, however, were weak and ill conducted; every scheme was betrayed to government as soon as projected. The university of Oxford was treated with great severity on this occasion. Major general Pepper, with a strong detachment of dragoons, took possession of the city at day break, declaring that he would instantly shoot any of the students, who should presume to appear without the limits of their respective colleges. In the northern counties, the insurrection came to greater maturity. In October, 1715, the earl of Derwentwater and Mr. Forster took the field with a body of horse, and, being joined by some gentlemen from the borders of Scotland, proclaimed James III. Their first attempt was to seize upon Newcastle, in which they had many friends; but, finding the gates shut, they retired to Hexham. To oppose these, general Carpenter was despatched to the north by government with a body of 900 men. The rebels took the route to Jedburgh, where they hoped to leave Carpenter on one side, and penetrate into England by the western border. This was an effectual method of cutting themselves off from retreat or assistance. A party of Highlanders, who had joined them by this time, at first refused to accompany them in such a desperate incursion, and one-half of them actually returned to their own country. At Brampton Mr. Forster opened his commission of general, which had been sent him by the earl of Mar, and there proclaimed James III. They continued their march to Penrith, where the body of the militia that was assembled to oppose them fled. From Penrith they proceeded by the way of Kendal and Lancaster to Preston, of which they took possession without resistance. But this was the last stage of their ill-advised excursion; for general Wills, at the head of 7000 men, came up to attack them; and from his activity there was no escaping. They now, therefore, began to raise barricades about the town, and to put the place in a posture of defence: repulsing the first attacks of the royal army with success. Next day, however, Wills was reinforced by Carpenter, and the town was invested on all sides. In this deplorable situation, to which they were reduced by their own rashness, Forster hoped to capitulate with the general; and accordingly sent to him colonel Oxburgh, who had been taken prisoner, to propose a surrender. Wills, however, alleged that he would not treat with rebels, and that the only favor they had to expect was to be spared immediate slaughter. These were hard terms, but no better could be obtained. They accordingly laid down their arms, and were put under a strong guard. To intimidate their partizans, in the neighbourhood, a few of the officers, that had deserted from the royal army, were shot by order of a court martial: the soldiers were imprisoned at Chester and Liverpool; and the noblemen and considerable officers were sent to London, where they were led through the streets pinioned and bound together.

In the mean time Louis XIV., who had always

espoused the interest of the excluded family, was just dead; and the duke of Orleans, who succeeded in the government of the kingdom, was averse to lending the pretender any assistance. Though James therefore might, at this period, easily have seen that his affairs were desperate; yet, with his usual infatuation, he resolved to hazard his person among his friends in Scotland. Passing through France in disguise, and embarking in a small vessel at Dunkirk, he arrived after a voyage of a few days on the coasts of Scotland, with only six gentlemen in his train. At Fetteresso he was met by the earl of Mar, and about thirty noblemen and gentlemen of the first quality; and here he was solemnly proclaimed. Hence he went to Dundee, where he made a public entry; and in two days more arrived at Scoon, where he ordered thanksgivings to be offered for his safe arrival; enjoined the ministers to pray for him in their churches; and, without the smallest share of power, went through the ceremony of a coronation. Scarcely had he concluded this piece of unimportant parade, when he resolved to abandon the enterprise. Having made a speech to his grand council, he informed them of his want of money, arms, and ammunition, for undertaking a campaign, and therefore deplored that he was obliged to leave them. Then he re-embarked on board a small French ship, that lay in the harbour of Montrose, accompanied with several lords, his adherents, and in five days arrived at Gravelines.

General Gordon, who was left commander in chief of the forces, now proceeded at their head to Aberdeen, where he secured three vessels to sail northward, which took on board such persons as intended to make their escape to the Continent. He then continued his march through the Highlands, and quietly dismissed his forces as he proceeded. With such expedition was this retreat made, that the duke of Argyle, with all his activity, could never overtake his rear, which consisted of 1000 horse. The rebellion being ended, the law was put in force with all its terrors; and the prisons of London were crowded with those deluded persons, whom the ministry seemed resolved not to pardon. The commons, in their address to the crown, declared they would prosecute in the most rigorous manner the authors of the late rebellion; and their measures were as vindictive as their resolutions were speedy. The earls of Derwentwater, Nithsdale, Carwath, and Wintown, the lords Widdrington, Kenmuir, and Nairne, were impeached; and, upon pleading guilty, all but lord Wintown received sentence of death. No intreaties could prevail upon the ministry to spare these unhappy noblemen. The house of lords even presented an address to the throne for mercy, but without effect; the king only answered, that on this, as on all other occasions, he would act as he thought most consistent with the dignity of the crown and the safety of the people. Orders were accordingly despatched for executing lords Derwentwater, Nithsdale, and Kenmuir, immediately; the rest were respited. Nithsdale escaped, his wife most adroitly contriving to substitute her own person for his, the day before his

intended execution. An act of parliament was next passed, for trying the private prisoners in London, and not in Lancashire where they were taken : a step considered by lawyers as an alteration of the ancient constitution of the kingdom, by which every prisoner should be tried in the place where the offence was committed. In the beginning of April, commissioners for trying the rebels met in the court of common pleas, when bills were found against Mr. Forster, Mr. Macintosh, and twenty of their confederates. Forster escaped from Newgate, and reached the Continent in safety ; the rest pleaded not guilty. After this, Macintosh, and several other prisoners, also broke out of Newgate. The court proceeded to the trial of those that remained ; four or five were hanged, drawn, and quartered at Tyburn ; twenty-two were executed at Manchester and Preston, and about 1000 were transported to North America. The rebellion being thus extinguished, the danger of the state was made a pretext for continuing the parliament beyond the term fixed for its dissolution. An act, therefore, was passed, repealing that by which it was to be dissolved every third year, and extending the term of its duration to seven years. The people might murmur at this encroachment, but expediency and power united to plead for it at the time, and it has ever since been found inexpedient to think of redress.

Domestic concerns being thus adjusted, the king resolved upon a voyage to the Continent. Charles XII. of Sweden was highly provoked against him for having entered into a confederacy with the Russians and Danes during his absence at Bender, and for having purchased from the king of Denmark the towns of Bremen and Verden. In consequence of this, Charles maintained a close correspondence with the dissatisfied subjects of Great Britain ; and a scheme was formed for landing a body of Swedish forces, with the king at their head, to erect the standard of the Pretender in some part of the island. Count Gyllenborg, the Swedish minister in London, was active in the conspiracy ; but, being seized with all his papers, the scheme was rendered abortive. A bill, however, was passed by the commons forbidding all commerce with Sweden ; and George I. now entered into a new treaty with the Dutch and the regent of France, by which they agreed mutually to assist each other in case of invasion. But the death of the Swedish monarch, who was soon after killed at the siege of Frederickshall, put an end to all disquietude from that quarter.

Among the many treaties for which this reign was remarkable, one had been concluded, which was called the quadruple alliance. It was agreed between the emperor, France, Holland, and Britain, that the emperor should renounce all pretensions to the crown of Spain, and exchange Sardinia for Sicily with the duke of Savoy ; and that the succession to the duchies of Tuscany, Parma, and Placentia, should be settled on the queen of Spain's eldest son, in case the present possessors should die without male issue. This treaty, however, was by no means agreeable to the king of Spain ; and it became consequently prejudicial to the English, as it interrupted their

commerce with that kingdom. A war soon after commenced between Spain and the emperor, who was considered as the principal contriver of the treaty ; and a numerous body of Spanish forces was sent into Italy to support Philip's pretensions in that quarter. The regent of France attempted in vain to dissuade him ; the king of England also offered his mediation in vain ; their interposition was considered as partial and unjust. A Spanish war was then resolved on ; and a squadron of twenty-two ships was placed under the command of Sir George Byng, and ordered to sail for Naples. Here he was received with the greatest joy, and informed that the Spaniards, to the amount of 30,000 men, were then just landed in Sicily. On learning this he resolved to sail thither to pursue the Spanish fleet, and coming round Cape Faro perceived two small Spanish vessels ; pursuing which, he was led to their companions, whom, before noon, he discovered in line of battle, amounting to twenty-seven sail. Notwithstanding their superiority in number, the Spaniards attempted to make their escape : but, finding it impossible, they kept up a running fight ; in spite of which, they were all taken except three. Sir George Byng behaved on this occasion with great prudence and resolution ; and the king wrote him a letter with his own hand, approving his conduct. This rupture with Spain was thought to be favorable to the interests of the pretender ; as it was hoped, that, by the assistance of cardinal Alberoni, the Spanish minister, a new insurrection might be excited in England. The duke of Ormond was even fixed upon to conduct this expedition ; and he obtained from the Spanish court a fleet of ten ships of war and transports, having on board 6000 regular troops, with arms for 12,000 more. But fortune was still as unfavorable as ever. Having set sail, and proceeded as far as Cape Finisterre, he was encountered by a violent storm, which disabled his fleet, and frustrated the expedition. This, together with the bad success of the Spanish arms in Sicily and other parts of Europe, induced Philip to wish for a cessation of arms ; and he at last consented to sign the quadruple alliance, by which peace was again restored to Europe.

Tranquillity being thus established, the ministry proceeded to secure the dependency of the Irish parliament on that of England. A Mr. Maurice Annesley had appealed to the British house of peers from a decree made by the Irish peers, and their decree was reversed. The British peers ordered the barons of the exchequer in Ireland to put Mr. Annesley in possession of the lands he had lost. But, when the barons obeyed this order, the Irish peers passed a vote against them, as having attempted to diminish the just privileges of the parliament of Ireland ; and ordered their lordships to be taken under the custody of the black rod. On the other hand, the house of lords in England resolved, that the barons of the exchequer in Ireland had acted with great courage and fidelity ; and addressed the king to signify his approbation of their conduct. To complete their triumph, a bill was prepared, by which the Irish house of lords was deprived of all right of final

jurisdiction. Mr. Pitt, on this occasion, said, that it would only increase the power of the English peers, who were already but too formidable." Mr. Hungerford demonstrated, that the Irish lords had always exerted their power of finally deciding causes. Notwithstanding all opposition, however, the bill was carried by a great majority, and soon after received the royal assent. This blow was severely felt by the Irish.

The celebrated South Sea scheme commenced in the year 1721. To explain this, as concisely as possible, it must be observed, that, ever since the Revolution, government had been obliged to borrow money from different companies of merchants; and, among the rest, from that company which traded to the South Sea. In 1716 the government being indebted to this company about £9,500,000 sterling, at the rate of 6 per cent. interest, Sir Robert Walpole formed a design of lessening the national debt, by giving the several companies the alternative, either of accepting a lower interest, namely, 5 per cent., or of being paid the principal. The companies generally chose rather to accept of the diminished interest; and the South Sea Company, in particular, having augmented their loan to £10,000,000, were contented to receive £300,000 annually as interest, instead of £600,000, which they formerly received. At this same period one Blount, a scrivener, proposed to the ministry, in the name of the South Sea Company, to buy up all the debts of the different companies, and thus for the South Sea Company to become the sole creditors of the state. The terms offered to government were extremely advantageous. The company was to redeem the debts of the nation out of the hands of the private proprietors, upon whatever terms they could agree on; and, for the interest of the sum thus redeemed, to be allowed by government 5 per cent. for six years; after which the interest was to be reduced to 4 per cent., and the debts to be at any time redeemable by parliament. For these purposes a bill passed both houses. But now appeared a part of the scheme pregnant with fraud and ruin. As the directors of the South Sea Company could not of themselves be supposed to possess a capital sufficient to buy up the debts of the nation, they were empowered to raise it by opening a subscription to an imaginary scheme for trading in the South Seas. All the creditors of government, therefore, were invited to come in, and exchange their securities, viz., the security of government for that of the South Sea Company. The directors' books were no sooner opened for the first subscription, than crowds came to effect this. The delusion was artfully continued and spread. Subscriptions in a few days sold for double the price they had been bought at. The scheme succeeded beyond even the projector's hopes, and the whole nation was infected with a spirit of avaricious enterprise. The infatuation still prevailing, the stock rose even to nearly ten times the value of what it was first bought for. After a few months, however, the people awoke from their dream of riches; and found that all the advantages they expected were merely imaginary, while thousands of families were

involved in ruin. Many of the directors, by whose arts the public were taught to expect such great benefits from a traffic to the South Seas, had amassed considerable fortunes by their credulity. It was some consolation, however, to the people, to find the parliament sharing in the general indignation, and resolving to strip those unjust plunderers of their gains. Orders were given to remove all the directors of the South Sea Company from their seats in parliament, and the places they possessed under government; and the principal delinquents were punished by a forfeiture of all such possessions and estates as they had acquired during the continuance of this popular frenzy. The next care was to redress the sufferers. Several just and useful resolutions were taken by parliament, and a bill was prepared for repairing the late sufferings, as far as the inspection of the legislature could extend. Of the profit arising from the South Sea scheme, the sum of £7,000,000 was given back to the original proprietors; several additions were made to their dividends out of what was possessed by the company in their own right; and the remaining capital stock was divided among the old proprietors at the rate of 33 per cent. In the mean time petitions from all parts of the kingdom were presented to the house demanding justice; and the whole nation seemed exasperated to the highest degree. Public credit sustained a terrible shock. Some principal members of the ministry were deeply concerned in these fraudulent transactions. The bank was drawn upon faster than it could supply; and nothing was heard but the ravings of disappointment, and the cries of despair. By degrees, however, the effects of this terrible calamity wore off, and matters returned to their former tranquillity.

At this time a new war with Spain commenced. Admiral Hosier was sent to South America to intercept the Spanish galleons: but the Spaniards, being apprised of his design, re-landed their treasure. The greatest part of the British fleet sent on that expedition was rendered entirely unfit for service. The seamen were cut off in great numbers by the malignity of the climate, and the length of the voyage, while the admiral himself is said to have died of a broken heart. To retaliate these hostilities, the Spaniards undertook the siege of Gibraltar; but with little success. In this dispute France offered her mediation; and such a reconciliation as treaties could procure was the consequence; a temporary peace ensued, both sides only watching an advantageous opportunity to renew hostilities. Soon after the breaking up of the parliament, in 1727, the king resolved to visit his electoral dominions of Hanover. Having appointed a regency, to act in his absence, he embarked for Holland, and in three days arrived at Delden, to all appearances in perfect health. He supped there very heartily, and continued his journey early the next morning; but between eight and nine, ordering his carriage to stop, it was perceived that one of his hands lay motionless, and every attempt to quicken the circulation proved ineffectual. The king had but just strength enough to bid them hasten to Osn-

burgh, where he languished until eleven o'clock next morning, when he expired in the sixty-eighth year of his age, and thirteenth of his reign. His body was conveyed to Hanover for interment.

On the accession of George II. the two great parties into which the nation had so long been divided again changed their names, and were now called the court and country parties. Throughout this reign there seem to have been two great objects of controversy every session of parliament, viz. the national debt, and the number of forces to be kept in pay. The government, on the king's accession, owed more than £30,000,000 sterling; and, though there was a long continuance of profound peace, this sum was constantly increasing. The country party enquired how this could happen, and it was the business of the court to give plausible reasons for the increase. Demands for new supplies were made, either for the purpose of securing friends upon the continent, or guarding the kingdom from internal conspiracies, or of enabling the ministry to act vigorously in conjunction with the powers in alliance abroad. It was in vain alleged, that these expenses were incurred without prescience or necessity; and that the national debt, by multiplying and increasing taxes, would at last become an intolerable burden. These arguments were offered, canvassed, and rejected; but the court party was constantly victorious: and every demand was granted with cheerfulness and profusion.

In the reign of George II. arose 'the charitable corporation,' a society of men who professed to lend money at legal interest to the poor upon small pledges, and to persons of higher rank, upon proper security. Their capital was at first limited to £30,000, but they afterwards increased it to £600,000. Their funds were, as usual, raised by subscription, and the care of conducting their affairs was intrusted to a proper number of directors. This company having continued for more than twenty years, the cashier, George Robinson, member for Marlow, and the warehouse-keeper, John Thomson, disappeared in one day. £500,000 of capital were found to be sunk or embezzled, by means which the proprietors could not discover. They therefore in a petition represented to the house of commons the manner in which they had been defrauded. A secret committee being appointed to examine into this grievance, a most iniquitous scheme was soon discovered, in which Thomson and Robinson, in concert with some of the directors, had deliberately embezzled the capital of the company. No less than six members were expelled the house of commons, for sordid acts of knavery connected with this business. It was at this time asserted, in the house of lords, that not one shilling of the estates forfeited in the late rebellion was ever applied to the service of the public, but became the reward of fraudulence and venality.

This happened in the year 1731; in 1732 a scheme was formed by Sir Robert Walpole, for fixing a general excise. He introduced it by recounting the frauds practised by the factors in London, employed in selling the American

tobacco. To prevent these frauds, he proposed, that, instead of having the customs levied in the usual manner upon tobacco, all hereafter to be imported should be lodged in warehouses appointed for that purpose by the officers of the crown; and should thence be sold, upon paying the duty of 4*l.* per pound, when the proprietor found a purchaser. This proposal raised such a violent ferment, both within doors and without, that the houses of parliament were surrounded by mobs, who intimidated the ministry, and compelled them to drop the design. The miscarriage of the bill was celebrated with public rejoicings in London and Westminster, where the minister was burnt in effigy. On this occasion an attempt was made to repeal the septennial bill. But, notwithstanding the warmth of the opposition, the ministry were victorious, and the motion was negatived. However, the country party on this occasion seemed to have gained strength, and it was thought proper to dissolve the parliament. In the new parliament, a convention agreed on by the ministry with Spain, became an object of warm altercation. By this the court of Spain agreed to pay £95,000 to the English, as a satisfaction for all demands; and to discharge the whole in four months from the day of ratification. This, however, was considered as not equivalent to the damages that had been sustained. The minister, on this occasion, was provoked into such unusual vehemence, that he branded the opposite party with the appellation of traitors; and the country party, finding themselves out-numbered and out-voted in every debate, resolved to withdraw. Walpole, being thus left without opposition, took the opportunity of passing some useful laws.

In 1739 a new war commenced with Spain. Ever since the treaty of Utrecht, the Spaniards in America had insulted and distressed the commerce of Great Britain; while the British merchants on the other hand had endeavoured to carry on an illicit trade in their dominions. As the right of cutting logwood in the bay of Campeachy, claimed by the British, gave them frequent opportunities of pushing in contraband commodities upon the continent, the Spaniards resolved to put a stop to the evil, by refusing them liberty to cut logwood in that place. The Spanish guarda-costas continued their severities upon the British, and many British subjects were sent to dig in the mines of Potosi. One remonstrance followed another to the court of Madrid; but the only answers given were promises of enquiry. War, therefore, was now declared; and soon after admiral Vernon, with six ships only, destroyed all the fortifications of Porto Bello, and came away victorious with scarcely the loss of a man. For a war thus successfully begun supplies were cheerfully granted. Commodore Anson was sent with a squadron of ships to distress the enemy in the South Seas, and to co-operate with Vernon across the isthmus of Darien. Through the mismanagement of the ministry, however, these schemes were frustrated. Anson was detained till too late in the season; he then set out with five ships of the line, a frigate, two storeships, and about 1400 men. Coming into the stormy South Seas at a

wrong season of the year, his fleet was dispersed, and his crew deplorably afflicted with the scurvy; so that with difficulty he gained the island of Juan Fernandez. Thence sailing along the coast of Chili, he plundered and burnt the town of Païta. He next traversed the Great Pacific Ocean, in hopes of meeting with one of the rich galleons that trade from the Philippine Islands to Mexico; and, having refreshed his men at the islands of Tinian, set forward for China. Returning the same way he came, he at last discovered and took the galleon, valued at £313,000, together with other captures to the value of about as much more. By this expedition the public sustained the loss of a fine squadron of ships, while a few individuals became possessed of immense fortunes. Another expedition to New Spain ended more unfortunately. It consisted of twenty-nine ships of the line, and almost an equal number of frigates, furnished with all kinds of warlike stores, nearly 15,000 seamen, and as many land forces. The most sanguine hopes of success were entertained; but the ministry detained the fleet, without any visible reason, till the season for action in America was almost over. At last, however, they arrived before the city of Carthage, and became masters of the strong forts which defended the harbour. But, though by this means they advanced a good deal nearer the town, they found great difficulties before them. It was asserted, that the fleet could not lie near enough to batter the town, and therefore the remaining forts must be attempted by scalade. This dangerous experiment was tried; when the guides were cut off by the enemy's fire, and the forces mistook their way. Their scaling ladders were too short; and, at last, after sustaining a dreadful fire for some hours, they retreated, leaving 600 men dead on the spot. The terrors of the climate now began to be more dreadful than those of war. The rainy season commenced, and it was impossible for the troops to continue their encampment. To these calamities was added a dissension between the sea and land commanders, who blamed each other, and at last could be only brought to agree in one mortifying measure, viz. to re-embark the troops, and withdraw them. The miscarriage of this enterprise produced the greatest discontents; the commerce of Britain was greatly annoyed by the Spanish privateers, who had taken 407 ships, it was said, since the commencement of the war; while the British fleets seemed to be quite inactive, and to suffer one loss after another, without endeavouring to make reprisals. These discontents being visited at once upon Sir Robert Walpole; a majority of the house of commons was formed against him; he was created earl of Orford, and resigned all his employments.

The new ministry were no sooner in power, however, than they trod in the footsteps of those whom they had so much condemned. The nation had now become disgusted with naval operations. The people wished for a renewal of their victories in Flanders, and the king ardently joined in this desire. An army of 16,000 men was therefore embarked for Flanders, to take part in the contest then beginning on the continent. To trace the origin of this, it is necessary

to go back for some years. The emperor Charles VI. dying October 20th, 1740, the French court had thought this a favorable opportunity for exerting its ambition. Regardless of treaties, therefore, particularly that called the Pragmatic Sanction, by which the late emperor's dominions were settled upon his daughter Maria Theresa, the elector of Bavaria was now crowned emperor. Thus the queen of Hungary was at once stripped of her inheritance, and left for a whole year deserted by all Europe. At the same time she lost the province of Silesia by an irruption of the young king of Prussia, who renewed his pretensions to that province, of which his ancestors had been unjustly deprived. France, Saxony, and Bavaria, attacked the rest of her dominions: Britain was the only ally that seemed willing to assist her; in which, however, Sardinia, Holland, and Russia, soon after concurred. It must be owned that Britain had no other reason for interfering in these disputes, than that the security of the electorate of Hanover depended upon nicely balancing the different interests of the empire; and the ministry were willing to gratify the king. His majesty informed the parliament, that he had sent a body of British forces into the Netherlands, which he had augmented by 16,000 Hanoverians, to make a diversion upon the dominions of France, in favor of the queen of Hungary. When the supplies came to be considered, by which this additional number of Hanoverian troops was to receive pay from Britain for defending their own cause, most violent debates ensued; but the ministry carried their point in parliament. They also effectually retrieved the queen of Hungary's desperate affairs. The French were driven out of Bohemia. Her general, prince Charles, at the head of a large army, invaded the dominions of Bavaria. Her rival, the nominal emperor, was obliged to fly before her; and being abandoned by his allies, and stripped even of his hereditary dominions, he retired to Frankfurt, where he lived in obscurity. In the mean time, the British and Hanoverian army advanced, in order to effect a junction with that of prince Charles of Lorraine. To prevent this, the French opposed an army of 60,000 men, under the command of the marshal de Noailles, who posted his troops on the east side of that river. The British army was commanded by the earl of Stair, who had been educated under the great prince Eugene; nevertheless he suffered himself to be enclosed by the enemy on every side, near Dettingen. See DETTINGEN. In this situation, the whole army, with the king himself, who had by this time arrived in the camp, must have been taken, had the French behaved with prudence. Their impetuosity, however, saved our troops. They passed a defile, which they ought to have contented themselves with guarding; and, under the conduct of the duke of Grammont, their horse charged the British foot with great fury. Being received with equal resolution, they were at last obliged to repress the Mayne with precipitation, and the loss of about 5000 men. But, though the British were victorious in this engagement, the French were not disconcerted by it. They opposed prince Charles, and interrupted his attempts to pass the

Rhine. In Italy they also gained some advantages; but their chief hopes were placed on an intended invasion of England. From the violence of parliamentary disputes in England, France had been persuaded that the country was ripe for a revolution, and only wanted the presence of the pretender to bring about a change. An invasion was therefore projected. The troops destined for the expedition amounted to 15,000; and preparations were made for embarking them at Dunkirk, under the eye of the young pretender. The duke de Roquenuille, with twenty ships of the line, was to see them safely landed, and the famous count Saxe was to command them afterwards. But the whole project was disconcerted by the appearance of Sir John Norris, who attacked them with a superior fleet. The French fleet was obliged to put back, and a very hard gale of wind damaged their transports beyond redress. The national joy for Sir John Norris's success, however, was soon damped by the miscarriage of admirals Matthews and Lestock; who, through a misunderstanding between themselves, suffered a French fleet of thirty-three sail to escape them near Toulon. In the Netherlands the British arms were attended with still worse success. The French had there assembled an army of 120,000 men, commanded by count Saxe, natural son to the late king of Poland. The English were headed by the duke of Cumberland, who had an inferior army, and was very unequal in his knowledge of war to the French general. Count Saxe, therefore, carried all before him. In 1743 he besieged Fribourg, and in the beginning of the campaign, 1744, invested the strong city of Tournay. To save this place, if possible, the allies resolved to hazard an engagement; and on this ensued the bloody battle of Fontenoy, in which they left on the field of battle nearly 12,000 men, and the French almost an equal number. Tournay, in consequence of this victory, was soon after taken by the French. To balance this bad success, however, admirals Rowley and Warren had retrieved the honor of the British flag, and made several rich captures at sea. The fortress of Louisbourg, a place of great consequence to our commerce, surrendered to general Pepperell; while, a short time after, two French East India ships, and a Spanish ship from Peru laden with treasure, put into the harbour, supposing it still their own, and were taken.

During this appearance of returning success, Charles Edward, the son of James, the old pretender to the British crown, resolved to make an attempt to recover what he called his right. Being furnished with some money from France, he embarked for Scotland, on board a small frigate, accompanied by the marquis of Tullibardine, Sir Thomas Sheridan, and some others; and, for the conquest of the whole British empire, only brought with him seven officers and arms for 2000 men. Fortune, however, seemed at first not more favorable to this attempt than to the former. His convoy, a ship of sixty guns, was so disabled in an engagement with an English man of war, that it was obliged to return to Brest, while he continued his course to the western parts of Scotland. On the 27th of

July, 1745, he landed on the coast of Lochaber, and was joined by the Highlanders to the number of 1500, before the ministry could be induced to credit his arrival. When they could no longer doubt it, they sent Sir John Cope with a small body of forces to oppose his progress. By this time the young adventurer was arrived at Perth, where he performed the ceremony of proclaiming his father king of Great Britain. From thence proceeding towards Edinburgh, with continually increasing forces, he entered the capital without opposition; but was unable, from want of cannon, to reduce the castle. Here he again proclaimed his father; and promised to dissolve the union. In the mean time Sir John Cope, being reinforced by two regiments of dragoons, resolved to give the rebels battle. They attacked him near Prestonpans, and in a few minutes put him and his troops to flight, with the loss of 500 men. Charles was now joined by the earl of Kilmarnock, lord Balmerino, lords Cromarty, Elcho, Ogilvy, Pittligo, and the eldest son of lord Lovat, who with their vassals considerably augmented his army. Lord Lovat himself, so remarkable for his treachery, was an enthusiast in favor of the pretender, but was unwilling to act openly for fear of the ministry. While Charles trifled away his time, however, at Edinburgh, the British ministry were not idle; they took 6000 Dutch troops into their pay, and despatched them northward under the command of general Wade. The duke of Cumberland soon after arrived from Flanders, and was followed by another detachment of well disciplined dragoons and infantry; besides these, volunteers offered themselves to the government in every part of the kingdom. At last Charles resolved upon an irruption into England. He entered that country by the western border, and took Carlisle; after which he continued his march southwards, receiving assurances that a considerable body of forces would be landed on the southern coasts, to make a diversion in his favor. He established his head quarters at Manchester, where he was joined by about 200 English, formed into a regiment under the command of colonel Townley. Thence he pursued his extraordinary march to Derby, intending to go by the way of Chester into Wales, where he hoped to be joined by a great number of malcontents; but in this he was prevented by the factions of his followers. Being now advanced within 130 miles of London, that capital was in the utmost consternation; and, had he proceeded with the same expedition he had hitherto used, he might perhaps have made himself master of it. But the young pretender was in fact but the nominal leader of his forces; his generals, the Highland chiefs, being averse to subordination, and ignorant of command. They were now unanimous in their resolution to return, and Charles was forced to comply. Retreating towards Carlisle, therefore, without any loss; from thence they crossed the rivers Eden and Solway, and entered Scotland. They next marched to Glasgow, which they laid under severe contributions, and, now advancing to Stirling, were joined by lord Lewis Gordon, at the head of some forces which had been assembled in the pretender's

absence. Other clans also came in; and prince Charles's affairs altogether began to wear a promising aspect. He invested the castle of Stirling, and defeated general Hawke, who commanded a considerable body of forces near Falkirk, with the loss of their tents and artillery. This was the last triumph, however, of the rebel army. The duke of Cumberland arrived, and took the command of the royal troops at Edinburgh, which amounted to about 14,000 men. With these he advanced to Aberdeen, where he was joined by several of the nobility; the enemy in the mean time retreating before him. He next advanced to the banks of the Spey, where the rebels might have disputed his passage; but their contentions with one another were now risen to such a height, that they could scarcely agree in any thing. At last they resolved to await their pursuers; when an engagement ensued at Culloden, in which they were defeated with great slaughter (See CULLODEN), and a final period was put to all the hopes of the young adventurer. The conquerors behaved with the greatest cruelty, refusing quarter to the wounded, the unarmed, and the defenceless; some were slain who had only been spectators of the combat, and the king's soldiers anticipated the base employment of the executioner. The duke immediately after the action ordered thirty-six deserters to be executed; and, after a short space, the whole country round was one dreadful scene of plunder, slaughter, and desolation. Prince Charles, after a variety of surprising adventures and narrow escapes, notwithstanding the highest rewards were offered to apprehend him, arrived safely in France. Meantime the scaffolds and gibbets were erected for his adherents; seventeen officers were hanged, drawn, and quartered, at Kennington, in the neighbourhood of London; nine at Carlisle, and eleven at York. A few obtained pardons, and a considerable number were transported to America. The earls of Kilmarnock and Cromarty, and lord Balmerino, were tried and found guilty of high treason. Cromarty was pardoned: but Kilmarnock and Balmerino were executed; as was also Mr. Radcliffe, brother to the late earl of Derwentwater, who was sentenced upon a former conviction. Lord Lovat was tried, and suffered some time after.

Immediately after the suppression of the rebellion the legislature undertook to establish several regulations respecting Scotland, which were equally conducive to the happiness of the people and the tranquillity of the united kingdoms. The Highlanders had till this time continued to wear the military dress of their ancestors, and never went without arms. They considered themselves in consequence a body of people distinct from the rest of the nation, and were ready upon the shortest notice to second the insurrections of their chiefs. An act of legislature now compelled them to discontinue the national habit: but what contributed still more to their felicity was, the abolition of that hereditary jurisdiction which their chieftains exerted over them. Soon after the battle of Culloden the duke of Cumberland returned to Flanders, where he resumed the command of an army, to

which he was by no means equal. The French carried every thing before them; and reduced under their dominion all those strong towns which had been taken by the duke of Marlborough, and formed a barrier to the United Provinces. They gained a considerable victory at Roucoux; which, however, cost them as many men as they destroyed of the enemy; but these they could easily spare. Another victory, which they obtained at La Feldt, served to depress the allied army still lower. But the taking of Bergen-op-Zoom, the strongest fortification of Brabant, reduced the Dutch to a state of desperation. These victories of the French in Flanders were, however, counterbalanced by almost equal disappointments. In Italy the marshal Belleisle's brother, attempting to penetrate at the head of 34,000 men into Piedmont, was defeated and killed. A fleet was fitted out for the recovery of Cape Breton, but without success. Two others were then fitted out, one to make a descent upon the British colonies in America, and the other to carry on the operations in the East Indies; but these were attacked by Anson and Warren, and nine of their ships taken. Not long after this, commodore Fox, with six ships of war, took above forty French ships richly laden from St. Domingo; and, soon after, the French fleet was defeated by admiral Hawke, who took seven ships of the line and several frigates. For a long time Louis XV. had been desirous of a general tranquillity; but now the ill success of his admirals at sea, and of his armies in Italy, the frequent bankruptcies of merchants at home, and the election of a stadtholder in Holland, who gave spirit to the opposition, contributed to make him weary of the war, and to propose terms of accommodation. A congress, therefore, was held at Aix-la-Chapelle, where a treaty of peace was concluded on the following terms: 1. That all prisoners on each side should be mutually given up, and all conquests restored. 2. That the duchies of Parma, Placentia, and Guastalla, should be ceded to Don Philip, heir apparent to the Spanish crown; after whom these dominions should return to the house of Austria. 3. That the fortifications of Dunkirk towards the sea should be demolished; and that the British ship annually sent with slaves to the coast of New Spain should have this privilege continued for four years. 4. That the king of Prussia should be confirmed in the possession of Silesia, and that the queen of Hungary should be secured in the possession of her patrimonial dominions. The most mortifying clause to this country was, that the king of Great Britain should, immediately after the ratification of the treaty, send two persons of rank to France as hostages, until restitution should be made of Cape Breton and all other British conquests made during the war.

In 1751 died Frederic prince of Wales, of a pleurisy. He was greatly regretted; for his good nature had rendered him popular; and those who opposed administration had grounded their hopes of redress upon his accession to the throne. Some time before this, viz. in 1749, a scheme was entered upon for encouraging those who had been discharged from the army or navy to be-

come settlers in Nova Scotia. On account of this cold and barren spot, the English and French renewed the war, which soon after spread with such terrible devastation over every part of the globe. The possession of this country was reckoned necessary to defend the English colonies to the north, and to preserve their superiority in the fisheries in that part of the world. The French, however, who had been long settled in the back parts, resolved to use every method to dispossess the new comers, and urged the Indians to begin hostilities. Another source of dispute also sprung up soon after, in the same part of the world. The French, pretending to have first discovered the mouth of the Mississippi, claimed the whole adjacent country towards New Mexico on the east, to the Apalachian Mountains. In order to assert their claims, they dispossessed several English settlers of their homes, and built such forts as would command the country. Negotiations, and mutual accusations, first took place between the two powers; at length, in 1756, four operations were undertaken by the British in America at once. Colonel Monkton had orders to drive the French from their encroachments upon the province of Nova Scotia. General Johnson was sent against Crown Point; general Shirley against Niagara, to secure the forts on the river; and general Braddock against Fort du Quesne. In these expeditions, Monkton was successful; Johnson also was victorious, though he failed in taking the fort against which he was sent; Shirley was thought to have lost the season of operation by delay; and Braddock was defeated and killed. In return for this ill success, the British made reprisals at sea; so that the French navy was unable to recover itself during the continuance of the war.

Once more, at this period, the French renewed the threat of an invasion. Several bodies of troops were sent down to the coast opposite the British shores; and were instructed in the manner of embarking and relanding from flat-bottomed boats. The number of men thus trained amounted to 50,000. The British ministry were greatly alarmed. But when they applied to the Dutch for 6000 men, which they were by treaty obliged to furnish in case of an invasion, this supply was refused; the Dutch alleging that their treaty was to send the troops in case of an actual, not a threatened, invasion. Upon this, 10,000 Hessians and Hanoverians were brought over, which occasioned great discontent. The ministry were upbraided for such disgraceful condescension, as if the nation was unable to defend itself. The invasion, however, never took place; but a French army landed in Minorca, and invested the citadel of St. Philip, reckoned the strongest in Europe; but the garrison was weak, and no way fitted to stand a siege. To raise this siege, therefore, admiral Byng was despatched with a squadron of ten men of war. His orders were to relieve Minorca, or, at any rate, to throw a body of troops into the garrison. On arriving at the island, he considered this last too hazardous an undertaking. Soon after, a French fleet appeared nearly equal in force to his own; but the admiral resolved to act only upon the defensive. The French ad-

vanced; a slight engagement ensued with part of the English fleet; after which the enemy slowly sailed away, and another opportunity never occurred of coming to a close engagement. It was now resolved in a council of war to return to Gibraltar to refit, and that the relief of Minorca was impracticable. For this conduct Byng was brought home under arrest, tried, and sentenced to be shot. He suffered with the greatest resolution, after delivering a paper filled with protestations of his innocence, and was evidently a sacrifice to party. After the conquest of Minorca, the French declared that they would revenge all injuries they should sustain in their colonies, on the king of Britain's dominions in Germany. Upon this, the court of London, eager to preserve Hanover, entered into a treaty with Russia, by which it was stipulated, that a body of 50,000 Russians should be ready to act in the British service, in case Hanover should be invaded. For this the czarina was to receive £100,000 annually, to be paid in advance.

This treaty was opposed by the king of Prussia. He had long considered himself as guardian of the interests of Germany, and was therefore alarmed at a treaty which threatened to deluge the empire with an army of barbarians. Besides, he was already apprised of an agreement between the Austrians and Russians, by which the latter were to enter the empire and strip him of his late conquest of Silesia. He therefore declared that he would not suffer any foreign forces to enter the empire either as auxiliaries or principals. The king of Great Britain now therefore found himself obliged to drop his Russian connexion, and conclude a treaty with Prussia. As both monarchs wished only to prevent the invasion of Germany, they soon came to an agreement mutually to assist each other; and from this alliance a new combination took place among the European powers. Britain opposed France in America, Asia, and on the ocean. France attacked Hanover; which the king of Prussia undertook to protect, while Britain promised him troops and money to assist his operations. Austria had her eye on the dominions of Prussia, and drew the elector of Saxony into the same designs. In these views the Austrians were seconded by France, Sweden, and Russia, who had hopes of acquiring a settlement in the west of Europe. Thus the king of Prussia launched into the tumult of war, having only Great Britain for his ally, while the most potent states of Europe were his antagonists. The British ministry, in order to procure a diversion in his favor, planned an unsuccessful enterprise against the coast of France. It ended in seizing the little island of Aix, an easy and an useless conquest. By this miscarriage the ministry were so discouraged that they had thoughts of abandoning the king of Prussia to his fate; but success, which had long fled from the British arms, now dawned upon them from the east. For a particular account of the operations alluded to, see HINDOSTAN. Their conquests in the western world, too, were about this time equally splendid. An expedition was set on foot against Cape Breton, under general Amherst and admiral Boscawen; another, under general Abercromby,

against Crown Point and Ticonderago; and a third, under brigadier general Forbes, against Fort du Quesne. The fortress of Louisburg, which defended the island of Cape Breton, was very strong both by nature and art; the garrison was numerous, the commander vigilant, and every precaution had been taken to prevent a landing. But the activity of the British surmounted every obstacle; the place was surrendered by capitulation, and its fortifications were demolished. The expedition against Fort du Quesne was equally successful; but that against Crown Point once more miscarried. General Abercromby attacked the French in their entrenchments, was repulsed with great slaughter, and obliged to retire to his camp at Lake George. But, though in this respect the British arms were unsuccessful, yet, upon the whole, the campaign of 1758 was greatly in their favor. The taking of Fort du Quesne served to remove from their colonies the terror of the incursions of the Indians; while it interrupted that correspondence, along a chain of forts, with which the French had environed the British settlements in America. In 1759 it was also resolved to assault the French in several parts of their empire. General Amherst, with a body of 12,000 men, was commanded to attack Crown Point; General Wolfe was to undertake the siege of Quebec; while general Prideaux and Sir William Johnson were to attempt a French fort near the cataracts of Niagara. This last expedition was the first that succeeded. The siege was begun with vigor, and promised an easy conquest; but Prideaux was killed in the trenches by the bursting of a mortar, so that the whole command devolved on general Johnson. A body of French troops attempted to relieve it, but were defeated and dispersed; soon after which the garrison surrendered prisoners of war. On his arrival at the forts of Crown Point and Ticonderago, general Amherst found them deserted and destroyed. There now remained, therefore, but one decisive blow to reduce all North America under the British dominions; and this was the taking of Quebec, the capital of Canada. See QUEBEC. This expedition was commanded by admiral Saunders and general Wolfe. The enterprise was attended with difficulties which appeared insurmountable; but all were overcome by the conduct of Wolfe, and the bravery of his men. He engaged and put to flight the French under Montcalm; but, to the great regret of the nation, was killed in the action. The surrender of Quebec was the consequence of this victory, which was soon followed by the cession of all Canada. The following season, indeed, the French made a vigorous effort to recover the city; but the resolution of governor Murray, and the appearance of a British fleet under the command of lord Colvil, obliged them to abandon the enterprise. The whole province was soon after reduced by general Amherst, and it has since remained annexed to the British empire. About the same time the island of Guadaloupe was reduced by commodore More and general Hopsou.

The British affairs in Germany had at the beginning of the war worn a very unfavorable as-

pect. The Hanoverians were commanded by the duke of Cumberland, who was greatly outnumbered by the enemy. He was driven beyond the Weser, the passage of which might have been disputed, but the French were suffered to pass it unmolested. The Hanoverians were driven from one part of the country to another, till at length they made a stand near Hastenbeck, where it was hoped the numbers of the enemy would have the least opportunity of being used to advantage. The Hanoverians, however, left the field to the French, after a faint resistance. Their enemies pursued, and the duke retired towards Stade. Here, unable either to escape or advance, he was compelled to sign a capitulation, by which the whole army laid down their arms, and were dispersed into different quarters of cantonment. By this remarkable capitulation, which was called the capitulation of Closter Seven, Hanover was obliged to submit quietly to the French, who were now determined to turn their arms against the king of Prussia. But soon after both sides began to complain that the treaty was not observed. The Hanoverians exclaimed against the rapacity of the French general and the brutality of his soldiers. The French, retorting the charge, accused them of insolence and insurrection; and, being sensible of their own superiority, resolved to bind them strictly to their terms of agreement. The Hanoverians only wished for a pretence to take arms, and a general to head them. Neither was long wanting. The oppressions of the tax-gatherers, whom the French had appointed, were considered as so severe, that the army rose to vindicate the freedom of their country, while Ferdinand, prince of Brunswick, put himself at their head. As soon as this was known in Britain large supplies were granted, both for the service of the king of Prussia and to enable the Hanoverian army to act vigorously in conjunction with him. A small body of British forces was sent over to join prince Ferdinand under the duke of Marlborough. After some inconsiderable successes at Crevelt, the duke of Marlborough dying, the command of the British forces devolved on lord George Sackville. A misunderstanding arose, however, between him and prince Ferdinand, which appeared at the battle of Minden that was shortly after fought. Lord George pretended that he did not understand the orders sent him by the prince, and of consequence did not obey them; and, although the allies gained the victory, it would have been more decisive had the British commander obeyed his orders. He was soon after recalled, tried by a court-martial, found guilty of disobedience, and declared incapable of serving in any military command. After this victory it was imagined that one reinforcement more, of British troops, would terminate the war in favor of the allies; and this was quickly sent. The British army in Germany was augmented to upwards of 30,000 men: and sanguine hopes of conquest were entertained. These hopes, however, were soon seen to be ill founded. The allies were defeated at Corbach; but retrieved their honor at Exdorf. A victory at Warlough followed shortly after, and another at Zierenberg: but they suffered a defeat at Compen; after which both sides re-

tured into winter quarters. On the 25th of October, 1760, king George II. died. He had risen at his usual hour, and observed to his attendants that, as the weather was fine, he would take a walk in the gardens of Kensington, where he then resided. In a few minutes after, being left alone, he was heard to fall down upon the floor; and, the noise bringing his attendants into the room, he desired, with a faint voice, that the princess Amelia might be sent for; but, before she could reach the apartment, he expired, in the seventy-seventh year of his age, and thirty-third of his reign. An attempt was made to bleed him, but without effect; and the surgeons afterwards, upon opening him, discovered that the right ventricle of the heart was ruptured, and a great quantity of blood discharged through the aperture.

6. *Great Britain under the reign of George III. until the revolt of the American Colonies.*—Our late excellent sovereign, George III., ascended the throne amidst the greatest successes both by sea and land. At this time, indeed, the efforts of Britain, in every quarter of the globe, were truly astonishing. The king of Prussia received a subsidy; a large body of English forces commanded the extensive peninsula of India; another army of 20,000 men confirmed their conquests in North America; 30,000 men were employed in Germany; and many more were dispersed in garrisons in different parts of the world: but all this was surpassed by the good fortune of our naval force, which carried command wherever it came, and had totally annihilated the French maritime power.

When the young king met his parliament, which was opened November 18th, 1760, he confirmed the hopes of his allies, and gave assurances of his intentions to prosecute the war with vigor. By this time, however, the people were in some measure weary of conquests in Germany, from which they could never hope for any solid advantage. For some time, however, no change took place in the method of carrying on the war. But in 1761, proposals of peace being made between the belligerent powers, Mr. Stanley was sent to Paris to negotiate a peace, and Mr. Bussey to London; but the French court, hoping to draw Spain into a confederacy, was not sincere in its professions, and the treaty came to nothing. An enterprise was projected at this time against the island of Belle-isle, near the coast of France, which was conducted by commodore Keppel and general Hodgson. See BELLE-ISLE. The place was taken, with the loss of 1800 men killed and wounded; and, though it was a conquest of no great moment, the rejoicings on account of it were great. In Germany the campaign was unsuccessful on the part of the allies. At first, indeed, they drove the French out of the territory of Hesse, and laid siege to the city of Cassel; but, being defeated at Stangerod, they were forced to raise the siege, retire behind the Dymel, and again abandon Hesse. Here they were followed and attacked by the French; who, though defeated in that attempt, were with difficulty prevented from making themselves masters of Munster and Brunswick. All this time an appearance of ne-

gociation had been carried on; until the French, at last, having brought their designs with the court of Spain to an issue, Mr. Bussey delivered to Mr. Pitt a memorial, signifying that, in order to establish the peace on a lasting foundation, the king of Spain might be induced to guarantee the treaty: and, to prevent the differences which then subsisted between Britain and Spain from producing a fresh war in Europe, he proposed that, in this negotiation, the three points which had been disputed between the crowns of England and Spain might be finally settled:—1. The restitution of some captures made upon the Spanish flag; 2. The privilege of the Spanish nation to fish upon the banks of Newfoundland; 3. The demolition of the English settlements made in the bay of Honduras. Mr. Pitt in reply, however, declared that it would be considered as an affront to the dignity of his master, and incompatible with the sincerity of negociation, to make any farther mention of such a proposal; and, being now thoroughly convinced of the sinister designs of Spain, he proposed immediately to declare war against that kingdom. On this proposal being rejected, he resigned: after which he was created earl of Chatham, and had a pension of £3000 per annum settled upon him for three lives.

Soon after this, however, the new administration found it necessary to declare war against Spain. This involved our ally, Portugal; the French and Spaniards resolving to attack that kingdom, which was then in no capacity to defend itself. Joseph, the Portuguese monarch, was, by the most haughty memorials, commanded to accede to the confederacy against Britain, and threatened with the vengeance of France and Spain in case of refusal. In vain he promised to observe a strict neutrality, and urged the obligations he was under to the king of Britain; this moderate and reasonable reply only drew on more haughty and insulting answers. This prince, however, continued to reject their proposals in the most resolute manner; and concluded his final declaration by observing that ‘it would affect him less, though reduced to the last extremity, of which the great Judge is the sole arbiter, to let the last tile of his palace fall, and to see his faithful subjects spill the last drop of their blood, than to sacrifice the honor of his crown, and to submit, by such extraordinary means, to become an unheard of example to all pacific powers.’ As the design of the courts of France and Spain, in making war with Portugal, was professedly to deprive Great Britain of the military and commercial use of the ports of that kingdom, their principal efforts were directed against the two great ports of Oporto and Lisbon. With this view three inroads were made into that country, one to the north, another more to the south, and the third in the middle provinces. The first body of troops was commanded by the marquis of Savria; and entered the north-east angle of Portugal, marching towards Miranda; where, a powder-magazine having been blown up by accident, the Spaniards entered on the 9th of May by the breaches made by the explosion. Thence they marched to Braganza, which surrendered six days after Miranda. Moncorvo was taken in like manner:

every thing was clear before them to the banks of the Douro; and they became masters of almost the whole extensive province of Tralos Montes. Oporto was now considered as lost, and the admiralty prepared transports to carry off the effects of the British merchants. On the banks of the Douro, however, the career of the enemy was stopped. The peasants, animated and guided by some British officers, seized a difficult pass, and drove the enemy back to Moncorvo. The second body of Spaniards entered the province of Beira, at the villages called Val de Mulo and Val de Coelho, and laid siege to Almeida, the strongest and best provided place on the frontiers of Portugal. This place was defended with sufficient resolution; but was obliged to surrender on the 25th of August. The Spaniards then over-ran the whole territory of Castel Branco, a principal district of Beira, making their way southward to the banks of the Tagus. During their whole progress, and indeed during the whole of the campaign, the allied troops of Great Britain and Portugal had nothing that could be called an army in the field. All that could be done was by the defence of passes, and skirmishes. The third Spanish army had assembled on the frontiers of Estremadura, with a design to invade the province of Alentejo. To prevent this, brigadier general Burgoyne was despatched to attack an advanced body on the frontiers, in the town of Valencia de Alcántara. On the 27th of August the town was surprised; the Spanish general taken, who was intended to command in the invasion, together with one colonel, two captains, and seventeen subaltern officers; one of the best regiments in the Spanish service was also entirely destroyed. Colonel Lee harassed their subsequent attempts in this directions: until, the season being far advanced, immense quantities of rain fell; the roads were destroyed, and the Spaniards, having seized no advanced posts, where they could maintain themselves, and being unprovided with magazines, every where fell back into Spain.

No less successful were the British arms in America and the East Indies. From the French were taken the islands of Martinico, St. Lucia, St. Vincent, and Granada; from the Spaniards the strong fortress of Havannah, in Cuba. By the acquisition of the first mentioned islands, the British became the sole and undisturbed possessors of all the Carribees; and that chain of innumerable islands which extend from the eastern point of Hispaniola to the continent of South America. The conquest of the Havannah cost a number of brave men, but more were destroyed by the climate than the enemy. Nine of the enemy's men of war, with four frigates, were taken here; three of their capital ships were sunk in the harbour at the beginning of the siege, and two more on the stocks, in great forwardness, were destroyed. In money and valuable merchandise, the plunder did not fall short of £3,000,000 sterling. To this success in the western part of the world may be added the capture of the Spanish register-ship, called *Hermione*, supposed to be worth £1,000,000 sterling, by the *Active* and *Favorite*, king's ships. This happened on the 21st of May, 1762, just as she

was entering one of the ports of Old Spain. In the East Indies an expedition was undertaken against the Philippine Islands, which was committed to colonel Draper, who arrived for this purpose at Madras in the end of June 1762. The seventy-ninth regiment was the only regular corps that could be spared for this service. Every thing was conducted with the greatest celerity and judgment. The British forces landed on Manila on the 24th of Sept.; on the 6th of October the governor surrendered at discretion; and soon after the galleon bound from Manila to Acapulco, laden with rich merchandise to the value of more than half a million, was taken by the *Argo* and *Panther* frigates. By the conquest of Manila, fourteen considerable islands fell into the hands of the British; which, from their extent, fertility, and convenience of commerce, furnished the materials of a great kingdom. By this acquisition, also, joined to our former successes, we secured all the avenues of the Spanish trade, and interrupted all communication between the parts of their vast but unconnected empire. The conquest of the Havannah had cut off in a great measure the intercourse of their wealthy continental colonies with Europe: the reduction of the Philippines excluded them from Asia; while the plunder taken was far more than sufficient to indemnify the charges of the expeditions. All this time the war in Germany had been prosecuted with the utmost vigor; the allies under prince Ferdinand had continued to give the highest proofs of their valor, but no decisive advantage could be obtained against the French. It was, therefore, no longer the interest of Britain to continue a destructive war; and the French and Spaniards were desirous of a peace which was at length concluded at Paris on the 10th of February, 1763. The terms granted the enemy were but too favorable. The principal were, That the French king should relinquish all claims to Nova Scotia; that he should likewise give up all Canada; and that, for the future, the boundary betwixt the British and French dominions in America should be fixed by a line drawn along the middle of the river Mississippi, from its source to the river Ibberville; and thence by a line along the middle of this river, and the lakes Manrepas and Pontchartrain, to the sea. The islands of St. Pierre, Miquelon, Martinico, Guadaloupe, Marigalante, Desirade, St. Lucia, and Belle-isle, were restored to France; Minorca, Granada, and the Grenadines, St. Vincent, Dominica, and Tobago, were ceded to Britain. In Africa, the island of Goree was restored to France; and the river Senegal, with all its forts and dependencies ceded to Great Britain. In the East Indies, all the forts and factories taken from the French were restored. In Europe, the fortifications of Dunkirk were to be destroyed; and all the countries, fortresses, &c., belonging to the elector of Hanover, the duke of Brunswick, and the count of La Lippe Buckeburg, restored. With regard to Spain, the British fortifications on the Bay of Honduras were to be demolished; and the Spaniards were to desist from their claim of a right to fish on the Newfoundland bank. The Havannah was restored; in consequence of which, Florida, St.

Augustine, and the bay of Pensacola, were ceded to Britain, and the Spaniards were to make peace with Portugal; all other countries not particularly mentioned were to be restored to their respective owners at the beginning of the war.

The conclusion of the war did not by any means tend to heal those domestic divisions, which had arisen on the resignation of Mr. Pitt; on the contrary, it furnished abundant matter of complaint for the discontented party. At the time the treaty was under consideration, however, only some faint attempts were made to oppose it; but it soon appeared, that, though this opposition had proved so feeble, the spirit of the party was far from being exhausted. The state of affairs at that time indeed greatly favored the views of those who opposed the ministry. A long and expensive war had drained the national treasure, and greatly increased the public debt. Heavy taxes had already been imposed, and it was still as necessary to keep up these, and even to impose new ones, as if the war had not ceased. Thus the bulk of the nation, who imagined that conquest and riches ought to go hand in hand, were easily induced to believe that administration arbitrary and oppressive, which continued to load them with fresh taxes, after such great successes as had attended the British arms. It must be owned, that the new administration were not sufficiently wary in this respect. Among other methods of raising the supplies for 1763, they had thought proper to lay a duty of 4s. per hoghead upon cyder, payable by the maker, and to be collected in the same manner as other excise imposts. The other articles of supply furnished also matter of declamation for the members in opposition; but this inflamed the popular fury to a great degree, and made them readily imbibe as truth whatever was thrown out by the minority. Besides the usual statements, that it was oppressive, unconstitutional, and injurious to the land-holder and farmer, the smallness of the sum to be raised by it was now urged. This was said to indicate, that the supplying the wants of government could not be the sole motive for imposing such a duty. The city of London, therefore, instructed their representatives to oppose the passing of the bill with all possible vigor, and sent in petitions against it to each branch of the legislature; a measure till that time totally unprecedented: two protests were also entered against it in the house of lords; in short, all England was thrown into a ferment on the subject. Virulent libels, the audacity of which far exceeded any thing known in former times, now made their appearance: and such was the general intemperance in this respect, that it would be difficult to determine which side paid least regard to any kind of decency or decorum. In the midst of this general ferment, the earl of Bute unexpectedly resigned his place of first lord of the treasury.

The popular resentment against government was not, however, in the least abated by lord Bute's resignation. His lordship, though withdrawn from the ostensible administration of affairs, was still considered as principal director of the cabinet; and this opinion gained the more ground, as none of the popular leaders were ad-

mitted, nor any other change made in the conduct of administration. Not that moderate men could find any reasonable objection to those who filled the great offices of state. Mr. Grenville, who succeeded the earl of Bute in the treasury, was a man of acknowledged integrity, understanding, and experience. Lord Holland was universally considered as an able statesman, and lord Egremont, the third secretary, though he had not been long in office, conciliated the esteem of all parties. The other departments were filled in a similar manner; yet the discontents and public clamors were not diminished. It was still insisted that a secret cabinet of the king's friends, as they were called, controlled every thing: and that, according to the spirit of the constitution, the crown should be directed in the choice of its ministers by motives of national utility, not by private friendship. When ministers found themselves recommended to the royal favor, and as it were presented to their places by the esteem of the people, they would be studious, it was said, to deserve and secure themselves in it; and that upon these (which were called the principles of whigs) the government had been honorably conducted since the revolution. The disposition to libel and invective, in the mean time, exceeded all bounds. The peace, the Scots and Scottified administration, afforded such subjects of abuse to the patriots, real and pretended, that ministry resolved at last to make an example of one of them. The paper called the North Briton, in language much superior to any other political work of the time, except Junius's Letters, had abused the king, the ministry, and the Scots in an extravagant manner. One particular paper, No. XLV., was deemed by those in power to be actionable, and John Wilkes, Esq. M.P. for Aylesbury, was supposed to be the author. A secretary of state's warrant was therefore issued for apprehending the author, publishers, &c., of this performance, but without mentioning Wilkes's name. Three messengers accordingly entered his house on the night of the 29th of April, 1763, with an intention to seize him. He objected, however, to the legality of the warrant, because his name was not mentioned in it, and to the lateness of the hour; and they thought proper to retire for the night. Next morning he was apprehended with some violence, and taken before the secretaries of state for examination. On the first intimation of Mr. Wilkes's being in custody, application was made for a writ of habeas corpus. In the interim his papers were seized, and, after it was ascertained that the writ was obtained, he was committed to the tower. Here not only his friends, but several noblemen and gentlemen of the first distinction, were denied access; nor was even his own brother allowed to see him. On the 3d of May he was brought before the court of common pleas, where he made a most patriotic speech, setting forth the love he had for his majesty, the bad conduct of ministry, with his own particular grievances; and that he had been treated 'worse than a Scotch rebel.' His case being argued by several eminent lawyers, he was remanded to the tower for three days; after which he was ordered to be finally brought up. Next day lord Temple re-

ceived a letter from secretary Egremont, informing him, that the king judged it improper that Mr. Wilkes should continue any longer a colonel of the Buckinghamshire militia; and, soon after, that nobleman was removed from the lord lieutenancy of that county. Mr. Wilkes being brought to Westminster Hall, at the time appointed, the judges decided that the warrant of a secretary of state was in no respect superior to that of a common justice of peace; and, on the whole, that Mr. Wilkes's commitment was illegal. It was determined, also, that his privilege as member of parliament had been infringed, and that this could not be forfeited but by treason, felony, or breach of the peace; none of which was imputed to him; for a libel, even if it had been proved, had only a tendency to disturb the peace, without any actual breach of it. It was resolved, therefore, to discharge him. Mr. Wilkes had no sooner regained his freedom than he wrote and printed a letter to the earls of Egremont and Halifax, informing them that his house had been robbed, and that the stolen goods he understood were in the possession of one or both of their lordships. He erected a printing press in his own house; from whence the North Briton again made its appearance; the popular party were elated beyond measure with their success; while those who had suffered by general warrants sought redress at law, and commonly obtained damages far beyond their real sufferings. During the whole summer the minds of the people were kept in continual agitation by political pamphlets and libels of various kinds, while the affair of general warrants so engrossed the public attention, that by the time parliament met, November 15th 1763, scarcely any other subject was agitated.

His majesty, in his speech, mentioned the attempts that had been made to divide the people; and, before the addresses could be made in return, a message was sent to the commons, informing them of the offence of Mr. Wilkes, and of the proceedings taken against him; the exceptionable paper being laid before the house. After warm debates, the North Briton was declared to be a false, scandalous, and seditious libel, tending to excite traitorous insurrections, &c. This was followed by another declaration, that the privilege of parliament does not extend to the writing and publishing of seditious libels, nor ought to obstruct the ordinary course of the laws in the speedy and effectual prosecution of so heinous and dangerous an offence. This did not, however, pass the commons without a vigorous opposition, and seventeen members of the upper house protested against it. The North Briton, No. XLV., being thus condemned, was ordered to be burnt by the common hangman; but this was not attempted without great opposition from the mob. The constables, officers, &c., were pelted and insulted in the grossest manner. Mr. Harley, one of the sheriffs, was wounded by a billet taken from the fire; and the whole civil force driven from the field, while the remains of the paper were carried off in triumph from the flames, and in return a large jack boot as a species of effigy of lord Bute) was burnt

at Temple Bar. Mr. Wilkes in the mean time commenced an action in the court of common pleas against Robert Wood, Esq., the under secretary of state, for seizing his papers, and Wood was condemned in £1000 damages and costs. On the other hand the prosecution, with which Wilkes had been threatened, was now carried on with great vigor; but he having now grossly affronted Samuel Martin, Esq., member for Camelford, by his abusive language in the North Briton, he was challenged by that gentleman, and dangerously wounded in the abdomen. The house of commons delayed their proceedings therefore from time to time; but, beginning at last to suspect that there was some collusion between him and his physician, they enjoined Dr. Heberden, and Mr. Hawkins an eminent surgeon, to attend him, and report upon his case. These gentlemen Mr. Wilkes did not think proper to admit to visit him; but soon after retired to France. On this the commons, having certified that he had refused to admit the physician and surgeon sent by them, proceeded to expel him from their house, and the lords resolved that he had committed a breach of their privileges in an obscure and blasphemous pamphlet, in which he had libelled one of the bishops. The event of all was, that, failing to appear to answer the charges against him, he was outlawed. This severity, however, against Mr. Wilkes did not at all extinguish the spirit of the party. A sort of infatuation in favor of licentious and abusive writings seemed to prevail. The common council of London presented their thanks to the city representatives, for their zealous and spirited endeavours to assert the rights and liberties of the subject, 'by their laudable attempt to obtain a seasonable and parliamentary declaration, that a general warrant for apprehending and seizing the authors, printers, and publishers of a seditious libel, together with their papers, is not warranted by law;' and evinced their gratitude to lord chief justice Pratt, for his decision in Wilkes's affair, by presenting him with the freedom of the city, and desiring him to sit for his picture to be placed in their Guildhall.

The public business, however, at last gained attention. The practice of franking blank covers, to go free per post to any part of Great Britain or Ireland, had arisen to an incredible height, and greatly prejudiced the revenue. As a remedy for this the following act was passed, viz. That from the 1st of May 1764 no letters or packets should be exempted from postage, except such as were sent to or from the king; or such as, not exceeding two ounces in weight, should be signed by a member of either house, the whole of the superscription being in his own hand writing; or such as should be directed to members of parliament, or other persons specified in the act. It was likewise enacted, that printed votes and proceedings in parliament, sent without covers, or in covers open at the sides, and only signed on the outside by a member, should go free, though such packets were liable to be searched; and, to give the greater force to these regulations, it was made felony and transportation for seven years to forge a frank

Other plans for augmenting the revenue were that for settling the island of St John, and for the sale of the lately acquired American Islands. The former was proposed by the earl of Egremont, who presented a memorial to his majesty, desiring a grant of the whole island, to hold the same in fee of the crown for ever; specifying the various divisions, government, &c., but, for reasons unknown, the plan was never put in execution. The sale of the conquered lands took place in March 1764. These were Grenada, the Grenadines, Dominica, St. Vincent, and Tobago. Sixpence an acre was to be paid as a quit rent for cleared lands; a penny a foot for ground rent of tenements in towns; and sixpence an acre for fields; but no person was to purchase more than 300 acres in Dominica, or 500 in the other islands. One of the most remarkable transactions of this year was the renewal of the charter of the bank, for which the latter paid the sum of £1,100,000 into the exchequer, besides advancing £1,000,000 to government upon exchequer bills.

Another, and, by its consequences, still more momentous affair, was the consideration of methods to raise a revenue from the American colonies. This had been formerly proposed to Sir Robert Walpole; but that prudent minister said 'he would leave the taxation of the colonies to those who came after him.' Before this time, indeed, hints had been thrown out, that it was not impossible for the colonists to withdraw their dependence on Great Britain: and some disputes had taken place between the different provinces, which were quieted only by the fear of the French. It was thought proper, therefore, now, when the colonies were not only secured but extended, to make this important experiment. They contained more than 2,000,000 of subjects; and it was considered by the ministry, as well as the vast majority of the nation at home, both just and necessary to raise a revenue from such a numerous portion of the people. In an act therefore, which was now passed for preventing smuggling, certain duties laid on the American commerce were ordered to be paid into the hands of government. At this time an illicit trade was carried on betwixt the British and Spanish colonies, which seemed to bid defiance to all law and regulation; and was no less disagreeable to the Spanish than to the British court. In some respects, however, the suppression of this was very inconvenient, and even intolerable to the colonists; for, as the balance of trade with Britain was against them, it was impossible they could procure any specie, except by trading with the Spaniards, from whom they were paid for their goods in gold and silver. This, and another act requiring them to pay certain duties in cash, was probably the reason of that excessive resentment shown by the Americans to government, and their absolute refusal to submit to the stamp act, which was also passed this year.

The increase of the revenue being a chief object of administration at this time, the suppression of smuggling at home, as well as in America, was taken into consideration. Though the great number of cutters and other vessels fitted out by government for this purpose had produced very

salutary effects, the isle of Man, which belonged to the duke of Athol, and was not subject to the custom-house laws, lay so conveniently for the purposes of illicit trade, that the utmost vigilance of government was not sufficient to suppress it. The event was a treaty betwixt government and the duke, by which the latter, for a sum of money, ceded the sovereignty of the island. This disposition to augment the revenue by all possible methods, served to keep up the general opinion of the oppressive and arbitrary measures about to be pursued by government; the opposition of the so-called patriots at home still continued; and the stamp bills were received in America with the utmost indignation. At this time the colonists were indebted to the merchants of London alone, £4,000,000 sterling; and so ready were the latter to give them credit, that some of the American legislatures passed acts against incurring such credit in this country. A petition on the subject was presented to the house of commons; but, as it denied the parliamentary right of taxation, it was not allowed to be read. It was then proposed, on the part of administration, that the agents should join in a petition to the house for their being heard by counsel in behalf of their respective colonies against the tax. The agents, however, not thinking themselves empowered to present such a petition, the negotiation was broken off, and the quarrel proceeded in America as we have related under that article. In other respects, the ministry took such steps as were proper for supporting the honor of the nation. Some encroachments having been made by the French and Spaniards, such remonstrances were made to their respective courts, that satisfaction was quickly offered. The disposition to tumult and insurrection, however, seems to have been now general. The silk-weavers of Spitalfields being distressed for want of employment, which they supposed to proceed from the clandestine importation of French silks, laid their case before his majesty in 1764, who graciously promised them relief. But a bill, which was supposed favorable to them, being thrown out of parliament, they began to assemble in vast numbers, several disorders were committed, and it was not without the assistance of the soldiery, and the utmost vigilance of the magistrates, that riots could be suppressed. The ministers were still attacked in numberless publications, and accused as being merely dependents on the earl of Bute. An accident, however, now produced a considerable revolution at court. This was an illness with which the king was seized in the beginning of the year, which gave rise to a bill for settling the affairs of the kingdom, in case of the crown falling into the hands of a minor. In settling this bill, ministers were said to have behaved with very little respect to the princess dowager of Wales, and industriously to have excluded her from a share of the government.

On this occasion lord Chatham is said to have been solicited again to accept the office which he had formerly filled so much to the satisfaction of the nation, and to have declined it. A new ministry, however, was soon formed, at the recommendation of the duke of Cumberland. The

duke of Grafton and the honorable Mr. Conway, brother to the earl of Hertford, were appointed secretaries of state, and the marquis of Rockingham first lord of the treasury. The office of lord privy seal was conferred on the duke of Newcastle; other places were filled with men not only of known integrity, but high popularity. Yet even these changes were not able to give satisfaction. The opinion that affairs were still managed by the earl of Bute, was industriously kept up by the political writers of the time. In the mean while the discontents, which inflamed the American colonies, continued also to agitate the minds of the people of Great Britain; nor indeed was it reasonable to expect that they could be satisfied in their present condition; commerce being almost entirely destroyed, manufactures at a stand, and provisions extravagantly dear. The vast sums owing to the British merchants by the Americans also severely affected the trading and manufacturing part of the country. These, amounting to several millions, the colonists absolutely refused to pay, until the obnoxious laws should be repealed. Administration were therefore under the necessity of either instantly enforcing the stamp act, or of procuring its immediate repeal in parliament. The loss of the duke of Cumberland, who died suddenly 31st October 1765, was now severely felt, as he had been accustomed to assist in the councils of administration, and was highly respected by the nation. At this period, however, it is doubtful if human wisdom could have prevented the consequences which ensued. Administration endeavoured to avoid the two extremes of rushing into a civil war, on the one hand, and of sacrificing the dignity of the crown or nation on the other. They suspended their opinion until they should receive certain intelligence from the American governors how affairs stood in that country; and their letters on that occasion still do them honor. The opposite party animadverted severely on this conduct. They insisted on having the most coercive methods immediately put in execution for enforcing the laws. Pacific measures, however, at this time prevailed; the stamp act was repealed; but at the same time another was passed, declaring the right of parliament not only to tax the colonies, but to bind them in all cases whatever.

The repeal of the stamp act occasioned universal joy both in Britain and America, though, as parliament insisted upon their right of taxation which the opposite party denied, matters were still far from any real accommodation. This ill humor of the Americans was soon after augmented by the duties laid upon glass, painters' colors, and tea. In this state of affairs, administration were once more disturbed by the appearance of Mr. Wilkes, who had returned from his exile, and on the dissolution of parliament in 1768, though an outlaw, he stood candidate for the city of London. He was received by the populace with loud acclamations; several merchants and people of property espoused his cause: and a subscription was entered into for the payment of his debts. He failed, however, in his design of representing the city of London, but instantly declared himself a candidate for Middlesex. The tumults and riots which now took place were

innumerable; and such was the animosity between the two parties, that a civil war seemed to be threatened. Our limits do not allow of a particular detail of these transactions. It will be sufficient to notice, that, on a legal argument, the outlawry of Mr. Wilkes was reversed, and he was condemned for his offences to pay a fine of £1000, and to be imprisoned for twelve months. Being idolized by the people, however, and powerfully supported, he was repeatedly chosen member for Middlesex, and as often rejected by the house of commons. The tumults on this occasion were not always ended without bloodshed; and the frequently interposition of the soldiery was construed by the patriots as an indication of a design to establish military authority.

These dissensions did not pass unnoticed by the powers of Europe, particularly the French and Spaniards. Both had applied themselves with assiduity to the increase of their marine; and many began to prognosticate an attack from one or other, or both of these nations. The Spaniards first showed an inclination to come to a rupture; the subject in dispute being a settlement formed on Falkland Islands, near the southern extremity of the American continent. It was not till after lord Anson's voyage, that much attention had been paid to this spot. In the printed account of it, his lordship showed the danger incurred by our navigators through the treachery of the Portuguese in Brasil; and that it was a matter of the greatest importance to discover some place more to the southward, where ships might be supplied with necessaries for their voyage round Cape Horn. When at the head of the admiralty, he forwarded the scheme of a settlement here, and some preparations were made for putting it in execution; but as it met with opposition at home, and gave offence to the court of Madrid, it was laid aside till 1764, when it was revived by lord Egmont. Commodore Byron, being then sent out with proper necessaries, took possession of these islands in the name of his majesty, and represented them in a favorable light: while his successor, captain M'Bride, affirmed that the soil was utterly incapable of cultivation, and the climate intolerable. The islands in question had also about this time attracted the notice of the French; and M. Bougainville, with the assistance of his friends, undertook to form a settlement there at their own risk. The scheme was put in execution at the beginning of 1764; on the east part of the same island on the west side of which commodore Byron had established an English colony. Two years afterwards, the French adventurers becoming weary of their colony, the Spaniards reimbursed them their expenses, took possession of the fort built by the French, and changed the name of the harbour from Port Louis to Port Solidad. It is uncertain when the British and Spanish settlers became known to each other. But about this time captain Hunt, commanding the Tamar frigate, charged the commander of a Spanish schooner to depart from that coast, it being the property of his Britannic majesty. On the other hand, and to resent this interference as it was thought, a Spanish frigate arrived on the 4th June 1770, at the English settlement of Port Egmont, and after

threatening a siege, took possession of the colony. The English were ordered to depart within a limited time, carrying with them what they could. An insult to the British flag, so audacious, seemed to render war inevitable, unless proper reparation was made. It was accordingly mentioned in the speech from the throne, November 13th, 1770; and immediate satisfaction for the injury was promised to be demanded. The affairs of America were also taken notice of, where grounds of complaint still existed, notwithstanding the cessation of those combinations which had distressed the commerce of Britain. These promises, with regard to the affairs of Falkland Islands, however, were far from giving general satisfaction. The speech was violently attacked by opposition. News had arrived, they said, from Falkland Islands in June, which sufficiently demonstrated the designs of Spain; and Gibraltar and Minorca were left open to the attacks of that power, without any preparation being made on our part to resist them. The whole conduct of the ministry was declared to be pusillanimous; and great disputes arose respecting the production of papers and the degree to which they were bound to acquaint parliament with verbal negotiations: it being suspected that France had insidiously interfered in this question.

Opposition insisted that they had a right to have an account of verbal negotiations as well as others; and that, if this right was given up, a minister had no more to do, when he wished to promote an insidious measure, than to conduct it by verbal correspondence. The motion, however, was lost by a great majority in both houses. The entire transaction, however, was considered as disgraceful to the British nation: nor were all the arguments that could be used by the ministerial party, aided by the pen of Dr. Samuel Johnson, in any degree sufficient to overthrow the general opinion. The restitution of the island was thought to be an inadequate recompense for the affront that had been offered; and the objections to it were urged on a motion for an address to return thanks for the communication of the Spanish declaration. This address was not carried without considerable difficulty, and produced a protest from nineteen peers. On the part of Spain, however, every part of the agreement was ostensibly fulfilled; Port Egmont was restored, and the British once more took possession of it, though it was in a short time after evacuated, according to a private agreement, as was suspected, between ministry and the court of Spain.

The discontents which prevailed at that time throughout the kingdom, were increased by a fire which happened at Portsmouth in 1770, and was by some imputed to our enemies on the continent. The affair of the Middlesex election also was not forgotten; and, notwithstanding repeated repulses, the city of London presented new petitions on the subject to the throne. In one presented by Mr. Beckford, the lord mayor, they lamented the heavy displeasure under which they seemed to have fallen with his majesty, and renewed a petition, frequently before presented, that parliament might be dissolved. This, how-

ever, met with a very unfavorable answer; his majesty informed the lord mayor that his sentiments on that subject continued unchanged; and that 'he should ill deserve the title of Father of his People, should he suffer himself to be prevailed on to make such a use of his prerogative, as he could not but think inconsistent with the interest, and dangerous to the constitution, of the kingdom.' Mr. Beckford, on this, took the unprecedented resolution of replying to the king; and concluded with telling his majesty, that 'whoever had already dared, or should hereafter endeavour, by false insinuations and suggestions, to alienate his majesty's affections from his loyal subjects in general, and the city of London in particular, was an enemy to his majesty's person and family, a violator of the public peace, and a betrayer of our happy constitution as it was established at the glorious revolution.' This notable scheme for insulting the institutions of the country, in the person of the chief magistrate, while it obtained Beckford unbounded popularity at the time, has been since claimed and acknowledged as Mr. John Horne Tooke's.

A new subject of contention, however, now occurred. The navy was in a bad condition, and the sailors every where avoided the service. Towards the end of August sixteen ships of the line were ready to put to sea; but, the legality of press warrants being questioned, the manning of them became a matter of great difficulty: for the new lord mayor, Brass Crosby, Esq., refused to back the warrants. Ministers were further perplexed by the unbounded liberty to which the productions of the press had been carried, and the mode of proceeding against some libellers had produced many complaints respecting the powers of the attorney-general. He had filed informations, and carried on prosecutions, *ex officio*, without going through the forms observed in other cases.—This, it was said by the patriotic party, was inconsistent with the nature of a free government. No power can be more dangerous to private liberty, nor to the virtue or principles of him who enjoys it. The attorney acts under a minister, and his sense of duty must be very strong, or his independence very thoroughly secured, if he is at no time tempted to swerve from the laws of conscience and equity. A motion was made in the house of commons to bring in a bill for explaining and amending an act of the 4th and 5th of William and Mary to prevent invidious informations, and for the more easy reversal of outlawries in the court of king's bench. This motion was rejected by a great majority: the ministerial party urging that the power of the attorney-general was the same that ever it had been, and founded on common law. The abuse of power was no argument against the legal exercise of it; it was dangerous to overthrow established customs; the actions of the attorney-general were cognizable by parliament, which control must for ever prevent a licentious exertion of his power, &c. These arguments, however, even with the rejection of the motion, did not put an end to the disputes on this subject. The courts of justice themselves were at this time very unpopular, on account of some late decisions which had

been deemed contrary to law. The judges had assumed a power of determining whether a paper was a libel or not; and the business of the jury was confined to the determination of the fact regarding its publication: thus, it was said, the judges had it in their power to punish a man who had been found guilty of publishing a paper, whether seditious or not. Lord Chatham, in a speech on the Middlesex election, took occasion to mention these abuses; and was answered by lord Mansfield, who looked upon himself to be particularly pointed at. The former finally moved that a day should be appointed for taking into consideration the conduct of the judges; in which he was ably seconded by the lord chancellor. A committee of enquiry was accordingly moved for, on December 6th, 1770: but, after a long debate, was rejected by 184 to seventy-six. Other disputes arose in parliament on the external relations of the country. A motion was made on the 10th of December 1770, by the duke of Manchester, that an address be presented to his majesty that he would give orders for quickening our preparations for defence in the West Indies and in the Mediterranean; and particularly for securing the posts of Gibraltar and Minorca. But while the noble mover was descanting on the negligence of ministry, in leaving posts of such importance in a defenceless state, he was interrupted by lord Gower, with a motion for clearing the house. His lordship was answered by the duke of Richmond, who complained of the interruption given to the duke of Manchester, as a proceeding both irregular and insidious. This produced a considerable degree of altercation. Several members attempted to speak; but finding it impossible, and piqued at the behaviour of the minister, eighteen or nineteen of them left the house in a body. The members of the house of commons then present were not only commanded to depart, but some of the lords went personally to the bar, and insisted on their leaving the house immediately. These members alleged that they attended with a bill, and were there in discharge of their duty; but this availed nothing, and they were peremptorily ordered to withdraw till their message should be delivered. In the mean time the eighteen lords, who had just left the house of peers, had gone to the lower house, where they were listening to the debates, when the commoners, who had been ejected from the upper house, arrived full of indignation, and making loud complaints of the affront they had received. The affair terminated in a misunderstanding between the two houses, which continued during the whole session.

After the discussion of the affair of Falkland's Islands, a gross instance of corruption, in the borough of New Shoreham, Sussex, was laid before parliament. Roberts, the officer of the borough, having returned a candidate with only thirty-seven votes, when his opponent had eighty-seven. It was discovered that a select committee of the members of a club in the town were appointed to sell the borough to the highest bidder; the committee men never appearing at elections, but giving orders to the rest, and directing them how to vote. The motion for an

enquiry being carried unanimously, a bill was brought in to incapacitate eighty-one freemen of this borough, whose names were mentioned, from ever voting at elections: and, for the more effectually preventing bribery and corruption, the attorney-general was ordered to prosecute the committee belonging to the 'Christian club.' The bill for incapacitation did not receive the royal assent, however, till the last day of the session.

Some members of the house of commons complained at this period that their speeches had been misrepresented in the papers, and endeavoured to put a stop to the practice of printing them. It was contrary to the standing order of the house to print the speeches of the members of parliament at all; and a motion for calling two of the principal printers to account was carried by a considerable majority. The printers, however, did not attend the summons of the messenger; and their disobedience was greatly applauded by the popular party. It was now farther moved that they should be taken into custody, by the serjeant at arms, for contempt of the orders of the house; when this officer complained that, not being able to meet with them at their houses, he had been treated with indignity by their servants; on which a royal proclamation was issued for apprehending Wheble and Thomson, the two obnoxious printers. In the mean time six other printers, who had rendered themselves equally obnoxious on the above account, were ordered to attend the house. Some of these delinquents were reprimanded at the bar; and one, who did not attend, was ordered to be taken into custody. But Wheble being now apprehended, in consequence of the proclamation, was carried before Mr. Alderman Wilkes, by whom he was discharged. Thomson was discharged in the same manner. J. Miller, one of the six who had refused to attend, was taken into custody, from his own house, by the messenger of the commons. On this he sent for a constable, and was carried along with the messenger before the lord mayor, and aldermen Wilkes and Oliver, at the mansion house. The lord mayor refused to deliver up the printer and messenger at the request of the serjeant at arms; and, after some dispute, the messenger was committed to prison, as he had been accused by Miller of assault and false imprisonment, and the serjeant had refused to find bail; however, he was immediately released upon bail being given. By this affront not only the ministerial majority, but many of the popular party in the house of commons, were greatly irritated. The lord mayor was ordered to attend the house next day: when he pleaded that he had acted in no way inconsistent with the duties of his office; as, by an oath which he took when entering upon it, he was bound to preserve the franchises of the city, as recognised by act of parliament. It was then moved that he should be allowed counsel. The motion, however, was over-ruled, it being insisted that no counsel could ever be permitted against the privileges of the house. At last it was resolved that the lord mayor's clerk should attend with the book of minutes; and he was obliged to expunge out of it the re-

cognizance of Whittam the messenger; this was followed by a resolution that there should be no more proceedings at law in the case; and that the lord mayor and Oliver should be committed to the Tower. Some proposed his expulsion from the house; others a vote of censure: and, when it was proposed to commit him, the utmost confusion took place, some members declaring that they would accompany him to the place of confinement, &c. Some days after the commitment, when the lord mayor attended at the house of commons, insults were offered to many of the members, particularly lord North; who, on this occasion, lost his hat, and narrowly escaped with his life.

Wilkes, on being ordered to attend on this memorable occasion, wrote a letter to the speaker, in which he observed, that no mention had been made of his being a member; and that if his seat in parliament, to which he had been duly elected, was to be granted him, he would attend and justify his conduct. The ministry, however, declined to encounter this demagogue at this time: and were reduced to the miserable shift of ordering him to attend on the 8th of April, 1771, at the same time that they adjourned the house to the 9th.

Every step taken about this time by administration seemed calculated to add to the public ill humor. Towards the end of the session a bill was brought in 'for enabling certain persons to enclose and embank part of the river Thames, adjoining to Durham yard, Salisbury-street, Cecil-street, and Beaufort-buildings, in the county of Middlesex.' This bill was opposed, as contrary to the ancient rights and privileges of the city of London; but was easily carried through both houses, though it produced a protest in the upper house; and, a few days before the rising of the session, the city of London petitioned against it. The only other transaction of moment during this session related to the East India company. It was proposed to raise 2000 men in England for the service of the company, the officers to be appointed by the king, and to be paid by the company. But, after much argument, it was rejected as unconstitutional and dangerous to keep an armed force in the kingdom which was not paid by government. The session terminated on the 8th of May, 1771. When the lord mayor and aldermen were released by this event from the tower, they were welcomed by every mark of public congratulation. The city was illuminated; and the mob, as usual, took vengeance on their opponents by breaking their windows. A committee was even appointed to carry on a prosecution against the speaker of the house of commons; but, as this did not seem likely to afford them any redress, they determined once more to have recourse to the throne. Accordingly, on the 10th of July, 1771, another petition and remonstrance was presented, the subjects of which were the embankments of the Thames, the proceedings against the magistrates, and a speedy dissolution of parliament. But this met with as unfavorable an answer as before. His majesty said, that he was ready to put an end to the real grievances of his faithful subjects; but was

sorry to find that a part of them still renewed requests, which he had repeatedly refused to comply with.

In the speech from the throne, when the parliament met, January 21st, 1772, his majesty observed, that the performance of the king of Spain's engagements, and the behaviour of the other European powers, promised a continuance of peace; and, though the necessity of keeping up a respectable naval force was evident, yet no extraordinary aid for that purpose would be necessary: he concluded with recommending the most vigilant and active attention to the concerns of the country, with an assurance of the interposition of the crown to remedy abuses or supply defects. Little dispute was made about the addresses in answer to this speech; but an ample subject of altercation soon occurred. This was a motion made by administration, intimating the necessity of raising 25,000 seamen for the service of the year; 'it being always necessary,' they said, 'for us to preserve a superiority to the French in the East Indies, which had not been the case since they sent a considerable fleet thither. It was equally necessary to preserve the present strength of the West Indies unimpaired; as the Spaniards knew the importance of our settlements there too well not to make an attack upon them first, if ever a rupture should take place. A declaration of this kind, coming immediately after the assurances of peace that had been given from the throne, was said to be a contradiction; that the peace establishment would be thus augmented till we were overburdened by it, &c. If the assurances of peace from the throne were well founded, the force in the East Indies was already too great; if, on the contrary, a war was at hand, it would be too small notwithstanding the proposed augmentation. The question for the augmentation, however, was carried without a division: after which the subject of subscription to articles of religion came to be discussed. This was, in fact, occasioned by the general tendency to Arianism or Socinianism which had for some time prevailed, and had infected the established church in such a manner, that the subscription to her standards was reckoned intolerable by many of the clergy. Meetings had been held by the discontented members, to consider of some mode of relief; and in the beginning of February, 1772, about 250 of them, with several professors of law and physic, joined in a petition to the house of commons, expressing their dissatisfaction with the subscription to any human forms, and praying for relief. In this petition they asserted, that they held certain rights and privileges from God alone; such as the exercise of their own reason and judgment, by which they were instructed and confirmed in their belief of the Christian religion, as contained in the holy scriptures. They accounted it a blessing to live under a government, which maintained the sufficiency of the scriptures to instruct in all things necessary to salvation. Hence they concluded, that they had a right from nature, as well as from the principles of the reformed religion, to judge for themselves, what was or was not contained in the scriptures. From this invaluable

privilege, however, they found themselves in a great measure precluded by the laws relative to subscription; by which they were enjoined to acknowledge certain articles and confessions of faith, framed by fallible men, as entirely agreeable to scripture. They prayed, therefore, to be relieved from such impositions, and to be restored to their undoubted right of interpreting scripture for themselves, without being bound by any human explanation of it, or being required to acknowledge, by subscription or declaration, the truth of any formula of religious faith and doctrine whatever, excepting the holy scripture itself. The affair of subscription they looked upon to be not only a grievance to themselves, but an encroachment on their rights as men, and members of a Protestant establishment, as well as a great hindrance to the spreading of the Christian religion; giving occasion for unbelievers and Papists to reproach and vilify the clergy, by representing them as guilty of prevarication, and of accommodating their faith to lucrative views. Such of the petitioners, as had been educated with a view to the professions of civil law and physic, said they, could not but think it a great hardship to be obliged, as they all were in one of the universities, even at their first matriculation and admission, though at an age very improper for such important disquisitions, to subscribe their assent to a variety of theological tenets, concerning which their private opinions could be of no consequence to the public, in order to entitle them to academical degrees in those faculties; more especially as the course of their studies, and attention to their practice, did not afford them leisure sufficient to examine how far these tenets were consonant to the word of God. This petition was presented by Sir William Meredith, who, along with the other members who favored the cause, enforced it by many arguments drawn from the principles of toleration. The articles themselves were said to have been composed in haste; that they contained doctrines highly controvertible; and that this restraint on the consciences of men was of all others the greatest hardship. A majority of both houses of parliament, however, were inimical to the petition, though some who opposed it wished for time to consider it more deliberately. By the rest it was urged, that the matter of the petition was a violent infraction of the laws; and that, if this was granted, another would soon follow against the liturgy. The conduct of many of the petitioners, instead of being founded in any regard for religion, it was said, had its origin in hypocrisy and dissoluteness, and proceeded in many instances from a disbelief of the Trinity, and of the divinity of our Saviour. The complaints of men were to be disregarded, when they wished to profit by the emoluments of the church without subscribing to its laws; besides, the king was bound by his coronation oath to continue the government of the church without alteration. The rejection of the subscription bill was followed by that of a bill for quieting the possessions of his majesty's subjects from dormant claims of the church; after which the attention of parliament was called to another measure of the utmost importance,

introduced by a message from the king. This was the famous royal marriage act, occasioned by the marriage of the duke of Cumberland with Mrs. Horton, a widow lady, daughter of lord Irnham, and sister to colonel Luttrell, and that of the duke of Gloucester with the countess dowager of Waldegrave. By the message it was recommended to both houses to take it into their consideration, whether it might not be expedient to supply the defects of the law then in being, and by some new regulations more effectually to prevent the descendants of his late majesty (excepting the issue of the princesses who had married, or might hereafter marry into foreign families) from marrying without the consent of his present majesty, his heirs, and successors: and a bill was brought in by the ministry, declaring all such marriages, without the consent above mentioned, to be null and void. The descendants of his majesty, however, if above the age of twenty-five years, might marry without the royal consent, provided they gave intimation a year before to the privy council, and no opposition was made to the match by parliament during that interval. This bill met with the most violent and powerful opposition. The principal arguments against it were expressed in two protests from the upper house, and were to the following purpose:—1. The doctrine that marriages in the royal family are of the highest importance to the state, and that therefore the kings of this realm have ever been trusted with the care thereof, is both absurd and unconstitutional: though it would from that period have the force of a parliamentary declaration. The immediate tendency of this was to create as many prerogatives to the crown, as there are matters of importance in the state; and to extend them in a manner as vague and exceptionable, as had ever been done in the most despotic periods. 2. The enacting part of the bill had an inconvenient and impolitic extent; namely to all the descendants of George II. In process of time, that description might become very general, and comprehend a great number of people; and it was apprehended that it would be an intolerable grievance for the marriages of so many subjects, perhaps dispersed among the various ranks of civil life, to be subject to the restrictions of this act; especially as the abettors of this doctrine had also maintained, that the care and approbation of the marriage also included the education and custody of the person. This extensive power might in time make many of the first families of the kingdom entirely dependent on the crown; and it was regretted that all endeavours to limit, in some degree, the generality of that description, had proved ineffectual. 3. The time of nonage for the royal family appeared to be improperly extended beyond the limit of twenty-one years; a period which the wisdom of the constitution seems with great wisdom to have assigned to minority. 4. The deferring their marriage to the age of twenty-six might also be attended with other bad consequences, by driving them into a disorderly course of life, which ought to be particularly guarded against in those of such an exalted station. 5. The power given by this bill, to a

prince to marry after the age of twenty-six, is totally defeated by the proviso, which declares the consent of parliament to be ultimately necessary. Thus great difficulties must be laid on future parliaments, as their silence in such a case must imply a disapprobation of the king's refusal; and their concurrence with it might prove a perpetual prohibition from marriage to the party concerned. 6. The right of conferring a discretionary power of prohibiting all marriages, appears to be above the reach of any legislature whatever, as being contrary to the inherent rights of human nature; which, as they are not derived from, or held under, the sanction of any civil laws, cannot be taken away by them in any case whatever. 7. This bill has a natural tendency to produce a disputed title to the crown. If those who are affected by it are in power, they will easily procure a repeal of this act, and the confirmation of a marriage made contrary to it; and if they are not, it will at least be the source of the most dangerous faction that can exist in any country, viz. one attached to the pretender to the crown; whose claim, he may assert, has been set aside by no other authority than that of an act to which the legislature was not competent, as being contrary to the common rights of mankind. 8. The bill provides no security against the improper marriages of princesses married into foreign families and those of their issue; which may fully as materially affect the interest of this nation, as the marriages of princes residing in the dominions of Great Britain; and it provides no remedy against the improper marriage of the reigning king, or regent, &c., though evidently the most important of all others to the public. The answer to all these arguments was, that the inconveniences so much talked of were merely imaginary; and, if the king should make any improper use of his authority, parliament had it either in their power to prevent the effect, or to punish the minister who advised it. The crown, it was said, was dishonored by improper connexions, and many of the greatest national calamities have proceeded from improper alliances between the royal family and subjects; and that if, from after experience, we should find any material grievances ensue from this act, it could as easily be repealed at that time as thrown out now, and on better grounds. It was very rapidly carried through both houses; in the upper house by ninety to twenty-six; and in the lower by 165 to 115.

Although the late decision, concerning subscription to the thirty-nine articles, did not promise much success to any innovations in religious matters, yet the case of dissenting ministers was introduced soon after the discussion of the royal marriage act. A petition was presented by a great body of these people, praying to be relieved from the hardship of subscribing to the articles of a church to which they did not belong, and a bill grounded on the petition was fully debated. It was violently opposed by the opponents of the former bill, though with very little success in the house of commons, where it was carried by a prodigious majority. It was argued that nothing can advance the true interest of religion so much

as toleration; and, if articles of subscription are necessary, it must only be for men destitute of principle, and who would, in compliance with ambition or avarice, as readily subscribe to one set of articles as another. If thus any of the fundamental doctrines of Christianity are impugned, there are many laws in existence to correct the impiety. The dissenters have indeed altered some of their original forms and doctrines, but that only in matters of indifference. It is the effect of learning, leisure, and refinement, to give men many opportunities of altering established forms. This has been the case formerly, and always will be. The dissenters have long been virtually exempted from this subscription; and yet the piety and decency of many of them, particularly in Scotland and Ireland where no such laws are in being, sufficiently show, that men, whose minds are steadfast in the purity of religion, will not be confined nor influenced by laws of human invention. But, though the dissenters enjoy full liberty by connivance at present, where is their security against the sudden attacks of malice and envy, which may be backed by the sanction of law? Every neglect of a law by connivance is an additional proof of the necessity of abrogating that law; and liberty is but an empty name, where it is enjoyed by an oversight only, as it were, of our superiors. In the house of lords, however, the bill was rejected by a majority of seventy. Here the doctrine of universal toleration was strenuously opposed, as well as the great danger set forth to which the church of England would be exposed, by departing from the laws which guarded its privileges. The dissenters, it was said, had great reason to be satisfied with the favor they enjoyed by connivance; and the laws were only kept on record as a necessary curb, lest, in the degeneracy of a declining age, religion should be destitute of protection against heresy and blasphemy.

The only other important debates of this session were respecting an enquiry into the affairs of the East India company, which were now in a very critical situation. These, however, did not come under full consideration till the next session, which took place November 26th, 1772; and now they occupied the chief attention of parliament. It had been projected, as far back as the year 1767, when they were in a very flourishing condition, to bring them under the inspection of government, that the nation might share the immense wealth supposed to be enjoyed by the company. The design, did not succeed at that time, nor would it probably have been easily brought to bear, had not the affairs of the company become embarrassed. A motion was now made in parliament, by a gentleman unconnected with administration, for a select committee to enquire into the affairs of the company: but many reasons were urged against this, particularly that the season was too far advanced for a business of such importance; that the committee, being a secret one, was not accountable for its conduct; and that, as the minister would have it in his power to nominate the members of the committee, considerable partiality might on that account take place. The motion, however, was

carried without a division; and the members were chosen by ballot. During the recess, the affairs of the East India company proceeded from bad to worse. The treasury at home was quite exhausted; while bills to a vast amount, drawn on Bengal, were nearly due; which, with the debt to the bank and other public offices, along with the sum to be paid to government, reduced them almost to the brink of bankruptcy. They were therefore reduced to the expedient of borrowing a sum of money from administration: but their application was received with great indifference. The minister desired them to apply to parliament. The reports of the select committee, in the mean time, contrary to the promise of secrecy, were published, and gave the public no favorable opinion of the behaviour of the company's servants. At the next meeting of parliament, the minister moved for another committee, under the title of the committee of secrecy, to consist of thirteen persons, for taking into consideration the state of the company's affairs; which might thus undergo a full investigation. The members of this new committee were also to be chosen by ballot. It was objected that this mode of secret enquiry, by a small number, was unprecedented and unconstitutional; that the members would, in effect, be nominated by the minister, and act under his direction; and that a free investigation by parliament was essentially different from that by a secret committee. In the latter case, every information that the minister thought proper to conceal would be withheld: at any rate a committee of secrecy is an evident absurdity; a committee can be no longer secret than during the time it takes up for enquiry. Its proceedings must be laid before the public; and, in case of unjust accounts, the parliament had no means of being undeceived. These reasonings, however, were of no avail. The committee of secrecy was carried without a division; and the members, though chosen by ballot, were almost all devoted to administration. The select committee was likewise revived. In a very short time after these appointments, a report was given in, stating that the company were in great distress for want of money; and, as this was the case, a bill ought to be brought in for restraining them from sending out supervisors to India, a scheme which they, at this time, meditated. The minister and his adherents enlarged greatly on the utility of this bill. It was the sincere wish of parliament, they said, to render them a great and successful company: but it was absolutely necessary for this purpose not to allow them to engage in an expensive commission, at a time when their affairs were so much embarrassed. It was even doubted whether the company, without the sanction of parliamentary authority, had power to appoint a commission of this kind. On the other hand, the minister's proposal was characterised by opposition as unconstitutional and insidious. Two gentlemen, belonging to the company, offered to pledge themselves, that the commission of supervision should not be allowed to depart, until, from further reports, a full knowledge of the company's affairs should be acquired. This, however, was instantly rejected, it being said to be

defective in security; that the East India company would not scruple to make an agreement of this kind to-day, and break it to-morrow; which could only be prevented by an act of parliament, &c. The company, in fact, used every endeavour to prevent this bill passing into a law. They petitioned; and some of their servants were examined in the house of commons, in order to show the necessity of supervisors being sent out, who might be qualified to reduce their affairs to some order by being on the spot. In spite of all opposition, however, the bill for restraining the company from sending out any commission of supervision was carried by a majority of 153 to twenty-eight. In the house of lords it met with similar success, being carried by twenty-six to six, though the minority entered a protest. The secret committee now gave in their second report, containing a statement of the debt, credit, and effects of the company in England; beginning with an account of the cash in the company's treasury on the 1st December, 1772, and containing a statement of all their debts and claims. Thus it appeared that the cash, credit, and effects, of the company amounted to £6,397,299 10s. 6d., and their debts to the sum of £2,032,306, leaving a balance in their favor of £4,364,993 10s. 6d., without any estimate of the value of their fortifications and buildings abroad. The statement, however, was complained of as unfair: and it was said that impartiality was not to be expected from men who had it in their power to make what report they pleased for the interest of government: but the administration insisted, that, until proof could be brought that the statement was unfair, the house was bound to adhere to it.

The business was revived, after the holidays, by an application from the company to government, for a loan of £1,500,000, for four years, at four per cent. interest, with the liberty of repaying the same according to their ability; and that the company should not make a dividend of more than six per cent. until the loan should be reduced to £750,000. It was also requested, that the company should be released from the heavy penal interest, incurred by the non-payment of money owing in consequence of the late acts for the indemnity on teas; and that they should be discharged from the annual payment of the £400,000 to the public, for the remainder of the five years specified in the agreement. They further requested that the accounts of the Duanee revenues, of the charges of collection, expenses of Bengal, company's accounts of sales, &c., should be delivered annually to parliament, and that leave might be given to export teas, free of all duty, to America, and to foreign parts. This request was judged expedient to be granted, and resolutions in conformity to it were agreed to. The two following motions were also founded upon the report of the secret committee, viz. That, supposing the public should advance a loan to the East India company, it was the opinion of the committee that the dividend should be restrained to six per cent., until the payment of the sum advanced; and that the company be allowed to divide no more than seven per cent. until their bond debt be

reduced to £1,500,000. These severe restrictions were judged proper by administration for the security of the public, and were such, they said, as every creditor has a right to make beforehand with a person who wishes to borrow money from him. The company, however, replied, that the restrictions were contrary to the proposals they had made, and void of foundation, as being built on the erroneous reports of the secret committee. The chairman of the company declared, at a general court, that the government had agreed, or would agree, to the proposed dividend, before the participation of profits took place betwixt the government and company; the first lord of the treasury had told him so, and now wished to deny what he had said. Some time was demanded to consider of these motions; but, that being denied, the question was put and carried as the ministry proposed.

It was next proposed to deprive the company of their supposed territorial right to the countries they possessed in the East Indies. This had been allowed them in the most explicit manner, as appears by some of the papers which passed between the French and English ministers, during the negotiations for the treaty of Paris; from one of which the following is an extract:— 'Respecting those territorial acquisitions which the English East India company have made in Asia, every dispute relative thereto must be settled by that company itself, the crown of England having no right to interfere in what is allowed to be the legal and exclusive property of a body corporate, belonging to the English nation.' This right, however, was now denied. After reading the company's petition, lord North told the house, that it was the opinion of several great lawyers, that such territorial possessions as the subjects of any state shall acquire by conquest, are virtually the property of the state, and not of those individuals who acquire them. It was his opinion, however, that it would be more beneficial to the public, and to the East India company, to let the territorial acquisitions remain in the possession of the company for a limited time, not exceeding six years, to commence from the agreement betwixt the public and the company. At the same time it was moved, that no participation of profits should take place betwixt the public and the company, until after the repayment of £1,400,000 advanced to the company; and the reduction of the company's bond debt to £1,500,000. That after the payment of the loan advanced to the company, and the reduction of their bond debts to the sum specified, three-fourths of the neat surplus profits of the company at home, above the sum of eight per cent. upon their capital stock, should be paid into the exchequer for the use of the public, and the remaining fourth be set apart, either for reducing the company's bond debt, or for composing a fund for the discharging of any contingent exigencies the company might labor under. These proceedings were exceedingly disagreeable to the company. But the only effect which these remonstrances produced was that it was agreed by government that, as the company had a stock of teas amounting to about 17,000,000 of pounds in their warehouses, they should be allowed to export as

much of it as they thought proper free of duty, and employ the money thence arising for the benefit of their affairs. This concession in favor of the East India company, it is remarkable, proved in the event the loss of the American colonies; nor, indeed, could these arbitrary proceedings with such a considerable body tend to impress the minds of any part of the nation with ideas favorable to the views of administration. In other respects the minister abated nothing of the disposition he had from first to last shown with regard to the company. On the 3rd May, 1773, the following resolutions were proposed by him as the foundation of a bill for establishing certain regulations for the better management of the East India company, as well in India as in Europe. 1. That the court of directors should, in future, be elected for four years; six members annually, but not to hold their seats longer than four years. 2. That no person should vote at the election of the directors, who had not possessed their stock twelve months. 3. That the stock of qualification should, for the future, be £1000 instead of £500. 4. The mayor's court of Calcutta should, for the future, be confined to small mercantile causes, to which its jurisdiction only extended before the territorial acquisitions. 5. That, instead of this court thus taken away, a new one should be established, consisting of a chief justice and three puisne judges. 6. These judges to be appointed by the crown. 7. That a superiority be given to the presidency of Bengal over the other presidencies in India. Each of these resolutions was carried by a great majority. The salaries of the judges were fixed at £6000 each, and that of the chief justice at £8000. The governor of the council was to have £25,000 annually, and the members of the council £10,000 each.

By the friends of the company this bill was supposed to have a tendency to effect a total alteration in its constitution in England, as well as in the administration of all its presidencies in Asia. No delinquency was charged, nor any specific ground of forfeiture of their privileges, they said, assigned; yet, by this bill, more than 1200 freemen were to be disfranchised and deprived of any voice in the management of their own property. By cutting off the £500 stockholders, the proprietary would become more manageable by the crown; nor was there any security, that the directors would be faithful to the interests of the company, when they were no longer responsible to them for their actions. The proprietors of £500 stock presented a petition, setting forth that, by king William's charter granted to the company, and repeatedly confirmed since that time, in consideration of many large sums repeatedly advanced by the company to the public, they were legally possessed of a right of voting at the election of directors, making of bye laws, or in any other matter relating to the affairs and government of the company; but, by a clause in this regulating bill, they were deprived of this right, and that under a pretence of preventing the pernicious practice of splitting stock by collusive transfers; for so far were the proprietors from giving way to such practices, that, in the year 1767, they petitioned parliament for

an act, by which the several proprietors entitled to vote should be obliged to hold this qualification six months, at least, before the exercise of their right, afterwards extending the time to twelve months, rather than the act should fail of its intended effect. This proposed increase of the qualification of the voters, however, could not, in any degree, answer the end desired; for, the splitting of stock being confined to such proprietors as held large quantities, they would find it an easy matter to place their stocks in the hands of half the number of persons, and thus extend their influence in a great and undue proportion: but, if ever government conceived designs against the company, they would find it much easier to execute them while the proprietors were few and opulent, than when they were numerous, and at the same time independent, and possessed of moderate fortunes. This petition produced a motion in the house of commons, 'That it does not appear that the proprietors of £500 stock in the East India company have been guilty of any delinquency in the exercise of their charter rights, according to the several acts of parliament made in their behalf.' This, however, being rejected, the regulating bill passed in the house of commons by a majority of more than six to one. In the house of lords it passed by seventy-four to seventeen.

All this time enquiries were continued by the select and secret committee; and a report was presented by general Burgoyne, containing many charges of cruelty and rapacity in the conduct of several gentlemen, concerned in the management of the affairs of the company; particularly with regard to the deposition of Surajah Dowlah in 1756. This was said to have been the origin of all the evils that had happened since that time. He insisted much on the treachery used in bringing about that revolution, and particularly the fictitious treaty with Omichund; exposed the conduct of lord Clive, who had caused admiral Watson's name to be affixed to that treaty, which the admiral had refused to sign in person, &c. He concluded with moving for the restitution of all the money received in presents, or otherwise, in India, while the receivers acted in a public capacity: 'That all acquisitions made under the influence of a military force, or by treaty with foreign powers, do of right belong to the state; that to appropriate acquisitions obtained by such means is illegal; and that great sums of money had been obtained by such means from the sovereign princes in India.'

The general belief that many of the company's servants had acted in a most infamous manner, was at this time so strong, that the above resolutions were carried almost unanimously. Lord Clive defended himself by general protestations of innocence; which, however, gained him but little credit, till he entered into a particular refutation of the charge against him. General Burgoyne now moved, 'That lord Clive, in consequence of the powers vested in him in India, had received at various times presents to the amount of £234,000 sterling, to the dishonor and detriment of the state:' but this being rejected, after violent debates, the following was substi-

tuted: 'That lord Clive did, in so doing, abuse the power with which he was entrusted, to the evil example of the servants of the public.' This motion, also, being rejected, another was made, 'That lord Clive, when he received the sum above mentioned, did at the same time render great and meritorious services to his country.' Thus the matter was concluded, and the affairs of the company delivered into the hands of administration, who declared that their regard for its welfare was the sole motive for bringing about this revolution.

In America the trifling tax on tea, which had not been repealed, and the allowance given to the East India company to export what quantities they pleased, now threw matters into a ferment not to be quelled. The various proceedings there, and subsequent war, are elsewhere related. Here it only remains to give an account of the manner in which the legislature and people of Great Britain were affected by these events. Ever since the peace, in 1763, the disposition shown by government to augment the revenue had produced in the popular party of Great Britain a spirit very similar to that manifested by the Americans, though in an inferior degree: so that the patriots of Britain considered the Americans as oppressed by government, and suffering in the same cause with themselves. The destruction of the tea at Boston and other places in America, however, considerably diminished the number of their friends, and made many of those who still adhered to their cause much less sanguine. The matter was announced to parliament by a special message from the throne. Lord North and the other ministers set forth the conduct of the colonists, particularly of the town of Boston, in a most atrocious light; and concluded that government was now perfectly justifiable in adopting any measures they might think proper, to inflict punishment on that town. Opposition did not pretend to exculpate, though they still attempted to excuse them, by deriving all the disturbances in that country from the arbitrary and absurd measures pursued at home. This charge the minister evaded by drawing the attention of the house to the more important consideration, Whether the Americans were now to be dependent, or independent, on Great Britain? The Boston port bill, being then brought in, was carried, but not without considerable opposition, both within and without doors. A petition was first presented against it by Mr. Bollen, agent for the council of Massachusetts's Bay, urging an act of queen Elizabeth for the security of the liberty of the colonies. This was presented before the bill had actually made its appearance. After it had passed two readings, this gentleman presented another, desiring to be heard in behalf of the town of Boston, for the council of Massachusetts's Bay. This was refused; because, though Mr. Bollen was agent for the colony, he was not for the corporation of the town of Boston. Another petition followed from the lord mayor, in the name of the natives and inhabitants of North America residing at that time in London. It concluded with these remarkable words, that 'the attachment of America would not survive the justice of Britain.' As little re-

gard, however, being paid to this as to the former petitions, and all proposals for a delay rejected, the bill passed both houses without a division. That this obnoxious bill might not be sent to America without some mitigation, the popular party now proposed to repeal the duty on tea laid on in 1767; but this was also rejected, from a vain expectation that the opposition of the Americans was that of a mere tumultuous mob.

Still greater opposition was made to the Quebec bill, so that, before it could be carried, the ministers were obliged to drop much of that high and aspiring tone to which they had accustomed the selves in talking of American affairs. The minority contended, that here, without any necessity pleaded, or even suggested, an arbitrary influence was extended by act of parliament to that province, furnishing a dangerous precedent, and an additional instance of the aversion which ministry bore to the rights of the people. The people at large, also, were alarmed at the religious part of the bill; and thought that the establishment of the Roman Catholic religion there gave it a preference over the protestant. At the conclusion of the session, the king expressed the greatest satisfaction at what had been done, and hopes of the good effects that would attend the new regulations. The reception they met with in AMERICA is related in its proper place; in Britain the people seemed to wait the event with indifference, but their bad success with the colonists furnished the minority with new matter of reproach on administration. The parliament in the mean time was dissolved by proclamation, and a very short time allowed for the election of new members. The new parliament met on the 30th of November, 1774; when his majesty acquainted the houses that a most daring spirit of resistance still prevailed in America, notwithstanding the most proper means had been taken to prevent the mischiefs thence arising; and assured them that they might depend on a firm resolution, on his part, to withstand every attempt to weaken or impair the supreme authority of this legislature over all the dominions of the crown. In answer to the speech, the minority demanded a communication of all the letters, orders, and instructions, relating to American affairs; but this being over-ruled, and the address carried as a matter of form, American affairs were delayed, in spite of all opposition, till after the holidays. In the question on the address, the majority in favor of administration, was 191; the votes being 264 to seventy-three.

7. *The American War.*—In the beginning of 1775 the minority received a considerable accession of strength by the return of lord Chatham to the house of lords, after a long absence. He testified his disapprobation of the measures which had been pursued with regard to America in the warmest terms; moved for addressing the king to recall the troops from Boston: and predicted that, if ministers went on in the way they had done for some time, they would make the crown not worth the king's wearing. All his eloquence, however, proved ineffectual; administration was determined to force the Americans into subjec-

tion, and his motion was rejected by sixty-eight to eighteen. Lord North now presented the papers which had been called for by the minority; with the exception of particular names, lest they should prove detrimental to individuals. This was complained of, but to no purpose; and the papers were laid before a committee of the whole house. In the mean time petitions against coercive measures with America had been received from most of the trading companies of the kingdom; and a committee was appointed to take them into consideration: but such a delay took place, in regard to these petitions, that the committee to which they were consigned was humorously called the committee of oblivion. A violent debate arose on the petition of congress to the king, which had been delivered and by him referred to parliament. It was argued by administration, that no petition could be received from the Continental congress, which was no legal body, and it would be admitting their legality to receive a petition from them; the general assemblies and their agents were the only lawful representatives of the colonies, and none else could be admitted. After an ineffectual struggle of opposition, the petition was finally rejected by 218 to sixty-eight. In the mean time a conciliatory plan was prepared by the earl of Chatham, which was presented on the 1st of February, 1775. The intent of this bill, he said, was to settle the troubles in America, and to assert at the same time the supreme legislative authority and superintending power of Great Britain over her colonies. This was to be done by their acknowledging the supremacy of the British legislature and the superintending power of parliament. No taxes were to be levied in America but with the free consent of their assemblies. It asserted a right in the crown to keep and station a military force established by law in any part of its dominions; but declared, that it could not be legally employed to enforce implicit and unlawful submission. A congress might also be held, in order to recognise the supreme sovereignty of Great Britain over the colonies, and to settle, at the same time, an annual revenue upon the crown, disposable by parliament, and applicable to the exigencies of the nation. On complying with these conditions, the acts complained of by congress were to be suspended, with every other measure pointed out as a grievance, and the constitution of their governments to remain as settled by their charters. This bill was, however, at once deemed inadmissible, on account of its alleged partiality to America, and particularly by its empowering the colonies to assemble in congress: a measure which, of all others, was at that time the most offensive. Lord Chatham was by no means deficient in arguments in support of his plan: but these, supported by all the powers of his eloquence, proved unsuccessful; the proposal being rejected by sixty-one to thirty-two. So determined were the majority in this entire rejection, that it was not even permitted to lie upon the table. A petition was next presented to the house of commons, by the proprietors of estates in the West India islands, representing their alarm at the association of the Americans, and

their intended stoppage of trade with the British islands; the situation of which, they said, would be very calamitous, if the acts in question were not immediately repealed. Administration represented all petitions now as the contrivance of faction; and said, that, however inconvenient the coercive measures might be, they ought not to be retarded by the consideration of any temporary losses. As it was necessary, however, to let the nation know the ultimate resolves of administration respecting America, Lord North in a long speech asserted, that the universal fermentation, then prevailing in the colonies, proceeded from the arts used to dispose them against the ruling powers in Britain; and that, notwithstanding all their complaints, the public charges borne by individuals in America were, on the strictest computation, not more than one to fifty when compared to what was paid by individuals in England. Nothing, therefore, but a settled determination to quarrel with the parent state could induce the Americans to persist in their disobedience to the lawful injunctions laid upon them. For this reason he proposed to the house to send a competent force to America; and to pass a temporary act, suspending all the foreign trade of the different colonies of New England, particularly the Newfoundland fishery, until they should acknowledge the supreme authority of the British legislature. New England, he said, was justly singled out upon this occasion, as being the most guilty of the whole. The question now was simply, Whether we would at once abandon all claims on the colonies, and instantly give up the advantages arising from our sovereignty, and the commerce dependent on it? or, Whether we should resort to the measures indispensably necessary to ensure both? An address was carried, which, in the ideas of opposition, amounted to an absolute declaration of war.

In the mean time matters went on from bad to worse in New England; so that it was soon perceived, either that the friends of government in that colony did not exert themselves, or that they were far from being so numerous as had been imagined. To make their coercive plan the more effectual, therefore, it was judged necessary to extend it, so that every individual of the colony should become sensible of the punishment. This, it was supposed, would be done by a bill for restraining the four provinces of New England from commerce with Great Britain, Ireland, or the British West India islands; and prohibiting them from carrying on the fishery at Newfoundland. The reasons given for this were in substance the same as those for the others; and indeed both parties had now so much exhausted their arguments, that very little new matter was left for either. Every step taken by ministry, and every proposal made by them, however, produced a violent debate; and, though they constantly gained the victory, it was not without the mortification of hearing their principles and conduct reprobated in the most opprobrious manner. In this instance the bill was carried by 261 against eighty-five.

The restraining bill was no sooner carried, than a petition was presented against it, by the

London merchants concerned in the American trade, setting forth the danger that would accrue to the fisheries of Great Britain from such a prohibition. From the evidence brought in support of this petition it appeared, that ten years before the American fisheries had been in such a flourishing state, that the four provinces of New England alone employed nearly 46,000 ton of shipping, and 6000 seamen; and that the produce of their fisheries in the foreign markets amounted in 1764 to upwards of £320,000. Since that time they had greatly increased; and what rendered the fisheries particularly valuable was, that all the materials used in them, excepting only the timber for building the vessels, and the salt for curing the fish, were purchased in Britain, and the nett proceeds of the trade were also remitted thither. It appeared, also, that it would not be practicable to transfer these fisheries to Halifax or Quebec. Some other circumstances were likewise urged as strong reasons against this bill; particularly the commercial concerns of London with New England (to which city alone the colony stood indebted for nearly £1,000,000), and the bad consequences of it to the people of Nantucket, a barren island, lying off the coast of New England, about fifteen miles long, and three broad, containing about 6000 inhabitants, almost all Quakers. The natural produce of this island could not maintain twenty families; but the industry of the inhabitants was such, that they kept 130 vessels constantly employed in the whale-fishery, which they carried on in the North Seas, to the coasts of Africa and Brasil, and even as far as the Falkland Islands, and the shores of Terra Magellanica. This bill was debated with great animosity in the house of peers, and produced a remarkable protest, in which the measures of government were spoken of with great severity. 'That government (said the protesting peers) which attempts to preserve its authority by destroying the trade of its subjects, and by involving the innocent and guilty in a common ruin, if it acts from a choice of such means, confesses itself unworthy; if from inability to find any other, admits itself wholly incompetent to the end of its institution.' They also reprobated in severe terms the assertion, that the Americans wanted spirit to resist, and that Britain would find them an easy conquest.

The final resolution of reducing the colonies by force being now taken, it became necessary to make proper preparations for the purpose; and in this the conduct of administration was little less censured than in other respects. As the opinion that the Americans were timid and incapable of becoming soldiers, prevailed greatly at that time, a force of 10,000 men was judged sufficient to reduce the province of New England to obedience. This was vehemently opposed by the minority. They insisted that the force was totally inadequate, and only calculated to produce expense to no purpose. The first impression, they justly observed, ought to be decisive, if possible; and, to render it so, it was necessary to send such a fleet and army as might ensure the confidence of the public, and be certainly capable of surmounting all obstacles.

Many of the friends of administration were of the same sentiments, and the only reason assigned for acting otherwise was, a hope that the Americans would, upon more mature consideration, desist from their opposition. That they might the more readily be induced to this submission, lord North's conciliatory proposition was formed. By this it was enacted, that when the governor, council, and assembly, of any of the colonies, should propose to make a provision for the common defence, &c., and if such provision should be approved of by the king in parliament, the levying, or imposing of taxes on that colony should then be forborne, those duties excepted which it might be expedient to impose for the regulation of commerce; the nett produce of which should be carried to the account of the colony where it was raised. But this proposal, though highly extolled by the friends of administration, was no less reprobated by the minority than the others had been. It was said to be insidious, and calculated for the purpose of raising a revenue, which was now said to be the object of ministers. There was no essential difference between the present and former modes of taxation. The colonies were as effectually taxed without their consent, by requiring them to pay a stated sum, as by laying a number of duties upon them to the same amount. There was besides a capital deficiency in the proposal, viz. that no sum was specified; so that the Americans were left totally ignorant of what the demands of Britain might be. After a long debate, however, the question was carried in favor of administration by 274 to eighty-eight. The like fate attended a petition to the throne from the island of Jamaica. Instead of relaxing any thing of their severity, the ministry now included the southern colonies in the restrictions laid on New England. Still, however, the petitioners were indefatigable in their endeavours to be heard.

The West India merchants and planters seconded their last petition, by a detail of circumstances relating to the British islands in that part of the world. This affair was conducted by Mr. Glover, a gentleman equally celebrated for his literary talents and commercial knowledge. From his investigations it appeared that, exclusive of the intrinsic worth of the islands, their stock in trade and other property amounted to no less than £60,000,000: the exportation to Britain had of late been nearly 200,000 hogsheds and puncheons of sugar and rum, amounting to no less than £4,000,000 in value; the direct revenue arising from which was £700,000, besides that which accrued from the collateral branches depending upon it. All this, however, was urged in vain. Conciliatory proposals were also made by Mr. Burke and Mr. Hartley, but they were rejected by great majorities. Government continued to enact new laws against the Americans; and their antagonists opposed these in a manner similar to what has been already related. Other petitions were presented and treated with neglect. The increase of union, and preparations for war among the colonists were by the ministerial party treated as the mere commotions of a headstrong mob: and by the other as an association of an injured and virtuous

people, who were about to found a mighty empire in the west, while Britain was to sink in utter disgrace and contempt by their secession. On this principle, the event of the skirmish at Lexington was magnified by the one into a 'disgraceful defeat' on the part of the British; and by the other treated with absolute unconcern. Thus, also, the battle at Bunker's Hill, and all the transactions of the year 1775, were unfairly stated by both parties; and the only consequence ensuing from these misrepresentations was, the inflaming to a violent degree the resentment betwixt the two parties; one of which depressed the Americans to the rank of consummate poltroons, while the other exalted them almost to that of demigods.

While these alterations continued to agitate the minds of the superior classes of people in Britain, the middle and lower ranks remained in a kind of indifference, or rather were against the proceedings of ministry. This opposition could not indeed influence the councils of the nation, but in other respects it proved very troublesome. The levies were obstructed, and the recruiting service was never known to go on so heavily; numbers of people not only refusing the usual proffers, but even reprobating the cause in which they were solicited to engage. Besides this, several officers of high rank showed a great aversion to the service. Lord Effingham, who had distinguished himself by his opposition to ministerial measures, resigned the command of his regiment, rather than fight against the cause he had espoused so warmly. His example was followed by that of several other officers; and, while this step conferred upon them a considerable share of popularity, it excited in the minds of ministry an equal degree of resentment. Lord Effingham, in particular, received the public thanks of the cities of London and Dublin; both of which showed an extreme aversion to the commencement of hostilities with America. The former, after the affair at Lexington, framed a remonstrance and petition, animadverting in the most severe manner on the ministry and parliament; and it was not without the greatest difficulty, that the more moderate party procured one to be drawn up, under the name of an 'humble petition,' couched in less reprehensible terms. In the mean time several inconveniences began to be felt in different parts of the nation. The suspension of the sale and purchase of negro slaves in the West Indies and in North America, and the prohibition to export arms and gunpowder, had greatly impeded the African trade from Bristol and Liverpool. In consequence of this, a great number of ships which formerly sailed from these ports had been laid up, and nearly 3000 sailors belonging to Liverpool were dismissed from service. Their situations soon rendered them riotous; and it was not without the assistance of the military that they were quelled. These distresses, however, made no impression on administration; who having once laid it down as a maxim, that the subjection of America was the duty of Great Britain, were, in consistence with their own principles, obliged to overlook every disaster that might happen in the mean

time as a temporary inconvenience. It was with the utmost satisfaction, therefore, that the nation received the news of Mr. Penn's arrival in 1775, with a new petition from the congress to the king. This petition was delivered to lord Dartmouth on the 1st of September; and in three days it was replied, that no answer would be given to it; a procedure which excited no small surprise, as it was universally allowed that the language of the petition was respectful, and that it expressed the strongest desire for peace and reconciliation. On the other hand, the friends of administration insisted, that the petition offered nothing that could in consistency with the dignity of the British empire be taken notice of. Instead of professing any repentance for their own conduct, the Americans had offered stipulations, and even required concessions on the part of Britain. It was likewise said, that fear had a share in framing the proposals now held out. The colonists were sensible, that, though the first steps taken by Britain had not answered the purpose, much greater efforts would quickly follow; and that, without being allowed time, it was impossible they could bring their matters to bear. The petition, therefore, might be considered as written with a view to procrastinate matters. It was also plain, that a great majority of the nation approved of the measures of government; for addresses were received from all quarters, recommending in the most explicit manner vigorous exertion against America.

To the violent bickerings at home, some serious commercial misfortunes were now added from abroad. It had been represented as very probable, during the last session of parliament, that the bill for depriving the people of New England of the benefits of the Newfoundland fishery, would redound greatly to the interest of Great Britain, by throwing into her hands alone the profits which were formerly divided with the colonies. This expectation, however, proved totally void of foundation. The number of ships fitted out that year was scarcely greater than usual. The congress had also prohibited them from being supplied with provisions; so that not only those on board the ships, but even the inhabitants on the island of Newfoundland itself, were in danger of perishing. Many of the ships were therefore obliged to go in quest of provisions, instead of prosecuting the business on which they came. On the whole, therefore, the profits of the fishery suffered this year a diminution of nearly £500,000. Along with this, some natural causes co-operated, which, by the more superstitious, were considered as the effects of divine wrath. A most violent and uncommon storm took place in these latitudes during the fishing season. The sea arose full thirty feet above its ordinary level; and that with such rapidity, that no time was allowed for avoiding its fury. Upwards of 700 fishing boats perished, with all the people in them; and some ships foundered with their whole crews.

Ministers had determined on their plan of subjugating America; and the only difficulty was, how to put it in execution as quickly as possible. For this purpose, application was

made to the petty states of Germany, who had frequently sent auxiliaries to Britain in former cases of exigency. At present, however, the scheme met with considerable difficulties. The princes were alarmed at the appearance of losing so many subjects; while the latter were no less startled at the proposal of being transported across the ocean into a new world, there to be exposed to all the miseries of war. In these plans, therefore, for the most part, the administration were disappointed. All the states of Europe looked upon Britain with an invidious eye, though none so much as Holland and France. A very strong party in Holland contended for the American interest, and pamphlets were daily published at Amsterdam in justification of the colonies. Their case was compared with that of the Netherlands in former times; and they were exhorted to persevere in their claims. Great Britain they represented as insatiably covetous of wealth and power. Since her successes in the war of 1775, it was said, she had become intolerable, not only to her neighbours, but to the whole world. But, though these powers thus early expressed their hostile disposition towards Britain, it was otherwise with the princes of Hesse and Brunswick; by whom, and some other German princes of inferior note, a considerable number of troops were supplied. At the same time, as many British forces as possible were drawn from the garrisons of Gibraltar and Minorca, which were supplied in return with men from the electorate of Hanover. In justice to the ministers, indeed, it must be owned, that they prosecuted the scheme they had undertaken with all possible vigor; inasmuch that the expenses already began to occasion considerable alarm. It had always been supposed, that the British army would be at once victorious; or at least would remain so far masters of the field, that they could easily command what supplies of provisions were necessary. Instead of this, they were now cooped up in such a manner as to be actually in danger of perishing for want. The supplies, therefore, of necessity, were sent from Britain; and the exertions for their relief were at once magnificent and ruinous. One advantage, however, was derived from this immense profusion; the price of every consumable commodity was augmented; that of shipping, particularly, rose one-fourth in the ton; and, though the profits made by contractors and their numerous friends were complained of, the benefits which accrued to multitudes employed in the various branches of public business seemed in some measure to make amends for every thing. Misfortune, however, now seemed to attend every scheme in which the ministers engaged. The sailing of the transports was delayed so long, that their voyages were lost. They remained for a long time wind-bound; and, after leaving port, met with such stormy weather, that they were tossed to and fro in the channel, till most of the live stock they had on board perished. After clearing the coast of England, their progress was retarded by a continuance of bad weather. They were forced by the periodical winds from the coast of America into the ocean.

Some were driven to the West Indies, others were captured by American privateers, and only a very few reached the harbour of Boston with their cargoes quite damaged, so that they could be of little or no use.

Notwithstanding, therefore, the immense supplies above mentioned, a subscription was set on foot for the relief of the soldiers, as well as of the families of those who died in the service. This was liberal on the whole, though many refused to contribute, from their disapprobation of the cause. All this time the violent party animosities continued, and the desire of peace was gradually extinguished on both sides. Each seemed to be of opinion, that the other would willingly ruin the nation if possible; a remarkable instance of which was the commitment of Stephen Sayre, Esq., banker (one of the sheriffs of the preceding year), to the tower, for high treason. The accusation laid against him was no less than that of having formed a design to seize his majesty as he went to the house of lords: but the scheme itself, and the method in which it was to be executed, appeared so ridiculous, that the prisoner was very soon discharged; after which he commenced a process against lord Rochfort for false imprisonment. With respect to the parliamentary proceedings, during this period, we need only say, every measure of administration, right or wrong, was violently opposed. The employment of foreign troops, and admitting them into the fortresses of Gibraltar and Minorca, were severely censured, as contrary to the bill of rights. But administration contended, that this bill only forbade the introduction of a foreign military power into the kingdom during peace. The force designed for the conquest of America was then declared to be inadequate to the purpose; but it was replied on the part of ministry, that the design was to conciliate not to conquer. The force (25,000 men) was sufficient to strike terror; and, though this should not instantly be produced, conciliatory offers would still be held out after every blow that was struck.

In the mean time, the Americans, sensible of the dangerous situation in which they stood, exerted themselves to the utmost to dislodge the British troops from Boston. This being at length accomplished, in March 1776, they proceeded to put their towns in the most formidable state of defence; and actually repulsed Sir Peter Parker, at Charlestown; but they did not exert equal spirit in the defence of New York; where, besides losing the town, they received such a defeat, as threatened their affairs with total ruin. In this view it appeared to the majority of the people in Britain. The successful campaign of 1776 was looked upon as so decisive, that the Americans were supposed to be incapable of ever retrieving their affairs. Opposition were embarrassed, and now almost reduced to the single argument of the interference of foreign powers, which they had often unsuccessfully used before. Besides this, indeed, the obstinacy of the Americans in refusing the offers of lord Howe, even at the moment of their greatest depression, seemed to be a very bad presage. The strength of ministry, however,

now became so decisive, that whatever they proposed was immediately carried. The number of seamen for 1777 was augmented to 45,000, and upwards of £5,000,000 voted for the expenses of the navy. Those of the land service amounted to nearly £3,000,000, besides the extraordinaries of the former year, which amounted to more than £1,200,000. But, however administration might now triumph, their exultation was but of a short continuance. The misfortune of general Burgoyne, at Saratoga, threw the whole nation into a kind of despair, and reduced the ministry to the greatest perplexity.

The ministry after this were in no small difficulty how to raise a sufficient number of forces to carry on the war; but they extricated themselves by a masterly contrivance. This was the encouraging levies for government service by cities and private persons; and, as the design was kept a profound secret before the Christmas recess, they were not disturbed by the clamors of opposition. The recess was purposely extended, to give time for the scheme to take effect; and, before parliament met again, it was actually accomplished, so that ministers could once more face their opponents without fear. Another and more weighty consideration, however, now occurred. The European states, in general, had long beheld the grandeur of Britain with an invidious eye. The news of the disaster at Saratoga was therefore joyfully received among them. But, of all the foreign powers, the French, for obvious reasons, were the most active in supporting the Americans. Numbers of the young nobility were eager to signalise themselves in the cause of the colonies; and among the rest, the celebrated marquis de la Fayette. Impelled by an enthusiastic ardor in favor of the American cause, he purchased a vessel, loaded her with military stores, and sailed, with several of his friends, to America, to offer his services to congress. He met of course with a most gracious reception, and was invested with a command, in which he lost no opportunity of distinguishing himself. Besides this nobleman, several other officers of France and Germany entered into the American service, and by their military talents greatly contributed to the exertions which the colonies were enabled to make. The French court also now interested itself in their behalf; and the celebrated Dr. Franklin negotiated a treaty, recognising the United States of America. Whatever might have been the motives of the British ministry, however, it is certain, that in defiance of probability, even when joined by the most acrimonious censures of opposition, they continued to pretend ignorance of any hostile intentions in the court of France, until that court of its own accord announced them, by a formal notification to the court of St. James's, in March 1778.

An acknowledgement of the independence of America was now by many supposed to be the only rational step that could be taken, particularly before they had time to enter into exclusive engagements with France. This of course would lessen their dependence on France, and leave

them at liberty to form such connexions as they thought most proper. The ministerial party, however, still insisted on vigorous measures, representing it as spiritless and disgraceful to bend beneath the power of France, and setting forth the resources of Great Britain as sufficient to resist the efforts of all her enemies. The dishonor of leaving the American loyalists exposed to the resentment of their countrymen was also urged. These were said to be by far the greater number; and it was insisted that their loyalty ought to be rewarded by putting arms into their hands: whatever the danger of the experiment might be, we could not abandon them without exposing our reputation, and losing that character of fidelity to our engagements for which we had hitherto been so justly respected. Unanimity in the present case was strongly insisted upon; and when opposition complained of some occult irresistible influence by which the councils of the nation were directed, in despite of every suggestion of reason and argument, the charge was denied in the strongest manner, and ministers disclaimed every motive of their conduct, excepting that of an internal conviction of its rectitude. In the midst of these violent altercations, the greatest courage and steadiness were manifested by the deliberate part of the nation. The French once more insulted the country by a threat of invasion; and orders were issued to draw out and embody the militia, which was then composed of men in every respect as well exercised and disciplined as any regular troops. It was complained, however, that a French squadron of twelve ships of the line had sailed from Toulon without any obstruction, under the command of the count d'Estaing. Great apprehensions were entertained from the evident inferiority of lord Howe's naval force, which might expose him to a total defeat, and the whole fleet of transports to be taken or destroyed by the enemy. But, whatever might have been the probabilities in this case, it is certain that either the fortune or conduct of this commander was such, that no exploit of any great consequence was ever performed by d'Estaing. The operations of the French in America, with the various success of the war, are related under the article AMERICA. We have only to notice here, that d'Estaing having failed in his attempt on the British fleet at New York, and in assisting his allies in their attempt on Rhode Island, as well as having by other parts of his conduct greatly disgusted them, sailed for the West Indies, where he unsuccessfully attacked the island of St. Lucia. Being repulsed in this attempt, he sailed to the island of Grenada, which he reduced, treating the vanquished in a very cruel manner, while a body of troops despatched by him also reduced the island of St. Vincent.

The count d'Estaing was now powerfully reinforced; so that his fleet consisted of twenty-six sail of the line and twelve frigates. During the time he was employed at Grenada, admiral Byron, with the British squadron, was accompanying the homeward bound West India fleet till out of danger; after which he sailed with a body of troops under general Grant for the re-

covery of St. Vincent; but, before they could reach that island, intelligence was received of the descent at Grenada. On this they steered directly for that island, where they encountered the French fleet without hesitation, notwithstanding the great superiority of the latter. At this time the French squadron amounted to twenty-seven sail of the line and seven frigates; while that of Britain consisted only of twenty-one ships of the line and one frigate. On the British admirals, Byron and Barrington, endeavouring to bring the enemy to a close engagement, it was studiously avoided by d'Estaing; and such was the dexterity and circumspection with which the latter conducted himself, that it was only by seizing the transient opportunities of the different movements, occasioned by the wind and weather, that some of the British ships could be made to close in with their antagonists. Even then the engagement was carried on upon such unequal terms, that the British ships were terribly shattered. For some time captains Collingwood, Edwards, and Cornwallis, stood the fire of the whole French fleet. Captain Fanshaw of the Monmouth, a sixty-four gun ship, singly threw himself in the way of the enemy's van to stop them; and several of the British ships forced their way to the very mouth of St. George's Harbour, on the island of Grenada; but, finding it in the hands of the French, an end was put to the engagement: nor did the French try to renew it, though the British ships had suffered so much. The count d'Estaing, having received fresh reinforcements, now set sail for America. The islands of DOMINICA, ST. VINCENT, and GRENADA, were quite lost to Great Britain; the first being taken by the marquis de Bouille, governor of Martinico, and the last two by d'Estaing (see these articles); but these successes were balanced by the failure of the French commander in every other enterprise; by his terrible disaster at the Savannah; and by the acquisition of St. Lucia, which was taken in 1778 by admiral Barrington and generals Prescott and Meadows. See LUCIA, ST. In other parts of the West Indian seas, also, the honor of the British arms was very effectually supported. Admiral Hyde Parker, assisted by admiral Rowley, kept the enemy in continual alarm, and intercepted the trade of the French islands in such a manner as greatly distressed them. Three large frigates despatched by d'Estaing, after his failure in America, were taken, and a great part of a convoy seized or destroyed in sight of M. de la Motte Piquet's squadron in the harbour of Port Royal at Martinico, the admiral himself having narrowly escaped. These successes, which happened in 1778, 1779, and beginning of 1780, kept the event of the war pretty much in an equilibrium on the western seas and continent; but in the mean time the most unhappy dissensions prevailed through every department of the government at home. Among other charges brought by the opposition, against the ministry, that of neglecting the navy had been one of the most considerable; nor indeed was the charge without foundation. The fleet was at this time in a very weak condition, and the valor and experience of the officers alone seemed to compensate that defect. The chief command was given

to admiral Keppel, who had served with uncommon reputation during the last war. Admirals Sir Robert Harland and Sir Hugh Palliser served under him. Arriving at Portsmouth about the end of March, 1778, Keppel exerted himself with so much diligence that, exclusive of those ships which it was found necessary to despatch to the coast of North America under admiral Byron, a fleet of twenty sail of the line was got in complete readiness by the beginning of June, and ten more were in a forward state. At the head of this fleet admiral Keppel sailed from Portsmouth on the 13th of June, to protect the vast number of commercial ships expected from all parts of the world, and at the same time to watch the motion of the French fleet at Brest. On the arrival of the British off the coast of France two French frigates approached to make observations. These were the *Licorne* of thirty-two guns, and the *Belle Poule* of twenty-six. In consequence of a signal to give chase, the *Milford* frigate overtook the *Licorne* towards the close of the day, and requested the French captain to come under the British admiral's stern; upon his refusal a ship of the line came up and compelled him to come into the fleet. Next morning, the *Licorne* seeming by her motions to be altering her course, a shot was fired across her way as a signal for keeping it. Hereupon she discharged a broadside and a volley of small arms into the *America* of sixty-four guns that lay close to her, and immediately struck. The *Arethusa* of twenty-six guns, commanded by captain Marshal, with the *Alert* cutter, was mean while in pursuit of the *Belle Poule*, also accompanied by a schooner, and the chase was continued till they were both out of sight of the fleet. On his coming up he informed the French captain of his orders to bring him to the admiral. This being refused, the *Arethusa* fired a shot across the *Belle Poule*, which she returned with a discharge of her broadside. The engagement, thus begun, continued more than two hours with uncommon warmth and fury. The *Belle Poule* was greatly superior not only in number but weight of metal; her guns were all twelve-pounders; those of the *Arethusa* only six: Notwithstanding this inferiority, she maintained so desperate a fight that the French frigate suffered a much greater loss of men than the British. Captain Fairfax in the *Alert*, during the engagement between the two frigates, attacked the French schooner, which being of much the same force, the dispute continued two hours with great bravery on both sides, when she struck to the English cutter. The *Arethusa* received so much damage that she became almost unmanageable. The *Belle Poule*, in the mean time, stood into a small bay surrounded with rocks, where she was protected from all attacks. Notwithstanding the great superiority on the side of the French, this action was extolled by them as a proof of singular bravery, and the account of it received with as much triumph as if it had been a victory. On the 18th of June, the day following the engagement with the *Belle Poule*, another frigate fell in with the British fleet; and was taken by the admiral's orders, on account of the behaviour of the *Licorne*. The capture of these French frigates produced such

intelligence to the admiral, as proved of the utmost importance, at the same time that it was highly alarming. He was informed that the fleet at Brest consisted of thirty-two ships of the line and twelve frigates. This was in every respect a most fortunate discovery, as he had no more with him than twenty ships of the line and three frigates. The superiority of the enemy being such as neither skill nor courage could oppose in his present circumstances; and, as the consequences of a defeat must have been fatal to this country, he thought himself bound in prudence to return to Portsmouth for a reinforcement. Here he arrived on the 27th of June, and remained there till the ships from the Mediterranean, and the Spanish and Portuguese trade, and the summer fleet from the West Indies, coming home, brought him a supply of seamen, and enabled him to put to sea again with an addition of ten ships of the line. But still there was a great deficiency of frigates, owing to the great numbers that were on the American station, and the necessity of manning the ships of the line preferably to all others. In the mean time, the preparation at Brest being fully completed, the French fleet put to sea on the 8th of July. It consisted of thirty-two ships of the line, besides a large number of frigates. On the following day the British fleet sailed out of Portsmouth in three divisions; the first commanded by Sir Robert Harland, the third by Sir Hugh Palliser, and the centre by admiral Keppel, accompanied by admiral Campbell, an officer of great courage and merit. The French had been informed that the British fleet was greatly inferior to their own; and the admiral sailed at first in quest of it. On the 23rd of July they came in sight. But the appearance of the British ships soon convinced the French admiral of his mistake, and he immediately determined to avoid an engagement; in which he was favored by the approach of night. All that could be done on the part of the British was to form the line of battle, in expectation that the enemy would do the same. During the night the wind changed, however, so favorably for the French as to give them the weather gage; and thus it remained during the space of four days. Our fleet continued the whole time beating up against the wind, with a resolution to attack them; but the British admiral had the mortification to see his endeavours continually eluded by the vigilance of the enemy. The chase lasted till the 27th of July, when an alteration of wind and weather brought the fleets so near each other that it was no longer in their power to decline an engagement. Both were now on the same tack: had they so remained, the British fleet, on coming up with the French, would have had an opportunity of a fair engagement; but this was a matter quite contrary to the wishes of the French admiral. Instead of receiving the British in this position, as soon as he found that an action must ensue, he put his ships on the contrary tack, that, sailing in opposite directions, they might only fire at each other as they passed. The fire of the British ships, however, was universal, till they came close up to the enemy, and were sure of doing execution. In this manner they all passed close alongside each other in

opposite directions, making a heavy and destructive fire; when, the centre division of the British line having passed the rearmost ships of the enemy, the first care of the admiral was to effect a renewal of the engagement. Sir Robert Harland, with some ships of his division, had already tacked, and stood towards the French; but some of the fleet were dropped to leeward, and repairing the damages they had received in the action. As soon as it was practicable, however, the Victory wore, and steered again upon the enemy. The other ships not having recovered their stations near enough to support each other on a renewal of action, in order to collect them more readily for that purpose, he made the signal for the line of battle ahead. It was now 3 P. M., but the ships of the British fleet had not sufficiently regained their stations to engage. Sir Hugh Palliser, who commanded the rear during the time of action, came of course the last out of it; and, in consequence of the admiral's signal for the line, was to have led the van in renewing the fight; but his division was upon a contrary tack and was entirely out of the line. Several signals for calling them back, and some verbal orders were mistaken, until it was too late to recommence any operations against the enemy. In the night the French took the determination to put it wholly out of the power of the British fleet to attack them a second time, and retired with all speed towards Brest. The killed and wounded on board the British fleet, in this action, amounted to somewhat more than 500; but the French, it has been asserted, lost 3000. The event of the engagement, however, became an object of very severe criticism; and complaints were made, that, through the bad conduct of the blue division, an opportunity had been lost of gaining a complete victory over the French. This induced Sir Hugh Palliser to apply to admiral Keppel for a justification of his conduct; and, on the rejection of this demand, Sir Hugh published in one of the daily papers a variety of circumstances, reflecting severely on the conduct of the admiral himself. The latter now declared to the admiralty, that unless Sir Hugh Palliser should explain this attack, to his satisfaction, he could not, consistently with his reputation, ever act conjointly with him; and, the altercation happening just before the meeting of parliament, it was of course noticed when it met.

In the house of peers an enquiry was demanded into the conduct of the commanders of the fleet on the 27th of July; and in the commons it was urged, that, as admiral Keppel had expressed a public refusal to serve in conjunction with Sir Hugh Palliser, the cause of such a declaration ought to be investigated. Both these commanders being present in the house on this occasion, spoke to the point in question. The issue was, that a motion was made for an address to the crown to bring Sir Hugh Palliser to trial, for his behaviour in the late engagement with the French fleet. Sir Hugh, however, now astonished the house with the information, that he had already demanded and obtained a court-martial to sit on admiral Keppel. The dissatisfaction that was excited upon this occasion, among the upper classes in the navy, appeared in a

memorial presented to the king by twelve of the oldest and most distinguished admirals, at the head of whom was lord Hawke. The conduct of Sir Hugh Palliser was therein condemned without reserve: and, that of the admiralty itself was severely censured, as having established a precedent pregnant with the most ruinous consequences to the naval service of the kingdom. By the measure it had now adopted, that Board had submitted to become the instrument of any individual, who might be prompted by iniquitous motives to deprive the navy of its best and highest officers. It was a destructive violation, they said, of all order and discipline in the navy, to permit and countenance long concealed, and afterwards precipitately adopted, charges and re-criminatory accusations of subordinate officers against their commanders in chief. It was no less improper and scandalous, to suffer men at once in high civil office, and in subordinate command, previous to their making such accusations, to attempt to corrupt the judgment of the public, by publishing libels on their officers in a common newspaper. Such was the public sympathy in this affair that no business of consequence was agitated in either of the houses of parliament while the trial continued. It began upon the 7th of January 1779, and lasted till the 11th of February; the court, after a long and accurate investigation of every species of evidence that could be produced, acquitting admiral Keppel of all the charges that had been brought against him. He was declared to have acted the part of a judicious, brave, and experienced officer; and the accusation was severely condemned: both houses of parliament voted him their thanks for his eminent services, and the whole nation rejoiced at his triumph.

The conduct of those who presided at the admiralty board was now watched with great jealousy; and a number of facts were cited, to prove that for many years past it had been highly reprehensible. The debates were uncommonly violent; and a resolution to condemn the measures of the admiralty was lost only by a majority of thirty-four. Administration, however, still kept their ground; lord Howe declared his resolution to relinquish the service while it continued under the direction of its present managers: his resignation was followed by that of Sir Robert Harland, Sir John Lindsay, and several others; nay, so general was the dislike to the service become, that no fewer than twenty captains of the first distinction proposed to go in a body to resign their commissions; and were prevented only by the great occasion they saw there was for their services. This produced a direct attack upon lord Sandwich, then first lord of the admiralty; and an enquiry into the cause of our want of success in the American war was insisted upon by lord and general Howe, whose conduct had been also much reflected upon. From the evidence of lord Cornwallis, and other officers of high rank, it appeared that the forces sent to America were not at any time sufficient to reduce it; that the Americans were almost universally unfriendly to the British cause; and that the nature of the country was such, that the conquest of it must be excessively

difficult. It appeared also, that the camp of the Americans on Long Island was so strong, that it could not have been attacked with any probability of success, after their defeat in 1776. In every instance, therefore, general Howe's conduct was shown to have been most judicious. General Burgoyne next insisted upon an examination of his conduct; which indeed had been so unmercifully censured, that even the ministers began to think he ought to be allowed to vindicate himself, which he did successfully. It appeared, on these investigations, that the Americans, far from being the contemptible poltroons they had been called, were intrepid and resolute, and fully equal to the defence of their own country.

On the resignation of admiral Keppel, the command of the channel fleet was bestowed on Sir Charles Hardy, a brave and experienced officer, but now much advanced in years. Spain had now joined France and America, in the contest with Great Britain: and various projects for the internal defence of the country were laid before parliament. The principal of these were the raising of volunteer companies to be added to the regiments of militia belonging to the counties, and augmenting the number of militia. The latter was judged inadvisable, on account of the necessity there would be to send a great number of regular forces out of the kingdom, which would require new supplies of recruits; and the increase of the militia might prove detrimental to the recruiting service. The spirit and magnanimity displayed on this occasion, however, did the highest honor to the national character, and fully justified the opinion generally entertained of its opulence and valor. All parts of the kingdom seemed actuated by a laudable zeal to concur in every measure necessary for its defence; large sums were subscribed by people of rank and affluence; and companies were raised, and regiments formed, with such alacrity as quickly banished all apprehensions for the safety of the kingdom. On the other hand, the French, now thinking themselves secure of victory by the accession of Spain to their cause, began to extend their plans of conquest. A squadron was fitted out under the command of the marquis de Vaudreuil, destined to reinforce the fleet commanded by D'Estaing. But, before its proceeding thither, an attack was made on the British settlements on the rivers Senegal and Gambia in Africa. These were easily conquered; and, on this occasion, the French quitted their own island of Goree, which was very soon after taken possession of by Sir Edward Hughes in his way to the East Indies. These unimportant and distant conquests, however, being insufficient to produce any great eclat, it was resolved to strike a blow nearer home, by the conquest of Jersey and Guernsey. An attempt was accordingly made; but with so little success, that not a single man could be disembarked on the island they intended to conquer. The enterprize, however, proved indirectly of great service to the cause of America. A fleet of 400 merchantmen and transports were at that time on the point of sailing for New York, under the conduct of admiral Arbuthnot; but that officer,

being informed of the attack on Jersey, thought it his duty to come to the assistance of the island rather than proceed on his voyage. This delay was followed by another, occasioned by bad weather; so that the fleet, which was laden with warlike stores and necessities, did not arrive till the end of August, and several important enterprizes projected by Sir Henry Clinton were of course laid aside. The French, in the mean time, determined to make a second attempt on Jersey; but their squadron, being attacked by another under Sir James Wallace, was driven ashore in a small bay on the coast of Normandy. Thither they were pursued by the British commander; who took a large frigate of thirty-four guns, with two rich prizes, and burned two other frigates and several other vessels. Thus disappointed, they next formed a project of invading Great Britain itself; and, their preparations for it were so formidable, that they excited considerable alarm. The best troops in the French service marched down to the coasts of the channel, transports were provided in great numbers; a junction was formed betwixt the French and Spanish fleets, in spite of the endeavours used on the part of the British to prevent it; and the allies made their appearance in the British seas with upwards of sixty ships of the line, besides a vast number of frigates and other armed vessels. All this formidable apparatus, however, ended in nothing more than the capture of a single ship, the *Ardent* of sixty-four guns: which they took off Plymouth. All ranks, however, were now weary of the American war; and, even those who had formerly been the most sanguine, in defence of coercive measures, began to be convinced of their inutility.

The enormous expenses already incurred, and still necessary to be incurred, for the carrying on of the war, occasioned such a general alarm, that it was no longer possible to refuse compliance with some scheme of economy, or at least giving it a patient hearing. The duke of Richmond proposed that the crown should set the example, and moved for an address to this purpose; but the motion was lost by seventy-seven to thirty-six. The earl of Shelburne next undertook the discussion of the subject; and, in a most elaborate speech, compared the expenses of former times with the present. He moved, that the expenditure of those vast sums annually sunk in extraordinary should be brought under some control; and that to extend the public expenses beyond the sums granted by parliament, was an invasion of its peculiar and exclusive rights. Though this motion and some others of a similar tendency were rejected, the minds of the people were far from being conciliated. The opinion began to be general, that ministers exercised an unconstitutional influence over the representatives, and that this influence was very much augmented within these few years; and it was supposed by many, that nothing short of a change in the constitution of parliament could remedy the evil complained of. To this purpose the famous York petition was framed in December, 1779; in which it was stated, that, in consequence of the war, the public debt was greatly augmented, taxes increased, and trade and manu-

factures much affected. The profusion attending the war was complained of; and parliament was requested, previous to the raising of any new taxes, to enquire into, and correct the abuse of expenditure in the public money; to reduce exorbitant emoluments, abolish sinecure places and unmerited pensions, and apply the produce to the exigencies of the state. This petition was followed by others of a similar kind from twenty-seven of the principal counties and most of the large towns in England. The ministry, however, continued firm and undaunted. Previous to the taking any of the petitions into consideration, they insisted on going through the business of the supply, by determining the ways and means; nor did either the number of English petitions, or an additional one from the island of Jamaica setting forth the extreme danger that island was in, make them alter their resolution. At last, in the beginning of February 1780, a plan was brought forward by Mr. Burke, for securing the independency of parliament, and introducing economy into the various departments of government. This plan, among other things, proposed the abolition of the offices of treasurer, comptroller, and cofferer of the household; treasurer of the chamber, master of the household, the board of green cloth, with several other places under the steward of the household; and removing the great wardrobe, the jewel office, the robes, board of works, and the civil branch of the board of ordnance. Other reformatory measures were also proposed; but though the temper of the times obliged the minister to admit the bills, and even to pretend an approbation of the plan, he meant nothing less than to admit it in its full extent, or indeed in any part, if it could be prevented. When the plan, therefore, which he had approved in general, came to be particularly considered, he was found to be determined against every part of it. The general temper of the people, without doors, however, seemed now to have affected many of the members of parliament, and made them desert their old standard. An economical plan, proposed in the house of lords by the duke of Shelburne, was rejected only by a majority of 101 to fifty-five. This was the strongest opposition that had appeared in that house for many years; but in the lower house the strength of ministers was still more on the decline. The first proposition in Mr. Burke's plan was to abolish the office of secretary of state for the colonies; and the utmost efforts of ministry could preserve this office only by a majority of 208 to 201. The board of trade was abolished by 207 to 198; but this was the only defeat sustained by ministry at this time; all the rest of the plan being rejected, excepting only one clause, by which it was determined that the offices of lieutenant and ensign, &c., belonging to the yeomen of the guards, should not any longer be sold, but given to officers in the army and navy on half pay, and of fifteen years standing in their respective lines of service. Administration, however, had a still greater defeat to meet with than what they had experienced in the abolition of the board of trade. The 6th of April 1780 was the day appointed for taking into consideration the numerous petitions, from half the king-

dom of England. They were introduced by Mr. Dunning; who, in a very elaborate speech, set forth the many attempts that had been made to introduce reformation and economy into the plans of government. These had been defeated by ministerial artifice, or overthrown by mere dint of numbers: he concluded therefore, and moved as a resolution of the house, That the influence of the crown had increased, was increasing, and ought to be diminished. This motion being carried, after a long and violent debate, he next moved, that the house of commons was as competent to examine into and correct abuses in the expenditure of the civil list, as in any other branch of the public revenue. To this another was added by Mr. Thomas Pitt, that it was the duty of the house to provide an immediate and effectual redress of the abuses complained of in the petitions. The ministry now requested that nothing farther might be done that night: but such was the temper of the house, that both these motions were carried without a division; after which they were read a first and second time, and agreed to without a division.

Ministry had never received such a complete defeat, nor ever had been treated with so much asperity of language. The news of the proceedings of this day were received by the people at large with as much joy as if the most complete victory over a foreign enemy had been announced. Opposition, however, though masters of the field at present, did not imagine, they had obtained any permanent victory, and therefore resolved to make the most of the advantages they had gained. It was moved by Mr. Dunning, at the next meeting, that to ascertain the independence of parliament, and remove all suspicions of its being under undue influence, there should, every seven days after the meeting of parliament, be laid before that house an account of all the sums issued out of the civil list, or any other branch of the revenue, since the last recess, in favour of any of its members. This passed with little difficulty; but when he moved that the treasurers of the chamber and household, the cofferer, comptroller, and master of the household, with the clerks of the green cloth, and their deputies, should be excluded from having seats in the house, a warm debate ensued; and the motion was carried only by 215 to 213. This was the last triumph of the popular party; their next motion, for the exclusion of revenue officers, being thrown out by 224 against 195. A last effort was made by Mr. Dunning's proposal of an address to the throne against proroguing or dissolving the parliament, until measures had been taken to prevent the improper influence complained of in the petitions. On this occasion the debates were long and violent; but the motion was lost by 254 against 203. Ministry would gladly have screened their friends from the vengeance of opposition: alleging the lateness of the hour, it being then past midnight. The speaker of the house, however, perceiving Mr. Fox about to rise, insisted that the house should remain sitting; and thus the deserters from the popular party were condemned to hear their conduct set forth in such terms as perhaps were never applied, on

any other occasion, to members of the British senate. This last victory of administration confirmed the dissatisfaction and ill opinion which the people had conceived of the majority of their representatives. It was in the height of that ill will which the conduct of parliament had created in the multitude, that those discontents broke out which were so near involving the kingdom in universal desolation.

The hardships, under which individuals professing the Roman Catholic persuasion had labored for many years in England, had lately awakened the consideration of the liberal minded. The inutility and impropriety of persecuting people from whom no danger was apprehended, and who were not suspected of disaffection to the civil constitution of this country, induced several persons of rank to undertake the procuring them relief; and the calamities of the times had afforded the English Roman Catholics a very proper occasion to manifest their attachment to government. They presented a most loyal and dutiful address to the king, containing the strongest assurances of affection and fidelity to his person and the civil government of this country. 'Our exclusion,' said they, 'from many of the benefits of that constitution, has not diminished our reverence for it. We behold with satisfaction the felicity of our fellow subjects; and we partake of the general prosperity which results from an institution so full of wisdom. We have patiently submitted to such restrictions and discouragements as the legislature thought expedient. We have thankfully received such relaxations of the rigor of the laws, as the mildness of an enlightened age, and the benignity of the British government, have gradually produced; and we submissively wait, without presuming to suggest either time or measure, for such other indulgence as those happy causes cannot fail in their own season to effect.' This address was presented to the king on the 1st of May 1778, and signed by the duke of Norfolk, the earls of Surrey and Shrewsbury, the lords Stourton, Petre, Arundel, Dormer, Teynham, Clifford, and Linton; and by 163 commoners of rank and fortune. The only obstacle was, the difficulty of overcoming the prejudices of the lower classes, who would probably condemn the indulgence shown to the people of a persuasion, which, when powerful, had been extremely intolerant, and which they therefore had been taught to look upon with horror and detestation. About the middle of May Sir George Saville made a motion for the repeal of some penalties enacted against them. He grounded his motion, on the necessity of vindicating the honor and asserting the true principles of the Protestant religion, of which the peculiar merit was to admit of no persecution. It ill became the professors of such a religion to be guilty of that intolerance with which they reproach others. The statutes he meant to repeal were such as gave occasion to deeds that were a disgrace to human nature, by inciting relations to divest themselves of the feelings of humanity, and by encouraging the rapacity of informers. He represented the address above quoted as a full proof of the loyal disposition of the Roman

Catholics, and as an unfeigned testimony of the soundness of their political principles. In order, however, to silence the objections of those who might suspect them of duplicity, a test was proposed of so binding and solemn a nature, that no man could be supposed to imagine that any authority could annul its efficacy.

The pains and penalties of the statutes to be repealed were laid before the house by Mr. Dunning. By these statutes it was made felony in a foreign clergyman of the Roman communion, and high treason in one that was a native of this kingdom, to teach the doctrines or perform divine service according to the rites of that church: the estates of persons educated abroad in that persuasion were forfeited to the next Protestant heir; a son or any other nearest relation, being a Protestant, was empowered to take possession of his own father's, or nearest of kin's estate, during their lives; a Roman Catholic was disabled from acquiring any legal property by purchase. The mildness of the British government did not indeed countenance the practice of the severities enacted by these statutes; but still the prospect of gain subjected every man of the Roman persuasion to the ill usage of informers; as on their evidence the magistrates were bound, however unwilling, to carry these cruel laws into execution. In consequence of these representations, the motion made in favor of the Roman Catholics was received without one dissenting voice; and a bill in conformity to its intent was brought in and passed both houses. The test or oath by which they were bound was conceived in the strongest and most expressive terms. The indulgence shown the Roman Catholics in England now encouraged those of the same persuasion in Scotland to hope for a similar relief. Several gentlemen of that nation of great rank and character, and who were members of parliament, expressed their warmest wishes that it should be extended to their country; and declared their intention to bring in a bill for that purpose the following session. The design was approved by the general assembly of the church of Scotland; who rejected, by a majority of no less than 1000, a remonstrance that had been proposed against it. In consequence of these flattering appearances, a petition was prepared for parliament, in behalf of the Roman Catholics in Scotland.

But these expectations were soon damped. A pamphlet was published against the doctrine and professors of the Popish religion, which represented them as the common foes to mankind and the disturbers of all states. The opposition was at first chiefly conducted by some persons at Edinburgh, who assumed the title of a committee of correspondence for the Protestant interest; and under that denomination corresponded with all those who coincided with their opinions, and who formed a very large proportion of the people in Scotland. The persons who made up this committee, however, acted from no mean or mercenary views; they aimed only at the preservation of the Protestant religion, and the liberties of their country; both which they conceived were in danger, from the indulgence of government to individuals of the Roman Catholic persuasion. Actuated by these ideas,

they exerted themselves with so much activity, that the principal gentlemen of the Catholic persuasion thought it requisite, for their safety, to convey an intimation to the British ministry, that they were desirous to drop the application they had proposed to make. They published also, in the newspapers, the representation they had made to ministry; hoping thereby to convince the public, that they were sincerely desirous to remove any cause of dissatisfaction on their own account, and to submit to any inconvenience sooner than occasion disturbance. But matters were now gone too far to be conciliated by any means. On the 2d of February, 1779, the populace of Edinburgh attacked and set on fire a house, just built by a Roman Catholic bishop, which was intended to contain a place of worship. They next day gutted another house in Blackfriars' Wynd, that had a popish chapel attached; after which they proceeded to vent their resentment on several individuals of that persuasion, by destroying their property. The next objects of their vengeance were those who had patronised the Roman Catholics. They beset the houses of principal Robertson and Mr. Crosby; but the friends of both came to their assistance in such numbers, and so well prepared, that they did not dare to exercise the violence they had premeditated: and this put an end to the attempts of the mob at Edinburgh. But the spirit of dissatisfaction at the indulgence extended to the Roman Catholics remained in great force in England: and a society was formed in London, which took the title of the Protestant Association, of which lord George Gordon, who had been conspicuous in this business in Scotland, was elected president. It now prepared to act in a decisive manner against the resolutions of the legislature. On the 29th of May, 1780, the associates held a meeting to settle in what manner they should present a petition to the house of commons against the repeal of the penal statutes. A long speech was made on this occasion by their president, who represented the Romish persuasion as gaining ground rapidly in this country; that the only method of stopping its progress was to go up with a spirited remonstrance to their representatives, and to tell them, in plain and resolute terms, that they were determined to preserve their religious freedom with their lives, &c. This harangue being received with the loudest applause, he moved that the whole body of the association should meet on the 2d of June, in St. George's Fields, at ten o'clock in the morning, to accompany him to the house of commons on the delivery of the petition. This being assented to, he informed them, that if he found himself attended by fewer than 20,000, he would not present the petition. He then directed them to form themselves into four divisions: the first, second, and third, to consist of those who belonged to the City, Westminster, and Southwark; the fourth of the Scotch residents in London. They were, by way of distinction, to wear blue cockades in their hats. Three days previous to the presentation of the petition, he gave notice of it to the house, and of the manner in which it was to be presented. On the 2d of June, about 50,000 or 60,000 of the po-

pulace assembled in St. George's Fields. They drew up in four separate divisions, as had been agreed, and proceeded to Westminster, with lord George Gordon at their head. An immense roll of parchment was carried before them, containing the petition. On their arrival they compelled several members of both houses to put blue cockades in their hats, and call out 'No Popery.' They forced them to take an oath that they would vote for the repeal of the popery act, as they styled it, and treated others with great indignity, posting themselves in all the avenues to both houses; they had even the audacity more than once to endeavour to break open the doors. Several members of the house of lords narrowly escaped with their lives. During these disturbances, lord George Gordon moved for leave to bring up the petition. This was granted; but, when he proposed it should be taken into immediate consideration, it was strenuously opposed by almost the whole house. Enraged at this, he came out several times to the people during the debates, acquainting them how averse the house appeared from granting their petition, and naming particularly those who had spoken against it. Several members expostulated with him in the warmest terms on this unjustifiable conduct; and one of his relations, colonel Gordon, threatened to run him through the moment any of the rioters should force their way into the house. After some hours, during which the house could carry on none of its deliberations with regularity, the members were relieved by the arrival of a party of the guards. Order being restored, the business of the petition was resumed; when lord George Gordon told them it had been signed by nearly 120,000 British Protestant subjects. He therefore insisted that the petition should be considered without delay. But the commons continued immovable in their determination. Of 200 members, then present in the house, six only voted for it. In the mean time the mob had dispersed themselves into various parts of the metropolis, where they demolished two Romish chapels belonging to foreign ministers; and openly vented the most terrible menaces against all people of that persuasion. On the 4th of June they assembled in great numbers in the eastern parts of London; and attacked the chapels and houses of the Roman Catholics, stripping them of their contents, which they threw into the street, or committed to the flames. They renewed their outrages on the following day, destroying several Romish chapels, and demolishing the house of Sir George Saville, in resentment of his having brought into parliament the bill in favor of the Catholics. Next day both houses met as usual; but, finding that no business could be done, they adjourned to the 19th. During the 6th and 7th of June, the rioters were absolute masters of the metropolis and its environs. Some of those who had been concerned in the demolition of the chapels belonging to foreign ministers, having been seized and sent to Newgate, the mob collected before that prison, and demanded their immediate release. On being refused, they proceeded to throw firebrands and all kinds of combustibles into the keeper's house;

which communicated to the prison; so that this immense pile was soon in flames. In this scene of confusion the prisoners, amounting to about 300, were all released; among whom were several under sentence of death. The mob set fire, in the same manner, to the King's Bench and Fleet prisons, and to a number of houses belonging to Roman Catholics. The terror excited by these incendiaries was such, that most people hung out of their windows pieces of blue silk, the color assumed by the rioters; and chalked on their doors and shutters the words, 'No Popery.' The night of the 7th of June concluded these horrors. No less than thirty-six different conflagrations were counted at the same time. The bank had been threatened, and was twice assailed; but happily was too well guarded for their attempts. In the evening, large bodies of troops arrived from all parts, and came in time to put a stop to the progress of the rioters. The king having, under his sign manual, directed that the troops should not scruple to act, they dispersed them every where; but it was not until the afternoon of the 8th, that the people began to recover from their consternation. During great part of the day, the disorders of the preceding night had created so terrible an alarm, that the shops were almost universally shut. The melancholy effects of misguided zeal were not, however, confined to London. The outrageous disposition of the populace was preparing to act the like horrid scenes in other parts of England. The mob rose in Hull, Bristol, and Bath; but, through the timely interposition of the magistracy, these places were saved from their fury.

On the subsiding of this violent commotion, lord George Gordon was arrested, and committed close prisoner to the Tower, and on the 19th of June both houses met according to adjournment. The speech from the throne, acquainting them with the measures that had been taken in consequence of the disturbances, and assuring them of the utmost readiness to concur in whatever could contribute to the safety and maintenance of the laws and liberties of the people, was highly approved; but the conduct of administration was severely censured, and charged with unpardonable neglect for not calling forth the civil power, and employing the military in due time. Ministry excused themselves, from the want of sufficient strength to answer all the demands of assistance that were made during the riots, and the absolute impossibility of suppressing them till the arrival of troops from the country. The various petitions were now taken into consideration, that had been presented for the repeal of the act which had occasioned the riots; but the house continued in the same mind. Nevertheless it was thought proper to yield somewhat to the prejudices of the people, by passing a bill for preventing persons of the Popish persuasion from teaching or educating the children of Protestants; but this was afterwards thrown out by the lords. Nothing could have happened more opportunely for the ministry than these riots; for such was the terror occasioned by them, that the ardor which had appeared for promoting popular meetings, and opposing the measures of government, was in a great degree suppressed.

Even the country meetings were represented as having a tendency, like the Protestant association, to bring on insurrections and rebellions. Many began to consider all popular meetings as extremely dangerous; and, among the commercial and monied people, there was no small number who were so panic struck, that all attention to the principles of the constitution was over-ruled by their extreme anxiety for the preservation of their property. Indeed the friends of the association did not hesitate to allege, that the riots had been secretly encouraged by ministry to produce these consequences.

In the debate in the house of lords on the subject of the riots, the duke of Richmond expressed his hopes, that some of his majesty's ministers would give their lordships assurances, that the measures taken to suppress them were defensible only upon the ground of necessity: and that what was illegally done, on that ground, would be cured by an act of indemnity. Other observations were thrown out relative to the king's prerogative and military law: upon which lord Mansfield observed, that neither the king's prerogative nor military law, had any thing to do with the conduct of government, in their endeavours to quell the late outrages. All men, of all ranks, descriptions, and denominations, were bound, by their oath of allegiance, to interpose for the prevention of acts of high treason, or felony, wherever any attempts to perpetrate such crimes were made in their presence; and were criminal if they did not do it. In the whole of these proceedings, therefore, the military had not acted in their technical capacity as military, but had merely exercised their duty as members of civil society. When a body of men were convened, without proceeding to the actual perpetration of treasonable or felonious acts, then, by a clause in the riot act, the presence of the civil magistrate was necessary, before the military could interpose; and for this reason, that, as no acts of felony were committed, they could have no plea in their civil character for interfering with them. But, by the statute law of the country, it became felonious in any combination of men to persevere in that combination, after the riot act had been read by a justice of the peace; and this being done, then, and not till then, they had a constitutional reason for their interposition; namely, the privilege and duty of hindering the commission of felony, whenever they had it in their power. This being, therefore, the plain voice of the law, his lordship did not see how any prerogative of the king had been exercised, nor how military law had been established. Many persons, however, were alarmed at the dangerous precedent which the late exertions of the military afforded. Among others, Sir George Saville, in an address to his constituents some time afterwards, declared, that he considered them as 'fully, effectually, and absolutely, under the discretion and power of a military force, which was to act without waiting for the authority of the civil magistrates.' A letter written by lord Amherst to lieutenant colonel Twisleton, who commanded the troops employed in London for the suppression of the riots, and which was understood to be an order for disarm-

ing the citizens, was also much canvassed in both houses of parliament.

We now return to the operations of the war, which, notwithstanding the powerful confederacy against Great Britain, seemed to be decidedly in her favor. The Spaniards had begun their military operations by the siege of Gibraltar, but with very little success (see GIBRALTAR); and the close of the year 1779 and beginning of 1780 were attended with some considerable naval advantages to Great Britain. On the 18th December, 1779, the fleet under the command of Sir Hyde Parker in the West Indies took nine sail of French merchant ships, which, with several others, were under the convoy of some ships of war; and about the same time several other vessels were taken by his squadron. On the 8th January 1780 Sir G. B. Rodney, who had been intrusted with the command of a fleet, one object of the destination of which was the relief of Gibraltar, fell in with twenty-two sail of Spanish ships, and in a few hours the whole were taken. On the 16th he engaged, near Cape St Vincent, another Spanish fleet, of eleven ships of the line, and two frigates, under Don Juan de Langara. The Spaniards made a gallant defence; but four of their largest ships were taken, and carried into Gibraltar: viz. the *Phoenix* of eighty guns and 700 men, on board which was the admiral; the *Minorca*, of seventy guns and 600 men; the *Princessa*, of seventy guns and 600 men; and the *Diligente* of seventy guns and 600 men. Two other seventy gun ships were also taken; but one of them was driven on shore on the breakers and lost. Four ships of the line escaped, and the two frigates; and in the course of the action the *St. Domingo*, a Spanish ship of seventy guns, and 600 men, was blown up. The five men of war taken were remarkably fine ships. On the 20th March there was an action in the West Indies between some French and English men of war, the former under the command of M. de la Mothe Picquet, and the latter, being part of Sir Peter Parker's squadron, under that of commodore Cornwallis. The engagement was maintained on both sides with great spirit; but the French at length gave up the contest, and made the best of their way for Cape François. Admiral Rodney having arrived in the West Indies, and taken upon him the command of his majesty's ships at the Leeward Islands, an action was fought between him and the French fleet under the command of count de Guichen, on the 17th of April. The British squadron consisted of twenty ships of the line, besides frigates; and the French fleet of twenty-three ships of the line, and several frigates. The action began a little before one, and continued till about a quarter after four P. M. Admiral Rodney was on board the *Sandwich*, a ninety gun ship, which beat three of the French ships out of their line, and entirely broke it. But such was at length the crippled condition of the *Sandwich*, and of several other ships, that it was impossible to pursue the French. The victory was, indeed, claimed on both sides; but no ship was taken on either; and the French retired to Guadaloupe. Admiral Rodney's ship, the *Sandwich*, had suffered so much, that for twenty-four hours she was with difficulty kept above water. Of the

British there were killed in this engagement 129, and 353 were wounded. On the 15th May another action happened between the same commanders, but only a few ships were engaged, which soon separated. The fleets met a third time in an indecisive action of the 19th of the same month. In June, admiral Geary, who commanded on this station, took twelve valuable merchant ships bound from Port au Prince to Bourdeaux and other ports of France; but in August a very important and unexpected capture was made by the Spaniards. Captain Moutray, who had under his command the *Ramilies* of seventy-four guns and two frigates, with many vessels bound for the East and West Indies under convoy, had the misfortune to fall in with the combined fleets of France and Spain, which had sailed from Cadiz the preceding day. The *Ramilies* and the two frigates escaped; but the rest were so completely surrounded, that five East Indiamen were taken, and fifty merchant ships. Their cargoes were extremely valuable: and it was one of the most complete naval captures ever made. The Spaniards on this occasion behaved to their prisoners with great humanity; and made a suitable return for the generous treatment which their countrymen had experienced from admiral Rodney. As some compensation, the British took about this time Fort Omoa from the Spaniards, where upwards of 3,000,000 of dollars were gained by the victors, and, among other valuable commodities, twenty-five quintals of quicksilver, without which the Spaniards could not extract the precious metals from their ores.

And now arose a formidable confederacy of the northern powers under the title of the Armed Neutrality. Of this confederacy the late Catherine II. of Russia declared herself the head; and her plan was intimated on the 26th February 1780, in a declaration addressed to the courts of London, Versailles, and Madrid. In this declaration it was observed, that, though from the conduct of her imperial majesty, it might have been hoped, that her subjects would have been allowed peaceably to enjoy the fruits of their industry, and of the advantages belonging to all neutral nations, experience had proved the contrary; her imperial majesty's subjects had been often molested in their navigation, and retarded in their operations, by the ships and privateers of the belligerent powers. Her imperial majesty therefore declared, that she found herself under the necessity of removing those vexations which were offered to the commerce of Russia, as well as to the liberty of commerce in general, by all means compatible with her dignity and the welfare of her subjects: but before she came to any serious measures, and in order to prevent all new misunderstandings, she thought it just and equitable to expose to the eyes of all Europe the principles which she had adopted for her conduct, and which were contained in the following propositions: 1. That neutral ships should enjoy a free navigation, from port to port, and on the coasts of the belligerent powers. 2. That all effects belonging to the subjects of the belligerent powers should be located upon as free on board such neutral ships, excepting only such

goods as were stipulated contraband. 3. Her imperial majesty, for the proper understanding of this, refers to the articles ten and eleven of her treaty of commerce with Great Britain, extending her obligations to all the other belligerent powers. In the treaty made between Great Britain and Russia in 1734, it is said, 'The subjects of either party may freely pass, repass, and trade in all countries which now are or hereafter shall be at enmity with the other of the said parties, places actually blocked up or besieged only excepted, provided they do not carry any warlike stores or ammunition to the enemy: as for all other effects, their ships, passengers, and goods, shall be free and unmolested. Cannons, mortars, or other warlike utensils, in any quantity beyond what may be necessary for the ship's provision, and may properly appertain to and be judged necessary for every man of the ship's crew, or for each passenger, shall be deemed ammunition of war; and, if any such be found, they may seize and confiscate the same according to law; but neither the vessels, passengers, nor the rest of the goods, shall be detained for that reason, or hindered from pursuing their voyage.' The same enumeration of the goods, stipulated as contraband, was given in the treaty concluded between Great Britain and Russia in 1766. 4. That, in order to determine what characterises a port blocked up, that denomination should not be granted but to such places before which there were actually a number of enemy's ships stationed near enough so as to make its entry dangerous. 5. That these principles should serve as rules in the judicial proceedings and sentences upon the legality of prizes. This declaration was communicated to the States General, now openly manifesting hostile intentions to this country, by prince Gallitzin, envoy extraordinary from the empress of Russia; and she invited them to make a common cause with her, so far as such a union might serve to protect commerce and navigation. Similar communications and invitations were also made to the courts of Copenhagen, of Stockholm, and of Lisbon, in order, it was said, that, by the united care of all the neutral maritime powers, the navigation of the neutral trading nations might be established and legalised. The king of France said in reply, 'what her imperial majesty claimed from the belligerent powers was nothing else than the rules prescribed to the French navy;' while Sweden and Denmark formally acceded to the armed neutrality proposed. The States General did the same towards the close of the year. It was now resolved, by the powers engaged in this armed neutrality, to make common cause at sea against any of the belligerent powers who should violate, with respect to neutral nations, the principles which had been laid down in the memorial of the empress.

The British ministry determined, therefore, to take vengeance on the Dutch, whose ingratitude and perfidy had become evident ever since the commencement of hostilities with the Americans. On the 25th January, 1781, it was announced to the house of commons, that his majesty had been obliged to direct letters of marque and reprisal to be issued against the

States General and their subjects. For the causes and motives of his conduct in this respect, he referred to a public manifesto against that republic, which he had ordered to be laid before the house. Lord North on this occasion said that the States, in open violation of treaties, had not only refused to give Great Britain that assistance which those treaties entitled her to claim when attacked by the house of Bourbon, but had also, in direct violation of the law of nations, contributed as far as they could to furnish France with warlike stores, and had also at length thought proper to countenance the magistracy of Amsterdam, in the insult which they had offered to this country, by entering into a treaty with the rebellious colonies of Great Britain, as free and independent states. By the treaty of 1678 it was stipulated, that, in case Great Britain was attacked by the house of Bourbon, she had a right to take her choice of either calling upon the States General to become parties in the war, and to attack the house of Bourbon within two months, or of requiring an aid of 6000 troops, and twenty ships of war. But, though this country had always preserved her faith with Holland, yet that republic had refused to fulfil the terms of this treaty. Lord North farther observed, that the States General had suffered Paul Jones, a Scotchman, and a pirate, acting without legal authority from any acknowledged government, to bring British ships into their ports, and to refit there, &c. Lord North added, that he lamented the necessity of a war with Holland; but it appeared to him to be an unavoidable measure; and that the only means of obtaining an honorable and a just peace, was to show ourselves capable of carrying on the war with spirit and vigor. The Dutch island of St. Eustatius was, therefore, on the 3d February 1781, summoned by admiral Rodney and general Vaughan to surrender to the arms of Great Britain; the immense property on the island was confiscated, and a sale of private effects instituted, with such circumstances of apparent rapacity, as became the subject of a warm discussion in parliament.

At this time the Dutch do not appear to have acted with their usual prudence. Notwithstanding their provoking conduct towards Britain, they had made no preparations for war; but by August, 1781, they had equipped a considerable squadron, the command of which was given to rear-admiral Zoutman. On the 5th of that month this squadron fell in with the British fleet, commanded by admiral Parker. The force commanded by the Dutch admiral consisted, according to their own account, of one ship of seventy-four, one of sixty-eight, one of sixty-four, three of fifty-four, and one of forty-four guns, besides frigates; but the English account represents the Dutch fleet as consisting of eight two-decked ships. No gun was fired on either side till they were within the distance of half musket-shot. The action then began about 8 A.M., and continued for three hours and forty minutes. Both sides fought with equal ardor, and the action terminated indecisively: the Dutch ships of war with their convoy bearing away for the Texel; and the English ships being too much disabled to follow them. A Dutch seventy-four

gun ship sunk soon after the action. In Europe the utmost efforts of France and Spain were able to produce nothing more than the annual parade of a mighty fleet in the channel; which was answered by the appearance of a British fleet so formidable that the allies never durst attack them. In the East Indies the united powers of the French, and native powers, had been conquered, and the Dutch settlements had suffered severely. In 1781, however, the British naval power in the West Indies was so greatly surpassed by that of France and Spain, that great apprehensions were entertained for our possessions. An ineffectual attempt on the island of St. Vincent was made by admiral Rodney; and an indecisive engagement took place, April 28th, 1781, between admiral Hood and the count de Grasse; the event of which, however, if not advantageous, was certainly honorable to Britain, as the French had a superiority of six ships of the line. The damage done to the British ships having obliged them to retire to Barbadoes to refit, the French took that opportunity to make a descent on the island of Tobago. See *Tobago*. Admiral Rodney had sent rear-admiral Drake with six sail of the line, three frigates, and some troops, to the assistance of the island; but they were too late. Besides the inconveniences which the British West India islands suffered in consequence of the war, it was also the misfortune of some of them to be involved in domestic disputes with their governors. This was particularly the case with Jamaica and Barbadoes; and it seemed to be a maxim with the British ministry, at this period, to pay little regard to complaints from the subjects of the empire, respecting any abuse of authority. But the great and decisive blow of the American contest, which happened this year, was the capture of lord Cornwallis with the division of the army under his command. Other events, indeed, were sufficiently mortifying. The province of West Florida had been reduced by the Spaniards; Minorca was besieged by them with an apparent impossibility of holding out; and the island of St. Eustatius was re-captured by the French. In short, every circumstance seemed to proclaim the necessity of putting an end to a war so calamitous and destructive.

Parliament met 27th of November, 1781. The ministry had received such a signal defeat in 1780 as seemed to prognosticate the ruin of their power. They had indeed afterwards acquired a majority, and the terror produced by the riots had assisted the re-establishment of their authority; to which the success at Charlestown, and other parts of America, also contributed. But the disasters of 1781 involved them in the utmost difficulty and distress. In the speech from the throne, his majesty observed, that the war was still unhappily prolonged by that restless ambition which first excited the enemies of his crown and people to commence it, and which still continued to disappoint his earnest desire and diligent exertions to restore the public tranquillity. No endeavours, he added, had been wanting on his part, to extinguish that spirit of rebellion which his enemies had found means to foment and

maintain in the colonies, and to restore, to his deluded subjects in America, that happy and prosperous condition which they had formerly derived from a due obedience to the laws; but the late misfortune in that quarter called loudly for the firm concurrence and assistance of parliament, to frustrate the designs of their enemies, which were equally prejudicial to the real interests of America, and to those of Great Britain. The address was vehemently opposed by Mr. Fox and Mr. Burke. The latter remarked, that if there could be a greater misfortune than had already been undergone by this kingdom, in the present disgraceful contest, it was hearing men rise up in the great assembly of the nation, to vindicate such measures. If the ministry and the parliament were not to be taught by experience; if neither calamities could make them feel, nor the voice of God make them wise, what had this fallen and undone country to hope for! If any thing could tend to deject the people of England, to make them despair of their situation, and resign themselves to their fate, it must be to receive information that their ministers, after all that had been suffered, were yet determined to go on with the American war. A battle might be lost, an enterprise might miscarry, an island might be captured, an army might capitulate in the best of causes, and even under a system of vigor and foresight; because the battle, after all the wisdom and bravery of man, was in the hands of heaven; and if either, or all of these calamities, had happened in a good cause, and under the auspices of a vigilant administration, a brave people would not despair. But it was not so in the present case. Amidst all their sufferings, and their misfortunes, they saw nothing so distressing as the weakness or wickedness of their ministers. They seemed still determined to go on, without plan, and without foresight, in this war of calamities; for every thing that happened in it was a calamity. He considered them all alike, victories and defeats; towns taken and towns evacuated; new generals appointed, and old generals recalled; they were all alike calamities in his eyes, for they all spurred us on to this fatal business. Victories gave us hopes, defeats made us desperate, and both instigated us to go on. They were, therefore, both calamities; and the king's speech was the greatest calamity of all; for the king's speech showed us the disposition of the ministers: and this disposition was not to retreat an inch; but to go on, to plunge us deeper, to make our situation more disgraceful and more unhappy. The address, however, was carried by a majority of 216 to 129. In the house of peers the earl of Shelburne observed, that seven years had now elapsed since blood was first drawn in America; and, from that period to the present, the affairs of Great Britain had been continually growing worse. Of nearly 87,000 men sent to America, how few had returned! What treasures had been in vain expended! What enormous debts accumulated! The most liberal national supplies had been followed by nothing but calamities; and the whole proceedings of the ministry manifested a want of system and of intelligence. Among other instances of mis-

management, his lordship remarked that, instead of blocking up the French fleets within their own harbours, or immediately intercepting them on their putting out to sea, we had suffered them to sail far upon their expeditions to our distant settlements; and, when they had acquired this great advantage, we slowly followed their powerful armaments with inconsiderable squadrons, and scarcely ever reached the place of destination till the enterprises of the enemy were accomplished. As to the farther prosecution of the war with the least prospect of success, it was totally impossible: the nation was too much exhausted both of men and money; recruits were not to be procured for the army; and, if we had the best first lord of the admiralty, and the ablest board that ever sat, it was impossible to provide for all the distant services of so extensive a war. The reason was obvious. The fine navy that belonged to Great Britain at the conclusion of last war, had been suffered to rot and moulder away; while France and Spain had recruited and repaired their marine during the whole period of the peace. The house at length divided on an amendment of lord Shelburne's, which was rejected by a majority of seventy-five to thirty-one. A short protest against the address was entered by the duke of Richmond, the marquis of Rockingham, and earl Fitzwilliam; in which they declared that they dissented, 'for reasons too often urged in vain for the last seven years, against the ruinous prosecution of the unjust war, carrying on by his majesty's ministers, against the people of North America, and too fatally confirmed by repeated experience, and the late disgraceful loss of a second army, to stand in need of a repetition.' Though ministers thus succeeded in carrying the addresses, they did not meet with the same success in their plan of carrying on the war. After the debate on the number of seamen, which was fixed at 100,000, for the ensuing year, Sir James Lowther moved, as a resolution of the house, 'That the war carried on with America had been ineffectual for the purposes for which it was undertaken; and that all farther attempts to reduce that continent by force of arms would be in vain, and must be injurious to this country, by weakening her powers to resist her ancient and confederated enemies;' which was very ably supported, though rejected by a majority of 220 to 179. This, however, was a majority in which the ministry had little reason to exult; as it was sufficiently apparent, from the numbers who voted against them, that the uninfluenced sense of that house was clearly and decisively against any farther prosecution of the American war. Other arguments against it were urged in the debate on the army estimates. On the 14th December the secretary of war informed the house, that the whole force of the army, including the militia, required for the service of 1782, would amount to 136,220 men, and for this force the parliament had to provide. The sum required for these troops for pay, clothing, and other articles, amounted to £4,220,000. This military force exceeded that of the last year by 4074 men; and the expense was consequently greater by £29,067 15s. The increase was occasioned by the greater

number of troops already sent, or then going, to the East Indies. But the expense of those troops was to be reimbursed by the East India company. After some farther statements, relative to the military force of the kingdom and its expense, had been made by the secretary at war, colonel Barre rose, and with great vehemence declared, that the estimates of the army, which were laid before that house, were scandalous and evasive. There was a much greater number of non-effective men than were stated in the estimates. In fact, they amounted to a fifth part of the army. The house should also recollect, that the estimates lying on the table did not compose the whole of the expenses of the army; for extraordinary of several millions were yet to come. Neither were the men under the several descriptions given by the secretary at war the whole number of military force employed. Other troops were employed solely at the discretion of the minister, and paid irregularly and unconstitutionally, without the assent or knowledge of the legislature; particularly the provincial corps in America, amounting to 9000 men in actual service, the statement of which force, though it had been called for from year to year, was never brought into the estimates. Lord George Germaine said, that the reason why the provincial corps had not been included in the estimates was, that some share of the public money might be spared, by avoiding to vote an establishment for these troops. They were raised and paid in a manner by much the most economical for the nation. They were solely under the management of the commander in chief: and an officer, called the inspector-general of the provincial corps, regularly took care to muster them from time to time. He also informed the house that the ministry were unanimously of opinion that, considering the present situation of affairs, and the misfortunes of the war, it would not be right to continue any longer the plan on which it had hitherto been conducted; and therefore that a fresh army would not be sent to supply the place of that captured at York-town under earl Cornwallis. General Conway declared that he entirely disapproved of a continuance of the American war in any form, as he wished that it might totally cease. He eagerly desired the recall of our fleets and armies, and was anxious for an entire and immediate prevention of those calamities which had almost completed the destruction of the empire. He considered an avowal of the independence of America as a severe misfortune, and a debasing stroke against Great Britain; but of the two evils he would choose the least, and he would submit to the independence of America. In short, he would almost yield to any circumstance whatsoever, rather than persist a day longer in the prosecution of so pernicious a war. Ideas had been started relative to a war of posts, among which New York had been particularly mentioned. But on what military authority did the ministry presume to think that New York was tenable? What garrison would be able to maintain it? The diversity of military opinions given on this subject served rather to alarm than to convince. To secure New York, the possession of Long

Island, which is 100 miles in length, is absolutely necessary; and it is well known that Sir Henry Clinton, with all his troops, did not consider himself as secure. Notwithstanding these and other arguments, however, the question was carried in favor of ministry by a considerable majority, and the supplies were voted.

Besides the grand question, for and against the continuance of the American war, several other matters of smaller moment were agitated this session; particularly the affair of St. Eustatius, an enquiry into the state of the navy, and into the causes, generally, of our bad success in the American war. A motion for censuring lord Sandwich was lost only by 236 to 217; and so general did the desire of a change of administration now appear, that it excited no small degree of surprise that the present ministers should retain their places. Nothing could set in a more striking point of view the detestation in which they were held, than the extreme aversion shown at admitting lord George Germaine to the dignity of the peerage. On this occasion his conduct at Minden was again investigated; and when he had taken his seat in the house, under the title of lord viscount Sackville, a protest was entered, signed by nine peers, in which the sentence and the public orders against him were particularly stated; and in which they declared, that they 'could not look upon the raising to the peerage a person so circumstanced, in any other light than as a measure fatal to the interests, as well as to the glory of the crown, and to the dignity of that house; insulting to the memory of the late sovereign, and likewise to every surviving branch of the illustrious house of Brunswick; repugnant to every principle of military discipline, and directly contrary to the maintenance of the honor of that house, and to that honor which has for ages been the glorious characteristic of the British nation, and which, as far as could depend on them, they found themselves called upon, not more by duty than inclination, to transmit pure and unsullied to posterity.' On the 22d of February, a motion was made in the house of commons by general Conway, 'That an humble address be presented, earnestly imploring his majesty, that, taking into his royal consideration the many and great calamities which had attended the present unfortunate war, and the heavy burdens thereby brought on his loyal and affectionate people, he would be graciously pleased to listen to the humble prayer and advice of his faithful commons, that the war on the continent of North America might no longer be pursued for the impracticable purpose of reducing that country to obedience by force; and expressing their hope that the earnest desire and diligent exertion to restore the public tranquillity, of which they had received his majesty's most gracious assurances, might, by a happy reconciliation with the revolted colonies, be forwarded and made effectual; to which great end, his majesty's faithful commons would be ready most cheerfully to give their utmost assistance.' It was seconded by lord John Cavendish, who remarked, that the American war had been a war of malice and resentment, without either dignity in its conduct,

probability in its object, or justice in its origin. It was, however, vigorously opposed by administration, who had still sufficient strength to gain their point, though only by a single vote, the motion being rejected by 194 to 193. The increasing strength of opposition now showed that the downfall of ministry was at hand. The decision of the last question was considered as a victory gained by the former; and Mr. Fox instantly gave notice that the subject would be resumed in a few days, under another form. It was accordingly revived on the 27th of February; on which day a petition from the city of London was presented to the house, soliciting the house to interpose in such a manner as should prevent any further prosecution of the American war; after which general Conway moved, that it should be resolved, 'That it was the opinion of that house, that the farther prosecution of offensive war on the continent of North America, for the purpose of reducing the revolted colonies to obedience by force, would be the means of weakening the efforts of this country against her European enemies, and tend, under the present circumstances, dangerously to increase the mutual enmity so fatal to the interests both of Great Britain and America; and, by preventing a happy reconciliation with that country, to frustrate the earnest desire graciously expressed by his majesty to restore the blessings of public tranquillity.' In order to evade coming to any immediate determination on the question, a proposition was made by Mr. Wallace, the attorney-general, that a truce should be entered into with America; and that a bill should be prepared to enable his majesty's ministers to treat on this ground; and, under the pretence of allowing time for this measure, he moved, 'that the present debate should be adjourned for a fortnight.' The house divided upon this motion, when there appeared for it 215, and against it 234; so that there was a majority of nineteen against the ministry. General Conway's original motion was then put and carried without a division.

He immediately made another for an address to the king, in which the American war was spoken of precisely in the terms made use of in the first motion, and in which his majesty was solicited to put a stop to any further prosecution of offensive war against the colonies. This motion was agreed to; and it was also resolved, that the address should be presented on the 1st of March; when his majesty returned an answer, in which he declared, that there were no objects nearer to his heart than the ease, happiness, and prosperity of his people; that the house of commons might be assured, that, in pursuance of their advice, he should take such measures as should appear to him to be most conducive to the restoration of harmony between Great Britain and her revolted colonies, so essential to the prosperity of both; and that his efforts should be directed in the most effectual manner, against our European enemies, until such a peace could be obtained as should consist with the interests and permanent welfare of his kingdoms. This answer being not thought sufficiently explicit, it was observed by general Conway, in the house of commons, on the 4th of March, that he hoped

he should be supported by the house in his desire of securing the nation against the possibility of a doubt, that the American war was not now completely concluded. He therefore moved, 'That an humble address should be presented to his majesty, to return his majesty the thanks of that house for his gracious answer to their last address; that house being convinced, that nothing could, in the present circumstances of this country, so essentially promote those great objects of his majesty's paternal care for his people, as the measure which his faithful commons had most humbly, but earnestly recommended to his majesty.' This motion was unanimously agreed to; after which the general moved 'That, after the solemn declaration of the opinion of that house, in their humble address presented to his majesty on Friday last, and his majesty's assurance of his gracious intention, that house would consider as enemies to his majesty and this country, all those who should endeavour to frustrate his majesty's paternal care for the ease and happiness of his people, by advising, or by any means attempting, the farther prosecution of offensive war on the continent of North America, for the purpose of reducing the revolted colonies to obedience by force.' After some debate, the motion was agreed to without a division.

On the 6th of the month, after a number of papers had been read in the house of peers relative to the surrender of earl Cornwallis and the army under his command, the two following motions were made by the duke of Chandos: 1. 'That it was the opinion of that house, that the immediate cause of the capture of the army under earl Cornwallis, in Virginia, appeared to have been the want of a sufficient naval force to cover and protect the same.' 2. 'That the not covering and protecting the army under earl Cornwallis in a proper manner was highly blameable in those who advised and planned the expedition.' After some debate, the motions were rejected, upon a division, by a majority of seventy-two to thirty-seven. Thus the ministry still kept their ground, and, with the most astonishing resolution, combated the powers of opposition.

The unpopularity of lord North was now farther augmented by his proposal of some new taxes, particularly on soap, the carriage of goods, and places of entertainment. On the 15th of March, it was moved by Sir John Rous, that 'the nation could have no farther confidence in the ministers who had the conduct of public affairs.' The debate was remarkable for an argument, in the affair of America, perfectly new and unprecedented. Sir James Marriot informed the house, that though it had been frequently pretended, that the inhabitants of the colonies were not represented in the British parliament, yet the fact was otherwise: for they were actually represented. The first colonisation, by national and sovereign authority, he remarked, was the establishment of the colony of Virginia. The grants and charters made of those lands, and of all the subsequent colonies, were of one color, and expressed in the following terms: 'To have and to hold of the king or queen's ma-

jesty, as part and parcel of the manor of East Greenwich, within the county of Kent, redden-dum, a certain rent at our castle of East Greenwich, &c.' So that the inhabitants of America were, in fact, by the nature of their tenure, represented in parliament by the knights of the shire for the county of Kent! This curious legal discovery, that the American colonies were part and parcel of the manor of East Greenwich, though delivered by the learned judge with all proper gravity and solemnity, yet excited so much merriment in the house, that it was with great difficulty, for some time, that the speaker could preserve any kind of order. Lord North endeavoured to vindicate his own administration. He affirmed, that it could not be declared with truth, by that house, that the national calamities originated from the measures of the present administration. The repeal of the American stamp act, and the passing of the declaratory law, took place before his entrance into office. As a private member of parliament, he gave his vote in favor of both; but, as a minister, he was not responsible for either. When he accepted his post, the times were scarcely less violent than the present. He approached the helm when others had deserted it; and, standing there, he had used his utmost efforts to assist his country. That the American war was just and requisite, and prosecuted for the purpose of supporting and maintaining the rights of the British legislature, was a position, for the truth of which he would ever contend. As to peace, he not only wished most earnestly for it, but also for the formation of such a ministry as might at once prove welcome to the country, and with unanimous cordiality co-operate for the welfare and the honor of the state. It was not an attachment to the honors and emoluments of office which had kept him so long in place; and he should disdain to throw impediments in the way of any honorable and salutary coalition of parties, though for the adjustment of an administration from which he might perceive himself excluded. The house at length divided upon the question, when there appeared for it 227, and against it 236; so that there was a majority of nine in favor of administration. Notwithstanding this seemingly favorable determination, it was so well known that the ministry could not stand their ground, that, four days after, a similar motion to that made by Sir John Rous, was to have been made by the earl of Surrey; but, when his lordship was about to rise for that purpose, lord North addressed himself to the speaker, and endeavoured to gain the attention of the house. This occasioned some altercation, many members insisting, that the earl of Surrey ought to be heard first. But lord North observed, that as he understood the motion to be made by the noble earl was similar to that made a few days before, and the object of which was the removal of the ministers, he had such information to communicate to the house, as must, he conceived, render any such motion unnecessary. He could with authority assure the house, that his majesty had come to a full determination to change his ministers. Indeed, those persons who had for some time conducted the public affairs were no longer his majesty's ministers

They were not now to be considered as men holding the reins of government, and transacting measures of state, but merely remaining to do their official duty, till other ministers were appointed. The sooner these new ministers were appointed, his lordship declared, that, in his opinion, the better it would be for the public business, and the general interests of the nation. He returned thanks to the house for the many instances of favor and indulgence which he had received from them during the course of his administration; and he declared, that he considered himself as responsible, in all senses of the word, for every circumstance of his ministerial conduct, and that he should be ready to answer to his country whenever he should be called upon for that purpose.

The earl of Surrey informed the house, that the motion which he intended to have made was designed to declare to the nation, and to all Europe, that the ministry were not dismissed because they wanted to avoid the fatigues of office, but because the parliament had totally withdrawn from them their good opinion and their confidence, and were determined no longer to permit the perpetration of those violent abuses of their trust, to which, with impunity, and to the disgrace and detriment of the state, they had for such a length of time proceeded. His lordship, however, in consequence of the declaration of lord North, waived his intended motion; and, after some farther debate, the house adjourned.

Thus an end was put to an administration which had for so long been obnoxious to a great part of the nation, and whose removal contributed very much to allay those dangerous ferments by which every part of the British dominions had been agitated. Peace now became as much the object of ministry as war had been formerly. Before we proceed to any account of the negotiations for that desirable event, it is necessary to take notice of those military events which disposed the other belligerent powers to an accommodation. The disaster of lord Cornwallis had produced a sincere desire of being at peace with America: but that could not be accomplished without making peace with France also; and that power was haughty and elated with success. Minorca had now fallen into the hands of the Spaniards: and though the capture of a few miserable invalids, attended with such extreme difficulty as the Spaniards experienced (see *Minorca*), ought rather to have intimidated them than otherwise, they projected the most important further conquests. Nothing less than the reduction of the British West India Islands became the object of the allies; and there was too much reason to suppose that this object was within their reach. In the beginning of 1782 the islands of Nevis and St. Christopher were obliged to surrender to the French admiral, and the marquis de Bouille. Jamaica was marked out as the next victim; but an end of all these aspiring hopes was fast approaching. The advantages hitherto gained by the French in their naval engagements with the British fleet, had often proceeded from their keeping at a great distance during the time of action, and from their good fortune and dexterity in gaining the

wind. At last the French admiral, De Grasse, determined, after an indecisive action on the 9th of April 1782, to stand a close engagement with his formidable antagonist Rodney. This took place on the 12th of April, off the island of Dominica. The British fleet consisted of thirty-seven ships of the line, and the French of thirty-four. The action commenced at seven o'clock, A.M. and continued with unremitting fury till half past six P.M. It is said that no other signal was made by the admiral but the general one for action, and that for close fight. Sir G. Rodney was on board the *Formidable*, a ship of ninety guns; and the count De Grasse was on board the *Ville de Paris*, a ship of 110 guns, which was a present to the French king from the city of Paris. In the course of the action, the *Formidable* fired nearly eighty broadsides; and, for three hours, the admiral's ship was involved in so thick a cloud of smoke, that it was almost invisible to the officers and men of the rest of the fleet. The van division of the British fleet was commanded by Sir Samuel Hood, and the rear division by rear-admiral Drake. But the decisive turn on this memorable day was given by a bold manœuvre of the *Formidable*, which broke the French line, and threw them into confusion. The first French ship that struck was the *Cæsar*, a seventy-four gun ship, which, at the time, had not a foot of canvas without a shot-hole. Unfortunately, soon after she was taken possession of, she took fire by accident, and blew up. The *Glorieux* and the *Hector*, both seventy-four gun ships, were also taken by the British fleet, together with the *Ardent* of sixty-four guns. It was a very close and hard fought action on both sides, but the French were at length totally defeated. When the *Ville de Paris* struck, it was almost dark. There were 5,500 troops on board the French fleet, and the havoc among these was very great. On the 19th, a squadron, which was detached from the main fleet, under the command of Sir Samuel Hood, captured the *Cato* and the *Jason*, two French men of war of sixty-four guns each; with the *Amiable* of thirty-two guns, and the *Ceres* of eighteen. About the same time the fleet under admiral Barrington took from the French, off Ushant, the *Pégase* of seventy-four guns, the *Actionnaire* of sixty-four, and ten sail of vessels under their convoy. It was universally allowed, that, in this engagement, the French, notwithstanding their defeat, behaved with the greatest valor. De Grasse himself did not surrender till 400 of his people were killed, and only himself and two others remained without a wound. The captain of the *Cæsar* after his ensign staff was shot away, and the ship almost battered to pieces, caused his colors to be nailed to the mast, and thus continued fighting till he was killed. The vessel, when taken, was a mere wreck. Other French officers behaved in the same manner. The valor of the British requires no encomium: it was evident from their success. The admiral was created an English peer by the title of baron Rodney, of Rodney Stoke, in the county of Somerset. Sir Samuel Hood was also created baron Hood of Catherington, in the kingdom of Ireland; and rear-admiral Drake, and captain

Affleck, were created baronets of Great Britain. The count De Grasse, after his defeat, was received on board the *Bartleur* man of war, and landed at Jamaica, where he was treated with great respect. After continuing there some time, he was conveyed to England, and accommodated at the Royal Hotel in Pall-Mall. His sword, which he had delivered up to admiral Rodney, was returned to him by the king. This etiquette enabled him to appear at court, where he was received by their majesties and the royal family in a manner suitable to his rank, and, from the time of his arrival in London to his departure on the 12th of August 1782, was visited by many persons of distinction.

Though the designs of the French against Jamaica were now effectually frustrated, the victory was not followed by those beneficial consequences which many expected. None of the British islands which had been taken by the French in the West Indies were recaptured; some of the ships which were taken by admiral Rodney were afterwards lost at sea; particularly the *Ville de Paris*, the *Glorieux*, and the *Hector*. A British man of war, the *Centaur*, of seventy-four guns, was also sunk, in lat. 48° 33' and long. 43° 20', on the 24th September, 1782, in consequence of the disabled state to which it was reduced by violent storms; and the lives of captain Inglefield the commander, and ten other officers and seamen, were only preserved by their getting on board a pinnace. The Jamaica homeward bound fleet was also dispersed this year by a hurricane off the banks of Newfoundland, when the *Ramillies* of seventy-four guns, and several merchantmen, foundered. The British navy also sustained, about this time, a considerable loss at home, by the *Royal George*, of 100 guns, being overset and sunk at Portsmouth. This melancholy accident, which happened on the 29th August, was occasioned by a partial heel being given to the ship, with a view to cleanse and sweeten her; but the guns on one side being removed to the other, or at least the greater part of them, and her lower deck ports being not lashed in, the ship thwarted on one side with a squall from the north-west, filled with water, and sunk in the space of three minutes. Admiral Kempenfelt, a very meritorious officer, other officers, upwards of 400 seamen, and 200 women, besides many children, perished in her. Thus the prosecution of the war seemed to be attended with endless disasters and difficulties.

In the beginning of May an expedition was undertaken, by the French, to the remote and inhospitable regions of Hudson's Bay; and, though no force existed in that place capable of making any resistance, a seventy-four gun ship and two thirty-six gun frigates were employed on the service. The loss of the Hudson's Bay company, on this occasion, amounted to £500,000, but the humanity of the French commander was conspicuous, in leaving a sufficient quantity of provisions and stores of all kinds, for the use of the British who had fled at his approach. Another expedition was undertaken by the Spaniards to the Bahama Islands, where a like easy conquest was obtained. The island of Providence was

defended only by 360 men, who, being attacked by 5000, could make no resistance. Some settlements on the Musquito shore were also taken by the Spaniards; but the Bay men, assisted by their negroes, bravely retook some of them; and having formed a little army with the Indians in these parts, headed by colonel Despard, they attacked and carried the posts on the Black River, making prisoners of about 800 Spanish troops. The great disaster which befel this power, however, was their failure before Gibraltar, which happened in September, 1782, with such circumstances of horror and destruction as evinced the absurdity of persisting in the enterprise. See GIBRALTAR.

All parties to the war were at length desirous to put an end to it. We have already noticed the events which led to the removal of lord North and the other ministers, who, for so long a time, had directed the public measures of this country. His majesty, it was said, expressed, on this occasion, considerable agitation of mind; and the members of opposition would form no coalition with any of the old ministry, except the lord chancellor. On the 27th and 30th of March, 1782, the marquis of Rockingham was appointed first lord of the treasury; lord John Cavendish chancellor of the exchequer; the earl of Shelburne and Mr. Fox principal secretaries of state; lord Camden president of the council; the duke of Richmond master of the ordnance; the duke of Grafton lord privy seal; admiral Keppel first lord of the admiralty; general Conway commander in chief of all the forces in Great Britain; Mr. Thomas Townshend secretary at war; Mr. Burke paymaster of the forces; and colonel Barre treasurer of the navy. Other offices and honors were likewise conferred on different members of the opposition; and some were raised to the peerage, particularly admiral Keppel, Sir Fletcher Norton, and Mr. Dunning. The first business, of course, in which the ministry engaged, was the taking such measures as were proper to effect a general peace. Accordingly, the empress of Russia having offered her mediation to restore peace between Great Britain and Holland, Mr. secretary Fox wrote a letter to M. Simolin, the Russian minister in London, informing him that his majesty was ready to negotiate on the terms and conditions of the peace which was made in 1674; and that, in order to facilitate such a treaty, he was willing to give immediate orders for a suspension of hostilities. But the states of Holland did not appear inclined to a separate peace: negotiations for a general peace were now indeed commenced at Paris.

Mr. Granville was invested with full powers to treat with all the parties at war; and was directed to propose the independency of the thirteen united provinces of America, in the first instance. Admiral Digby and general Carleton were also directed to acquaint the American congress with the pacific views of the British court, and with the offer that was made to acknowledge the independence of the United States. But, before this work of pacification had made any considerable progress, the new ministry sustained an irreparable loss (July 1782) by the death of the marquis of Rockingham. Even before this

event, considerable apprehensions were entertained of their want of union; but, on the death of that nobleman, the earl of Shelburne, who succeeded him as first lord of the treasury, proved so disagreeable to some of his colleagues, that Mr. Fox, lord John Cavendish, Mr. Burke, and some others, instantly resigned. Others, however, though little attached to the earl, kept their places, and his lordship found means to attach to his interest Mr. Pitt, son of the late earl of Chatham. Though then in an early stage of life, this gentleman had distinguished himself greatly in parliament, and was now, at the age of twenty-three, prevailed upon to accept the office of chancellor of the exchequer. The seceding members of the cabinet were at great pains to explain their motives to the house for taking this step. These were in general a suspicion that matters would be managed differently from the plan they had proposed while in office, and particularly that the American independence would not be allowed; but this was positively denied at the time: and with truth, as appeared by the event. No obstruction, however, arose to the general pacification, and as early as 30th November, 1782, the articles of a provisional treaty were settled between Britain and America. By these it was stipulated that the people of the United States should continue to enjoy, without molestation, the right to take fish of every kind on the grand bank, and on all the other banks of Newfoundland; and that they should likewise exercise and continue that same privilege in the gulf of St. Lawrence, and at every other place in the sea, where the inhabitants used heretofore to fish. They were likewise to have liberty to take fish of every kind on such part of the coast of Newfoundland as British seamen shall resort to; but not to cure or dry them on that island; to possess the privilege of fishing on the coasts, bays, and creeks of all the other dominions of his Britannic majesty in America; and to cure and dry fish in any of the unsettled bays, harbours, and creeks of Nova Scotia, Magdalen Islands, and Labrador. But it was agreed that, after such places should be settled, this right could not be legally put in practice, without the consent of the inhabitants and proprietors. It was accorded, that creditors upon either side should meet with no impediment in the prosecution of their claims: that the congress should earnestly recommend it to the legislatures of the respective states, to provide for the restitution of all estates and properties which had been confiscated, belonging to real British subjects, and of the estates and properties of persons resident in districts in the possession of his majesty's arms, and who had not borne arms against the United States. It was resolved that persons of any description should have free liberty to go to any part whatsoever of any of the thirteen United States, and remain in it for twelve months unmolested in their endeavours to recover such of their estates, rights, and properties as might not have been confiscated; and it was concerted, that the congress should earnestly recommend to the several states a revision of all acts or laws regarding the premises, so as to render them perfectly consistent, not only with justice and equity,

but with that spirit of conciliation which, on the return of the blessings of peace, should universally prevail. It was understood that no future confiscations should be made, nor prosecutions commenced against any person, or body of men, on account of the part which he or they had taken in the present war; and that those who might be in confinement on such a charge, at the time of the ratification of the treaty in America, should, together with all prisoners, be immediately set at liberty. The navigation of the river Mississippi, from its source to the ocean, was to remain for ever free and open to the subjects of Great Britain and the citizens of the United States. In fine, it was agreed, that if any place or territory belonging to Great Britain, or to the United States, should be conquered by the arms of either before the arrival of the provisional articles in America, it should be restored without compensation or difficulty.

In the treaty between Great Britain and France it was agreed, that Newfoundland should remain with England, as before the commencement of the war; and, to prevent disputes about boundaries, it was accorded that the French fishery should begin from Cape St. John on the eastern side, and, going round by the north, should have for its boundary Cape Ray on the western side. The islands of St. Pierre and Miquelon, which had been taken in September, 1778, were ceded in full right to France. The French were to continue to fish in the gulf of St. Lawrence, conformably to the fifth article of the treaty of Paris. The king of Great Britain was to restore to France the island of St. Lucia, and to cede and guarantee to her that of Tobago. The king of France was to surrender to Great Britain the islands of Grenada and the Grenadines, St. Vincent, Dominica, St. Christopher's, Nevis, and Montserrat. The river of Senegal and its dependencies, with the forts of St. Louis, Podor, Galam, Arguin, and Portendic, were to be given to France; and the island of Goree was to be restored to it. Fort James and the river Gambia were guaranteed to his Britannic majesty; and the gum trade was to remain in the same condition as before the commencement of hostilities. The king of Great Britain was to restore to his most Christian majesty all the establishments which belonged to him at the breaking out of the war on the coast of Orixa and in Bengal, with the liberty to surround Chandernagor with a ditch for draining the waters; and became engaged to secure to the subjects of France in that part of India, and on the coast of Orixa, Coromandel, and Malabar, a safe, free, and independent trade, either as private traders, or under the direction of a company. Pondicherry, as well as Karikal, was to be rendered back to France; and his Britannic majesty was to give, as a dependency round Pondicherry, the two districts of Valanour and Bahour; and, as a dependency round Karikal, the four contiguous Magans. The French were again to enter into the possession of Mahe, and of the comptoir at Surat.

The allies of France and Great Britain were to be invited to accede to the present pacification; and the term of four months was to be

allowed them, for the purpose of making their decision. In the event of their aversion from peace, no assistance on either side was to be given to them. Great Britain renounced every claim with respect to Dunkirk. Commissioners were to be appointed respectively by the two nations, to enquire into the state of their commerce, and to concert new arrangements of trade on the footing of mutual convenience. All conquests on either side, in any part of the world whatsoever, not mentioned nor alluded to in the present treaty, were to be restored without difficulty, and without requiring compensation. It was determined that the king of Great Britain should order the evacuation of the islands of St. Pierre and Miquelon, three months after the ratification of the preliminary treaty; and that, if possible, before the expiration of the same period, he should relinquish all connexion with St. Lucia in the West Indies, and Goree in Africa. It was stipulated, in like manner, that his Britannic majesty should, at the end of three months after the ratification of the treaty, or sooner, enter into the possession of the islands of Grenada and the Grenadines, St. Vincent, Dominica, St. Christopher's, Nevis, and Montserrat. France was to be put into possession of the towns and comptoirs which were to be restored to her in the East Indies, and of the territories which were to serve as dependencies round Pondicherry and round Karikal, six months after the ratification of the definitive treaty; and, at the termination of the same term, she was to restore the towns and districts which her arms might have taken from the English or their allies in that quarter of the globe. Each crown was respectively to reimburse the sums which had been advanced for the maintenance of their prisoners by the country where they had been detained, according to attested and authentic vouchers. With a view to prevent every dispute and complaint, on account of prizes which might be made at sea, after the signing of the preliminary articles, it was mutually settled and understood, that the vessels and effects which might be taken in the channel, and in the North Seas, after the space of twelve days, to be computed from the ratification of the preliminary articles, were to be restored upon each side; that the term should be one month from the Channel and the North Seas, as far as the Canary Islands inclusively, whether in the ocean or the Mediterranean; two months from the Canary Islands as far as the equinoctial line or equator; and lastly, five months without exception in all other parts of the world. These preliminary articles of peace were concluded at Versailles on the 20th January, 1783, between Mr. Fitzherbert, minister plenipotentiary on the part of his Britannic majesty, and the comte de Vergennes, the minister plenipotentiary on the part of the king of France.

At the same time the preliminary articles of peace between Great Britain and Spain were also concluded at Versailles, between Mr. Fitzherbert and the comte d'Aranda, the minister plenipotentiary for the Spanish monarch. His Catholic majesty was to keep the island of Minorca; and was to retain West Florida. East Florida was to be ceded to him by the king of

Great Britain. Eighteen months from the date of the ratification of the definitive treaty were to be allowed to the subjects of the latter, who had settled in the island of Minorca and in the two Floridas, to sell their estates, to recover their debts, and to transport their persons and effects, without being restrained upon account of their religion, or on any other pretence whatsoever, except that of debts and prosecutions for crimes. His Britannic majesty, was at the same time to have the power to cause all the effects that might belong to him in East Florida, whether artillery or others, to be carried away. The liberty of cutting logwood, in a district of which the boundaries were to be ascertained, without molestation, was permitted to Great Britain. The king of Spain was to restore the islands of Providence, and the Bahamas, without exception, in the condition in which they were when they were conquered by his arms. All other conquests of territories and countries upon either side, not included in the present articles, were to be mutually restored without difficulty or compensation. The epoch for the restitutions to be made and for the evacuations to take place, the regulations for the release of prisoners and for the cessation of captures, were exactly the same as those which have already been related, as stipulated in the preliminary articles with France.

8. *History of Great Britain from the peace of 1783 to the war of 1793.*—No sooner were these articles ratified and laid before parliament, than the most vehement declamations against ministry took place. Never had the administration of lord North himself been arraigned with more asperity of language. The ministry defended themselves with great resolution; but found it impossible to avoid the censure of parliament. An address without any amendment was indeed carried in the house of lords by seventy-two to fifty-nine; but in the lower house it was lost by 224 to 208. On the 21st of February some resolutions were moved in the house of commons by lord John Cavendish, of which the most remarkable were, that the concessions made by Britain were greater than its adversaries had a right to expect; and that the house would take the case of the American loyalists into consideration. The last motion indeed his lordship consented to waive; but all the rest were carried against ministry by 207 to 190. These proceedings, however, could make no alteration, with regard to the treaty, which had already been ratified by all the contending powers, the Dutch only excepted. The terms offered them were a renewal of the treaty of 1674: which, though the most advantageous they could expect, were positively refused at that time. Afterwards they offered to accept the terms they had formerly refused; but the compliment was then returned, by a refusal on the part of Great Britain. When the preliminary articles were settled with the court of France and Spain, a suspension of arms took place with Holland also; but, though the definitive arrangements with the other powers were finally concluded by September, the preliminary articles were only then settled with Holland. The terms were a general restitution of all places taken on both sides during the war, excepting the settle-

ment of Negapatam in the East Indies, which was to remain in the hands of Britain, unless an equivalent was given on the part of Holland. The navigation of the eastern seas was to remain free and unmolested to all the British shipping. The other articles concerned only the exchange of prisoners, and such other matters as are common to all treaties.

An end was now put to the most dangerous war in which Britain had been hitherto engaged; and in which, notwithstanding the powerful combination against her, she still remained in a state of superiority to all her enemies. At that time, and ever since, it has appeared, how much politicians were mistaken, who imagined that the prosperity of Britain depended in a great measure on her colonies: though, for a number of years, she had not only been deprived of these colonies, but opposed by them with all their force; though attacked at the same time by three of the greatest powers in Europe, and looked upon with an invidious eye by all the rest; the injury inflicted on her enemies still greatly exceeded that she had received. Their trade by sea was almost ruined; and, on comparing the loss of ships on both sides, the balance in favor of Britain was twenty-eight ships of the line and thirty-seven frigates, carrying in all nearly 2000 guns. Notwithstanding this, however, the state of the nation appears to have been really such, that a much longer continuance of the war would have been impracticable. In the debates, which were kept up with the greatest violence on account of the peace, Mr. Pitt exhibited our situation with great energy and strength of argument. 'It was in vain,' he said, 'to boast of the strength of our navy; we had not more than 100 sail of the line: but the fleet of France and Spain amounted to nearly 140 ships of the line. Seventy-two ships of the line were to have acted against Jamaica. Admiral Pigot had only forty-six sail to support it; and it was a favorite maxim, of many members of the house, that defensive war must terminate in certain ruin. It was not possible that admiral Pigot could have acted offensively against the islands of the enemy; for lord Rodney, when flushed with victory, did not dare to attack them. Would admiral Pigot have recovered by arms, what the ministers had regained by negotiation: with a superior fleet against him, and in its sight, is it to be conceived that he could have taken Grenada, Dominica, St. Christophers, Nevis, and Montserrat? On the contrary, is it not more than probable that the campaign in the West Indies must have terminated in the loss of Jamaica? In the east, it was true that the services of Sir Edward Hughes had been highly extolled; but he could only be commended for a merely defensive resistance. Victory seemed to be out of the question; and he had not been able to prevent the disembarkation of a powerful European armament, which had joined itself to Hyder Ally, and threatened the desolation of the Carnatic. See HINDOSTAN. At home, and in our own seas, the fleets of the enemy would have been nearly double to ours. We might have seized the intervals of their cruise, and paraded the channel for a few weeks; but that parade

would have only served to disgrace us. It was yet the only achievement in our power; for, to have hazarded an engagement, would have been equivalent to a surrender of the kingdom. Neither, in his opinion, was the state of our army to be considered as formidable. New levies could not be raised in a depopulated country. We might send upon an offensive scheme 5000 or 6000 men: and what expectation could be excited by a force of this kind? To have withdrawn troops from America was a critical game. There were no transports in which they might be embarked; and if it had been possible to embark them, in what miraculous manner were they to be protected against the fleets of the enemy? As to our finances, they were melancholy. Let the immense extent of our debts be weighed; let our resources be considered; and, let us then ask, what would have been the consequence of the protraction of the war? It would have endangered the bankruptcy of public faith; and this bankruptcy, it is obvious, if it had come upon us, might have dissolved all the ties of government, and have operated to the general ruin. To accept the peace on the terms already related, or to continue the war, was the only alternative in the power of ministers. Such was the ultimatum of France. At the same time, however, it ought to be remembered, that the peace obtained was better than could have been expected from the lowness of our condition. We had acknowledged the American independence; but what was that but an empty form? We had ceded Florida; but had we not obtained the islands of Providence and the Bahamas? We had granted an extent of fishery on the coast of Newfoundland; but had we not established an exclusive right to the most valuable banks? We have restored St. Lucia, and given up Tobago: but had we not regained Granada, Dominica, St. Christophers, Nevis, and Montserrat? And had we not rescued Jamaica from inevitable danger? In Africa we had given up Goree; but Goree was the grave of our countrymen; and we had secured Fort James and the river Gambia, the best and the most healthy settlement. In Europe we had relinquished Minorea; but Minorea is not tenable in war, and in peace it must be supported at a ruinous expense. We had permitted the reparation of the port of Dunkirk: but Dunkirk could only be an object when ships of a far inferior draught to the present were in use; the change in the operations of naval war had taken away its importance. In the East Indies cessions had been made; but let it be remarked that these cessions are inconceivable in themselves, and could not be protected by us in the event of hostilities. In fine, it was objected that we had abandoned the unhappy loyalists to their implacable enemies. What is this but to impute to congress, by anticipation, a violence which common decency forbids us to expect? But let it be considered, that the principle of assisting these unfortunate men would not have justified ministers to have continued the war. And let it be considered, that a continuation of the war would not have procured them any certain indemnity. The accumulation of our distresses

must have added to theirs. A year or two hence harder terms of peace might have been forced upon our acceptance. Their fate then must have been desperate indeed ! But as matters were now situated, there were hopes of mercy and reconciliation.'

Having thus given as full an account, as our limits would allow, of the great national events, to the conclusion of the peace in 1783, we shall now advert to some others, which, though of sufficient importance to deserve notice, could not have been mentioned earlier, without interrupting the narrative. Under the article DOCK-YARD we have given an account of the attempt of Aitken, or John the Painter, on the public works at Portsmouth. This, it seems, was the mere political enthusiasm of a wretched vagabond. It appeared, however, that the French court were very well acquainted with many particulars relating to the state of this kingdom, and the movements of our squadrons, which ought to have been kept secret. The sources of this information were first detected in June 1780. One Ratcliffe, master of a cutter, had been hired by Mr. Rogere, to carry packets to France, for which he was to be paid £20 each time, and to have £100 besides at a certain period. Apprehending at last, however, that he might incur some danger by continuing this employment, he gave information of what was going on, to one Mr. Steward, a merchant of Sandwich, by whom his last packet was carried to the secretary of state. After being opened and sealed up again, it was returned, and Ratcliffe was directed to carry it to France as formerly. At last, by his complaining to Rogere that he had not been paid £100 according to promise, a meeting was procured, in which it appeared that the person who gave intelligence to the enemy, was M. Henry de la Motte, a French gentleman residing in London. On searching his house, in his absence from home, no papers of any consequence were found ; but, on his arrival, he threw some out of his pocket, which led to the apprehension of Henry Luttreloh, esq ; a German, who then resided at Wickham near Portsmouth. This person made a full discovery of the treasonable correspondence with France, while he gave abundant proofs of himself being one of the most depraved and hardened of mankind. His evidence, however, and other strong circumstances, were sufficient to convict M. de la Motte, who was accordingly tried and executed for treason. During the whole course of the war, only one other person, David Tyrie, a native of Edinburgh, was detected in this crime ; and he appears to have been actuated merely by mercenary motives.

On the 21st of January, 1763, the house of commons met according to adjournment, and next day Mr. secretary Townshend, after observing, that it was become necessary to prevent the possibility of any farther doubts being entertained respecting the true meaning of the British parliament, in their proceedings of last session towards Ireland, moved, * that leave be given to bring in a bill, for removing and preventing all doubts, which had arisen, or might arise, con-

cerning the exclusive right of the parliament and courts of Ireland in matters of legislation and judicature ; and for preventing any writ of error, or appeal, from any of his majesty's courts in that kingdom, from being received, heard, and adjudged in any of his majesty's courts in the kingdom of Great Britain.' The cause of introducing this bill was as follows :—When the establishment of the legislative and judicial independence of Ireland was under the consideration of the late ministry, two methods of doing it had been suggested : the one by renouncing what England held to be a right, but was ready to give up : the other by declaring that England, though it had exercised, had never been legally possessed of this right. The former of these modes, it was said, might give offence to the people of Ireland, who insisted that England had never possessed any such right : and, to the latter mode of renunciation, it was apprehended that the parliament of Great Britain would never consent. The measure of a simple repeal of the declaratory act of the 6th of George I. was therefore adopted, as best suited to the spirit of the people of Ireland, and the dignity of the British parliament. After this, the parliament of Ireland proceeded to exercise their legislative powers, by enacting laws for regulating their judicial proceedings, and for confining the decisions of property to their own courts of law, with power of appeal to the house of lords in Ireland only. Affairs were proceeding in this amicable manner, when a cause that had been removed by writ of error from Ireland to the court of king's bench in England, long before the repeal had been in agitation, and which the judge by the rules of the court was obliged to determine, was brought to a decision. This unlucky accident was eagerly laid hold on by many in Ireland, and the jealousy they attempted to spread was improved by the British ministry, who seized the opportunity to show, from this instance, that the measures of their predecessors had not given complete satisfaction, and thus to court the applause of the people of Ireland, by the additional security which the bill now introduced would afford to their rights. The bill accordingly passed without any formal opposition ; though it was remarked, that as the parliament of Ireland had declared, that no constitutional question did any longer exist between the two kingdoms, it was neither consulting the dignity of the legislature of Great Britain, nor paying any compliment to the discernment of that of Ireland, to declare that doubts might still arise, and to pass an act to prevent them, unasked, and grounded on surmises. Mr. Fox insisted, that the repeal of the 6th of George I. was an effectual abandonment of the English right of legislation and judicature over Ireland. As such it had been accepted by the Irish government, and had given general satisfaction. He cautioned ministers against listening to discontents, that had no existence. It could not be expected, that measures, however good, would give satisfaction to every individual. It was necessary to stop at some point, which should be the ne plus ultra of concession.

We have already noticed how much the terms

of the peace were censured by the resolutions of a majority of the house of commons, passed on the 21st of February, 1783. Though lord North had been some time out of office, the supporters of his administration still formed a very powerful body in the state; and such influence had he gained while in office, that to the latest period of his life, it is said, he could command forty votes in the house of commons. This formidable power of lord North was now augmented by the party which opposed the war, at the head of which was Mr. Fox: and these parties, though they still pretended to adhere to their former decidedly different sentiments, had come to an agreement to unite their strength, so as to form a complete majority in parliament, in opposition to the present ministry. No other views possibly could have united together men who had so recently opposed each other with the greatest personal virulence. On this famous coalition, as it has been since denominated, the eyes of the public and of the crown were alike fixed with great jealousy; and had it not been for the cool but firm conduct of his late majesty, during the contest which now commenced, the consequences would have been fatal to the constitution. The earl of Shelburne resigned his office of first commissioner of the treasury, and Mr. Pitt declared publicly in the house, that he only held his place of chancellor of the exchequer till a successor should be appointed. The consequence was, that a ministerial interregnum ensued, which continued till the beginning of April. During this period, the kingdom remained in a state of no small disorder; and without any responsible government. The court made various attempts to form a new ministry, without completely resigning the government of the nation to the coalition; but in vain. On the 19th of March, Mr. Coke, member for Norfolk, gave notice, that, if an administration should not be formed on or before the Friday following, he would move an address to the king on the subject. Rumors of an intended arrangement were immediately circulated, but the negotiations for that purpose being suddenly broken off, Mr. Coke made his promised motion, 'That an humble address be presented to his majesty, that he would condescend to a compliance with the wishes of the house, by forming an administration entitled to the confidence of his people, and such as may have a tendency to put an end to the unfortunate divisions and distractions of the country.' This motion was received with general approbation; though the candidates for power, and particularly the members of the coalition, were openly blamed by several gentlemen. The address was ordered to be presented by such members as were of the privy council. On Wednesday, the 26th, the comptroller of the household reported his majesty's answer, 'That it was his earnest desire to do every thing in his power to comply with the wishes of his faithful commons:' and on Monday, the 31st, Mr. Pitt acquainted the house, that he had that day resigned his office. Being asked if any new arrangement was likely soon to take place, he replied that he knew of none, but concluded, from the king's message, that the measure would

not be unnecessarily delayed. This answer did not satisfy the house. It now appeared, that the care of the public money was left without any responsible minister whatever. Much difference of opinion prevailed with regard to the steps proper to be taken; at last the earl of Surrey proposed, 'That an humble address be presented to his majesty, to express the grateful sense the house entertains of the gracious intentions expressed in his message of the 26th inst. To assure his majesty, it is with a perfect reliance on his paternal goodness, and an entire deference to his royal wisdom, that this house again submits to his consideration the urgency, as well as the importance, of the affairs which require the immediate appointment of such an administration as his majesty has given them reason to expect. To assure his majesty, that all delays, in a matter of this moment, have an inevitable tendency to weaken the authority of his government, to which this house is not more bound by duty, than led by inclination, to give an effectual and constitutional support. To represent to his majesty, that the confidence of foreign powers may be weakened by a failure of the ordinary means of a constant communication with them. That the final execution of treaties, with the important and decisive arrangements of a commercial and political nature, in consequence of a late revolution; that a provision for the heavy expenses, and the important services voted; and the ordinary reduction of the forces, and the expenses of a new establishment; that the settlement of national credit, seriously affected by the critical state of the East India Company;—that these, with other important concerns, do severally, and much more collectively, require an efficient and responsible administration, formed upon principles of strength and stability, suited to the state of his majesty's affairs, both at home and abroad: and that this house most humbly repeats its application to his majesty, that he will take such measures towards this object as may become his most gracious disposition, and quiet the anxiety and apprehensions of his faithful subjects.' His majesty at last yielded, for a time, to what he could not avoid without calling a new parliament; and, on the 2d of April, a new administration was announced, the following persons composing the cabinet:—The duke of Portland, first lord of the treasury; lord North, and Mr. Fox, secretaries of state; lord J. Cavendish, chancellor of the exchequer; lord viscount Keppel, first lord of the admiralty; lord viscount Stormont, president of the council; earl of Carlisle, privy seal; earl of Hertford, chamberlain, and earl of Dartmouth, steward of the household; lord viscount Townshend, master of ordinance; Mr. Burke, paymaster-general, Mr. C. Townshend, treasurer of the navy; Mr. Fitzpatrick, secretary at war; Mr. Wallace, attorney, and Mr. Lee, solicitor-general; and the earl of Northampton, lord-lieutenant of Ireland.

The first object of importance that engaged the attention of parliament, after the change of administration, was the opening a commercial intercourse with the United States of North America. By the prohibitory acts, which had

passed previous to the war, all communication with that country in the way of trade had been entirely cut off; and though it was the prevailing opinion in parliament that those acts were virtually repealed, by the acknowledgment of the independence of the United States, yet in this new character they became subject to other restrictions, which it was necessary to relax and modify. A bill for this purpose had been introduced by the late ministry; but, during the various discussions which it underwent, difficulties of so complicated and important a nature had arisen, that it never passed through the committee. In the mean time, no regulations whatever having been stipulated by the treaty of peace, the commercial interests of Britain were suffering very materially. In this emergency, the new ministers thought it most advisable to drop the old bill, and to pass two short ones; the one to repeal all the prohibitory acts, and the other to remove the necessity of requiring documents, and to lodge, for a limited time, a power in the hands of the king and council, to make such other regulations as might be found expedient.

On the 16th of April the chancellor of the exchequer brought forward the loan for the current year, 1783. The sum borrowed was £12,000,000. Eleven bankers, with whom the terms were allotted, had £700,000 each; the rest was divided among the other bankers, the great trading companies, and the clerks of the public offices. The premium was £1 10s. per cent.; but, the stocks rising considerably in a few days after, the minister was censured for the disadvantageous bargain he had made. He vindicated himself by saying, that he had only been ten days in office; the late ministry had left the treasury without a shilling, and the public service admitted of no delay. On the 7th of May Mr. Pitt made his promised motion, respecting a reform in the parliamentary representation. He introduced it by declaring that 'he never felt more embarrassment or anxiety than at that moment, when, for his country's good, he found himself obliged to lay before the house the imperfections of that constitution to which every Englishman ought to look up with reverential awe; a constitution which, while it continued such as it was framed by our ancestors, was truly called the production of the most consummate wisdom. Raised by it to greatness and glory, England had been at once the envy and the pride of the world. Europe was taught by experience that liberty was the foundation of true greatness; and that, while England continued under a government perfectly free, she never failed to perform exploits that dazzled the neighbouring nations. But a melancholy series of events, which had eclipsed the glory of Britain, exhibited a reverse of fortune, which could be accounted for only on this principle, that during the last fifteen years there had been a deviation from the principles of that happy constitution, under which England had so long flourished. It was not for him to touch the venerable fabric; to see it stand in need of repair was sufficiently melancholy; but the more he revered it, the more he wished to secure its

duration, the greater he felt the necessity of guarding against its decay. An Englishman who should compare the flourishing state of this country twenty years ago, with the state of humiliation in which she now is, must be convinced, that the ruin which he now deploras, having been brought on by slow degrees, and almost imperceptibly, proceeded from something radically wrong in the constitution. Of the existence of a radical error, no one seemed to doubt. The house itself had discovered, that a secret influence was sapping the very foundation of liberty by corruption: the influence of the crown had been felt within those walls, and had often been found strong enough to stifle the sense of duty, and to overrule the propositions made to satisfy the people. The house of commons, in former parliaments, had been base enough to feed the influence that enslaved its members; and thus was at once the parent and the offspring of corruption. This influence had risen to such a height, that men were ashamed any longer to deny its existence; and the house had at length voted, that it ought to be diminished. Among the various expedients that had been devised to bar the entrance of such influence, he had heard principally of three. One was to extend the right of voting for members to serve in parliament, which was now so confined, to all the inhabitants indiscriminately; so that every man, without the distinction of freeholder, or freeman of a corporation, should have a vote for a person to represent him in parliament; and this mode was thought, by those who patronised it, the only one consistent with true liberty in a free constitution, where every one ought to be governed by those laws only, to which they have actually given their consent, either in person, or by their representative. For his part, he utterly rejected and condemned this mode, which it was impossible for him to adopt, without libelling those renowned forefathers, who had framed the constitution in the fulness of their wisdom, and fashioned it for the government of freemen, not of slaves. The second expedient he had heard of, was to abolish the franchise, which several boroughs now enjoy, of returning members to serve in parliament. These were known by the popular appellation of rotten boroughs. He confessed there was something very plausible in this idea, but still he was not willing to adopt it. He held these boroughs in the light of deformities, which in some degree disfigured the fabric of the constitution, but which he feared could not be removed without endangering the whole pile. This brought him to the third expedient, which was to add a certain number of members to the house, who should be returned by the counties and the metropolis. The county members were taken from that class of gentlemen the least liable to the seduction of corrupt influence; the most deeply interested in the liberty and prosperity of the country, and consequently the most likely to pursue such measures as appear the most salutary to it. This appeared to him the most fit expedient to be adopted, because it had the merit of promising an effectual counterbalance to the weight of the boroughs, without being an innovation on the form of the constitution.

Mr. Pitt added, that he had drawn up three resolutions, which he would propose for their consideration: viz. 1. 'That it was the opinion of the house, that measures were highly necessary to be taken, for the future prevention of bribery and expense at elections.' 2. 'That for the future, when the majority of votes for any borough shall be convicted of gross and notorious corruption, before a select committee of that house, appointed to try the merits of any elections, such borough should be disfranchised: and the minority of voters, not so convicted, should be entitled to vote for the county in which such borough should be situated.' 3. 'That an addition of knights of the shire, and of representatives of the metropolis, should be added to the state of the representation.' Mr. Duncombe seconded the motion. Mr. Powys said, before he consented to make any alteration in the constitution of that house, he desired first to have the existence of the evil proved. He ridiculed the extravagant ideas entertained by certain great reformers, and alluded particularly to the duke of Richmond's scheme, who, he said, disdained to regard the narrow limits of practicability, and insisted upon universal representation. In proof of this, he read a part of the duke's letter to the Yorkshire committee, some passages of their resolutions, and of those of the Constitutional Society, &c. He, therefore, moved the order of the day. Mr. Thomas Pitt supported his honorable friend's motion because it was specific, and less alarming than the many visionary schemes of vain speculatists talked of out of doors. He said the borough influence was not without its merit: it had opposed the influence of the counties, when the knights of the shire attempted to carry the influence of the democracy too far, and build an unconstitutional power on the ruins of the monarchy. As to the propositions, he thought the number of additional knights proposed by far too many. If his honorable friend would reduce the number to one knight for every county, he would agree to that, as a mean of putting an end to the clamors of the people; but begged they would be given to understand, that the house would do no more. Lord North denied the existence of the influence complained of, and insisted that he himself afforded a proof of its non-existence. The American war, which had been laid to his charge, had often been called the war of the crown, but very unjustly; for it was undertaken to maintain the rights of the parliament and people of Great Britain. For this reason it was popular. If the influence of the crown had produced great majorities within that house, it could not have produced the almost unanimous approbation of the people without doors. But what made the war at last unpopular? Not its want of justice, but want of success. Where was then the influence of the crown? Why did it not avert this blow? Why did it not keep a minister in office in spite of the voice of parliament? Such an influence could not interfere, for it did not exist. He, therefore, opposed all innovation.

Mr. Fox animadverted with great strength of argument on the reasonings of his colleague. He wished the question had not been so nar-

owed, as the friends of reform were thereby disjoined. But, though he objected to the specific propositions, he would vote against the order of the day, as that went to crush all reform. It had been said, that the constitution was in theory already quite perfect, though in practice it might appear otherwise. The contrary, paradoxical as it might seem, he would nevertheless maintain. It was, in his opinion, the most absurd thing on earth in theory, though its practice was consonant to sound sense. What, for instance, could be more absurd, than to say, that there should be three independent and equipotent estates, one of whom was the governor and the other two the governed; and yet that no act of the legislature should be made without the agreement of these distinct and jarring powers? What could be more absurd than to say, that one of the estates should consist of a single person, and that person the governor, and that this single person's voice should be of equal force, with those of the millions he governed? Yet, absurd as this theory was, nothing absurd appeared in the practice. By the benignity of the prince, and the wisdom of his counsellors, discordant as these principles appeared, there was in the functions of government nothing of disorder. People, therefore, should not discredit theories, as wild or chimerical, because they concurred not with their own ideas. Were it not for theorists, the constitution, much as it was boasted of, would have had now but little claim to praise. What should we be now, but for our Harringtons, our Sydneys, and our Lockes? To invigorate the constitution of government frequently is as requisite as to invigorate the body of every individual. We are every hour wasting, and every hour recruiting; so is the constitution. 'To talk of innovations,' added Mr. Fox, 'as a bug-bear against reform, is what uncandid men have always done in politics as well as in religion. What are the reforms in the trials of contested elections? What is the law disqualifying custom-house officers from voting in elections? What is the bill which goes by the name of my honorable friend, Mr. Burke? What are all these but innovations in the constitution?—Away with the canting phrase. The single consideration is this:—Is any reform wanting, or not?—I think it is, and therefore concur in the motion.' At half past two A.M. the house divided, when there appeared, for the order of the day 293; against it 149; majority against Mr. Pitt's propositions 144.

About this period a fraudulent transaction of a singular nature, respecting the public money, was brought under the consideration of the house of commons. Messrs Powell and Bembridge, clerks of the pay office, having fallen under suspicion of gross misbehaviour, were examined before the treasury board, and appearances were so strong against them, that colonel Barre, then paymaster general, dismissed them from their office. Mr. Burke, however, upon his being appointed paymaster, re-instated them. This being considered as reprehensible, lord Newhaven, on the 24th of April, moved in the house of commons for a copy of the minute of the treasury board, respecting their examination, which

was agreed to. But, on the 2nd of May, his lordship informed the house, that he had heard prosecutions were ordered against them, on which account he moved to have the order discharged, that no proceeding might take place in that house, tending to bias the minds of the public against them before trial. Mr. Burke, on this occasion, defended the restoration of these parties, and said it was entirely his own act, upon which he had asked no advice, being responsible for it to his country; and that he had so regulated the pay office, that there was no danger of the public money being embezzled. Mr. Martin said, he could not help looking upon the restoration of these gentlemen, as a gross and daring insult to the public. The subject was resumed on the 19th of May; and on the 21st Mr. Rolfe begged the paymaster to inform the house, whether he still intended to keep Messrs Powell and Bembridge in office? Mr. Burke assured the house, that he had not restored them upon slight grounds; he stated various savings to the public from his plan of reform, which the assiduity, fidelity, and industry of these two gentlemen had enabled him to introduce; and concluded by asking, was it then surprising that he should be unwilling to lose the assistance of men who had enabled him to make reforms so useful? However, he would abide by the judgment of the house. Mr. Powell had tendered his resignation, he said, and he had accepted it; Mr. Bembridge had also made frequent offers of resignation: it rested with the house, whether he should accept it. After some further conversation, it was understood, that Mr. Burke would accept of his resignation; but he declared, that he would keep both places vacant for them, in hopes that they would be acquitted. These hopes of Mr. Burke's, however, were disappointed; Mr. Powell, on the 26th of May, cut his throat in his bed-chamber: and, on the 18th of July, Mr. Bembridge was brought to trial before lord Mansfield, for embezzling the public money, to the amount of £48,709, when the jury, in fifteen minutes, returned a verdict of guilty. On the 26th of May, in the committee of ways and means, lord J. Cavendish opened the budget. The objects of taxation were bills of exchange; receipts, wills and legacies, bonds, law proceedings, admissions to inns of court, &c.; stage coaches; turnpike roads and enclosures; quack medicines; carriages; registers of births, marriages, and deaths; weights and measures; and an additional duty on postages; all of which, after some opposition, particularly to the receipt tax, passed.

On the 3rd of June, 1783, the duke of Richmond called the attention of the house of peers to an object, which he conceived might materially affect the administration of public justice, viz. the custody of the Great Seal, and the practice of committing it to the custody of judges, of which an instance then existed. The motion was as follows:—"The putting the seals in commission *durante beneplacito*, and appointing judges commissioners with large salaries and perquisites, to be received by them during the existence of a commission, originating in, and solely dependent on, the will and pleasure of the

crown, tended to invalidate an act of the 13th of William III. for securing the independency of the judges.' After declaring, that he meant nothing personal to the present commissioners, he entered largely into the nature of independency of the judges. To secure this great object, two things were necessary, viz. 1. That their offices should be independent of the will of the crown; and, 2. That their salaries should be ascertained. By the former, their fears were effectually removed; by the latter, only, all temptations from hope could be done away. The act of 13th of William III. was intended to secure both these objects; and consequently, to give three judges, selected by favor, the great emoluments accruing to the holders of the great seal, in addition to their salaries as judges, was in direct opposition to the spirit of that act, placed them immediately within the influence of the crown, and consequently tended to diminish their independence. But the mischief, he said, had not stopped here. Another inconvenience of the same sort had arisen out of it, viz. the commission by which the chief justice of the king's bench sat as speaker of the house of lords. This commission, he knew, was of long date; but still it was a mode of reward dependent on the will and pleasure of the crown, and therefore in opposition to the design of having the salaries of judges fixed. He mentioned another matter which deserved their consideration;—the impropriety of judges sitting at all in that house. He did not wish that the highest honors should not be open to that profession; but that, while peers sat on the benches as judges, they should abstain from exercising their privilege from voting in the house. So long as they sat there they were necessarily legislators, and almost unavoidably became politicians; characters, which, in the opinion of the best writers on civil government, were utterly inconsistent with that of judge. Another reason, why he thought the lord chancellor, lords commissioners, and lords chief justices, ought not to vote in that house, was that, by so doing, they were obliged to sit in judgment on their own decrees, and thus, as it were, to try themselves. He said, he had often heard it boasted, that lord Hardwicke never had one of his decrees reversed, while he sat on the woolsack. This he had always considered as no compliment to that learned peer, but as a fact that proved too much. Did their lordships think lord Hardwicke so infallible, that, during the great length of time he presided in the court of chancery, he had never given an erroneous judgment? Must they not rather concur with him, that the true reason, why none of his decrees were reversed, was the great influence a lord chancellor of lord Hardwicke's abilities must always possess in that house? In support of this opinion, he desired their lordships to remember, that, when Mr. Henley was lord keeper, he had several of his decrees reversed; but when he was created a peer, and sat there as lord Northington, no more reversals were heard of. In all cases of appeal, it was for the most part customary to leave the judgment to the law lords: the impropriety, therefore, of trying ever again the causes themselves had adjudged, needed,

he thought, no farther argument. The motion being objected to, as throwing a direct censure on the late appointment of commissioners, it was withdrawn, and the following substituted:—‘That a committee be appointed to take into consideration the independency of the judges, and such farther regulations as may be proper for securing the same.’ But the previous question was moved, and carried without a division.

On the 17th of June Sir Cecil Wray presented a petition to the house of commons from the people called Quakers, setting forth, ‘that the petitioners met in their annual assembly, having solemnly considered the state of the enslaved negroes, conceive themselves engaged, in religious duty, to lay the suffering situation of that unhappy people before the house, as a subject loudly calling for the humane interposition of the legislature; and they regret, that a nation professing the Christian faith should so far counteract the principles of humanity and justice, as, by cruel treatment of this oppressed race, to fill their minds with prejudices against the mild and beneficent doctrines of the gospel; and that, under the countenance of the laws of this country, many thousands of those our fellow creatures, entitled to the natural rights of mankind, are held, as private property, in cruel bondage; and the petitioners being informed that a bill for the regulation of the African trade is now before the house, containing a clause which restrains the officers of the African company from exporting negroes, the petitioners deeply affected with a consideration of the rapine, oppression, and bloodshed, attending that traffic, humbly request, that the said restriction may be extended to all persons whatsoever,’ &c. Lord North, after paying several just compliments to the petitioners for their humanity, expressed his fears that it would be found impossible to abolish the slave trade, as it had, in some measure, become necessary to almost every nation in Europe: and as it would be next to an impossibility to induce them all to give it up, and renounce it for ever, so he was apprehensive that the wishes of the humane petitioners could not be accomplished. Sir Cecil Wray said, he went heart and hand with the petitioners, and wished something might be done towards abolishing a traffic which disgraced humanity. His motion that the petition lie on the table was agreed to.

During the whole of this session, the affairs of the East India company were objects of the unremitted attention of two committees appointed on that business; but the unsettled state of the government prevented any effectual measures from being taken in consequence of their reports. In the course of their investigations, however, appearances of guilt had been discovered against Sir Thomas Rumbold, a man who, though originally of a low station, had returned from India with an immense fortune, and been knighted. A public prosecution had been commenced against him two years before, and a bill of restraint had passed to prevent him from leaving the kingdom, or alienating his property. On the 2nd of June, 1783, the lord advocate, observed, in the house of commons, that, Sir

Thomas Rumbold having finished his defence, it was now the duty of the house to take the whole of the evidence into consideration; but, as the season was far advanced, he moved for a bill to continue the proceedings and the restraining bill against him in their present state, notwithstanding any prorogation or dissolution of parliament. After some conversation, the motion passed, and the bill was brought in and agreed to.

On the same day Mr. Pitt brought in a bill for regulating the public offices; and said, the purpose of it was to embrace all the objects pointed out in the king’s speech at the opening of the session. On the 17th he moved the house to resolve itself into a committee on the bill. Lord John Cavendish opposed the motion, alleging the bill was useless, and that all its objects might be answered without it, as the regulations necessary in the offices might be established by the heads of these offices. Mr. Pitt expressed his surprise at this last assertion, and to convince the house that abuses did exist in several public offices, and that the heads of these offices were not the most fit persons to correct them, he stated the following facts:—In the pay office, under the name of gifts, two clerks, whose salary is only £240 each, had received in one year, the one £2000, and the other £2500, and yet this happened in an office where the commissioners of accounts had been told no fees were taken. In the post office the incidental expenses were enormous. The secretary had 2½ per cent. commission on packets provided for those taken or destroyed. Under this head of packets, the nation, this very last year, had paid £120,000, and thus the secretary, whose salary is only £500, made £2500 a-year by this commission. The noble lord in the blue riband, (lord North) had cost the public the last year he presided at that board £1340 for stationary ware! He was surprised how such a bill could be run up; but, when he read the particulars, he was astonished it had not been ten times as much; for he found in one article a charge of £350 for whip-cord! Above £10,000 had been laid out on his lordship’s house in Downing Street, and something near that sum on the house at Bushy Park. There were charges of £600 a-year for stationary consumed by the two secretaries of the treasury; and about £100 for each of the lords of that board. On the whole, Mr. Pitt expected, that, by this bill passing, there would be a saving of £40,000 a-year to the public.—Lord North vindicated himself from these charges; but, on the 19th, the bill was passed, though it was afterwards thrown out by the house of lords. On the 23rd of June the house was informed, by a message from the king, that £50,000 a-year was to be settled on the prince of Wales out of the civil list; but that £60,000 would be necessary as a temporary aid, to equip him at his outset in life. Mr. Fox observed that the proposed establishment was certainly far too low; and that he should undoubtedly, had the advising an establishment remained with him, have proposed a sum more adequate to the object in view. Such an observation coincided with what had been rumored, that Mr. Fox had suggested

a splendid establishment for the prince, which his majesty would not agree to. This sum was accordingly voted by both houses, and an address of thanks presented to his majesty. On the same day lord J. Caveendish moved for leave to bring in a bill for the better regulation of the offices in his majesty's exchequer, which was agreed to; and on the 4th of July, in the committee on the bill, he proposed, that after the interest of the then auditors, tellers, &c. should cease, the salaries of these officers should be fixed and certain. Mr. Fox said, the principle of the bill was not so much to reduce the salaries of these officers, as to prevent the emoluments arising from them from increasing with the public burdens, and the holders of them from becoming rich in proportion as the public should grow poor. It was estimated, that there would be a saving to the nation from these reforms of about £17,000 a-year in peace, and £40,000 in war. On the 1st of July, a motion was carried, for adjourning the farther consideration of the bill of pains and penalties against Sir T. Rumbold, &c., to the 1st of October, by which means the whole proceeding fell to the ground, and was never afterwards resumed.

Parliament met on the 11th of November, 1783, when the two houses were informed, in the speech from the throne, of the treaties of peace being concluded; and of the necessity of providing for the security of the revenue; and the East India company's affairs were stated as the reason of their being called together after so short a recess. Some days passed in discussions relative to different parts of the revenue; and on the 18th of November Mr. Fox moved for leave to bring in 'A bill, for vesting the affairs of the East India Company in the hands of certain commissioners, for the benefit of the public;' and also, 'A bill for the better government of the territorial possessions and dependencies in India.' By the former, he proposed to enact, 'That the whole government and management of the territorial possessions, revenues, and commerce of the company, together with all the powers and authorities before vested in the directors, or in the general court of proprietors, should be vested in seven directors, named in the bill; viz. earl Fitz-William, the right honorable Frederick Montague, lord viscount Lewisham, the honorable George Augustus North, Sir Gilbert Elliott, Sir Henry Fletcher, and Robert Gregory, Esq. These directors, or commissioners, were to hold their office for four years, and were not to be removable by his majesty, without an address of either house of parliament. That, for the sole purpose of ordering and managing the commerce of the said company, nine assistant directors, being proprietors, each of £2000 capital stock, should be appointed to act under the directors aforesaid. That all vacancies in the office of the directors should be filled by his majesty; and that the vacancies in the office of the assistant directors should be filled by a majority of the proprietors, at an election by open poll. That the assistant directors should be removable by five directors, the cause and reasons for such removal being

entered on their journals, and signed with their respective names; and that the directors and assistant directors should be removable by his majesty, upon an address of either house of parliament. The bill then provided certain regulations relative to the official proceedings of the directors; and enumerated certain disqualifications which should render any person incapable of being a director, or assistant director. It then proposed to enact, that the directors should, once in every six months, lay before a general court of proprietors an exact state of the mercantile concerns of the company; and that, before the commencement of every session, they should lay the same, with other accounts therein stated, before the commissioners of his majesty's treasury, to be by them laid before the parliament. Authority was given to the directors 'to remove, suspend, appoint, or restore, any of the officers in the company's service, either civil or military. It next provided for 'the speedy and effectual trial of all persons charged with any offences committed in India; and for the prevention of all persons so charged, from returning to India before a due examination of the matters charged shall be had; and required from every director, before whom examination into the subject matter of such charge shall be had, to enter into the journals, and subscribe with his name, the specific reasons on the particular case, for the opinion or vote he shall give thereon.' It further provided for 'a speedy decision upon all differences or doubts, which might arise among the members of their government in India;' and directed that, 'in case such a decision shall not be had within three months after the account of any such difference or doubt shall be received, the directors shall enter on their journals their reasons for not coming to such a determination.' And, lastly, that the assistant directors should be allowed a clear yearly salary of £500 from the company.' By the second bill (which Mr. Fox introduced on the 26th of November) 'the powers granted to the governor-general and council, by the 13th Geo. III., were more fully explained, and strict obedience to the orders of the directors enjoined. The delegation of the powers of the council general, or of any presidency, was prohibited; the revision of all proceedings in special commissions directed; and the regular communication of all correspondence in India provided for. It forbid the exchange, or the acquisition, or the invasion, of any territory in India, or the forming any alliance for such purposes, or the hiring out any part of the company's forces, by the council general, or any presidency. It prohibited the appointment to any office of any person removed for misdemeanor; and the letting out to hire any farm, or other thing, to the servants of any person in the civil service of the company. It abolished all monopolies in India. It declared the acceptance of all presents to be illegal with certain penalties; and made such presents recoverable by any person for his own sole benefit. It secured an estate of inheritance to the native landholders, and provided against the alteration or the increase of rents. It directed, that princes engaged to keep up or pay troops for the service

of the company, or paying tribute to them, or under their protection, shall not be molested in the enjoyment of their rights. It explained the powers granted by the 13th Geo. III. to the council-general over the other presidencies, in matters of war, peace, and treaties: and disqualified the agents of any protected prince, and all persons in the service of the company, from sitting in the house of commons during their continuance in such employment, and for a certain time after quitting the same. It lastly directed, 'that all offences against this act may be prosecuted in the courts in India, or in the court of king's bench.' Such was the substance of these two celebrated bills: but, whatever were their merits as a system of government for India, they were evidently to condemn what had hitherto been considered sacred in Britain: they were to wrest from the hands of those to whom privileges had been granted by charter, the powers attached to those privileges, by which the incorporation had managed their affairs: they were to do more, they were to place these powers, with all the pecuniary advantages connected with them, for four years in the hands of seven individuals nominated by the present administration, beyond the control of the crown.

Mr. secretary Fox introduced the first of these bills on the 18th of November, when he showed the necessity of remedying the many abuses that had crept into the government of the East India Company's territories. These had been so severely felt, that parliament had instituted enquiries by which the sources of them might be discovered, and proper remedies applied. Committees had been appointed; their researches had been pursued with uncommon industry, and their reports contained information so complete, that perhaps the like had never been laid before parliament. The state of the company's finances was truly deplorable: they had last year applied to parliament for leave to borrow £500,000 on bonds; they had petitioned for £300,000 in exchequer bills, and for the suspension of a demand on them by government for £700,000 due for customs: they owed £11,200,000, and had stock in hand only to the amount of about £3,200,000 which left a debt of £8,000,000, a sum highly alarming, when compared with the capital of the proprietors. Government must, therefore, either step in, or the company must be annihilated. Gentlemen must not be led away with the idea, that the public had no right to take upon themselves to control the government of the company's settlements. The public had a greater interest in them than the company itself. The whole amount of the dividend to the proprietors was only about £256,000, whereas the nation derived from the customs paid by the company about £1,300,000. The people of England had, therefore, a much greater stake in the business than the proprietors. The prosperity of the company was so closely connected with that of the state, that the credit of the former could not be injured without giving a shock to that of the kingdom. If the bills for £2,000,000 should return protested, what would the world say but that the people of England were bankrupt, else they would not have suffered the

bankruptcy of a company, which paid them £1,300,000 a year! He then said it was his intention, in the bills moved to be brought in, to authorise the lords of the treasury to consent that the directors shall accept the bills now on their way to England, though the nation would thus be liable to pay the whole, if the company should not be able to take up the debt. Thus he hoped to save the sinking credit of the company. He ascribed all the misfortunes of the company to their want of control over their servants. Having stated various grievances arising from this, he pointed out the remedies he intended to apply by the bill.

Mr. Fox's motion, strongly seconded by colonel North, was opposed by Mr. Pitt; who, though he admitted the necessity of the interference of parliament in the affairs of the East India Company, said, that the chartered rights of British subjects, confirmed by acts of the British legislature, could not be violated but by a breach of the constitution. Necessity was the common plea of tyranny. To reform the abuses of any government, he argued, was there a necessity to annihilate the very existence of it! By annihilating the constitution of the East India Company, established on the most sacred bonds of civil government, you shake the fabric of the British constitution to the foundation, destroy the distinctions of property, and establish a despotic power in a limited government. Not to mention the great increase of that undue influence of the crown, which the right honorable gentleman appeared lately so anxious to diminish, the measure threatened danger to liberty, destruction to commerce, and the most alarming consequences to national credit. Governor Johnstone treated with his usual asperity the measures that ministry had pursued to distress the East India Company; though he applauded the principles of justice and humanity that formed the basis of the bill, so far as it respected restitution to the native princes of India, and the establishment of the zemindars and poligars in their farms at the old rents. He concluded with a panegyric on governor Hastings. Mr. Fox begged gentlemen to recollect, that the character of Mr. Hastings was not involved in the consideration of the bill. The motion being carried without a division, the bill was read a first time on the 20th of November, and appointed to be read the second time on the 26th. On the 24th a petition was presented against it from the proprietors, and on the 25th another from the directors, praying to be heard by counsel, which were ordered to lie on the table. On the 26th Mr. Fox brought forward his second bill for the regulation of the affairs of the East India Company, which was read, and ordered to be read the second time on the Tuesday following. The arguments urged against the bills were drawn chiefly from two sources: 1. The arbitrary de-facance of the chartered rights of the courts of proprietors and directors, without a justifiable plea of necessity: 2. The dangerous power lodged in the hands of the new commissioners. On both these grounds, the advocates for the bills joined issue with their opponents. To substantiate the grounds of necessity, the sup-

porters of the bills argued, that the phrase chartered rights was full of affectation and ambiguity: that there were two kinds of charters; the first when the natural rights of men were confirmed by some public deed, such as the charters of king John and king Henry III. The second formed on principles the very reverse of these, for the purpose of suspending the natural rights of mankind at large, to confer some exclusive privileges on particular persons. Such were commercial charters; and such charters were therefore, in the strictest sense, voidable, whenever they substantially varied from the purpose of their existence. In conformity to this, parliament had actually passed several acts, all infringing on the company's charter. It had been admitted on all sides, that the company, under its present constitution, was totally inadequate to the government of their immense territorial acquisitions; but it was contended that, in the present measure, the extent of the remedy went infinitely beyond the extent of the necessity: that the disfranchisement of the members of the company, and the confiscation of their property, could only be justified by acts of delinquency legally established. To this it was replied, that their property was not confiscated, the bill expressly vesting it in the company, in trust for the sole benefit of the proprietors.

While these bills were thus supported with great ability, Mr. Pitt contended that, by vesting the whole patronage of India in the hands of seven directors nominally appointed by parliament, but really selected by administration, the influence of the crown would be augmented to such an extraordinary degree, that, like an irresistible torrent, it might utterly overturn and sweep away the remaining liberties of the country. Mr. Dundas opposed the measure, not because it augmented the power of the crown, but because it increased a power already overgrown: it placed a new and unparalleled influence in the hands of the minister and his coadjutors for four years, which would be independent of the crown and of parliament: it would thus create a fourth estate in the realm, with a power of a most dangerous nature, which in the end might annihilate the crown and subvert the constitution. Mr. Fox's motives on this occasion were attacked by the ordinary members of opposition in very pointed language. They said that it was evident nothing short of a perpetual dictatorship would satisfy his inordinate ambition. They allowed that he had many respectable qualities; but they could on no account see him exalted on the ruins of the constitution. It was alleged that he was ready to sacrifice the king, the parliament, and the people, at the shrine of a party, &c. The chief supporters of the bills were the two secretaries, Mr. Fox, and lord North; Sir Grey Cooper, and Messrs. Erskine, Burke, Sheridan, Anstruther, and Adam; against it were Messrs. W. and T. Pitt, the marquis of Graham, Sir J. Lowther, and Messrs. Dundas, Dempster, Powis, Jenkinson, and McDonald. During the progress of the bills the court of directors of the East India Company were heard by council; and the mayor and common council of the city of London presented a petition praying they might not pass into laws.

Such, however, was the influence of the coalition, that, on the 23th of November, the votes on the commitment of the first bill were 229 to 120. On the 1st of December, in the committee, the votes for proceeding on the bill stood 217 to 103; on the third the seven directors and nine assistants were nominated without opposition; and on the 8th the bill was passed by a majority of 106; there being 208 for it, and 102 against it.

On the 9th of December Mr. Fox carried the first bill to the house of peers, and on the 11th it was read a first time, when earl Temple, lord Thurlow, and the duke of Richmond, expressed their abhorrence of the measure in the strongest terms. Lord Thurlow descanted on the flourishing state of the company's affairs, and pronounced a brilliant panegyric on governor Hastings. After a short debate on the production of papers, the second reading was fixed for the 15th. In the mean time, the parliamentary debates on the bills being diffused through the nation, they not only created considerable interest in the minds of the public, but seem to have awakened the feelings of the sovereign. It was affirmed that, on the 11th of December, the king had signified to lord Temple his complete conviction of the correctness of the views of opposition, and authorised him to declare the same to such persons as he should think proper: that a written note was put into his hands, in which his majesty declared, that he should esteem those who should vote for the India bill, not his friends, but his enemies: and that if he (lord Temple) could put this in stronger words, he had full authority to do so. It was also said that a communication had been made to the same purport to several other peers in the house of lords; therefore, on the 15th of December, counsel being heard against the bill, and soliciting at eleven at night to postpone farther proceedings till next day, the motion for adjournment was carried against the ministry by eighty-seven to seventy-nine. In consequence of what had now taken place, a motion was brought forward in the house of commons on the same day by Mr. Baker: that it is now necessary to declare, that to report any opinion, or other proceeding depending in either house of parliament, with a view to influence the votes of the members, is a high crime and misdemeanour: derogatory to the honor of the crown; a breach of the fundamental privileges of parliament, and subversive of the constitution. The motion was seconded by lord Maitland, but strongly opposed by Mr. Pitt, who urged the impropriety of proceeding on mere unauthenticated rumor. With respect to the effects adduced as a proof of these reports, they were not conclusive, as it was not unusual for the lords to reject a bill that had been passed by the commons, without the least suspicion of undue influence. After a long and warm debate, the house divided, when there appeared for the motion 151, against it eighty. It was then resolved, that, on Monday next, the house should resolve itself into a committee of the whole house, to take into consideration the present state of the nation.

As a change of ministers appeared to be a

measure determined upon by the king, and a dissolution of parliament the immediate and necessary consequence, the majority of the house thought no time was to be lost, in endeavouring to render the attempt as difficult as possible. With this view, immediately after the above resolutions were agreed to, Mr. Erskine made the following motion, that it is necessary to the most essential interests of this kingdom, and peculiarly incumbent on this house, to pursue with unremitting attention the consideration of a suitable remedy for the abuses, which have prevailed in the government of the British dominions in the East Indies; and that this house will consider as an enemy to his country, any person who shall presume to advise his majesty to prevent, or in any manner interrupt, the discharge of this important duty. The motion was opposed as factious, as interfering with the executive part of government, and trenching on the undoubted prerogative of the crown, without any just cause. It was carried, however, by the same majority, with the former.

On the 16th of December the house of peers heard counsel against the bill, and on the 17th, after a warm debate, it was rejected by a majority of ninety-five to seventy-six. On this occasion the prince of Wales did not vote. Previous to the division, the reports of the undue influence being again mentioned by the duke of Portland, lord Temple acknowledged, that his duty had led him to solicit an interview with his sovereign on the bill; that he had then communicated his sentiments very fully to his majesty; that these were lodged in the breast of his sovereign; and what they were would for ever remain a secret. But though he would not declare affirmatively, what his advice to his sovereign was, he would tell their lordships negatively what it was not: it was not friendly to the principle and object of the bill. In doing this he was confident he had acted a dutiful part to his sovereign. On the 18th, at twelve o'clock at night, a messenger delivered to the two secretaries his majesty's orders, that they should deliver up the seals of their offices, and send them by the under secretaries, Messrs. Frazer and Nepean, as a personal interview would be disagreeable to him. The seals were immediately given by the king to lord Temple, who sent letters of dismission next day to the rest of the cabinet council; Mr. Pitt was forthwith appointed first lord of the treasury, and chancellor of the exchequer; earl Gower president of the council. On the 22nd lord Temple resigned the seals, which were delivered to lord Sydney and the marquis of Caermarthen as secretaries of state. Lord Thurlow was appointed lord high chancellor, the duke of Rutland lord privy seal; lord viscount Howe first lord of the admiralty; the duke of Richmond, master of ordnance; W. W. Grenville, esq., and lord Mulgrave paymasters general; H. Dundas, esq., treasurer of the navy; earl of Salisbury lord chamberlain; Lloyd Kenyon, esq., attorney general; R. Pepper Arden, esq., solicitor general; Hay Campbell, esq., lord advocate for Scotland; and R. Dundas, esq., solicitor.

A formidable majority in the house of commons still adhered to the late ministry, and, after

their dismissal, made the dissolution of parliament, in the public opinion, an event immediately to be expected. The passing of the land-tax bill, however, was previously necessary. It had been twice read, and the 20th of December appointed for the third reading. But, as the committee on the state of the nation was to sit on the 22nd, the house, on the 19th, after a short debate, adjourned to the 22nd. On that day, before the speaker left the chair, Mr. W. Grenville informed the house, that lord Temple had authorised him to say, that he was ready to meet any charge that should be made against him; and that he had thought fit to resign the seals to prevent all suspicion of his seeking for protection as a minister. In answer to this notification, Mr. Fox said, that, as to the earl's relinquishing an office which he had held but three days, he was doubtless the fittest judge; but as to the facts alluded to, facts of public notoriety, which affected the honor of parliament, and the safety of the constitution, he trusted the house would take them into their most serious consideration: though, indeed, the secret nature of them almost precluded the possibility of bringing a personal charge against any one. In the committee on the state of the nation, Mr. Erskine proposed that an address should be presented to the king, stating the alarming reports of an intended dissolution of parliament; to represent to his majesty the inconveniences and dangers that would attend such a measure, at a moment when the maintenance of public credit, the support of the revenue, and more especially the distressed state of the finances of the East India Company, and the disorders prevailing in their government both at home and abroad, demanded the most immediate attention: to beseech his majesty to suffer them to proceed on the important business recommended to them in his speech from the throne; and to hearken to the voice of his faithful commons, and not to the secret advices of persons who may have private interests of their own, separate from the true interest of his majesty and his people. This address being agreed to was presented to the king, and on Wednesday the 24th of December, the speaker read to the house the answer, which assured the house that it had been the constant object of his majesty to employ his authority to its true and only end—the good of the people; that he agreed with them in thinking that the support of the public credit and revenue must demand their vigilant care; and that the state of the East Indies was also an object of as much delicacy as importance. It concluded, ‘I trust you will proceed in these considerations with all convenient speed, after such an adjournment as the present circumstances may seem to require; and I assure you, I shall not interrupt your meeting by any exercise of my prerogative, either of prorogation, or dissolution.’ Objections were now made to these concluding words. It was said, that the whole extent of the royal favor amounted to no more than an assurance, that they should meet again; and in the committee upon the state of the nation, on motion of lord Beauchamp, the chairman was directed to move, ‘That it is the opinion of this

house, that the lords of the treasury ought not to consent that the directors of the East India Company do accept any more bills, unless they shall be able to prove to parliament that they have sufficient means to provide for the payment of them, after they shall have paid their dividend, and discharged the debt due to government.' It was next resolved, on a motion of lord Surrey, that an address be presented to the king, to desire that his majesty would not grant the office of chancellor of the duchy of Lancaster to any person, otherwise than during pleasure, before the 20th of January, 1784. These motions met with but a feeble opposition. The latter motion was founded on the enquiry that had been instituted, into the establishments of the duchy of Lancaster, for the purpose of determining whether these might not be reduced or abolished. These motions being passed, the house adjourned to the 12th of January, 1784.

The expectation of the public was now fixed with great anxiety on the meeting of parliament after the recess. A contest between the executive government and the house of commons was a spectacle that had not been exhibited in Great Britain since the accession of the house of Hanover: and many circumstances concurred to render it peculiarly important and interesting. The matter in dispute concerned the very essence of the constitution, and could not be decided without considerably affecting its bias. In the pretended defence of the authority of the house of commons were arranged the united abilities of two powerful parties, long exercised by mutual contests in all the arts of political warfare. The champion of prerogative was a person not less distinguished by his splendid talents, and the consequent unexampled rapidity of his rise to power, than by the courage and perseverance he had already demonstrated in the cause he now stood forward to support. By the usual effect of ministerial influence upon the house of commons, as well as by the increasing abhorrence of the designs of the coalition, a sufficient number of members joined the new administration to make their votes nearly equal to those of opposition. In this state of affairs, both houses met on the 12th of January, 1784. As soon as the speaker had taken the chair, Mr. Fox attempted to introduce, previous to any other business, the discussion of certain resolutions drawn up by the opposition; but was interrupted by the swearing in of new members; after which Mr. Pitt declaring he had a message to deliver from the king, and wishing to supersede the measures of opposition by the important consideration of the East India Company's affairs, rose up at the same instant with Mr. Fox. A tumult ensued as to who had the prior right to speak, but it was settled by the speaker in favor of Mr. Fox. He called upon the minister, if he wished to put a stop to such measures as the committee might think necessary to adopt for their own security, to give the house some satisfactory assurance, that no dissolution would take place. With this requisition, Mr. Pitt positively refused to comply, and declared, that 'he would

never compromise, nor bargain away, the royal prerogative in the house of commons.' The majority, who were now persuaded that the new ministers were only to be withheld by their fears from putting an end to the session, resolved to render such a step highly dangerous, at least, if not impossible. With this view, as soon as the question for the order of the day was carried, on a division of 232 against 193, and the speaker had left the chair, the two following resolutions were moved by Mr. Fox, passed without a division, and, being reported, were agreed to by the house: 1. 'That it is the opinion of this committee, that for any person or persons in his majesty's treasury, or in the exchequer, or in the bank of England, employed in the payment of the public money, to pay, or direct, or cause to be paid, any sum or sums of money, for, or towards, the support of the services voted in this present session of parliament, after the parliament shall have been prorogued or dissolved, if it be dissolved or prorogued before any act of parliament shall have passed appropriating the supplies to such services, will be a high crime and misdemeanor, a daring breach of the public trust, derogatory to the fundamental privileges of parliament; and subversive of the constitution of this country.' 2. 'That it is the opinion of this committee, that the chairman of the committee be directed to move the house, that the bill for punishing mutiny and desertion, and for the better payment of the army and their quarters, be read a second time, on Monday the 23d of February next.' The immediate dissolution of parliament being thus far rendered impracticable, two other resolutions were moved by the earl of Surrey, viz. 1. 'That, in the present situation of his majesty's dominions, it is peculiarly necessary that there should be an administration which has the confidence of this house and the public.' 2. 'That the late changes in his majesty's councils had been immediately preceded by dangerous and universal reports, that the sacred name of the king had been unconstitutionally used to affect the deliberations of parliament; and that the appointments made were accompanied by circumstances new and extraordinary, and such as do not conciliate or engage the confidence of this house.' Mr. Dundas objected to the first resolution, that the name of the king had been, perhaps, accidentally, but certainly very improperly omitted; and proposed an amendment by inserting, instead of the words 'this house and the public,' the following, viz. 'the crown, the parliament, and the people.' This amendment, being merely proposed to point out the factious spirit of the resolution, was rejected without a division. In the debates which now took place upon these resolutions, the most pointed and sarcastic personalities were thrown out and retorted from both sides of the house. The coalition was branded as a corrupt confederacy of two desperate factions, to seize upon the government; the India bill was said to have been an experiment made by the late secretary, to raise himself to a degree of power superior to that of the sovereign. On the other hand, the new administration were described as a coalition,

not indeed of parties, but of the shreds and remnants, the dregs and outcasts, of all parties; as a body collected for the purpose of fighting the battles of secret and unconstitutional influence; of trampling on the power and dignity of the house of commons; of establishing a government of cabal, intrigue, and favoritism; and of destroying the very principles of laudable ambition and honorable service in the state. At last, about seven o'clock in the morning of the 13th of January, the committee divided, when the motion was carried by a majority of 142, there being for it 196, against it fifty-four.

On Wednesday, the 14th of January, Mr. Pitt moved for leave to bring in 'a bill for the better government and management of the affairs of the East India Company.' By this bill commissioners were to be appointed by his majesty, from the members of his privy council, who were 'authorised and empowered from time to time, to check, superintend, and control, all acts, operations, and concerns, which in any wise relate to the civil or military government, or revenues of the territories and possessions of the said united company in the East Indies.' It proposed to enact, 'that the said board shall have access to all papers and muniments of the said united company, and shall be furnished with copies thereof, and of all the proceedings of all general and special courts of proprietors, and of the court of directors; and also copies of all despatches which the directors shall receive from any of their servants in the East Indies, immediately after the arrival thereof; and also of all letters, orders, and instructions, whatsoever, relating to the civil or military government or revenues of the British territorial possessions of the East Indies, proposed to be sent to any of the servants of his majesty, or of the said company in the East Indies: and that the court of directors shall, and are required to, pay due obedience to, and shall be governed and bound by, such orders and directions as they shall, from time to time, receive from the said board, touching the civil or military government and revenue of the territories and possession of the company. And it further proposed to enact, that the said board shall return the copies of the said despatches to the court of directors, with their approbation thereof, or their reasons at large for disapproving the same, together with instructions in respect thereto; and the court shall thereupon despatch and send the letters, orders, and instructions, so approved or amended, to their servants in India, without farther delay; and that no letters, orders, or instructions, until after such previous communication thereof to the said board, shall, at any time, be sent or despatched by the said directors, to the East Indies, on any account or pretence whatever. That in case the said board shall send any orders, which, in the opinion of the said court of directors, shall relate to points not connected with the civil or military government and revenues of the said territories and possessions in India, it shall be lawful for them to apply by petition to his majesty in council, touching such orders; and the decision of the council thereon shall be final and conclusive. That the nomination of the

commanders in chief shall be vested in his majesty, and that the said commanders in chief shall always be second in council. It also vested in his majesty the power to remove any governor general, presidents, and members of the councils of any British settlements in India; and proposed to enact, that all vacancies in the offices aforesaid shall be supplied by the court of directors, subject to the approbation of his majesty. Lastly, that no order or resolution of any general court of proprietors shall be available to revoke or rescind, or in any respect to affect, any proceeding of the court of directors, after his majesty's pleasure shall have been signified upon the same. The debates on this bill turned chiefly on its merits and demerits, as compared with Mr. Fox's India bill, rejected by the house of lords. Mr. Pitt said that, in his bill, all the rights enjoyed by the company under their charter were preserved inviolate, as far as was compatible with the public safety. When, in answer to this, it was shown, that nothing but the shadow of power was preserved to the company, and that, by the negative reserved to the crown in all matters whatsoever, the substance was in effect vested there; he replied that, whatever might be its effect, yet having previously obtained the consent both of the court of proprietors and directors, to all the regulations contained in it, no violation of privileges could be charged, where the surrender was voluntary. Various other arguments were adduced by both sides; but at a second reading of the bill, on the 23rd of January, the motion for its commitment was rejected by a majority of eight; the votes being for it 214, against it 222.

On the 16th of January, lord Charles Spencer moved, in the committee on the state of the nation, 'That it has been declared to be the opinion of this house (referring to the resolutions formerly moved by lord Surrey), that the continuance of the present ministers in trusts of the highest importance and responsibility is contrary to constitutional principles, and injurious to the interests of his majesty and the people.' In opposition to this motion it was argued, that the premises, admitting them to be true, did not warrant the conclusion; that the ministry had been constitutionally appointed by the king, whose sole right it was to appoint them, &c. After a warm debate, the resolution was adopted, by a majority of 205 to 184. On the rejection of the India bill, Mr. Pitt was requested to satisfy the house respecting the measure of a dissolution; and a loud and general call was repeated from every side of the house. At length some harsh personalities obliged him to rise and complain of such treatment, but he concluded with a flat refusal to give any answer on the subject. The house became unusually warm, and Mr. Eden was preparing a resolution, when Mr. Fox moved to adjourn till next day in order to give Mr. Pitt time to consider, whether he had treated the house with that respect which a minister in his peculiar circumstances ought to do. Next day, Saturday, January 24th, the house met again, but the only answer given by the minister was, 'that he had no intention to advise his majesty to prevent that house from meeting on Monday:

whereupon the house, upon Mr. Powis's motion, adjourned to that day, 'in the hopes, that before next meeting, some means might be invented of healing the divisions that threatened the country with anarchy and confusion.' These hopes, however, were disappointed; notwithstanding a respectable meeting was held on the 26th at the St. Alban's tavern, of about seventy members, who joined in an address to Mr. Pitt and the duke of Portland, recommending such a measure by a coalition of parties; 'being persuaded,' they said, 'that the united efforts of those, in whose integrity, abilities, and constitutional principles they had reason to confide, could alone rescue the country from its present distracted state.' Further, to promote such a union of parties, a motion was made by Mr. Grosvenor, on the 2d February, in the house of commons, 'That the present critical situation of public affairs required the exertions of a firm, efficient, extended, and united administration, entitled to the confidence of the people, and such as might tend to put an end to the divisions and distractions of this country.' A second resolution, of a less mild tenor, was moved by Mr. Coke, 'That the continuance of the present ministers in office was an obstacle to the forming a firm, efficient, extended, and united administration.' This motion occasioned a warm debate, but was at last carried by 223 against 204. Next day, these resolutions, after another long and warm debate, were ordered, by a majority of 211 to 187, to be laid before his majesty.

On the 4th of February, the earl of Effingham called the attention of the house of lords to the resolutions passed by the commons, which he considered as of the utmost importance to the constitution, and therefore moved as follows:—
I. 'That it is unconstitutional for one branch of the legislature to assume a right of resolving to impede the exercise of a power vested in any body of men by act of parliament.' And, II. 'That it is unconstitutional for either house of parliament to pass any resolution to deprive the crown of its just prerogative.' The first of these motions occasioned a very warm debate. It was supported by earl Fitzwilliam, earl Fauconberg, duke of Richmond, lord chancellor, lord Sydney, and lord Gower, and opposed by lord Loughborough, earl of Mansfield, and lord Stormont, who vindicated the resolutions of the house of commons. Upon a division there appeared for it 100, against it fifty-three; majority forty-seven. Lord Effingham's second resolution, and motion for an address to his majesty on the subject, were then agreed to without a division. Next day, Lord Beauchamp rose in the house of commons, and mentioned a rumor, that another house of parliament had gone so far as to censure the proceedings of that house: whereupon he moved for a committee to inspect the journals of the house of lords; which being agreed to, the report of the committee was brought forward on the 9th, and a committee appointed to search for precedents. In the mean time, the members of the St. Alban's meeting, to promote the wished-for coalition, came to the following resolution, which was read in the house of commons on the 11th February, by Mr. Marsham:—'That an

administration formed on the total exclusion of the members of either the last or present administration, would be inadequate to the exigencies of the public affairs.' This occasioned the leading men on both sides to express their wishes for a union of parties, though such difficulties were thrown in the way by each, as effectually prevented it. Mr. Fox insisted on the actual, or at least virtual resignation, of Mr. Pitt, as an indispensable preliminary step; and avowed his opinion, that the house had, and ought to have, a negative in the nomination of a minister. Mr. Pitt allowed, that no minister could continue long in office without the confidence of the house, but denied that there were any constitutional means to force him to resign, except by an address to the crown; and added that there were persons with whom he could not bring himself to act without forfeiting all character of consistency. This called up lord North, who said, that though he was not disposed to gratify the caprice of an individual, yet he would willingly do any thing for his country, and withdraw his pretensions, if they were an obstacle to a union. This candid declaration of lord North, and a similar one from Mr. Fox, procured them the applauses of both parties; and a measure was soon after suggested and acceded to which promised a speedy union. This was that his majesty should invite the duke of Portland to a conference with Mr. Pitt, for the purpose of forming a new administration, on fair and equal terms. But, after this message had been actually sent, the negotiation was broke off upon the duke's insisting on a previous explanation of the word equal, which Mr. Pitt refused to give till they should meet in conference. About this time ministry were much encouraged to perseverance by the interest which the public at large took in this extraordinary contest: an address to his majesty was voted by the common council of London, thanking him for the removal of his late ministers; approving the resolutions passed by the house of lords; and declaring their determination steadily to support the constitutional exercise of prerogative. Similar addresses immediately followed from the merchants and trades of the city of London, and from the city of Norwich: in short, from every corner of the kingdom. The efforts of the coalition, indeed, made some appearance in the county of Middlesex, in Westminster, and in the great county of York, but they proved fruitless. Still however, they maintained the struggle within doors: on the 16th, the report from the committee of privileges being called for, lord Beauchamp stated, that the lords could not constitutionally interfere with the resolutions of that house; that by custom and usage, whenever they disapproved of a resolution, and vice versâ, a conference of both houses was called: whereby the house complained of, could satisfy the house complaining; and this was necessary to preserve mutual confidence between the two houses. After quoting the journals, and censuring the resolution of the lords as rash, he moved six resolutions, viz. 1. 'That this house has not assumed any right to suspend the execution of any law. 2. That it is constitutional for it to declare

its sense of the exercise of any discretionary power vested in any body of men by act of parliament. 3. That it is its duty, as entrusted with the sole grant of money, to prevent the rash exercise of any power, that may be attended with danger to the public credit. 4. That the resolutions of the 24th December last were constitutional, founded on a sense of duty towards the people, and a becoming anxiety for the preservation of the revenue, and the support of public credit. 5. That if the house had neglected to pass the said resolutions, they would have been highly responsible for the increase of those evils already too severely felt. And, 6, That the house will with moderation, but with decided firmness, maintain inviolably the principles of the constitution; equally solicitous to preserve their own privileges, and to avoid any encroachments on those of the other two branches of the legislature.' These resolutions, after a warm debate, were carried by 186 against 157.

On the 18th February Mr. Pitt being asked, previous to the consideration of the supply for the ordnance, if he had any thing to communicate relative to the Resolutions, informed the house, 'That his majesty, after a consideration of all the circumstances of the country, had not thought proper to dismiss his ministers, and that his ministers had not resigned.' This brought on a long and violent debate. Mr. Fox said it was the first instance, since the revolution, of a direct denial on the part of the crown to comply with the wishes of the house of commons; that it was the first time the house had not received a gracious answer from a prince of the house of Brunswick: that an event so new and alarming required on their part a firm but moderate, a prudent but effectual, assertion of their privileges: that the power of granting or refusing the supplies, was their constitutional and legal weapon, which he did not wish to see wielded: that to this, if necessary, they were bound to resort; but to avoid all imputation of rashness, and give ministers time for recollection, he would only move to defer the report of the estimates till Friday next. The motion was seconded by lord Surrey: but the mention of refusing the supplies was received by the friends of ministry as a threat which even the utmost madness of faction, they said, could not seriously design to execute. The very right of such a refusal was questioned. The exercise of this privilege in former times, it was said, was founded on principles which did not now exist. The settled revenues were then sufficient for the ordinary purposes of government; and it was only in cases of extraordinary demands, for the prosecution of wars disapproved by parliament, that the right of refusal was exercised; whereas, in our present state, to deny the ordinary annual supplies would be in fact to dissolve the whole fabric of government. Mr. Pitt did not deny the right of the house to refuse the supplies in times of danger from the crown, but the answer he had delivered from his majesty was not a formal answer as to an address; and he appealed to the judgment of the house whether it afforded a justifiable ground for exercising that right. Mr. Fox's motion was carried; however, by a majority of twelve; ayes 208,

noes 196. Though the supplies were thus postponed, it was by no means the intention of the majority to carry matters to extremities by refusing them; and the ordnance supply was agreed to on Friday the 20th February. On the same day, Mr. Powys moved an address to the king, expressing 'the reliance of the house on his royal wisdom, that he would take such measures as might tend to give effect to the wishes of his faithful commons, already presented to his majesty.' Mr. Eden proposed an amendment by inserting after 'measures, as'—the words 'by removing such obstacles as this house had declared to stand in the way of forming a firm, extended, efficient, and united administration, such as this house had described to be requisite in the present critical and arduous state of public affairs.' The motion, thus amended, after a long debate, was carried by 197 against 177; and the address ordered to be presented by the whole house. This was done on the 25th, and on the 27th the speaker reported his majesty's answer; wherein, after 'assuring them of his earnest desire to put an end to the divisions and distractions of the country, he declared, that he could not see that this would be advanced by the dismissal of his ministers; that no charge was suggested against them, nor any one of them specifically objected to; and that numbers of his subjects had expressed their satisfaction on the change of his councils.'—The consideration of his majesty's answer was deferred to the 1st of March, when a second address was ordered to be prepared. In this, the house humbly claimed it as their right duty, to advise his majesty touching the exercise of his prerogative; and, after stating the substance of their former resolutions, concluded with a repetition of their request, 'that he would be pleased to lay the foundation of a stable government, by the previous removal of his ministers.' After a long and warm debate, this address was agreed to by a majority of 201 to 189. On the 4th of March it was presented to the king by the speaker and a numerous body of the members; when his majesty returned an answer similar to the former; with the additional remarks that, 'If there were any grounds for the removal of his ministers, it ought to be equally a reason for not admitting them as part of the extended and united administration: that he had never called in question the right of the commons to offer him their advice on every proper occasion touching the exercise of his prerogative; and that he will be ready at all times to receive it, and give it the most attentive consideration.' Mr. Fox moved that his majesty's answer be taken into consideration on Monday next, which was agreed to. Next day, March 5th, he moved to postpone the mutiny bill, till after the consideration of the king's answer, on the 8th. The secretary at war was surprised at the proposal of delaying what concerned the public safety; but the motion was carried by 171 against 162. On the 8th Mr. Fox, after a long speech, wherein he recapitulated every step taken since his dismission, moved, 'That an humble representation be presented to his majesty, to testify the surprise and affliction of this house on receiving the answer which his

majesty's ministers have advised to the dutiful and seasonable address of this house, concerning one of the most important acts of his majesty's government.'

This representation was the last successful effort of the coalition, and was carried only by 191 to 190. On this occasion, it would seem, they felt their strength failing them, and that they must ultimately yield; for on the 10th of March they allowed the mutiny bill to pass without a division. On the 12th Mr. Sawbridge brought forward a proposition for a parliamentary reform. The state of the representation in England, he said, was very inadequate, and infinitely more so in Scotland, where not above one man in 100 had a vote for a member. He therefore moved for a committee of enquiry on the representation of the people. Mr. alderman Newnham seconded the motion. Sir R. Clayton supported it, and declared himself ready to sacrifice his borough interest. Mr. Dempster avowed himself a friend to it, and said that 'the people of Scotland would be very grateful if one in 100 were allowed to vote; but in fact not one in 1000 had that privilege. Previous to the reign of Charles II. every 40s. freeholder had a vote, in Scotland, as well as in England; but in that arbitrary reign the right of voting was confined to those who held their lands from the crown, which has been continued ever since.' The motion, though supported by the abilities of both Mr. Pitt and Mr. Fox, was, after a long debate, rejected by 141 to ninety-three. On the 22d the American trade bill was passed; and on the 23d Mr. Pitt was repeatedly asked, by different members, if parliament was to be dissolved, but gave no answer. All the supplies had now been voted, to the amount of £10,000,000; but except the land and malt tax bills, no money had been raised or appropriated to specific services. It was insisted, however, that the voting of the supplies would be a sufficient justification of ministry in issuing money. On the other side it was urged that the house having resolved that such issuing of the public money would be 'subversive of the constitution,' no plea of necessity could avail, as the emergency would be wilfully created by those who should advise a dissolution. Next day, however, the parliament was prorogued, and on the 25th dissolved by proclamation. This measure, by terminating a contest in which the principles of the constitution had been much agitated, ultimately established them; and many of the most distinguished characters in the house of commons and in the kingdom now wished it had been resorted to at the first forming of the coalition.

The advantages which ministers generally possess over their opponents upon the dissolution of parliament, received very considerable additions at this time. The East India Company and their servants were exceedingly industrious; and the dissenters, a powerful and active body in England, were zealous to show that they considered the members of the late coalition as men who paid no regard to principle. In short, the counties, cities, manufacturing towns, and corporations, who had so recently given the court pledges of their support, now evidenced the contemptuous light in which they viewed the

adherents to the late turbulent party. Thus upwards of 160 members of the late house of commons lost their seats; and of these the far greater part were supporters of the late administration. But the consequence, however fatal to them, was perhaps on some accounts a misfortune to their country. It was well they gained not the ascendancy; yet few will think of the coalition without regretting its formation. It for a long time ruined the fortunes and destroyed the influence of Mr. Fox. See our memoir of that statesman. On the 18th of May, both houses being assembled, the commons re-elected Mr. Cornwall, the former speaker. Next day his majesty, in his speech from the throne, 'assured them of his satisfaction in meeting them, after recurring in so important a moment to the sense of his people; and of his reliance, that they were animated by the same sentiments of loyalty and attachment to the constitution which had been so fully manifested throughout the kingdom.' He directed 'their attention to the maintenance of the public credit, to the support of the revenue, and to the affairs of the East India Company: and, after warning them against adopting any new measure for the regulation of these last, which might affect the constitution, and our dearest interests at home, concluded with expressing his inclination to support and maintain, in their just balance, the rights and privileges of every branch of the legislature.' Before the motion was made for an address, Mr. Lee stated to the house, that the high bailiff of Westminster had neglected to make a return to the writ of election, on pretence of not having finished the scrutiny into the legality of the votes, and therefore moved a resolution declaring it to be 'his duty to return two citizens to serve for the said city.' This motion was seconded by Mr. Sheridan, but, after a long debate, was negatived by a majority of 283 to 136. The address was then moved and read, but the strong expressions it contained, of satisfaction and gratitude to his majesty for having dissolved the late parliament, occasioned a warm debate. As to the sense of the people, it was asked of Mr. Pitt, on what grounds he could pretend, that it had been collected in the new election, when he himself had enforced the necessity of a reform, on the very supposition that the people, as the law then stood, had little or nothing to do with them? An amendment was proposed, by the earl of Surrey, which was seconded by colonel North, but it was rejected by 285 to 114. On the 25th of May Mr. Fox presented a petition from himself, complaining of an undue return for Westminster; which was objected to by lord Mulgrave; who moved it to be the opinion of the house, that it did not come under the description in Grenville's act, no members having been returned, which after a short debate was agreed to without a division. Another petition from Mr. Fox was presented by colonel Fitzpatrick, complaining of the high bailiff of Westminster, in making no return, and requesting to be heard by council, which was granted. On the 28th a counter petition from the high bailiff was presented by lord Mahon, praying to be heard in answer to Mr. Fox: which was also granted.

On the 2d of June lord Mahon presented a petition from several electors of Westminster, praying that the high bailiff might be allowed to proceed with the scrutiny. This was ordered to be considered with the other petitions. Mr. Corbett, the high bailiff, being called to the bar on the 7th, stated as one of his reasons for granting the scrutiny, that in a former contested election there had been only 9200 and odd votes, but that in this instance there were above 12,200; whence he supposed there could not be such an increase. On the 8th of June Mr. Ellis moved 'that the high bailiff be forthwith directed to make return of his precept, and of the members chosen in pursuance thereof.' Lord Mulgrave opposed the motion, and Mr. Fox accused ministry of interfering to deprive the Westminster electors of the exercise of their rights. Mr. Pitt replied to Mr. Fox, denied his charges as calumnious, and vindicated the high bailiff. At half past four, A. M., the motion was rejected by a majority of 195 to 117. Lord Mulgrave then moved, 'that the high bailiff of Westminster do proceed in the scrutiny with all possible despatch;' which, after another warm but short debate, was agreed to. On the 14th of June Mr. Burke made his proposed motion respecting the dissolution of parliament. In his introductory speech, he examined at great length and with much freedom, 'the dangerous principles on which that act of power had been executed and defended;' but the motion was negatived without a division.

On the 21st of June Mr. Pitt moved several resolutions, as a foundation for the act, since called the Commutation Act. He stated, that the illicit trade of the country had increased to so alarming a height as to endanger the existence of several branches of the revenue, particularly that of tea. The committee on smuggling found, that only 5,600,000 pounds of tea were sold annually by the East India Company; whereas the annual consumption in Britain was estimated, on good authority, to exceed 12,000,000; so that the illicit trade in this article was more than double the legal. To remedy this evil, he proposed to lower the duties to so small an amount, as to make the profit on the illicit trade not adequate to the risk; and, as this would cause a deficiency in the revenue of £600,000 a-year, to make it up by an additional tax on windows; which, he showed, would prove a commutation very favorable to the people, and at the same time tend to relieve the East India Company. The bill was passed, after a warm opposition, in both houses.

Mr. Pitt next entered upon the arduous task of regulating the East India Company's affairs. This he proposed to do by three bills. The first was to enable the company to divide eight per cent. interest on their capital. By the dissolution, the committee on this business had been prevented from making any progress; and, though it had been resumed as early as possible in this session, yet before any report could be made the house was under the necessity of either authorising the company to make a dividend, without any information relative to their finances, or to endanger their credit by refusing its consent. The disgraceful and dangerous consequences of

this dilemma were urged by the late ministers, who proposed as the safest measure to make the dividend only six per cent. It was admitted, on all sides, that the affairs of the company were not in a flourishing condition; and it was stated as an act of mockery and injustice to the public, that, while the company were applying to parliament for a large pecuniary relief, they should yet divide among themselves as much as they had divided in their most flourishing circumstances. It was replied, that the company's distresses had not arisen solely from their own fault, as they had partaken in the general calamity occasioned by the war. The bill passed in the lower house without a division, and in the upper, after a warm debate, by a majority of twenty-eight to nine.

Mr. Pitt's second bill allowed the company a respite of duties; enabled them to accept of bills beyond the amount prescribed by former acts; and established their future dividends. Mr. Pitt's third bill, 'for the better government of the affairs of the East India Company,' though formed upon the same model with the one which he had brought into the last parliament, yet differed considerably from it in several points. The powers of the board of control, which, in contrast to the plan of the late ministry, and in compliance with the temper of those times, were kept as subordinate as possible, were now greatly enlarged. In urgent cases, which might not admit of delay, and in cases of secrecy, which might not admit of previous communication, they are enabled to transmit their own orders to India, without being subject to the revision of the directors. It also vests in the governor general and council an absolute power over the other presidencies in all points relative to transactions with the country powers, and in all applications of the revenues and forces in time of war; with a power of suspension in case of disobedience. The second part of it contains various internal regulations. The clauses relative to the debts of the nabob of Arcot, to the disputes between him and the rajah of Tanjore, and to the relief of dispossessed zemindars, and other native land-holders, were adopted from Mr. Fox's bill, with some exceptions and limitations. Various restrictions are also laid upon the patronage of the directors, and retrenchments ordered in the company's establishments. The third part relates to the punishment of Indian delinquents. All British subjects are made amenable to the courts of justice in England, for all acts done in India. The receiving of presents is declared to be extortion; and disobedience of orders and all corrupt bargains to be misdemeanors and punishable. Governors of settlements are empowered to seize all persons suspected of illicit correspondence, and to send them to England, if necessary. Every servant of the company is required, on his return to England, to deliver in upon oath to the court of exchequer, an inventory of his real and personal estates, and a copy of it to the directors for the inspection of the proprietors; and in case any complaints should be made thereon, by the board of control, the court of directors, or any three proprietors possessing stock conjunctly to the amount of £10,000, the court of exchequer is

required to examine the person upon oath, and to imprison him till he shall have answered the questions put to him to their satisfaction. Any neglect or concealment is punished by imprisonment and forfeiture, and incapacity of ever serving again. Lastly, for the more speedy prosecution of crimes committed in the East Indies, a new court of justice is erected; consisting of three judges, appointed by the three courts, four peers, and six members of the house of commons: the four peers to be taken by lot out of a list of twenty-six; the six commons out of a list of forty; and both lists to be chosen by ballot. Liberty is given to the party accused, and to the prosecutor, to challenge a certain number of these. All depositions of witnesses taken in India, and all writings received by the directors, with copies of those sent out by them, shall be received as legal evidence. The judgment of the court is made final, and extends to fine, imprisonment, and declaring the party incapable of ever serving the company. This bill was most strenuously opposed in every stage of its progress through both houses. The extension of the power of the board of control was objected to, as incongruous to the principle, and insufficient for the purposes of the bill. The enlarged powers conferred on the governor general were objected to, as an inversion of the order of government, which requires that authority exercised at a distance from the controlling power, and subject to almost insuperable temptations, should be as limited as possible. In the second part, the clauses, it was said, respecting disobedience, the commencing of wars, and the succession to offices by seniority, were rendered nugatory by exceptions and limitations. The inefficiency of the clause relative to oppressed native landholders, the ruinous delay in the mode of proceeding for their relief, and the abuses to which it was liable, were strongly objected to: but these clauses were all defended on the necessity of precautions against events, wherein a discretionary power might be necessary. But the last part of the bill met with the most violent opposition. The obligation to swear to the amount of property, and the powers granted to courts of putting interrogatories, to force persons to criminate themselves, were inquisitorial proceedings unknown to Britons. The minister was, however, supported in referring the bill to a committee of the whole house, by 276 against sixty-one: and, in the discussions which took place in the committee, Mr. Pitt acted in a manner, which, on after occasions distinguished his mode of conducting the national business. He did not come forward like the head of a party, with a measure complete in every part, confident of the support of his followers; but, while he himself proposed some essential alterations, he also adopted those suggested by others, from whatever side of the house they came. Thus, from the observations of Mr. Dempster, Mr. Eden, and lord North, the clause requiring persons returning from India to give an account of their property upon oath, was relinquished by Mr. Pitt; and there were no fewer than twenty-one new clauses added to the bill in the committee. The whole afterwards suffered very severe animadversions from Mr.

Sheridan and Mr. Fox; but the bill passed both houses by very large majorities.

On the 30th of June Mr. Pitt opened the budget, which consisted of new taxes on candles, coals, bricks, hats, horses, linens, cottons, ribbands, ale and beer licenses, game licenses, paper, hackney coaches, gold and silver plate, lead, postages, and silk, all of which passed with little opposition, except the additional duty on coals, which was rejected. These taxes Mr. Pitt calculated to produce £930,000. On the 30th of July Mr. Burke, after a long speech on East India affairs, wherein he mentioned the famine in Oude, the murder of Almas Ali Cawn, a native of rank, who had been, by order of governor Hastings, betrayed, seized, and put to death, without any charge, trial, or condemnation, and the treatment of the princesses of Oude, who had been seized, plundered of their property, and turned into the streets in misery, with a variety of other cruelties practised by the chief servant of the company, moved 'that there be laid before the house copies of all papers relative to the seizing and putting to death of Almas Ali Cawn,' which was seconded by Mr. Sheridan, and agreed to. Mr. Burke next moved 'that there be laid before the house copies of all papers relative to the money demanded of the princesses of Oude in 1782;' which was seconded by major Scott. He then moved, that there be laid before the house the produce of the sale of the jewels, &c., taken from these princesses; which was objected to by Mr. Pitt, who moved the order of the day, which was carried. On the 2d of August, Mr. Henry Dundas, after a suitable introduction respecting the bravery and loyalty of the Scots Highlanders, moved for 'leave to bring in a bill to repeal the act, 25th Geo. II., which confiscated certain estates in Scotland, and to empower the crown to restore them to the right heirs, under certain restrictions.' This popular motion met with universal approbation from the whole house. The only opposition the bill received was in the upper house from lord Thurlow and lord Loughborough; whose chief objection was founded upon its not extending to the estates forfeited in 1715. On the 3d of August Mr. Dempster moved for leave to bring in a bill for the abolition of the remains of vassalages in Scotland; which was granted: and on the 20th of August the session was closed with the usual formalities.

The second session of this parliament was opened, January 25th, 1785, by a speech from the throne, wherein his majesty particularly recommended the final adjustment of the commercial intercourse between Britain and Ireland, and the further suppression of smuggling. The first business of importance that came before the house was the Westminster election, the contest about which occasioned repeated discussions and divisions. At last, upon a motion of Mr. Alderman Sawbridge, that the high bailiff be ordered to make a return forthwith, which was agreed to by a majority of 162 to 124, the scrutiny was quashed, and lord Hood and Mr. Fox returned on the 4th of March. On the 16th of February Mr. Francis called the attention of the house to the civil establishment of Bengal, which, he said

had risen from £126,000 (the sum in 1774) to the enormous sum of £927,945 a year (a sum greater than the civil list establishment of Britain), in consequence of the whole power having devolved on governor Hastings. He therefore moved, 'that a statement be laid before the house, of the salaries and emoluments of the officers of revenue in Bengal, in 1776, 1782, and 1783; with a probable estimate of the expenditure from the 30th of April 1784, to the 16th of May 1785. The motion, after some opposition from major Scott and Mr. Pitt, was agreed to.

On the 18th of February, the earl of Carlisle made a motion in the house of lords, respecting the nabob of Arcot's debt. So early as April 1782 Mr. Dundas, in the house of commons, had moved a resolution relative to the suspicious nature of these debts, and their mischievous influence upon the government of the Carnatic. In Mr. Pitt's bill, passed in last session, it was enacted, respecting the origin and justice of these claims, that the court of directors shall 'give such orders to their presidencies and servants abroad, for completing the investigation thereof, as the nature of the case shall require; and for establishing in concert with the said nabob such funds, for the discharge of those debts which shall appear justly due, as shall be consistent with the rights of the said united company, the security of the creditors, and the honor and dignity of the said nabob.' The court of directors, in consequence of the trust reposed in them, prepared orders to be sent to their council at Madras, in which, after stating the suspicious circumstance under which many of the debts appeared to have been contracted, they direct them, in obedience to the positive injunctions of the act, to proceed to a complete investigation of their nature and origin. These orders, however, were rejected by the board of control, and a new letter drawn up, in which the claims of the creditors were all, with some little limitation, established, and a fund for their discharge assigned out of the revenues of the Carnatic. These orders were publicly read at a meeting of the nabob's creditors in England; and, on this ground, the earl of Carlisle moved, 'that there be laid before the house copies or extracts of all letters or orders issued by the court of directors, in pursuance of the injunctions in the regulating act.' The dangerous consequences of suffering the board of control to supersede the authority of an act of parliament, and the suspicious circumstances of its clandestinely interfering in an enormous money transaction, the management of which was delegated by the act to other persons, were strongly urged by the noble mover, and by lord viscount Stormont. Lord Loughborough insisted, that, even allowing the board of control not to have been guilty of an arbitrary assumption of power, yet their orders authorise transactions of a most corrupt and nefarious nature, highly injurious to the company, and ruinous to the country. Lords Sydney, Walsingham, and lord chancellor, opposed the motion; and lord Rawdon was afraid the papers called for might convey dangerous information to our enemies. The motion was rejected without a division.

On the 28th a similar motion was made by

Mr. Fox in the house of commons, when Mr. Dundas himself opposed it, and defended the board of control, insisting that they are enabled, by a clause in the act, to originate orders in cases of urgent necessity, and transmit them to India. He also justified the debts themselves, and cautioned the house not to imbibe prejudices against a board of control but newly instituted. Mr. Smith, chairman of the court of directors, admitted that some debts, ordered by the board to be paid, were just, but that others were of a very different complexion. Mr. Burke, in a long and eloquent oration, entered fully into the subject. He contended, that the board of control had no right to intermeddle in the business; but, even admitting such right, they were bound to make the same enquiries as the directors. He stated, 'that ever since the establishment of the British power in India, Madras and its dependencies, which before that time were among the most flourishing territories of Asia, had wasted away and declined so much, that in 1779 not a single merchant of eminence was to be found in the whole country. During this period of decay, nearly a million had been drawn from it annually by English gentlemen, on their own private account only. Mean time the nabob had contracted a debt with the company's servants, to the amount of £880,000; which, in 1767, was settled at ten per cent interest: 1,000,000 sterling had been lent by British subjects to the merchants of Canton, in China, at 24 per cent. In 1777 a second debt of £2,400,000, and a third of £160,000, called the cavalry debt, were settled by the nabob of Arcot at twelve per cent. The whole of these four capitals, amounting to £4,440,000, produced annuities of £623,000 a-year, more than one-half of which stood chargeable on the public revenues of the Carnatic. These annuities, equal to the revenues of a kingdom, were possessed by a few individuals of no consequence, situation, or profession.' Mr. Burke then examined the particular grounds of these debts.

Mr. Burke next called the attention of the house to the ruined condition of the country; entered into a statement of the internal politics of the Carnatic, and the causes of the war with Hyder Ali; describing its desolate ravages, while it raged for eighteen months without intermission, from Madras to Tanjore; and the redoubled horrors of the famine that ensued, inasmuch that when the British armies traversed the central provinces for hundreds of miles in all directions, in their whole march they did not see one man, woman, child, or four-footed beast of any description! And what, added he, would a virtuous, an enlightened ministry do, on the view of such ruins—of such a chasm of desolation as yawned in the midst of those once flourishing countries!—They would have reduced their most necessary establishments; they would have suspended the justest payments; they would have employed every shilling derived from the productive parts, to re-animate the powers of the unproductive. While performing this fundamental duty to justice and humanity, they would have ordered the corps of fictitious creditors, whose crimes were their claims, to keep an awful distance, to silence

their inauspicious tongues, to hold off their profane unhallowed paws from this holy work; they would have proclaimed with a voice that should make itself heard, that on every country the first creditor is the plough; that this original indefensible claim supersedes every other demand. This is what a wise and virtuous ministry would have done and said. They would thus have laid a solid foundation for future opulence and strength. But, on this grand point of the restoration of the country, there is not one syllable in the correspondence of the ministers. They felt nothing for a land desolated by fire, sword, and famine; their sympathies took another direction; they were touched with pity for bribery, so long tormented with a fruitless itching of its palms; their bowels yearned for usury, that had long rissed its monthly harvest; they felt for speculation, which had been for so many years raking in the dust of an empty treasury; they were melted into compassion for rapine and oppression, licking their dry, parched, unbloody jaws. These were the objects of their solicitude. As to the public debt, he afterwards said, nothing was provided for it, but an eventual surplus to be shared with one class of the private demands after satisfying the two first classes. Never was there a more shameful postponing of a public demand, which, by the practice of all nations, supersedes every private claim. By the mode of settling between the nabob and the company, the public and private debts are made to play into each other's hands a game of utter perdition to the unhappy natives. The nabob falls into an arrear to the company. The presidency presses for payment. The nabob answers 'I have no money.'—'Good: but the soucars (bankers) will supply you on the mortgage of your territories.' Then steps forward some Paul Benfield, and from his grateful compassion to the nabob, and his filial regard to the company, unlocks the treasures of his virtuous industry; and for twenty-four or thirty-six per cent., on a mortgage of the territorial revenue, becomes security to the company for the nabob's arrear. In consequence of this double game, the whole Carnatic has, at one time or other, been covered with these locusts, the English soucars. Far from painting, Mr. Burke added, he did not reach the fact, nor approach it. This tyrannous exaction brought on servile concealment, and that again called forth tyrannous coercion; till nothing of humanity was left in the government; no trace of integrity, spirit, or manliness in the people, who drag out a precarious and degraded existence, under such a system of outrage upon human nature. The motion, however, was rejected by a majority of 194 to ninety-seven.

On the 22nd February Mr. Pitt moved, that the propositions laid before the Irish parliament by Mr. Orde, for adjusting the intercourse between Britain and Ireland, be read; after which he remarked on the illiberal treatment of Great Britain to her sister kingdom in former times, and inveighed much against that narrow spirit which tended to exalt or enrich one people of the same empire at the expense of another. After obviating many objections to the proposi-

tions, he moved a resolution, 'That it is highly important, and for the general interest of the British empire, that an intercourse be finally settled between Great Britain and Ireland on equal terms; and that each country should have a like participation of trade, on Ireland securing that she will pay, in proportion to her growing wealth, such share of the public expense as may arise from the surplus of her revenue in time of peace.' Mr. Marshman thought Britain for seven years past had been giving too much. Lord North protested against a full participation of our trade with Ireland. Mr. Dempster approved of the propositions as just, and Mr. Fox spoke chiefly against beginning the business in Ireland.

On the 3rd March, Mr. Pitt brought forward the propositions, which were objected to by Sir W. Cunningham, as hurtful to the landed interest of Scotland, and ruinous to the corn trade and farmers. On the 8th a petition from the inhabitants of Glasgow was presented by the lord advocate against them; as well as from Manchester, Liverpool, and several other towns in England. A petition likewise from Manchester, Warrington, and some other towns in Lancashire, and Cheshire, subscribed by 80,000 persons, was presented by Mr. Stanley, against the late tax on fustians, calicoes, &c., which, after examining witnesses on the subject, was repealed. In the course of receiving these various petitions, it was agreed to revive the act of 1689, against receiving any petition not subscribed by all the petitioners.

Mr. Pitt, on the 18th of April, once more brought forward the popular subject of a parliamentary reform. Having formerly pledged himself to exert all his official weight in favor of it, he now employed his utmost abilities in recommending it to the house; and, after a speech of nearly three hours, moved, 'That leave be given to bring in a bill to amend the representation of the people of England in parliament.' The plan he now proposed was founded on the same principles with his former one, but differed in several particulars. He proposed to transfer the right of election from thirty-six of such boroughs as had already fallen, or were falling, into decay, to the counties, and to such chief towns and cities as were not represented: that a fund should be provided for giving the owners and holders of such disfranchised boroughs, an appreciated compensation: that the taking of this compensation should be a voluntary act of the proprietor; and, if not now accepted, the money should be laid out at compound interest, until it became an irresistible bait to such proprietors. He also proposed to extend the right of voting for knights of the shire to copy-holders. Mr. Fox approved of the spirit of the motion, but objected to the mode, particularly the purchasing of the boroughs; though he was not against transferring the right of electing representatives from them to the counties, and chief towns and cities. The principal arguments in favor of a reform were derived from the present partial and defective representation of the kingdom at large. It was argued, that an active, reforming, and regulating princi-

ple, which kept pace with the alterations in the state, was necessary to preserve the constitution in its strength and vigor: that, as any part of the constitution decayed, it had always been the wisdom of the legislature to renovate and restore it, by such means as were most likely to answer the end proposed: and that hence had arisen the frequent alterations that had taken place, with regard to representation, both before and at the Revolution. The chief objections to a reform, were, that it was not called for by the people in general; nor in particular by the unrepresented large towns and cities, which had the best right to claim the benefit of such a measure; that, if innovations in name of reform were once introduced, men's minds differed so much on the subject, that none could know to what extent they might be carried: that what were called rotten boroughs were often represented by gentlemen who had the greatest stake in the country; and consequently were as much interested in its welfare, and that of the constitution, as any other representatives, in whatsoever manner they were chosen, could be; and, in fine, that while the rights and liberties of the people were secure under the present representation, it was hazardous to make any alteration. The motion, after many extraneous arguments, and much personal animosity on both sides, was negatived by 248, against 174.

Previous to the opening of the budget Mr. Pitt, called the attention of the house to the national finances; of which he gave a very favorable view, from the increase of the revenue both from the old and new taxes. The whole of the public expenditure he estimated at £14,400,000 per annum. He then gave a comparative statement of the produce of the taxes ending 5th of January and 5th of April 1784, and of those ending at the same periods in 1785. The first of these he stated at £2,585,000; the second at £2,198,000; the third at £2,738,000; and the fourth at £3,066,000. From the increased produce of the taxes in these quarters, he made various calculations on their probable amount for the whole year: the highest of which he stated at £12,600,000, and the lowest at £12,000,000 per annum. The produce of the taxes, supposing them to continue stationary, would, on the average of the last quarter, amount to £12,264,000. The land and malt tax, £2,500,000, added to this, would make £14,764,000. Hence he expected an overplus of about £1,000,000 annually, which he would purpose to be appropriated as a sinking fund, to be applied to the discharge of the national debt. As he considered this estimate to be very low, he congratulated the public on the pleasing prospect. But, though he wished the house to consider the measure now announced, he did not intend to put it in execution till the ensuing year. To afford proper information, however, he moved, that the increase of the amount of the taxes, from 1783 to 1784, be laid before the house. His calculations, however, were much objected to. Mr. Sheridan doubted if the new taxes would be so productive as Mr. Pitt alleged, and moved that there be laid before the house the nett produce of taxes imposed last session, up

to the latest accounts. Mr. Dempster congratulated the minister upon his plan of appropriating a sum to liquidate the national debt. But he hoped this would be done so as to place it beyond the reach of any ministry, and exempt from all changes in administration: £1,000,000, he said, with compound interest, would in fifty years, pay off £218,000,000. The aggregate amount of the supplies, voted in 1785, was stated by Mr. Pitt at £9,737,868. The subjects of the new taxes, imposed to raise the sum of £413,000, were male and female servants, retail shops, post horses, gloves, pawn-brokers, and coach-makers licenses, game certificates, bachelors, wheel carriages, and attorneys. Of these the tax on maid servants, and the shop tax, were the most unpopular. On the 14th of June almost the whole shop-keepers of London and Westminster unanimously expressed their displeasure at the latter, by shutting the windows of their shops during the whole day, as well as by many satirical inscriptions on the window shutters. The example of London was followed at Bath, Bristol, Norwich, and many other places.

On the 27th of April, the lord advocate introduced a bill for diminishing the number and increasing the salaries of the judges of the court of session in Scotland. The former branch of it, being opposed in the committee, on the 3rd of June, by lord Maitland, Mr. Eden, and Sir James Johnston, was withdrawn, and the bill for increasing their salaries was passed by the house. On the 12th of May the Irish propositions were brought under the consideration of the house, and occasioned a number of warm debates from that day to the 30th, when several amendments, suggested by opposition, were admitted by ministry. On the 31st a committee was appointed to confer with the lords on them, and present to their lordships the twenty resolutions, to which the house had agreed, on the commercial intercourse with Ireland, along with the evidence.

On the 25th of June Mr. Pitt moved an address to his majesty, which after a violent debate was agreed to, and presented on the 29th by the lord chancellor, the speaker of the house of commons, and members of both houses. The address represented, that the two houses had 'taken into their most serious consideration the important subject of the commercial intercourse between Britain and Ireland, recommended in his majesty's speech, and the resolutions of the parliament in Ireland; and, after a careful investigation of the various questions arising out of the subject, had come to the resolutions now presented, which they trusted would form the basis of an advantageous and permanent settlement between the two kingdoms: that they had proceeded on the foundation of the rights of the parliament of Ireland, but had found it necessary to introduce some modifications, and to add such conditions as appeared necessary in establishing the proposed agreement as just and equitable; and for securing to both countries those advantages, to an equal enjoyment of which they are to be entitled.' The address concluded, by expressing their trust, 'that in the whole of its progress, reciprocal interests and

mutual affection will ensure that spirit of union so necessary to the great end in view; and their 'confidence, that the final completion of the measure, while it tends to perpetuate harmony and friendship between the two kingdoms, by augmenting their resources, uniting their efforts, and consolidating their strength, will afford his majesty the surest means of establishing a lasting foundation, in the safety, prosperity, and glory of the empire.' To this address his majesty returned a suitable answer, and on the 2nd of August Mr. Pitt introduced a bill for the commercial arrangement, without opposition; after which both houses adjourned to the 27th of October.

Years of peace, however favorable to arts, sciences, and human happiness, yet, as they afford no field for displaying the talent of the hero, so they yield few materials for employing the pen of the historian; unless when important constitutional questions occur in the senate. The principal transactions of the succeeding seven years, from this period to the commencement of the French Revolution, may, therefore, be comprised in little bounds.—Previous to the commencement of the third session of parliament, the French court had issued an edict prohibiting the sale of various English manufactures in that kingdom; and a similar edict had been published by the emperor, totally prohibiting the importation of any British goods into the Austrian territories. The latter had been excited to this measure by certain articles in a late treaty between the British monarch, as elector of Hanover, and the king of Prussia. To counteract proceedings so prejudicial to the trade of England, commercial treaties were entered into with the courts of Petersburg and Versailles. Oriental politics were also revived by the return of governor Hastings, as well as by petitions from the English inhabitants of India, against several clauses in Mr. Pitt's act: particularly those which established an inquisition into their fortunes, and took from them trial by jury. His majesty opened the session on the 24th of January 1786, with a speech, informing parliament, 'that the disputes, which threatened the tranquillity of Europe, had been brought to an amicable conclusion; that the growing blessings of peace were experienced in the extension of trade, and improvement of the revenue; and that the resolutions of last session had been communicated to the parliament of Ireland, but that no effectual steps had yet been taken to make any farther progress in that salutary work.' Among the subjects which early engaged the attention of parliament was a variation from the usual form, introduced into the mutiny bill, to make it include officers upon half pay, and by brevet; which was objected to in the lower house by colonel Fitzpatrick, and general Burgoyne, but passed by seventy-nine to seventeen. In the upper house it was still more violently opposed by lords Stormont, Loughborough, and Sandwich; but the amendment was rejected by forty-two to eighteen. The next important object was the plan of fortifications, originally suggested by the duke of Richmond, and now introduced into the house of commons by Mr. Pitt, who moved

it as 'an essential object for the safety of the state.' The motion was supported by lord viscount Mahon, lord Hood, Sir C. Middleton, captains Berkeley, Bower, and Luttrell, and Messrs. H. Browne and Dundas. It was opposed by Mr. Bastard, Sir W. Lemon, general Burgoyne, lord North, colonel Barre, and Messrs. Walwyn, Marsham, Wyndham, Courtney, Fox, and Sheridan. The latter entered largely into the question, particularly as it might affect the constitution. 'When we talk,' said he, 'of a constitutional jealousy of the military power of the crown, what is the object of our suspicion? what but that it is in the nature of kings to love power, and of armies to obey kings! This is doubtless plain speaking upon a delicate subject, but the question demands it; and I cannot be suspected of alluding either to the present monarch on the throne, or to the army now under his command. But the possible existence of sinister intentions must enter into the mind of every man who admits an argument on the subject. If this were not the case, we deride the wisdom of our ancestors in the provisions of the bill of rights, and mock the salutary reserve, with which we annually entrust the executive magistrate with the defence of the country.' He concluded by advising all sides of the house 'to assist in defeating a measure, which, under pretence of securing our coasts, strikes at the root of our great national defence, and at the heart of the constitution itself.' This speech appears to have had great weight with the house; for the votes upon the division were exactly equal, both the ayes and the noes amounting to 169; a circumstance unparalleled in the annals of parliament; and the speaker acquired no small applause from the country gentlemen, for giving his casting vote against the motion. Mr. Pitt, however, on the 17th of May, revived the question, by moving, 'that an estimate of the expense of such part of the plan of fortifications, as might appear most necessary to be carried into immediate execution, be referred to a committee.' The money necessary for completing this moderate plan he stated at £400,000. But this motion was received with such marked disapprobation by the house that it was withdrawn; and the sum of only £59,770 voted the 7th of June for completing the new works already begun at Portsmouth and Plymouth.

Another measure of considerable consequence repeatedly engaged the attention of parliament, viz. the amendment and reduction of the militia laws. A bill for this purpose, after repeated debates and divisions, passed both houses. On the 9th March Mr. Marsham introduced a bill to exclude persons holding places in the navy and ordnance from voting at elections, which was opposed by Mr. Pitt, lord Mulgrave, and Messrs. Dundas, Grenville, Pye, Drake, Gascoyne, Sir E. Deering, and Sir C. Middleton; and supported by Messrs. Fox, Jervoise, Sawbridge, and Sheridan; but rejected by 117 to forty-one. Though Mr. Pitt opposed this bill, upon the principle that no bad effects were felt from the interference in elections of the persons it was proposed to exclude, yet he supported lord Mahon's bill for regulating elections, which

was drawn up on liberal principles, and was also supported by the earl of Surrey, Sir J. Mawbey, Sir W. Dolben, &c.; but opposed by Messrs. Young, Powys, and Bastard, as well as by Mr. W. Grenville, who styled it a system of Utopianism and impracticability. It was passed, however, by a majority of ninety-eight to twenty-two, and sent up to the house of lords; where it was powerfully recommended by earl Stanhope, and supported by the marquis of Caermarthen and earl of Hopeton: so that it passed the second reading by a majority of eleven to four; but was thrown out at the third, by thirty-eight to fifteen votes.

Mr. Pitt having on the 7th March moved for a committee on the annual national income and expenditure, their report was laid before the house on the 21st, and copies delivered to the members on the 27th. Two days after Mr. Pitt opened his budget, by congratulating parliament on the pleasing prospect which the report afforded, after the country had emerged from a most unfortunate war, which had added such an accumulation to the national debt, before immense, that surrounding nations expected we should sink under the burden. Instead of this he showed, by various estimates, that our resources were such, that they were not only equal to the extraordinary demands without any additional burden upon the people, but could afford £1,000,000 annually to be allotted to a sinking fund, according to his plan formerly proposed, for reducing the national debt. This sum he proposed to be placed in the hands of commissioners in quarterly payments, to commence on the 5th July 1786. This million, he showed, by compound interest, would, in twenty-eight years, produce an annual income of £4,000,000. Mr. Fox, among other objections to this plan, said, 'that twenty-eight years was too long a period to look forward for its effect, as 'before that term we might probably have another war;' and afterwards moved, as an amendment, that if £1,000,000 be in the hands of the commissioners, when a new loan is proposed, they shall take £1,000,000 of the loan, and thus receive the bonus for the public. Mr. Pitt congratulated Mr. Fox upon the liberality of this motion, which was unanimously agreed to. A message from the king being now delivered to both houses, stating, 'That it had not been found possible to confine the expenses of the civil list within the annual sum of £850,000,' Mr. Pitt moved, that 'a sum be granted to defray all incumbrances, and that £900,000 should remain for the annual expenditure of the civil list;' which, after some debate, wherein the motion was contrasted with Mr. Burke's bill (which had enacted, that no debt should be incurred on the civil list), was agreed to.

On the 5th of May Mr. Pitt moved, 'to transfer a part of the duties on wines from the customs to the excise.' The reason he gave was, that the revenue on foreign wine was inferior by £280,000 to what it was forty years ago. Mr. Dempster recommended the utmost caution in passing bills that affected the liberties of the subject. Mr. Fox opposed the bill on the same ground, as an experiment peculiarly rash. But

though it was also opposed by earl Surrey, and Messrs. Sawbridge, Watson, Courtenay, and Sheridan, it passed by seventy-one to thirty-two; and in the house of lords without a division. In June a message was delivered from the king, recommending 'an enquiry into the condition of the woods, forests, &c., belonging to the crown, that they might be made as productive as possible.' A bill was accordingly brought in, which contained some clauses that were opposed in both houses, but chiefly in the upper, where they occasioned a division of twenty-eight to eighteen; and where a protest was entered against the act, by the duke of Portland, the earls of Sandwich and Carlisle, Dr. Wilson bishop of Bristol, and lord Loughborough. The commissioners appointed were, Sir C. Middleton, colonel Call, and Mr. A. Holdsworth.

Mr. Wilberforce introduced a bill for amending the criminal laws, which was so much approved in the house of commons that it passed without opposition: but, in the house of lords, it was treated with the severest invective by lord Loughborough, who, during the absence of lord Thurlow, took the lead in all proceedings of that assembly; pleading the cause of experience against innovation, and of liberty against political encroachment. The bill was therefore rejected without a division. East India affairs also occupied a good deal of the attention of parliament during this session; but we have already descanted so largely on these subjects that we shall not here resume them, farther than to mention, that Mr. Francis' bill, 'to extirpate,' as he expressed it, 'the principal evils of Mr. Pitt's bill,' was rejected; that Mr. Dundas's bill for amending the same act (which Mr. Burke styled 'a full grown monster of tyranny' in comparison of which Mr. Pitt's bill was only 'an abortion'), by increasing the power of the governor general, was passed; that an amendment moved upon it by Mr. Sheridan, to divide it into two bills, the one respecting the political, and the other the judicial government, was adopted; and that, after repeated motions for papers on India affairs, the refusal of some, and production of others, the exhibition of charges against Mr. Hastings, and the examination of various witnesses on the business, grounds of impeachment were found against him, by a majority of 119 to seventy-nine. About the close of the session a singular occurrence was mentioned in the house of lords. A bill had been introduced relative to the prize money obtained by the capture of St. Eustatius: lord Rodney said, he had lodged the papers of the merchants of that island in the secretary of state's office, as documents of treason against them; but, on calling for them in justification of his conduct, he was astonished to find that they had been carried off, and were now where to be found. Mr. Knox was called in proof of this fact. In consequence of this, the bill was rejected without a division; and two causes for £13,000 then depending before the court of appeals, at the instance of Messrs. Lindo and Ingram, against lord Rodney and the captors of St. Eustatius, were decided against the captors with full costs, on the 5th July. On the 11th the session was ended. On the 2d August his

majesty's life was attempted by a mad woman, named Margaret Nicolson, who, under pretence of presenting a petition, made two thrusts at his breast with a knife, both of which fortunately failed. His majesty with great temper exclaimed,—‘I am not hurt—Take care of the poor woman—Do not hurt her.’

On the 26th September 1786 the treaty of commerce and navigation, between France and Great Britain, was signed at Versailles. This treaty was extremely popular. It was not only very advantageous to England, but seemed to be the fruits of a triumph of liberal sentiments and enlarged views, over ancient prejudices and mercantile jealousy. Its general principle was, to permit the mutual exchange of every species of commodity, except warlike stores. It was recommended to the sanction of parliament in his majesty's speech, at their meeting on the 24th January 1787. But in the debate on the address, and on the 12th February (the day appointed for taking the treaty into consideration), it was censured by opposition, both as to its commercial and political tendency. Mr. Fox argued at great length ‘that France was the inveterate and unalterable enemy of Britain; that the incessant object of her ambition was universal monarchy, and from us alone she feared to be traversed in her pursuit.’ Mr. Pitt said, ‘his mind revolted from the supposition, that any nation could be unalterably the enemy of another. It had no foundation in history or experience. It was a libel on political society, and supposed the existence of a diabolical malice in our original frame. In a commercial view, this treaty would enrich this nation. It would be advantageous to France, but more so to us, &c. The premier's resolutions, approving of the different articles in the treaty, were all successively carried by large majorities in both houses. He soon after moved to lower the duties on Portuguese, Spanish, and Madeira wines, one-third below those on French wines, which was agreed to.

On the 26th February he moved several resolutions on the consolidation of the customs, which were so obviously advantageous, that they were agreed to with very little debate. Mr. Burke, instead of opposing the measure, returned thanks to Mr. Pitt as the author of it.

On the 7th May Mr. Dundas opened what he called the budget of India; upon which he moved several resolutions on the state of our revenues there, which, after some opposition, were passed without a division. On the 26th April Mr. Pitt introduced a bill for farming the tax on post horses, as a remedy for the frauds committed in that branch of revenue. This mode of collection was reprobated as unconstitutional, by opposition; but, after a warm debate, was carried by 162 to ninety-five. Previous to this decision Mr. Fox moved a repeal of the shop tax: which, after some debate, was rejected by 192 to 117. A bill for amending the laws respecting lotteries was introduced by ministry, and passed the house of commons; but, having been amended by the lords, was thrown out by the commons; and a new bill introduced, which passed both houses. Lord Rawdon called the attention of the house of lords to the convention with Spain,

and moved a resolution disapproving of it. He said, that ‘we certainly might have made a better bargain, than to yield a tract of land as large as Portugal, which produced cotton, indigo, logwood, and sugar, for a tract of twelve miles, and the liberty to cut logwood in Honduras Bay. It was an act of ingratitude, too, he said, to deliver up the inhabitants of Musquito shore to their old implacable enemy. Lord Caermarthen and the duke of Richmond opposed the resolution, which was defended by lord Stormont, but rejected by fifty-three to seventeen.

Two constitutional questions, respecting the Scottish peerages, were brought before the lords during this session. The first was on a motion by lord viscount Stormont, that the earl of Abercorn and duke of Queensberry, who had been chosen of the number of the sixteen peers, having been created peers of Great Britain, thereby ceased to sit as representatives of the peerage of Scotland.’ This motion was supported by the bishop of Landaff, the earls of Hopeton and Fauconberg; and opposed by lord Morton, but passed by fifty-two to thirty-eight. The second question arose from the election of the earl of Selkirk and lord Kinnaird, in the room of Queensberry and Abercorn; wherein the dukes of Queensberry and Gordon had voted contrary to the resolution of 1709. Lord Hopeton therefore moved, on the 18th May, ‘That a copy of that resolution should be transmitted to the lord register of Scotland, as a rule for his future proceeding in elections: which was opposed by the duke of Richmond, lords Thurlow, Morton, and Sydney; but supported by lords Kinnaird, Stormont, and Caermarthen; and carried by fifty-one to thirty-five.

The question respecting the hardships protestant dissenters labored under by the test act, was introduced by Mr. Beaufort on the 28th March, and urged with great strength of reasoning. One invincible argument he drew from ‘the hardship it imposed on conscientious ministers of the church of England itself. By the positive precepts of their religion, they were enjoined to warn from the sacred table all blasphemers, and persons of a profligate life: yet to these very persons, if they demanded it as a qualification, they were compelled by the test act to administer the sacrament. If there were any thing serious in religion, if the doctrines of the church of England were not a mere mockery of the human understanding, if to talk of peace of mind here, and of eternal consequences hereafter, were not the idle babblings of superstition, no pretext of state policy could justify this enormous profanation, this monstrous attempt, as irrational as impious, to strengthen the church of England by debasing the church of Christ.’ The motion was supported by Mr. Fox, lord Beauchamp, Sir James Johnston, Sir Harry Houghton, and Mr. Smith, but opposed by lord North, Mr. Pitt, and Sir W. Dolben; and rejected by 178 to 100.

The English law has long been disgraced by its severity to debtors. Imprisonment for an unlimited period had been the practice since the reign of Charles II. On the 22d May a bill to relieve unfortunate persons of this description was read the second time in the house of lords,

and supported by the duke of Norfolk; who stated that there were 3000 debtors confined in the different prisons. The bill was supported by lord Kinnaird and the earl of Hopetoun; but the rhetoric of lord Thurlow led the house to reject it by twenty-three to twelve. Debts of superior importance about this time occupied the attention of the lower house. On the 20th April Mr. alderman Newnham had announced a motion he intended to make, on the 4th of May, for an address to the king, respecting the prince of Wales's situation; who, nine months before, had reduced his household, and entered upon a plan of economy for the liquidation of his debts. This occasioned several delicate and interesting conversations in the house, but, on the day appointed, the intended motion was not made, on account of an interview between the prince and Mr. Dundas; in consequence of which his majesty sent a message to the house on the 18th, informing them, that he had ordered £10,000 a year to be paid out of the civil list, in addition to the prince's former allowance. On the Wednesday following the house voted an address to the king, requesting him to order £160,000 to be paid out of the civil list, in full, for the prince's debts, and £20,000 more to complete the works at Carlton house.

On the 15th May Mr. Charles Grey moved an enquiry into certain abuses in the post office, and, a committee of enquiry being appointed, their report confirmed Mr. Grey's statement of abuses: but, after a pretty warm debate on the 28th, the business was got rid of, by a motion of adjournment to that day three months. The only other important business before the house this session was, the impeachment of W. Hastings, Esq. which commenced on the 7th February, when Mr. Sheridan opened the third charge, respecting his treatment of the begums of Oude, in a speech of five hours and a half long. Conviction followed upon his arguments, and from that moment the whole house, except such members as were connected with the governor by friendship or gratitude, persevered in supporting the impeachment. The orator insisted that, 'in plundering these aged princesses, Mr. Hastings had no pretence, no excuse, nothing but his own corrupt will, to plead for his conduct.' He expatiated on 'his still more atrocious conduct in instigating a son against his mother, and sacrificing female dignity and distress, to parricide and plunder.'—The treaty of Chunar might challenge all the treaties that ever existed, for containing in the smallest compass the most extensive treachery. Mr. Hastings did not consent to it till he had received a bribe of £100,000 from the nabob.' Of Mr. Hastings's government he drew the following picture: 'Alike in the military and political line, we might see auctioneering ambassadors and trading generals: We saw a revolution brought about by an affidavit; an army employed in executing an arrest: a town besieged on a note of hand; and a prince dethroned for the balance of an account. Thus a government was exhibited, uniting the mock majesty of a bloody sceptre, with the little traffic of a merchant's counting house; wielding a truncheon with one hand, and picking a pocket with the other.'

Mr. Pitt also expatiated on many aggravating circumstances in Mr. Hastings's conduct. The charge was carried by 175 against sixty-eight. On the 2d March Mr. Pelham opened the charge as to the nabob of Farruckabad; which, after some debate, was carried by 112 to fifty. On the 15th the charge on contracts, &c., was opened by Sir James Erskine, which was voted by ninety-six to thirty-seven. On the 2d April Mr. Sheridan again displayed his rhetorical powers, by opening the charge on presents:—'In reviewing the governor's conduct,' he said, 'he had found it to spring from a wild, irregular, and eccentric mind. He had been every thing by fits and starts; now proud and lofty, now mean and insidious; now generous, now griping; now artful, now open; now temporising, now decided; in pride, in passion, in every thing changeable, except in corruption. In corruption alone he had proved uniform, systematic and methodical. His revenge was a tempest, a tornado, blackening in gusts of pride the horizon of his dominion, and occasionally carrying all before it. But his corruption was a regular trade wind, which always blew from the same point, and on which the circulation of the wealth of India depended.' Major Scott and Mr. Burges vindicated Mr. Hastings; but the charge was sustained by 165 to fifty-four. On the 19th April the charge as to the revenues was opened by Mr. Francis, and sustained by seventy-one votes against fifty-five. The report of the charges was brought up by Mr. Burke, and supported by Mr. Pitt, Mr. Martin, and Sir P. J. Clerke, but opposed by lords Hood and Mulgrave, Mr. N. Smith, Mr. Wilkes, Major Scott, and Mr. Sumner. Mr. N. Smith spoke at great length in Mr. Hastings's favor; but the report was approved by 175 against eighty-nine; and the next day Mr. Burke was ordered, 'in the name of the house, and of all the commons of Great Britain, to go to the bar of the house of lords, and impeach Mr. Hastings of high crimes and misdemeanors,' &c., which was instantly done; and on the 14th May the articles were sent to the house of lords, and an impeachment moved on the sixteenth article, by Mr. Burke. The impeachment was conducted by a number of its most distinguished members, and enforced with all their eloquence. But Mr. Hastings was supposed to have performed those acts, for which he was impeached, upon the most urgent necessity, and for the safety of the British empire in India. The East India Company, with all its most distinguished servants, exerted their influence in his favor; ministry wavered between his friends and his enemies, till the energy of the latter languished by the lengthening out of the trial. He was acquitted on the 23d April, 1795, and the East India Company not only defrayed the expenses of his trial, but settled upon him an annuity of £5000 a year.

During the year 1787 the good understanding betwixt Great Britain and France, which had resulted from the commercial treaty, was interrupted on account of the affairs of Holland. There the united aristocratical and democratical parties, supported by the French court, were become highly refractory and turbulent, and had treated

the consort of his serene highness the stadtholder, sister to the king of Prussia, with the greatest indignity. His majesty had thought it necessary to explain his intention of counteracting all forcible interference on the part of France in the internal affairs of Holland, and gave orders for an augmentation of the forces both by sea and land. It had also been thought proper to conclude a subsidiary treaty with the landgrave of Hesse Cassel. Meanwhile, the rapid success of the Prussian troops under the conduct of the duke of Brunswick at once obtained the reparation demanded, and an explanation took place between the courts of London and Versailles, by which it was mutually agreed to disarm, and to place their naval establishments on the same footing as in the beginning of this year. During the alarm respecting the affairs of Holland, Mr. Pitt had proposed to the East India directors to send out four regiments of the king's troops at the expense of the company, which they had agreed to; but, on the alarm subsiding, they refused, after the troops were ready to embark. Mr. Pitt, therefore, on the 25th of February, moved a declaratory bill, 'to remove doubts respecting the power of the commissioners on India affairs.' On the second reading, Mr. Erskine reprobated its tendency, and drew a striking contrast between the India bills of Mr. Fox and Mr. Pitt. 'The latter,' he said, 'had stolen every thing that the former demanded; and, while it presented the company with the trappings of sovereignty, reduced them to the condition of slaves.' The bill, however, after repeated violent debates, passed both houses. A protest was entered against it by fifteen peers, among whom was lord Hay, earl of Kinnoul.—While the prosecution of Mr. Hastings was going on before the house of lords, an impeachment was moved in the house of commons by Sir Gilbert Elliot, against Sir Elijah Impey. Of the six charges exhibited against him, the only one discussed before the house was, that for the murder of the rajah Nundcomar, a chief of the Bramins. On the 28th of April Sir Gilbert entered fully on the charge; and showed, that forgery, the pretended crime for which Nundcomar was executed, was not capital in India; that the English law had never been promulgated among the Hindoos; that it did not even extend across the Tweed; and therefore, it was as absurd and unjust to apply it to a Hindoo, as it would be to try the Great Mogul for bigamy. Mr. Fox said, 'It was not for forgery that Nundcomar was hanged. It was because he made an accusation against Mr. Hastings;—If,' said he, 'I were upon oath as a jurymen, I would pronounce Sir Elijah guilty of a deliberate murder.' Messrs. Pitt, McDonald, Arden, and Sir R. Sutton, defended Impey; and Messrs. Burke, Francis, and Sir J. Johnstone supported the impeachment, which, however, was negatived by seventy-three to fifty-five. The second charge, being now before the privy council, was deemed improper to be entered on; a circumstance, which Mr. Burke considered as a collusion between Sir Elijah and the company. The prosecution was therefore postponed for three months, and from the enquiry no impeachment resulted. A great number

of petitions having been presented against the slave trade, in the beginning of the session, Mr. Wilberforce gave notice of his intention to bring in a bill on the subject; but being prevented by indisposition, Mr. Pitt, on the 9th of May, moved a resolution, 'That they would early in the next session take into consideration the state of the slave trade.' Mr. Fox said, that 'the slave trade ought not to be regulated, but destroyed, as notoriously hostile to justice and humanity.' Mr. Pitt's motion was then agreed to, nem. con. The session was closed on the 11th of July.

Towards the end of the year a circumstance occurred which alarmed the whole nation. His majesty's health had been precarious for some months, and in November he was afflicted with a severe indisposition, which prevented him from meeting parliament. Symptoms of alienation of mind had appeared; and, after the examination of the royal physicians, an important question was started in the house of commons concerning the right of supplying the want of royal authority during the incapacity of his majesty. After very considerable debates, resolutions were carried in the commons for appointing the prince of Wales regent, with power to execute and administer the royal authority. He was, however, prevented from conferring peerages but on persons of the royal issue, and those of full age; and from granting offices or pensions, or salaries for life, or in reversion. The real, or personal property of his majesty was secured, and was not to be considered as appertaining to, or under the control of, the prince regent. The care and custody of the king's person was committed to the queen, who had power to remove and appoint, from time to time, all persons belonging to the different departments of his majesty's household, during the continuance of his indisposition, and no longer; and, for the better enabling her to perform this duty, a council was appointed to advise with her majesty on all matters relative to this trust, who were also empowered to examine upon oath, at such times as they should think fit, the physicians who had attended, respecting the state of his majesty's health. These resolutions being agreed to, after much debate, a committee was appointed to communicate them to her majesty, and his royal highness the prince of Wales. The prince replied to the committee in terms that did honor to his humanity, liberality, and patriotism; and the queen expressed her satisfaction and pleasure at the measures they had adopted in the present situation of affairs. The bill passed the house of commons on the 12th of February, and was presented to the house of lords on the following day. Here it was discussed on the 17th and 18th, and a few amendments were introduced into it; but before the lords could communicate their concurrence to the commons, a protest by upwards of fifty peers was entered on their journals. Happily, however, these proceedings terminated at this juncture. On the 12th of February the king had been declared by his physicians to be in a state of progressive amendment; and on the 17th convalescent; an adjournment of the house of lords was therefore

proposed on the 19th. On the 25th he was pronounced free from complaint; and on the 10th of March the lord chancellor addressed both houses of parliament in the name of his majesty, when the usual business commenced. On this occasion a general joy was manifested by all ranks of people, and illuminations and other marks of public rejoicings were made over all the kingdom. By his majesty's proclamation the 23d of April was observed as a day of public thanksgiving to Almighty God, for the removal of his late indisposition. The report of the privy council on the slave trade was laid on the table of the house of commons on the 25th of April, and on the 12th of May Mr. Wilberforce opened the discussion in a very forcible speech; but, after a great display of argument on both sides, the subject was deferred till next session. Here it may be observed, that the subject of the slave trade was agitated in several succeeding sessions, and its abolition warmly pressed; but Mr. Wilberforce's motions were rejected, and the question in a great measure dropped.

In the month of May, 1790, the Spaniards having captured two vessels belonging to Britain, in *NOOTKA SOUND* (see that article), a rupture seemed unavoidable; but, after vigorous preparations were made on both sides, all differences were settled. Thus was Great Britain happily rescued from the horrors of war in this quarter of the globe, while her Indian possessions, through accident or ambition, were involved in blood. Of all the native princes of India, Tip-poo Saib was the most formidable to the British government, and the most hostile to its authority. The dispute which finally involved the English with him, arose betwixt the Dutch and Tip-poo. The former were possessed of two forts, situated between Mysore and Cochin; to these the latter laid claim, in right of his father. The Dutch, unable to defend themselves, entered into a negotiation with the rajah of Travancore, for the purchase of them, considering that by placing these forts in the hands of the rajah, who was the ally of Great Britain, they erected a powerful barrier against the encroachments of their ambitious neighbour. The bargain was concluded, July, 1789. On the 1st of March, 1790, the rajah's troops made an attack upon Tip-poo, who had continued quiet within his lines from the 29th of December. An engagement took place, and, war being thus commenced, the British government conceived themselves bound to take an active part. For its result, see *HINDOSTAN*. Among the subjects which came before parliament, during this session, a repeal of the test act was again proposed. The motion was brought forward by Mr. Fox, and the subject, though ultimately rejected, was warmly debated; in the course of which, as well as on a previous question (the vote of supply for the army), Mr. Fox having made some references to the French republicans, as exemplary, Mr. Burke, who considered the French revolution in a very different light, opposed him with great keenness; and this afterwards ended in a total disunion of these two distinguished members of opposition. The parliament was dissolved on the 11th of June.

The new parliament assembled on the 25th of November, 1790, and the following day his majesty opened the session by a speech from the throne. Among several subjects of no great historical interest, which occupied the present session, a bill for the relief of protesting Catholics was passed; and the trial of Mr. Hastings gave rise to a question of considerable constitutional importance; whether impeachments by the commons abate by a dissolution of parliament? This was determined in the negative. In the end of March, 1791, an armament was voted, on account of the taking of Oczakow by the Russians; and, a bill having been brought in for regulating the government of Quebec, a debate ensued on the 6th of May, when Mr. Burke, after making some sarcastic references to the principles of the French revolution, and the abettors of them, declared that his friendship with Mr. Fox was dissolved by that cursed event.

The session was concluded on the 10th of June; soon after which a series of shameful and violent outrages took place in the town of BIRMINGHAM. See that article. The transactions of the session of 1792 were even less important than those immediately preceding. In the autumn of 1791 a marriage had been celebrated between the duke of York, his majesty's second son, and a daughter of the king of Prussia, which gave general satisfaction. On the 17th of February Mr. Pitt presented to parliament a copy of the treaty entered into between the British and Prussian monarchs. The dowry of the princess amounted to £12,000, which was viewed in an inconsiderable light in the wealthy nation of Britain, and parliament readily made a provision of £37,000 per annum for the parties. At this time, also, a statement of the public revenue was brought forward by Mr. Pitt, from which it appeared that about £400,000 might be applied towards the extinction of taxes, or the discharge of the national debt. An enquiry into the grievances complained of by the royal boroughs of Scotland was moved by Mr. Sheridan on the 18th of April, but refused by a considerable majority. In the course of this month a society was instituted in London, for the purpose of obtaining a reform in the representation of the people, which assumed the title of *The Friends of the People*. At the head of this association were Messrs. Grey, Baker, Whitbread, Sheridan, Lambton, and Erskine; and it was quickly joined by several respectable characters in the commercial and literary world. According to a resolution of the society, Mr. Grey, on the 30th of April, mentioned his intention to the house, of moving next session for a reform in the representation of the people. A tumultuous debate ensued, and the subject was dropped.

9. *From the war of 1793 to the peace of Amiens.*—The reader will have anticipated our entering upon a most eventful period of the British history; a period in which our most valuable institutions were threatened with unprecedented dangers. It could not but be obvious, upon the slightest observation, that the French revolution must produce consequences extremely important to Europe; and particularly to England, from the connexion which subsisted between the two

countries. We have already seen two very eminent British statesmen, who had been generally of one mind in political matters, totally divided in their views of this event. By one of these the celebrated *Reflections on the French Revolution* had been published in 1790: a work in which the illustrious author, with equal wisdom and eloquence, showed its true spirit, and the direct tendency of those principles which were professed by its authors. But we cannot pretend to give any idea of the ferment and commotion that the French revolution at that time occasioned throughout England. The proselytes to its principles spoke and acted as if a sudden blaze of light had illuminated the darkened world; as if mankind had awakened from a dream, and just opened their eyes, hitherto obscured by prejudice and superstition. Congratulatory addresses were sent from different societies to the national convention, extolling their new constitution in the highest terms; the press teemed with publications of the most seditious tendency; the wholesome principles of our ancestors were derided as the prejudices of narrow minds; and nothing but the vain sounds of 'liberty, equality, and the rights of man,' could be heard. These last insidious words were chosen as the title of one of the many replies which were made to Mr. Burke's *Reflections*; it was drawn up by Thomas Paine, a man who had formerly been caressed in North America, as the author of a pamphlet entitled *Common Sense*. This book, now published, contributed very much to poison the minds of the ignorant and profligate: it spread the infection of French principles among the lower classes; and the astonishing rapidity with which it circulated, together with the successes of the French in the Netherlands, inspired the favorers of French anarchy with uncommon boldness. Parliament was assembled on the 13th December, 1792, when his majesty, in a speech from the throne, intimated, that he had judged it necessary to embody a part of the militia, and to assemble his parliament earlier than the time specified. The first measure resorted to, in this difficult crisis, was the alien bill. In consequence of the disorders which at that time prevailed in France, under its then tyrannical rulers, great numbers of the French nobility and clergy had been obliged to emigrate, and to seek for safety in poverty and in exile. Another description of men had also emigrated from France for the worst of purposes. It was to thwart the designs of these men, that a bill establishing regulations respecting aliens arriving in Great Britain was presented to parliament. Mr. Burke gave this bill his most cordial support, as being calculated to keep out of England those murderous atheists, who would pull down the state and church, religion and God, morality and happiness. This bill was followed by another, brought in by the attorney-general, to prevent the circulation of assignats, bonds, promissory notes, &c., issued under the authority of France: another bill was passed, about the same period, for restraining the exportation of naval stores, ammunition, &c., and an order of council was issued for preventing the exportation of corn to France.

The French having now filled up the measure of their crimes, by embreuing their hands in the blood of their sovereign; having, by repeated decrees, held out encouragement and protection to traitors in every country, and attempted to kindle the flames of rebellion throughout the world; and having in their last outrage, the opening of the Scheldt, manifested their contempt of all the existing treaties of Europe, Great Britain could no longer remain an inactive spectator of their proceedings. On the 28th of January, 1793, a message was delivered to the house of commons, informing them that his majesty thinks it indispensably necessary to make a further augmentation of his forces by sea, for opposing views of aggrandisement and ambition on the part of France. The question in favor of the address was carried both in the house of lords and commons without a division; though the marquis of Lansdowne and Mr. Fox made several observations against the objects of the war. The French, however, anticipated our intentions, whatever they might have been, by a decree of the convention, formally declaring war against his Britannic majesty and the Stadtholder; and, while Mr. Pitt remarked the causes of his majesty's message, he read an extract from a letter, addressed by one of the executive council in France, to all the friends of liberty in the French sea-ports:—'The king of England and his parliament mean to make war against us. Will the English republicans suffer it? Already these free men show their discontent, and the repugnance which they have to bear arms against their brothers the French. Well, we will fly to their succor; we will make a descent on the island; we will lodge there 50,000 caps of liberty; we will plant there the sacred tree, and we will stretch out our arms to our republican brethren: the tyranny of their government will soon be destroyed.'

About this period, from various causes attendant on the situation of the continent and the declaration of war with France, a general paralysis seemed to seize the country, and the number of bankruptcies exceeded all that had ever happened in the most calamitous times. Those who were possessed of property, appeared, at last, as much at a loss where to deposit it as those who experienced pecuniary distress where to look for relief. The interference of government was solicited by several of the principal traders and merchants, to apply a remedy to this state of things; in consequence of which Mr. Pitt moved that £5,000,000 should be issued by exchequer bills, under certain restrictions, for the assistance of such persons as can give proper security to the commissioners, for the sums that may be advanced. The bill, authorising this, passed both houses without a division; but one-half of the exchequer bills were never applied for. During this session the house of commons, on the recommendation of Sir John Sinclair, voted £3000 per annum for the establishment of a board of agriculture. A bill also passed without opposition, to remove certain incapacities and restrictions from Catholics in Scotland; and the inhabitants of the north of Scotland were successful in obtaining, through Mr. Dundas, a repeal of

the duty on coals carried coast-ways. The charter of the East India Company being now within a year of expiring, they petitioned for a renewal of it, which was granted, under certain regulations, for twenty years. Barracks were this year erected in the neighbourhood of all the principal towns through Britain, that the army might, as much as possible, be kept free from the contagion of popular opinion.

It would exceed our limits to enter into the prosecutions and trials which took place in consequence of the boundless liberty taken by many in propagating sedition, and subverting the government. The session of 1794 (met January 21st) was opened by his majesty with the usual formalities; and the address voted by a majority of 118. Various important questions were agitated in this parliament. No fewer than three motions were made by different members of opposition, for altering the criminal laws of Scotland, and the different treaties that had been entered into with the court of Petersburg, the landgrave of Hesse Cassel, the kings of Sardinia, Spain, Naples, Prussia, Austria, and Portugal, were all canvassed by opposition, who reprobated the manner of conducting the war.

England, at the commencement of her long contest with France, took into her pay a large body of German troops; and the duke of York joined the allies, who confided to him the care of the army which in the summer of 1793 besieged Valenciennes. The trenches were opened on the 14th of June, 1793. The inhabitants wished to surrender; but the violence of the bombardment prevented their assembling. Much of the labor of the siege consisted of mines and countermines. Some of these having been successfully sprung by the allies, the town was surrendered on the 27th of July by capitulation to the duke of York, who took possession of it in the name of the emperor. The siege of Mentz was going on. It suffered much from famine. At last, after an unsuccessful attempt by the French for its relief, it surrendered on the 22nd of July.

At the termination of the siege of Valenciennes it is said that the allied powers were at a loss how to proceed next. Among various plans presented, that of the British ministry was adopted, to divide the grand army, and to attack West Flanders, beginning with the siege of Dunkirk. This determination proved ruinous. The French vanquished that army when divided, which they could not encounter when united. On the 24th of August the duke of York attacked and drove the French outposts into the town, after an action in which the Austrian general Dalton was killed. But a strong republican force menaced the covering army of the allies, under general Freytag. He was attacked and totally routed. The siege was raised. The British lost their cannon and baggage, with several thousand men; and the convention, believing that Houchard, their general, could have cut off the duke of York's retreat, tried and executed him for this neglect. Prince Cobourg and general Clairfait besieged Cambray and Bouchain without success. Quesnoy was, however, taken by general Clairfait on the 11th of September, which ter-

minated for that campaign the success of the allies in the Netherlands. A part of the French army of the north took a strong position near Maubeuge, where they were blockaded by prince Cobourg; but, upon the 15th and 16th of October, he was attacked by the French troops under Jourdan, who had now recovered their vigor. They brought into the field a formidable train of artillery, with many twenty-four pounders. Commissioners from the convention harangued the soldiers, threatened the fearful, and applauded the brave. Crowds of women, throwing off their natural timidity, went through the ranks, distributing spirituous liquors, and carrying off the wounded. The attacks were repeated and terrible on both sides; but the Austrians were defeated, and Cobourg retired in the night. The French now menaced maritime Flanders. They took Furnes, and besieged Neuport. A detachment of British troops were hastily sent to Ostend, and stopped the farther progress of the French. The leading people of Toulon now entered into a negotiation, and submitted to lord Hood, under condition that he should preserve the town and shipping for Louis XVII. and assist in restoring the constitution of 1789. The siege of Toulon was commenced by general Cartaux in September. Neapolitan, Spanish, and English troops, were brought by sea to assist in its defence. In November, Cartaux was removed to the army in Italy, and Dugommier succeeded him. General O'Hara arrived with reinforcements from Gibraltar, and took upon him the command of the town under a British commission. On the 30th of November the garrison made a powerful sally to destroy some batteries erecting upon the heights. The allies succeeded in their object; but, elated by the facility of their conquest, rushed forward in pursuit of the flying enemy, and were met by a strong French force that was drawn out to protect the fugitives. O'Hara now came from the city to bring off his troops; but was wounded and taken prisoner. The total loss of the allies in this affair was estimated at nearly 1000 men. The French had now mustered in full force around Toulon, and prepared for the attack. It was begun on the 19th of December, and was chiefly directed against Fort Mulgrave, defended by the British. This fort was protected by an entrenched camp, thirteen pieces of cannon, thirty-six and twenty-four pounders, &c., five mortars, and 3000 troops. Such was the ardor of assault, that it was carried in an hour, and the whole garrison destroyed or taken. The allies, finding it impossible to defend the place, in the course of the day embarked their troops, after having set on fire the arsenal and ships. A scene of confusion ensued, unparalleled in the history of modern wars. Crowds of people of every rank, age, and sex, hurried on board the ships, to avoid the vengeance of their enraged countrymen. Some of the inhabitants began to fire upon their late allies; others in despair plunged into the sea, making a vain effort to reach the ships: thirty-one ships of the line were found by the British at Toulon; thirteen were left behind; ten were burnt; four had been previously sent to the French ports of

Brest and Rochefort, with 5000 republicans who could not be trusted; and Great Britain obtained by this expedition three ships of the line and five frigates.

At this siege first appeared in command, a lieutenant of artillery, Napoleon Buonaparte, destined to disturb the whole civilised world in his future direction of the resources of France.

On the 1st February, 1794, the chancellor of the exchequer read to the house of commons the decree of an extraordinary commission instituted in France, in consequence of a resolution of the joint committees of finances, of public and general safety, and subsistence, directing the use of every possible expedient to ascertain the property of French subjects in foreign funds; in order that it might be delivered up to the state, and become public property; and that, when the transfer was made, it should be paid for in assignats estimated at par. The motion, on this occasion, was brought forward by the solicitor general, and was, in substance, for leave to bring in a bill to prevent the application of debts in the hands of any of his majesty's subjects, to or for the disposal of persons resident in France, under the power of those who now exercise the government of France. The bill passed without opposition. In consequence of the French leaders menacing the country with invasion, an act was passed for the embodying and training of volunteers, by which associations of both infantry and cavalry were voluntarily formed throughout the country. Though the ferment about the political principles of the French had now considerably subsided, there were still many secret espousers and propagators of these principles in the country. On the 12th of May the ministry issued warrants for apprehending Mr. Horne Tooke, Mr. Hardy, and Mr. Thelwall; with several other persons, on a charge of high treason. On the same day Mr. Dundas brought down a message from the king, recommending to the house to consider the books and papers of the London Corresponding Society, which had been seized by his majesty's order, and to pursue such measures as were necessary to prevent their pernicious tendency. The papers were referred to a committee of secrecy, who brought up their report on the 16th of May; when Mr. Pitt, after an eloquent speech, moved for leave to bring in a bill, empowering his majesty to secure and detain all persons suspected of designs against his crown and government. A strenuous opposition was made to the bill, but it passed by a great majority. The trials for high treason commenced soon after, and that of Thomas Hardy, which continued eight days, terminated in his acquittal; Mr. Horne Tooke obtained also a verdict in his favor, after six days' investigation; five days were occupied upon the trial of Mr. Thelwall, but the issue was alike favorable to him; and the others were discharged. Some differences happening with America occasioned several motions in the house of commons; but matters were afterwards happily adjusted; and the session terminated on the 11th of July.

Immediately on the rising of parliament several changes took place in administration. The duke of Portland was appointed one of his

majesty's principal secretaries of state, and Mr. Windham secretary at war. Earl Fitzwilliam was nominated president of the council, but was soon after sent to Ireland as lord-lieutenant.

In the Netherlands the emperor took the field at the head of the allied armies. West Flanders was to be protected by a strong body of men; the main army was to penetrate to Landrecy, and to cut off the French from the interior by covering the country from Maubeuge to the sea. The plan was bold; but, when attempting to put it in execution, the allies must have been ill-informed of the immense force which the French were collecting. The town of Lisle alone, which is capable of containing a numerous army within its walls, should have seemed an insurmountable objection to the plan. On the 16th of April the Austrian, British, and Dutch armies assembled on the heights above Cateau, and were reviewed by the emperor. On the 17th they advanced in eight columns against the French, drove in their whole posts, and penetrated beyond Landrecy. The allied army now amounted to 187,000 men, who were disposed in the following manner:—15,000 Dutch and 15,000 Austrians, under the prince of Orange and general Latour, formed the siege of Landrecy; 15,000 British and 15,000 Austrians, commanded by the duke of York and general Otto, encamped towards Cambray. The emperor and the prince of Saxe-Cobourg, at the head of 60,000 Austrians, were advanced as far as Guise; 12,000 Hessians and Austrians under general Wurmser were stationed near Douay and Bouchain; count Kaunitz with 15,000 Austrians defended the Sambre and the quarter near Maubeuge; and, general Clairfait, with 40,000 Austrians and Hanoverians, protected Flanders from Tournay to the sea; 60,000 Prussians, for whom a subsidy had been paid by Great Britain, were expected in addition to these, but they never arrived. The French now commenced their operations.

On the morning of the 26th of April they attacked the duke of York near Cateau in great force. After a severe conflict they were repulsed, and general Chapuy was taken prisoner. At the same time they attacked the troops under his imperial majesty, but were there also repulsed in a similar manner; losing in all fifty-seven cannon. On the same day, however, general Pichegru advanced from Lisle, attacked and defeated Clairfait, took thirty-two pieces of cannon; and in the course of a few days made himself master of Warwick, Menin, and Courtray. On the 29th of April the garrison of Landrecy surrendered to the allies. When this event was known in the Convention it excited a considerable degree of alarm. It was, however, the last effectual piece of success enjoyed by the allies during this disastrous campaign. General Clairfait was again completely defeated by Pichegru in a general engagement; and it was found necessary to send the duke of York to his assistance. On the 10th the duke of York was attacked near Tournay by a body of the enemy, whom he repulsed; but he was unable to join Clairfait, upon whose destruction the French were chiefly bent: for, at the same time that the duke of York was occupied by the attack upon himself,

Pichegru fell upon Clairfait with such irresistible impetuosity, that he was compelled to retreat in confusion, and a part of his army appears to have fled to the neighbourhood of Bruges. While Pichegru was thus advancing successively in West Flanders, Jourdan advanced in East Flanders from Maubeuge, crossed the Sambre, and forced general Kaunitz to retreat. On the 18th, however, general Kaunitz succeeded in repulsing the enemy, and they recrossed the Sambre with considerable loss. The allies now found that no progress could be made in France, while Pichegru was advancing successfully, and occupying West Flanders in their rear. The emperor, therefore, withdrew the greater part of his army towards Tournay, and resolved to make a grand effort to cut off the communication between Courtray and Lisle, to prevent completely the retreat of Pichegru. On the night of the 16th the army moved forwards in five columns for this purpose: Clairfait was directed to cross the Lys, to effect a general junction, and complete the plan; but, in the course of next day, the division under the duke of York was overpowered by numbers, and defeated. The progress of the rest was stopped, and Clairfait completely defeated. The duke of York escaped being made prisoner only by the swiftness of his horse.

The plan of the allies being thus frustrated, their army withdrew to the neighbourhood of Tournay. Pichegru attempted to retaliate. On the 22nd of May he brought down at day-break his whole force against the allies. The attack was commenced by a heavy fire of artillery, and all the advanced posts were forced. The engagement soon became general; the whole day was spent in a succession of obstinate battles. The French and the allied soldiers fought with equal courage and equal discipline. At nine o'clock P. M. the French at last withdrew from the attack. In this engagement the French were unsuccessful in their immediate object; but the weight of their fire, their steady discipline, and their violent obstinacy of attack, raised their military character high in the estimation even of their enemies. Their numbers were immense; they implicitly obeyed their generals. A combination of efforts was thus produced, whose operation was not retarded by divided counsels. On the other side, the numbers of the allies were daily declining; their leaders were independent princes, whose sentiments and interests were often hostile to each other, and their exertions were consequently disunited. On the 24th the French again crossed the Sambre, but were driven back with much loss. On the 27th they attempted to besiege Charleroi; but the prince of Orange, on the 3rd of June, compelled them to raise the siege. On the 12th a similar attempt was made, and they were again repulsed. In West Flanders, however, Pichegru commenced the siege of Ypres. It was garrisoned by 7000 men; reinforcements were therefore daily sent from the grand army to Clairfait to relieve it. The bloody contests in which the unfortunate general was daily engaged with the French were uniformly unsuccessful, and were the means of wasting the armies of the allies. Ypres held out

till the 17th of June, when it capitulated: and such was the discipline of the French army, at this time, that no notice could be obtained, for several days, of that event.

On this the duke of York retreated to Oudenarde; for Jourdan, after storming the Austrian camp of Betignies, advanced with such strength upon Charleroi in the east, that its immediate fall was feared. As this would have enabled the two French armies to encircle the whole of Flanders, the prince of Cobourg advanced to its relief. Charleroi surrendered at discretion on the 25th. The prince of Cobourg advanced on the 26th, to attack in their entrenchments the army that covered the siege near Fleurus; but, the covering army being by this time reinforced by the accession of the besieging army, the allies were repulsed. Jourdan then drew his men out of their entrenchments, and attacked the Austrians. He was three times repulsed, but was at last successful; the loss of the vanquished army was prodigious. The French said it amounted to 15,000 men. The allies now retreated in all quarters. Nieupoort, Ostend, and Bruges, were taken, and Tournay, Mons, Oudenarde, and Brussels, opened their gates. At this last place the French armies of East and West Flanders united. Landreecy, Valenciennes, Condé, and Quesnoy, were left with garrisons. The allied troops, evacuating Namur, formed a line from Antwerp to Liege to protect the country behind. The French advanced in full force, and attacked general Clairfait, cut to pieces half his troops that remained, and broke the line. The allies retreated. The duke of York was joined by some troops under the earl of Moira; with these and the Dutch troops he retired to near Bergen op Zoom and Breda for the protection of Holland. The prince of Cobourg evacuated Liege, crossed the Maese, and placed a garrison in Maestricht. He soon, however, sent back a part of his troops to the neighbourhood of Tongres; for here, to the astonishment of all Europe, the French armies made a voluntary pause in their career of victory, and ceased to pursue their retiring foes. Sluys in Dutch Flanders was the only foreign post that they continued to attack, and it surrendered after a siege of twenty-one days. On the Rhine the war was equally successful on the part of the French.

During the course of this summer Corsica was subdued by Great Britain: and the whole of the French West India Islands, except a part of Guadaloupe, yielded to the British troops under Sir Charles Grey and Sir John Jervis. On the 1st of June, 1794, the British fleet, under earl Howe, gained a most splendid victory over the French fleet to the west of Ushant. The French committee of safety had purchased, in America, immense quantities of grain and other stores. These were embarked on board 160 sail of merchantmen, convoyed by six sail of the line. Lord Howe sailed to intercept this valuable convoy. The French fleet sailed to protect it. On the morning of the 28th of May the fleets came in sight of each other. Lord Howe had previously despatched six ships of the line, under admiral Montague, to intercept the French convoy, while he should engage and

detain the grand fleet. The French despatched eight sail to defeat this attempt. In the course of the 29th Lord Howe got to windward of the French fleet. His force was twenty-five, and theirs was twenty-six sail of the line. The following day he bore down upon them and broke their line. The engagement was one of the severest ever fought. The French admiral, in less than an hour after the close action commenced in the centre, crowded off with twelve of his ships. The British fleet was so much disabled, or separated, that several of the French dismantled ships got away under sails raised on the stump of their fore masts. Seven sail of the line, however, remained in possession of the British, and two were sunk. In the mean time admiral Montague fell in with the French convoy, but it was now guarded by fourteen sail of the line. As he could not encounter such a force he returned home, and it was safely conveyed into port. Thus, by one of those contradictions which often occur in human affairs, the British fleet was victorious, and yet the French were left masters of the sea, and obtained their great object, provisions. As this engagement, however, testified that the British seamen had not lost their ancient superiority on their own element, the nation regarded the victory as a pledge of its independence, and very general rejoicings took place in consequence of it.

Parliament assembled on the 30th December, and his majesty's speech held forth the necessity of persisting in the war; which, when the address was moved, occasioned very warm debates in both houses of parliament. But the debates were still more remarkable upon a motion brought forward by Mr Grey in the house of commons, January 26th, 1795, and by the duke of Bedford in the house of lords on the following day, that the existence of the present government of France ought not to be considered as precluding at this time a negotiation for peace. Our limits will not permit us to enter upon these debates; but Mr. Grey's motion was negatived by a majority of 183; nor was the duke of Bedford more successful.

In the course of the preceding year a treaty of marriage had been negotiated between his royal highness the prince of Wales, and the princess Caroline of Brunswick. The nuptials were celebrated on the 8th of April this year, and on the 27th a message from his majesty was delivered to both houses of parliament, relating to the debts of the prince of Wales: it stated the reliance of his majesty on their generosity for enabling him to settle an establishment upon the prince and his august bride, suited to their rank and dignity; that the benefit of any settlement now made could not effectually be secured to the prince till he was relieved from his present incumbrances to a large amount; but that his majesty did not propose to his parliament any other means of providing for this object, than the application of a part of the income which may be settled on the prince, and the appropriation for a certain time of the revenue of the duchy of Cornwall, &c. After considerable difference of opinion on the subject, the annual sum of

£125,000 was voted by the house of commons as a suitable establishment for the heir apparent to the throne; but of this, £65,000, with the rents of the duchy of Cornwall, amounting to £13,000, were set apart for the liquidation of his debts, which, at this time, amounted to £630,000.

Parliament was prorogued on the 27th of June, but was again assembled much earlier than usual, chiefly on account of the unfavorable state of the domestic concerns of the country. At the close of the year 1794, the winter had become so very severe as to enable the French to make an easy conquest of Holland, by which they now held an immense length of sea coast opposite to Britain, while this summer had been so ungenial to Great Britain, that a dearth of provisions began to prevail. The London Corresponding Society, as if availing themselves of the discontent which this produced among the populace, had, previous to the meeting of parliament, held several meetings in the open fields, for the avowed purpose of petitioning the king in parliament for peace and parliamentary reform, which doubtless contributed to excite the riots that took place. The most daring insults were offered to his majesty as he passed along, at the usual hour, to open the session of parliament, by the crowd in St. James's park; and, in the streets adjoining Westminster Hall, stones and other missiles were thrown, several of which struck the state coach. As his majesty returned from the house the outrages were renewed, and, after he alighted, the coach was attacked, and almost demolished. His majesty in his speech, while noticing the situation of continental affairs, seemed to indulge a hope that terms of peace might soon be attainable, but, to accelerate this desirable end, it was necessary that we should prove our ability to prosecute the war. The usual address being moved, occasioned some debates on the propriety of the war, but an address to his majesty relative to the outrages committed against his person was proposed and agreed to; and on the 4th of November copies of his majesty's proclamation, relative to these outrages, were submitted to the house, and ordered to lie upon the table. On the 6th a bill was presented by lord Grenville, pursuant to the notice he had given on the former day, 'for the safety and preservation of his majesty's government against treasonable and seditious practices and attempts;' and, on the same day, the chancellor of the exchequer, after an eloquent speech, moved, that 'leave be given to bring in a bill for the more effectually preventing seditious meetings and assemblies.' These bills, after a violent opposition, passed both houses of parliament. During this year, 1795, Great Britain retained her usual superiority by sea. A British squadron, under admiral Elphinstone, had taken possession of the Dutch settlement of the Cape of Good Hope, on the 16th of September, 1795. This settlement the Dutch wished much to recover; and they advanced money to enable the French to fit out a squadron to co-operate with them in an attack upon it. The French government took the money, but the squadron was never equipped. The Dutch themselves this year sent a squadron of seven ships of war,

under admiral Lucas, to reconquer the Cape; but being no match for the British squadron, and being caught between two fires, without the possibility of escaping, the Dutch fleet, without firing a gun, was delivered up to the British admiral.

In the month of March, 1796, an attempt was made towards a negotiation for peace with France, but in vain. During this session supplies were voted to the amount of £37,588,000, and above £25,500,000 was borrowed. The guards and garrisons were reduced to 59,000 men, and the colonial forces increased to 77,000; sailors and marines were 110,000. But, after an active and successful campaign on the part of the French, several states thought proper to send ambassadors to Paris to open the negotiation for peace. A treaty was concluded with Spain and several of the German princes. The attention of Europe was, however, most deeply engaged by the negotiations opened by the English government. The commencement clearly foreboded what would be the event of these; the grossest calumnies, concerning the insincerity and even perfidy of the English court, were circulated under the apparent sanction of the directory. After a great deal of discussion, concerning the principle of restitution, the two governments at last agreed on that point, and lord Malmesbury delivered two memorials on the principal objects of arrangement. The directory, having read the memorials, sent an extract from the register of their deliberations, requiring lord Malmesbury's signature to the memorials, and also the ultimatum of his demands, in twenty-four hours. He complied with the forms required by the directory, but observed that the peremptory demand which they made of an ultimatum shut the door at once to all negotiation; and represented, that if the conditions submitted to their consideration were not approved, or were not to be the subject of discussion, if they would propose their own conditions he would submit them to the consideration of his court. Upon this the negotiation ended, for the directory, having read the memorials received on the 17th of December, ordered the ministry to write to lord Malmesbury on the 18th, that they could hear no propositions contrary to the constitution, and the laws and treaties by which the republic were engaged; and likewise enjoining him to leave Paris in twenty-four hours. Such was the event of this negotiation on the part of the French; commenced with reluctance, conducted with insincerity, and concluded with insult.

The French, towards the close of 1796, attempted an invasion of Ireland; but the plan was ill concerted. The whole conduct of it was entrusted to general Hoche, and no second was prepared to occupy his place in case of any accident. The disaffected faction, with whom the French meant to co-operate, was not warned of their approach, and the fleet was sent towards a quarter of the country where the people were not prepared to receive them. When about to sail it was detained for some time by a mutiny, which arose in consequence of the enlistment of about 1200 galley slaves. The frigate in which general Hoche had embarked was separated from the fleet in a

gale of wind; so that when the greater part of the fleet arrived at Bantry Bay, on the west coast of Ireland, nobody had instructions how to proceed. The troops and their officers wished to land, but the admiral, Bouvet, refused to allow them. Having remained several days upon the coast, he sailed for France, and arrived at Brest, with a part of the fleet on the 31st of December. General Hoche did not reach Bantry Bay till it was too late, and therefore could not land. The fleet suffered losses in its return.

At the opening of the session, in the end of 1796, his majesty took notice of the invasion which the enemy had projected against England. Mr. Pitt brought forward the business in the house of commons, and pointed out the means by which he proposed to raise 15,000 men, to be divided between the land and sea service; to raise a supplementary levy of 60,000 for the militia, and 20,000 cavalry, which, with a few alterations and amendments, were agreed to. But, in mentioning the supplies for the year, which amounted to £27,647,000, and explaining the different articles of expenditure, the minister alluded to an expense of a particular nature, which had been incurred during the interval of parliament. As it would have been a matter of very great delicacy to have brought forward a public discussion on the propriety of advancing a sum to a foreign court in the critical situation of the country, ministry had granted to the emperor, without a public discussion, the sum of £1,200,000. This transaction was canvassed soon after, and the opposition reprobated it with the utmost acrimony. While the senate appeared thus the scene of faction, a most daring mutiny broke out in the navy, the pride and glory of the nation. The seamen had addressed several letters to earl Howe, soliciting a redress of grievances, particularly as to provisions, in which it seems they had been imposed upon, both as to quantity and quality; but, as these letters were anonymous, his lordship paid no attention to them. This apparent neglect produced a general correspondence by letter through the whole fleet; and on the 14th of April, when the signal was made to prepare for sea, a general revolt ensued; and, instead of weighing anchor, the seamen of the admiral's ship gave three cheers, which were echoed by the other ships. Delegates were then appointed for each ship, to represent the whole fleet; and the cabin of the admiral's ship was fixed upon as the place of their deliberation. Petitions were drawn up and presented to the admirals upon the spot, stating their demand of an increase of wages, and of some regulations for their benefit with respect to the ratio of provisions. On the 18th a committee of the admiralty arrived at Portsmouth, who made several propositions to reduce the men to obedience; the lords of the admiralty next conferred with the delegates, who assured their lordships that no arrangement would be considered as final, until it should be sanctioned by king and parliament, and guaranteed by a proclamation for a general pardon. Matters remained in this situation till the 23d, when earl Howe returned to his ship, hoisted his flag, and, after a short address to his crew, informed

them that he had brought a redress of all their grievances, and his majesty's pardon for the offenders: after some deliberation these offers were accepted, and every man returned to his duty. All disputes seemed now to be settled, but it was quickly circulated among the sailors that government deluded them with vain hopes. The flame of mutiny was rekindled; and on the 7th of May, when lord Bridport made the signal to weigh anchor, every ship at St. Helens refused to obey. A meeting of the delegates was ordered on board the London; which vice-admiral Colpoys opposed, and gave orders to the marines to level their pieces at them; a skirmish ensued, in which five of the seamen were killed. The whole crew of the London now turned their guns towards the stern, and threatened to blow all aft into the water, unless their commanders surrendered; which they reluctantly did, and admiral Colpoys and captain Griffiths were confined for several hours. The seamen continued in this mutinous state till the 14th of May, when lord Howe at length arrived from the admiralty with plenary powers to enquire into and settle the matters in dispute; he was also the welcome bearer of an act of parliament, which had been passed on the 9th, granting an additional allowance as well as his majesty's proclamation of pardon for all who should immediately return to their duty. Matters being thus adjusted, the sailors appeared satisfied; the officers were generally reinstated in their commands, the flag of disaffection was struck, and the fleet prepared to put to sea to encounter the enemy. Such, however, is the propensity of the human mind, when gratified in one point, to entertain new desires, that the success of the seamen on this occasion encouraged another part of that heroic body to make farther claims. The sailors at the Nore insisted on a more punctual discharge of arrears, a more equal distribution of prize money, and a general abatement of the severity of discipline. They chose delegates from every ship, one of whom, a seaman named Richard Parker, being appointed President, assumed the command of the fleet. The flag of admiral Buckner was struck on the 23d of May, and the red flag, the symbol of mutiny, hoisted in its stead; while they transmitted a statement of their demands to the admiralty. At this alarming height of the mutiny, a deputation of the lords with earl Spencer at their head, proceeded to Sheerness; but finding the sailors rather rising in insolence and disobedience, than inclined to submission, they departed, after signifying that they need expect no concessions whatever, further than what had been already made by the legislature. The mutineers now proceeded to force a compliance with their demands, by blocking up the Thames, and refusing a free passage up and down the river to the London trade. Two merchant ships were robbed of provisions, and some ships of war, that refused to accede to the combination, were fired upon. Ships of neutral nations, however, colliers, and a few small craft, were allowed a passport, signed Richard Parker, president of the delegates. No hopes of accommodation appearing, every necessary measure was taken to compel the seamen to return to

their duty. An act of parliament was passed for preventing all intercourse with the mutinous ships; and government ordered all the buoys to be removed from the river Thames and the neighbouring coast. Preparations were also made at Sheerness against an attack from the mutineers, who seemed to meditate the bombardment of the place; and, after the rejection of the last attempt at a reconciliation through the medium of lord Northesk, measures were taken by lord Keith and Sir C. Grey, to attack the fleet from the works with gun boats. Happily, however, the defection of some of the ships, with other strong symptoms of disunion, rendered the application of force unnecessary; and on the 10th of June, several ships having pulled down the red flag, the rest followed their example within a few days, and went under the guns of the fort. Admiral Buckner's boat was then sent to the Sandwich, with a picket guard of soldiers, to arrest Parker, who was very peaceably surrendered to them with about thirty other delegates. They were soon after brought to trial; several were executed, but the greater part remained under sentence till the signal victory of admiral Duncan, in the month of October, when they were pardoned.

In the beginning of this year the public mind was considerably agitated also by another event, which at first threatened to overwhelm in ruin the pecuniary resources and commerce of the country: the Bank of England suspended its payments in specie. Though, doubtless, the large sums of money sent abroad as subsidies to foreign princes by government had diminished the quantity of gold and silver in Great Britain, one powerful cause of this event seems to have been the terror of invasion; this induced the farmers, and other persons at a distance from the metropolis, to withdraw their money from the hands of those bankers with whom it was deposited; and from the country bankers the demand for specie soon reached the capital. In this alarming state the ministry found themselves compelled to interfere, and an order of the privy council was issued on the 26th of February, prohibiting the directors from issuing any cash in payment till the sense of parliament could be taken of that subject. The business was immediately laid before parliament, when the most violent debates ensued; the opposition, as usual, imputed every evil to the incapacity and wickedness of the ministry, and insisted with great violence that the bank had failed, and that the nation was ruined. But, committees of both houses being appointed to examine the state of the bank's affairs, they reported them to be in a prosperous state, though they each recommended a continuance of the late prohibition. Measures were adopted for maintaining the means of circulation, and supporting and maintaining the public and commercial spirit of the kingdom; and the ferment and alarm which had been raised by this unexpected event was soon allayed. During this year the war on the part of Great Britain was almost exclusively confined to naval operations, in which the skill and activity of her seamen was eminently conspicuous, and invariably crowned with victory. Through

the influence of the French, Spain had been induced to declare war against Britain; and a Spanish fleet of twenty-seven sail of the line, while attempting to join a French armament, was attacked by Sir John Jervis with fifteen sail; the issue of which obtained for the English admiral the title of Earl St. Vincent, and the thanks of the British parliament. See JERVIS. We have, in our memoir of admiral DUNCAN, given an account of the heroism he displayed in the defeat of the Dutch fleet, and this defeat it was afterwards believed prevented the French from invading this country. But, while the power subordinate to France suffered these disasters by sea, the French armies were gaining fresh triumphs on the continent; and the consequences of these left Britain alone in the contest. Both the French and English nations were now, however, anxious for the restoration of peace; and a negotiation was entered into at Lisle: but by this time a sanguinary party, with the director Barras at their head, prevailed in the French councils, so that they demanded of lord Malmesbury, the British ambassador, as a preliminary to negotiation, the restitution of all his Britannic majesty's conquests. To this it was replied, that peace on such terms would not be thought of; and, after some farther fruitless discussion, his lordship was desired to return home. Having rejected our offers of peace, the enemy resumed the project of an invasion of Britain, and it was generally thought that they seriously intended to make the attempt. Vast preparations were made in all the different sea-ports of France; a great number of flat-bottomed boats and transports were fitted out; and a formidable force was assembled near the sea-coast, to which they gave the name of the Army of England. Idle stories were likewise propagated about rafts of an immense size, in which they were to float over to England, and to carry terror to her shores. In the mean time the British ministry adopted the most prudent and judicious precautions to repel attacks. A bill was passed for enabling his majesty to provide more effectually for the defence of the country, and to indemnify such persons as might sustain loss or injury, in consequence of the measures which it might be necessary to take for the general defence of the country, &c.; likewise to ascertain those who were willing, near their own homes, to co-operate with the existing force of the country, whether as soldiers, pioneers, drivers of waggons, or in any other situations; circular letters were addressed to the lord-lieutenants of the counties, informing them that any corps of respectable householders would be accepted: in short, every measure was taken which could ensure the public tranquillity, or defeat the attempts of our enemies. At no period of our history were there so much zeal and courage displayed by all ranks of the British nation. They united as one man in defence of their constitution. Before the spring the enemy finally abandoned the threat of invasion, and directed their fleet to sail for Egypt, accompanied by a great number of transports. This formidable armament was closely pursued by the British under admiral NELSON (see that article), and, though the French troops had af-

fectured a landing before he came up with it, he overtook their fleet in the bay of Aboukir, and obtained 1st August 1798, the memorable victory of the Nile.

In the mean time, while the British ministry watched with a jealous and vigilant eye the designs of the enemy abroad, their attention was not diverted from the treasonable attempts of their adherents at home: a conspiracy of a very dangerous nature was discovered; and Mr. O'Connor, a young man of family, leagued with several obscure persons, having given just grounds for suspecting his designs, the party was watched, and traced to Margate, from whence they proposed to embark for France. After several examinations they were finally committed to take their trial for high treason, which took place at Maidstone. Their defence consisted in a simple denial of the facts charged against them; but Mr. O'Connor brought forward, in his behalf, the most respectable members of the opposition, who gave him an excellent character. Only one of the prisoners, a Mr. O'Coigley, was found guilty, and was shortly after executed; but, by authority of a warrant from the duke of Portland, Mr. O'Connor was apprehended immediately after his acquittal, and sent under a guard to Dublin.

Matters there were still more alarming: an extensive and dangerous conspiracy had been formed for erecting Ireland into an independent republic. See IRELAND. About this time, also, the French fitted out an expedition for the invasion of Ireland. Their forces consisted of one ship of eighty guns, eight frigates, a schooner, and a brig. Being discovered by the squadron under Sir J. B. Warren, after an action of nearly four hours, the *La Hoche* with three other ships struck to the British. They were full of men and every thing necessary for the establishment of a formidable force in Ireland. Parliament assembled on the 20th of November 1798, when his majesty, in a speech from the throne, noticed particularly the late victory obtained by the fleet under admiral Nelson. Scarcely any single victory ever produced consequences of such importance. The grand seignior, who had paid little attention to the invasion of Egypt, now declared war, in the name of all Mussulmans, against the host of infidels which had invaded the land from whence the sacred territory of Mecca is supplied with bread. The powers on the continent of Europe were inspired with fresh vigor: and a coalition was formed between the emperors of Russia and Germany, and the king of Great Britain.

On the Rhine the French were repeatedly defeated and pursued by the Austrians; general Suwarrow drove them from all their conquests in Italy. In the mean time Great Britain prepared to invade Holland with an army of 40,000 men, consisting of British troops and Russian auxiliaries. The first division, under general Sir Ralph Abercromby, sailed in August, with a fleet commanded by admiral Lord Duncan. Bad weather prevented a landing from being attempted till the 27th. On the morning of that day the troops landed without opposition upon the shore of Helder Point in North Holland, at the entrance

to the Zuyder Zee. They had not been expected in this quarter, and the troops in the neighbourhood were consequently few. The British, however, had no sooner begun to move forward than they were attacked by a considerable body of infantry, cavalry, and artillery, who had been hastily assembled from the nearest towns. The Dutch troops maintained the contest with much obstinacy; but they were gradually fatigued by the steady opposition they encountered, and retired six miles. In the night they evacuated the fort of Helder, of which the British took possession on the morning of the 23th. A detachment from the British fleet, commanded by vice-admiral Mitchell, now entered the Zuyder Zee, by the strait of the Texel, to attack the Dutch fleet under admiral Story; who, instead of retiring for safety to any of the ports, or to the shallow water with which that sea abounds, surrendered the whole fleet, on the 30th of August, without firing a gun, under pretence that his seamen were mutinous and would not fight. Had the expedition terminated here it might have been regarded as extremely fortunate, and as establishing the power of the British navy without a rival. But it was resolved to follow up this first success by an effort on land to restore the authority of the Stadtholder, and the ancient government of the United Provinces. Many circumstances were hostile to this enterprise. The whole army had not been sent at once from Britain. As no more than the first division had arrived, the troops could only rest upon the ground they had gained till reinforcements should be sent. The terror arising from the first appearance of an invading army was thus allowed to pass away,⁶ the friends of the Stadtholder were discouraged, while leisure was afforded to the enemy to adopt effectual measures of defence. The place where the landing was effected was well chosen for an attack upon the Dutch fleet; but for an invasion, with a view to the restoration of the Stadtholder, it was the worst that could have been selected. North Holland, at the extremity of which it was made, is a narrow peninsula, every where intersected by canals and ditches, of about forty miles in length. Here the invaders might be detained, and even successfully resisted, by a force greatly inferior to their own. This also was the quarter of the country the most unfavorable to the cause of the Stadtholder. The rainy season too was approaching, which renders a winter campaign in Holland almost impossible.

Amidst the pressure of the difficulties which surrounded them, the French directory hesitated much about undertaking the defence of Holland; but the place, and the time of landing the invading army, soon determined them. General Brune was sent with troops to support the Dutch general Daendels. General Abercromby, in the mean time, remained upon the defensive at Schager Brug, waiting for reinforcements. His inactivity encouraged the enemy, on the 10th of September, to venture an attack upon his position. They advanced in three columns, two of Dutch, and one of French troops. They were repulsed, however, in all quarters, and retired to Alkmaer. On the 13th the duke of York arrived with ad-

ditional troops, and assumed the chief command. The Russian auxiliaries having also arrived, offensive operations were immediately resolved upon. On the 19th the army advanced. General Abercromby commanded the left, which proceeded along the shore of the Zuyder Zee against Hoorne. The centre columns were commanded by generals Dundas and Pultney; and the right wing, consisting of Russians, was commanded by their own general, D'Herman. By some strange misunderstanding, the Russians advanced to the attack soon after 3 o'clock A. M., which was some hours previous to the movement of the rest of the army. They were successful in their first efforts, and obtained possession of the village of Bergen; but pressing eagerly forward, and being unsupported by the other columns, they were nearly surrounded. Their commander was taken prisoner; and, though the British came in time to protect their retreat, they lost at least 3000 men. This failure on the right obliged the British commander-in-chief to recal his troops from the whole advanced positions they had gained, though general Abercromby had actually taken Hoorne with its garrison, and although general Pultney's column had carried by assault the principal position of the Dutch army called Ourds Carspel. The severity of the weather prevented another attack till the 2nd of October, when, after an engagement that lasted from 6 A. M. till 6 P. M., the British army succeeded in driving the united Dutch and French troops from Alkmaer and the villages in its neighbourhood. The contest was chiefly conducted amongst the sand hills in the vicinity of the ocean; and the battle was maintained with such obstinacy, that the fatigue of the troops, with the difficult nature of the country, prevented the British from gaining any great advantage in the pursuit. The retreating army immediately occupied a new position between Baverwyck and Wyck-op-zee. The duke of York once more attacked them on the 6th; and after an obstinate and bloody engagement, which was maintained till night, he remained in possession of the field. But this was the last success of the invaders. Finding himself unable to make farther progress, in consequence of the increasing numbers of the enemy, the impracticable nature of the country, and the badness of the weather, which during the whole of 1799 was unusually severe, the duke of York retired to Schager Brug, and waited for orders from England to return. He was, in the mean time, closely pressed by the united Dutch and French forces, so that his embarkation must have been attended with much hazard. He therefore entered into a convention with the French and Dutch generals; by which it was agreed, that they should no farther molest him in his retreat; that, in return, he should not injure the country by breaking down any of the dykes which protect it against the sea; and that Great Britain should restore to France and Holland 8000 prisoners of war, taken previous to this campaign.

In the view of our domestic concerns every other consideration was at this time absorbed in the question of a legislative union with Ireland. The late rebellion, and the fear that through the machinations and aid of the French, Ireland

might be separated from the British empire, made this object, which should have been effected three centuries before, of the utmost moment at the present era. Some preliminary discussion was introduced in a debate in the English house of commons on the 23rd of January, 1799; and the subject was again laid before the house on the 31st of the same month, by Mr. Pitt, and approved of by a majority of 145; the measure was discussed in the house of lords, and met with a similar approbation. In the Irish house of commons, however, which was opened on the 22nd, with a speech from the lord-Lieutenant, indirectly announcing the measure, the reception it met with was unworthy the dignity of a legislative assembly. Instead of that dispassionate consideration which such an important measure deserved, it was opposed with the utmost violence; and the enemies of the measure endeavoured, by every possible art, to kindle the passions and prejudices of the people of Ireland into a flame. The discussion did not close till noon the following day, when the address was carried by a majority of only one. Upon this, ministry desisted from the immediate pressure of the measure, which, however, was soon after effected. See IRELAND.

Meanwhile, the report of a committee of the British house of commons clearly developed the views and intentions of the Irish traitors. On the 19th of April the report was taken into consideration; and Mr. Pitt moved for a bill to renew and amend the bill passed in the thirty-eighth of George III., for securing and detaining persons accused of sedition, &c. The resolutions passed, and a bill was brought in by the lord mayor of London, for carrying the latter part of them into effect. Several other measures were adopted, which operated as a restraint upon liberty, but which were justified by the formidable appearance which treason had assumed. The finances of the year 1799 were introduced by a notice given to the house of commons on the 26th of November by the chancellor of the exchequer, that on that day fortnight he should make a statement of the whole ways and means of the year. The plan which he meant to follow was that of raising a considerable part of the supplies within the year, the principle of which had already received the sanction and approbation of the house. While the principle remained the same, the mode of raising the supply was rendered less exceptionable than in the year 1798. For this purpose the assessed taxes were repealed, and a general tax was imposed on all the branches of income. No income under £60 was subjected to any contribution, and the scale of modification was extended to £200, after which a tenth part of the contributor's income was exacted. The mode of obtaining this contribution differed from that pursued in the assessed taxes, as, instead of trebling the amount, the statement of income proceeded from the party himself, which it was in the power of commissioners appointed for the purpose, and sworn to secrecy, to return, if they thought that a false statement was given, or to demand a specification of income. A bill had been brought in during the last session for the redemption of the land-

tax. Its object was, by absorbing a large quantity of stock, to raise its price, and in the end to transfer a large portion of national debt into a landed security. The annual amount of the land-tax was £20,000,000. It was proposed to sell or commute this annuity at twenty years' purchase, at three per cent. stock, which the government was to take in payment at fifty. The preference was given to the owner of land; and if within a certain period he should not be able to purchase, a further period was allowed.

We have already hinted at the successes of the combined powers on the continent; but in the end of this year a misunderstanding took place between the Austrians and Russians, in consequence of which the emperor Paul abandoned the coalition. About the same time Buonaparte, after being disappointed in his projects on Egypt, particularly by the valor of Sir Sidney Smith (see ACRE), and hearing of the reverse of fortune which the French armies had suffered in Europe, left his army in Egypt; returned to France; and, abolishing the directory, obtained the appointment of an executive commission of three consuls, of which he himself was the chief, or first consul. To render himself popular in this high station, and to cast the odium of continuing the war upon others, he addressed a letter to the king of Great Britain, on the subject of a general peace; but the British cabinet conceived that the new French government could as yet give no security for terms of peace. Lord Grenville accordingly replied to the chief consul's letter, informing the French minister, that his majesty, in entering into the contest, 'had no other view than that of maintaining, against all aggression, the rights and happiness of his subjects; that for these he had contended against an unprovoked attack; and that for the same objects he was still obliged to contend; that he looked only to the security of his own dominions and those of his allies, and to the general safety of Europe. Whenever he can judge that security can in any measure be obtained, as resulting either from the internal situation of that country, from whose internal situation the danger has arisen, or from such other circumstances of whatever nature as may produce the same end, his majesty will eagerly embrace the opportunity to concert with his allies the means of immediate and general pacification.'

This correspondence occasioned very considerable debates in the British parliament; but ministry had still a great majority, and preparations were made for prosecuting the war. Austria also continued the contest, but Buonaparte was now (1800) at the head of the French army, which quickly retrieved the losses of the preceding campaigns. Suffice it here to say, that after the decisive battle of Marengo, in the month of June, Austria was obliged to sue for peace; while the northern powers, in consequence of Buonaparte's victorious career, seemed eager to court his favor, by forming designs against this country. The emperor Paul, naturally fickle and hasty, formed a close alliance with him; and in conjunction with the Danes, Swedes, and Prussians, began to renew their former engage-

ments, for establishing a new code of maritime laws, inconsistent with the rights, and hostile to the interests of this country. Towards the end of this year a scarcity of provisions pressed heavily on all ranks of people in Britain. By a long and almost constant series of rainy weather the crop of 1799 was materially injured, and the harvest retarded. The crop of 1800 was nearly as deficient. The people who had now expected relief grew fretful by calamity; and being persuaded that the scarcity was not altogether occasioned by the failure of the crops, but by artful combinations, a general odium was raised against all who traded in grain or any of the necessities of life: they were held up to popular obloquy as monopolists and forestallers; the sole authors of the miseries of the people; men for whose crimes it was impossible to devise an adequate punishment. Parliament was summoned, chiefly, it is probable, to take this subject into consideration; and by prohibiting the exportation of grain, and granting a bounty of importation, &c., the horrors of a famine were at least averted.

The great and important measure of a legislative union with Ireland having been fully settled in the course of the preceding year, the united parliament of Great Britain and Ireland, now called the imperial parliament, assembled on the 2nd of February, 1801; but another event now took place, which occasioned considerable agitation in the minds of the public: this was a schism in the cabinet. Mr. Pitt and his associates had considered it necessary, for completing and giving effect to the measures of the Irish union, that the benefit of full freedom should be extended to the Catholics; but, finding it impossible at present to attain this object, they did not think it consistent with their duty any longer to retain responsible situations in his majesty's councils. They therefore determined to give in their resignation as soon as the state of public business would allow. Their successors were Mr. Addington, lord Hawkesbury, lord Holart, lord Eldon, earl St. Vincent, &c. The new arrangements were, however, retarded by the illness of his majesty, and thus several of the ministers remained in their situations till all apprehensions with regard to his recovery were removed.

It was now eight years since Britain had been compelled to take up arms against the invidious and hostile designs of France. During that short period she had been exposed to perils novel in their nature, and menacing in their appearance, partly arising from the open and determined hostility of external enemies, and partly from the insidious machinations of intestine foes. She was now about to be assaulted by a combination of the northern powers, who in contradiction to the whole system of maritime jurisprudence, as acknowledged and practised by the nations of Europe, questioned her right of searching neutral vessels, thereby aiming an indirect blow at the superiority of her naval power. They affirmed that a belligerent had no right to search vessels escorted by a ship of war, that being deemed a sufficient security that the convoy contained no contraband goods; they moreover declared, that it was their determined resolution, if Great Britain

refused to agree to their alleged neutral rights, to assert them by force of arms. It was not to be expected that Britain would be awed by the menaces of this hostile combination, and relinquish a right sanctioned by the practice of all belligerent nations, and founded on the plainest and most unalterable principles of the law of nations. In Russia the subjects of Great Britain were robbed of their property, detained in tedious imprisonment, and subjected to the caprices of a cruel, vindictive, and unreasonable tyrant. Although a change had now taken place in the British cabinet, the new ministry, who had always given their most decided and strenuous support to the measures pursued by Mr. Pitt, professed to have the same views, and to act upon the same principles. They repeatedly affirmed that the dispute with the northern powers was so important to the prosperity and glory of Britain that it could neither be relinquished nor compromised; that, since the combined powers were determined to persist in their unwarrantable pretensions, it became necessary for Britain to assert her rights by force of arms. A formidable fleet was assembled at Yarmouth, which was entrusted to Sir Hyde Parker, and under him to lord Nelson, and rear-admiral Greaves. They sailed from Yarmouth on the 20th of March, and, forcing the passage of the sound, anchored before Copenhagen on the 30th of the same month. The Danes seemed to have made very formidable dispositions: they had assembled ships of the line, pontoons, galleys, fire-ships, and gun-boats; which were flanked and supported by extensive batteries, some of which mounted from fifty to seventy pieces of cannon. They were attacked by twelve sail of the line and four frigates, commanded by lord Nelson. The battle commenced at ten o'clock on the 2nd of April, and continued with great fury for four hours. The result was the capture or destruction of eighteen sail of Danish ships, including in that number seven sail of the line, together with 3000 men killed and wounded: the killed on the part of Britain were about 250, the wounded 700. This victory struck a terror into the confederates, and was immediately followed by an armistice for fourteen weeks. In the mean time, the emperor Paul had died suddenly on the 23rd of March, and was succeeded by his son Alexander, who disowned the confederacy against Britain, and matters were adjusted with Russia in the month of June.

While the British arms were thus acquiring additional lustre before Copenhagen, the valor and courage of her land troops were crowned with equal glory in Egypt, which see. Accounts of the final success of our troops in that quarter reached England the day after the preliminary articles of peace had been signed in London, by M. Otto on the part of the French republic, and lord Hawkesbury on that of his Britannic majesty. By these Great Britain agreed to restore all her conquests except the island of Trinidad, and the possessions of Ceylon: the Cape of Good Hope was to be a free port to all the contracting parties: the island of Malta was to be restored to the order of St. John of Jerusalem. Egypt was given back to the Ottoman Porte: and Portugal

was to be maintained in its integrity: the territory of Rome and Naples was to be evacuated by the French: and France was to recognise the republic of the Seven Islands. The fishery of Newfoundland was established on its former footing; and, lastly, the contracting parties were to name the plenipotentiaries to meet at Amiens, for the formation of a definitive treaty. These articles were attacked in both houses of the British parliament, as leaving France in possession of such power as she might renew the war at pleasure. The definitive treaty was, however, ratified in March 1802, and that while the first consul displayed his restless ambition in sending a large armament to St. Domingo, which obliged Britain to send a powerful fleet to watch its motions.

10. *From the peace of Amiens to the Regency.*—Though the people of Britain and France now seemed to congratulate each other on the return of peace, the spirit of the French government was manifest, in shutting their ports more closely than during the war; vainly imagining that they would thus curb the British commerce, and disregarding the loss which their own merchants sustained. Towards the conclusion of this year the subjugation of Switzerland, by the consular armies of France, attracted general attention; and, while other nations beheld in silence the outrages of a conqueror whose power they had so recently felt, the unbroken spirit of the British, who had closed the war with the most brilliant achievements, ventured loudly to sympathise with the brave Helvetians. Government remonstrated on the subject with the ruler of France, but, as they did not follow up their remonstrance with hostile measures, it produced no effect; and Switzerland was placed in the hands of the first consul's dependents. About this time, also, another singular instance of the unprincipled ambition of Buonaparte afforded matter for satirical remark. The French nation declared him consul for life, with the power of nominating his successor. Upon these and other parts of his personal and political conduct, the general feeling of Britain was expressed by the periodical journals in terms so offensive to his pride as induced him to propose that some restraint should be put on the liberty of the British press. He was still more chagrined in a contest of argument and eloquence which he foolishly commenced against the writers of English newspapers, through the medium of the French official journal. This was only a prelude to a renewal of the more serious warfare. On the 8th of March, 1803, orders were given by the British government for hostile preparations. France, during the peace, had been perpetually aggrandising herself; and arrogated a right to interfere in continental affairs, which she denied to Great Britain; she had adopted regulations hostile to our trade; endeavoured to establish spies in the ports of this kingdom; and avowed new projects of subjugating Egypt. The general grounds of war, therefore, for the great object of national independence, had been long prepared; but a matter of comparative insignificance drew them to a point. In the treaty of peace the evacuation of Malta had been sti-

pulated, on the fulfilment of certain preliminary conditions; these conditions were unfulfilled, and the subsequent conduct of France and Spain had rendered their fulfilment impossible. Yet, even in this case, we were called upon to perform our part of the contract. Had Great Britain submitted to this she might have lengthened a little the period of peace, but her independence would have been for ever forfeited; for the dispute respecting Malta, like the precedence of an ambassador, or the priority of a title, however trifling it may appear to superficial minds, involved the mighty question of our existence as a primary or secondary state. A fruitless negotiation of two months only served to aggravate the evil; as it drew from the French consul an insult to the nation in the person of lord Whitworth, its representative, and boastful threats of invasion. Preparations, on both sides, for some time constituted the only operations of war; and the enemy, by keeping his fleets in port, afforded us no opportunity of meeting them at sea. One novelty in a rupture of peace, however, occurred: the imprisonment of every British subject, without regard to sex or description, who was found in France.

Both houses of the British parliament were at this time singularly unanimous in their sentiments for the vigorous prosecution of the war. Even the principal members of the opposition, with few exceptions, seemed to vie with each other in support of the ministry. Among the preparations for the defence of the country, both ordinary and extraordinary militia were called out; a new body of troops was raised by ballot, called the army of reserve; and volunteers were raised throughout the island. In the mean time the French ports were closely blockaded, and the island of St. Lucia, Tobago, St. Pierre, and Miquelon, with the settlements of Demerara and Essequibo, were surrendered to the British arms. As the only step of retaliation which the French could now take they seized the electorate of Hanover, where they displayed the most implacable vengeance.

Soon after his majesty's message, on the 8th March, ministers found it expedient to make overtures to Mr. Pitt, inviting his return to office; but they were rejected on the ground, as he alleged, of their not appearing to come from 'the highest quarter'; similar overtures were made to lords Grenville and Spencer, and with the same result. Some changes after this took place in the cabinet, which had no tendency to strengthen the hands of administration. In the period of suspense, which preceded the declaration of war, the precautionary measures adopted were now generally thought inadequate to the occasion; in fact, in most important branches of the public service, they were lamentably deficient. An enquiry which had been instituted by lord St. Vincent, into the abuses in the naval department, had led to a system of retrenchment, which had been so rigorously enforced, that, on the renewal of hostilities, the royal arsenals were not provided with the quantity of stores necessary for the equipment of the fleet; and, in the bustle of preparation, many ships were sent to sea which were actually in a course of repair. With respect

also to the military force, the augmentations were limited to the purposes of defensive warfare. On the other hand, a few days after his majesty's message had been delivered to parliament, the French admiral Linois was despatched from Brest for the East Indies with a strong squadron, having 6000 troops on board, destined to strengthen the French colonies in the east, and to reinforce the Dutch garrison at the Cape. Orders were issued by the French government to increase the forces of the republic to 480,000 men. The army of Italy was considerably augmented; and large detachments were forwarded towards Tarentum, and all the strong posts in the kingdom of Naples which lay on the Adriatic. An army had also been ordered into Holland.

In Hanover the native army made dispositions for a brave resistance, though it proved ineffectual against so overwhelming a force; and the French troops ultimately took possession of the whole electorate, together with all the artillery, baggage, and ammunition: they thus were enabled to control the navigation of the Elbe and Weser, and to levy considerable contributions, under the shape of loans, on the rich Hanse towns of Hamburg and Bremen.

Other nations soon became involved in the contest. On the 17th of June his majesty announced to parliament, that he had communicated to the Batavian government his disposition to respect their neutrality, provided the French government would do so also, and would withdraw their troops from the Dutch territory; but, as this proposal had not been complied with, he had deemed it expedient to recall his minister from the Hague, and to issue letters of marque and reprisal against the Batavian republic. In conformity to another message on the following day, recommending a large additional force to be raised for the defence of the country, ministers proposed to levy an army of reserve, consisting of 50,000 men, whose services during the war should extend to Great Britain, Ireland, and the islands of the Channel. Various objections to the bill were urged in both houses; but it passed without a division, and in the course of the session was followed by another, enabling his majesty to raise a levy en masse of all his subjects in case of invasion. The necessity of this latter measure, however, was in part superseded by the renewal of voluntary associations.

On the 23d of July an insurrection broke out in Ireland, which, from its supposed connexion with the projects of the enemy, created considerable, and, as it appeared afterwards, undue alarm. Its instigators were a band of political enthusiasts, whose director and principal mover was Mr. Robert Emmett, a young man of distinguished talents and brilliant imagination. They had formed the design of establishing an independent Irish republic; and hoped to accomplish it by striking a decisive blow in the capital, possessing themselves of the seat of government, and proclaiming a new constitution which they had prepared. An armed mob collected for this purpose, which marched through the principal streets of Dublin, unresisted, on their way to the castle. They, however, soon lost all sense of subordination to their leaders, and meeting a carriage, in

which were lord Kilwarden and his nephew Mr. Wolfe, they dragged them from it, and butchered them on the spot. One circumstance attended this act of atrocity which showed that the infatuation of popular fury could not wholly extinguish the instinctive generosity of the Irish. The daughter of the venerable and ill-fated nobleman was likewise in the carriage; and, to his earnest appeal to their humanity, they replied, that they would sacrifice him and his male companion, but they would spare the lady. They then desired the distracted daughter to escape as well as she could, and allowed her to pass through their entire column without injury or interruption. The insurgents were at length dispersed by about 120 soldiers, and the whole insurrection was speedily extinguished. On the communication of this event to parliament, a bill was passed for trying the rebels by martial law, and another for suspending the habeas corpus act in Ireland. Several of the leaders of the insurrection, among whom was Emmett, having been apprehended, were tried for high treason in Dublin by a special commission, and underwent the sentence of the law.

In consequence of the seizure of Hanover by the French armies, and the interruption of British commerce on the Elbe and Weser, a squadron now blockaded the mouths of these rivers; and another compelled the French finally to abandon the once important colony of St. Domingo. The negro chiefs, on this, issued a proclamation declaring the island independent. See DOMINGO.

In the East Indies, under the able management of the marquis Wellesley, Great Britain triumphed still more decidedly. To counteract any danger from a possible union of the Maharratta against the British interest, the marquis Cornwallis, so far back as 1789, had concluded the treaty of Poonah, which was afterwards frustrated by the ambition and rapacity of Dowlut Rao Scindia, who had succeeded Madhagee Scindia in 1794, and whose conduct tended to favor the designs of France against the British empire in India. In pursuance of the same course of policy, the marquis Wellesley formed an alliance with the peishwa, and with the nizam of the Deccan, against Scindia, Holkar, and the rajah of Berar, supported by the French general Perron. The peishwa, having in 1802 been expelled from his dominions by Holkar, negotiated a subsidiary treaty with the English company, which was concluded at Bessein on the last day of the year.

According to a stipulation of this treaty, a plan for the restoration of the peishwa was adopted, and immediately carried into effect. Orders were despatched to general Stuart, commanding at Hurryhen, directing him to detach from the main body a considerable force, for the purpose of advancing into the Maharratta dominions. The command of this detachment was confided by lord Clive to major-general Arthur Wellesley, whose extensive local knowledge, and personal influence among the Maharratta chieftains, were peculiarly calculated to ensure success.

Holkar having precipitately retreated at the

approach of the British, general Wellesley advanced rapidly to Poonah, which was re-entered by its sovereign on the 13th of May. Meanwhile Scindia and the rajah of Berar were negotiating an alliance with Holkar, of which the governor-general happening to obtain certain information, it was resolved to employ the whole military force of the three presidencies, Madras, Bombay, and Bengal, to break a confederacy, rendered particularly dangerous by the junction of Perron, who had obtained the power and influence of a sovereign prince, and, moreover, possessed an army trained up in European discipline. At this critical moment the French admiral Linois, on arriving with a reinforcement of troops before Pondicherry, was prevented from forwarding them; and, on the arrival of intelligence of the renewal of hostilities, all those whom he landed were made prisoners of war. While negotiations were carrying on with the confederate chieftains, a comprehensive plan of operations was formed by the British, for a combined attack on the united armies in the Deccan, on the French establishment in the Douab, and on every assailable point in the vast territories of Scindia and the Berar rajah in Hindostan. When the period arrived for commencing hostilities, general Wellesley, who was opposed to the two latter chieftains, marched against the fortress of Amednugur, which he reduced on the 12th of August, and then advanced to Aurungabad. On the 23d of September he extended the foundation of his military renown by a decisive victory at Assaye, over the combined forces of the enemy, consisting of more than six times the number of his own army.

In the mean time the Bombay army had been successful in the Guzerat, and speedily gained possession of the territories of Scindia in that province. In the months of September and October the town and province of Cuttack were wrested from the rajah of Berar, by a British force under the command of lieutenant-colonel Harcourt. In the north of India, general Lake, at the head of the Bengal army, reduced the strong fortress of Ally Ghur, after compelling to a precipitate retreat the forces commanded by the French general Perron, who from that moment lost his reputation and influence in India, and forfeited the confidence which the native powers had reposed in him. Pursuing his successes, the British general advanced towards the city of Delhi, and gave battle to the army of Scindia, commanded by Louis Bourguein; and, after a severe conflict, obtained a complete victory, which prevented the release of the Mogul emperor Shah Aulum. He then reduced the fort of Agra; and, on the 1st of November, defeated the remainder of Scindia's forces, in which were fifteen of Perron's regular battalions, at Laswaree. In the mean time general Wellesley, following up his victory at Assaye, drove the rajah of Berar into his own territories, and encountering him on the 28th of November, in the plains of Argaum, obtained another splendid victory, which was followed by the capture of Garril Ghur, one of the strongest fortresses in India.

These successes compelled the rajah to sue for peace, which was concluded on the 17th of December. By its conditions he renounced the

confederacy against the English, ceded the province of Cuttack, with some other territories, and engaged never to take into his service the subject of any state at war with Great Britain. His example was speedily followed by Scindia, who, entering into similar engagements respecting the Shah, and the employment of foreigners, ceded all his forts, territories, and rights in the Douab, and in the districts northward of the dominions of the rajahs of Jeypoor and Judpoor, together with Baroach in the Guzerat, and Amednugur in the Deccan. Thus, after a brilliant campaign of five months, this powerful confederacy was dissolved by a treaty which extended and consolidated the dominions of the British, while it annihilated the influence of the French in India.

During this war hostilities broke out in Ceylon between the British and the king of Kandi, who had refused to give satisfaction for the seizure of some property belonging to the former. The king fled from his capital on the approach of the army sent against it, and his throne was occupied by a new claimant, who purchased his elevation by a grant of territory. The exiled monarch agreed to an armistice; and afterwards taking advantage of the absence of the British forces, who had been withdrawn in consequence of sickness, he invested the fort of Kandi, and, after promising a safe retreat to the garrison, murdered the new king, and about 170 Europeans. He afterwards invaded the British possessions, and met with a severe repulse; but he succeeded in re-establishing himself on the throne of Kandi.

On the meeting of parliament in November, 1803, the topics of the speech from the throne were, the successes in the West Indies, the suppression of the Irish insurrection, and the conclusion of a convention with Sweden, for the adjustment of certain differences arising from an article in the treaty of 1661 relative to maritime rights. Referring to the threat of invasion, his majesty declared, that, as he and his brave and loyal people were embarked in one common cause, it was his fixed determination, should occasion arise, to share their exertions and dangers in defence of their constitution, religion, laws, and independence.

When the usual addresses had been voted, acts were passed for continuing the suspension of the habeas corpus act, and the existence of martial law in Ireland. And, as the probable duration of the war demanded an augmentation of the army, troops were voted to the amount of 129,000 men for Great Britain and Ireland, and 38,600 for the colonies and dependencies, exclusive of India. On this occasion Mr. Windham inveighed with great severity against the military system adopted by ministers, and pointed out the inferiority of volunteer associations and bodies of reserve to a regular army of genuine soldiers, disciplined for offensive as well as defensive warfare. In connexion with these military arrangements, a bill was introduced on the 1st of February, 1804, for consolidating and explaining the existing laws relative to the volunteers. In the course of the debates to which it gave rise, Mr. Pitt proposed that this description of force should be subjected to stricter discipline and more active service, that

it might be more nearly assimilated with the regular army; but his amendments were rejected.

On the 14th of February the king was taken suddenly ill while at the queen's palace; and the public sympathy was deeply excited by an apprehension of the return of the malady with which he had been formerly afflicted. The attack, however, was so light, that there was no necessary suspension of the royal functions; and in the course of a month the symptoms of convalescence were so decided as to afford hopes of a rapid and complete restoration to health.

Mr. Pitt now began to institute those enquiries into the conduct of ministers, respecting the defence of the country, which resulted in the dissolution of the Addington administration. On the 15th of March he moved for an enquiry into the administration of the affairs of the navy. He called for the production of an account stating the number of ships and armed vessels in commission at three different periods, 1793, 1801, and 1803. from which he thought the result would be a conviction, that, considering the existing dangers of the country, its naval resources were more inadequate at the present than at any former period. The board of admiralty had considered gun-boats peculiarly serviceable for resisting invasion, yet in the course of a year they had built only twenty-three, while the enemy in the same space of time, had constructed 1000! From the moment that hostilities were renewed, our navy ought to have been increasing instead of diminishing. Notwithstanding which government had only contracted for the building of two ships of the line in the merchant-yards, when it was well known, that during a war the building of ships was always nearly suspended in the king's yards, which were then wanted for repairing damages which our ships might sustain in the service. It was also worthy of remark, that in the first year of the late war our naval establishment was increased from 16,000 to 76,000 seamen, whereas, having begun the present war with an establishment of 50,000, we had augmented them in the course of the last year to only 86,000 men.

Mr. Tierney, in resisting this attack, enumerated the efficient naval force, and asserted that it was adequate to all the purposes both of defence and aggression. Some of his statements, indeed, were controverted by admiral Berkeley, who urged the necessity of immediate enquiry. Mr. Sheridan vindicated the admiralty, and hinted, that lord St. Vincent had rendered himself obnoxious by his laudable zeal in the correction of abuses, and his hostility to all corrupt and fraudulent practices. In that eulogy Mr. Fox also concurred, though he was disposed to believe that the maritime defence of the country had been neglected. The motion of Mr. Pitt was negatived by the small majority of seventy-one, which indicated that the influence of ministers was on the decline.

This change became more apparent in a division on Mr. Fox's motion for an improvement in the defensive system of the country, and in that which took place on the following day (April 25th) in a committee on the army of reserve suspension bill, when the ministerial majority was reduced to thirty-seven. Mr. Addington

then determined on retiring from administration, when he had adjusted the financial concerns of the year. The supplies were estimated at £36,000,000 for Great Britain alone, and the ways and means consisted of certain additions to the war taxes, a loan of £10,000,000, and a vote of credit amounting to £2,500,000. On the 3d of May the thanks of both houses were voted to the civil and military officers of the army on the motion of ministers, which was the last act of the Addington administration. On the 12th of May it was announced that Mr. Addington had resigned the office of chancellor of the exchequer, and that Mr. Pitt was nominated his successor.

On the 27th of March, this year (see FRANCE), Buonaparte was addressed by his subversive senate with a proposal for him to assume the title of emperor of France; and this was accordingly effected 1st May.

In the new British ministry, lord Hawkesbury exchanged the foreign for the home department; the seals thus vacated being given to lord Harrowby. Lord St. Vincent was succeeded in the admiralty by lord Melville; the earl of Westmoreland was lord privy seal, and lord Eldon still lord chancellor; the duke of Portland also continued president of the council; lord Castlereagh of the India board; and the earl of Hardwicke lord-lieutenant of Ireland. Mr. Canning was treasurer of the navy.

On the 5th of June the minister produced his plan for raising and supporting an additional permanent military force. Though a real difference of opinion might easily exist on this subject, it was scarcely possible that something of personality should not blend itself with the long protracted discussions on this bill. Mr. Fox and Mr. Windham agreed in the principle, but found much to censure in many of its provisions. It was also assailed by the late ministers, Mr. Yorke and Mr. Addington; the latter of whom enlarged much on the dangerous policy of maintaining an immense military regular force, and of reducing the militia, the ancient constitutional safeguard of the nation.

The bill was ably defended by Mr. Canning, but chiefly by Mr. Pitt himself, who spoke in some chagrin at the combination formed against him, before he had carried into effect any one measure which could be characterised as good or bad. Sincere as he had been in his wishes for an extended administration, such conduct led him to question the possibility of harmony in a cabinet formed of such discordant materials. Mr. Fox, in adverting to this part of Mr. Pitt's speech, said, 'that he believed it to be the opinion of most persons of reflection, that if ever there was a time when it was indispensable that the government should consist of men most respected and distinguished for their ability to serve the country, it was the present moment. Notwithstanding the extraordinary talents of the present minister, it was not to be denied that the country had an inefficient administration. The refusal of certain gentlemen to form a part of that administration, which they could not do without abandoning a principle which, under existing circumstances, seemed to them essential to the public safety, was highly honorable to

their characters. As to himself, he was perhaps less eager than the right honorable gentleman respecting the objects of political ambition; and age had diminished his propensities to engage in such a contest:

*Lenit albescens animos capillus
Letium et rixæ cupidos protervæ.*

The bill at length passed on a division of 265 to 223 voices.

Mr. Wilberforce, having reason to expect a more cordial support from the present than the former minister, again brought forward, at a late period of the session, his almost hopeless motion for the abolition of the slave-trade, which he enforced with all his accustomed ardor and eloquence in the cause of humanity. It received the support of both Mr. Pitt and Mr. Fox, and the bill brought in for that purpose passed by a decisive majority of seventy-five to forty-nine members. But on its transmission to the upper house, though sixteen years had elapsed since the question was first agitated, it was postponed, on the motion of Lord Hawkesbury, for maturer investigation in the ensuing session.

Two years had scarcely elapsed since the sum of £990,000 had been voted by parliament to make good the deficiencies of the civil list. It now appeared by a statement of the chancellor of the exchequer, in a committee of supply, July 2d, that the arrears again amounted to the sum of £590,000 and upwards. On the present occasion, Mr. Pitt not only moved for a grant equal to the debt, but an annual augmentation of £60,000; and also to exonerate the civil list from a variety of charges which it was now first discovered did not properly belong to it;—all which was voted with singular facility. Exclusive of the vast sums granted from time to time for the discharge of arrears, the droits of the crown and the admiralty had amounted to many millions, offering, as it were, a perpetual bribe for eternal war. The civil list of Ireland was fixed at £225,000; and the revenues of Lancaster, of Cornwall, of the crown lands, of the Leeward Island duties, of fines, &c., must be added to the amount.

On the 10th of July lord Castlereagh brought before the house of commons the financial state of the affairs of the East India Company. He allowed that two years ago he had expressed his firm conviction, not only that the public would receive a participation of £500,000, but that the company would be able to establish a sinking fund of £2,000,000 for the extinction of their debt; but all this was in contemplation of the continuance of peace. But the resumption of hostilities had caused a great deficiency, instead of a great surplus, rendering a loan of £1,200,000 in India a measure of urgent and absolute necessity.

Lord Archibald Hamilton observed, that the house was annually amused with splendid promises of the extinction of the company's debt, and of the approach of that era when India would contribute to the expenses of the empire. On the contrary, the debt was last year £18,000,000 and now increased to £19,000,000. Mr. Francis affirmed that the mischief was in a state of progression. Every year had witnessed the dete-

rioration of the company's finances. At the renewal of the charter it had been provided, that this country should receive £500,000 annually, which, after the first year, however, was never paid. It had been the uniform practice, for the last twenty-one years, to announce the approach of prosperity, by estimates which subsequent events had not justified. Lord Castlereagh entered into long details to prove, that neither he nor his predecessor, lord Melville, had ever held out any promises which would not have been fulfilled, if it had not been for wars that could not have been foreseen. The resolutions proposed by the minister were carried without a division.

On the 31st of July parliament was prorogued, the king expressing his confidence, that, in the issue of the present contest, an effectual barrier would be finally raised against the unbounded schemes of aggrandisement and ambition, which threatened every independent nation that yet remained on the continent.

Mr. Pitt now bent all his efforts to renew his favorite plan of a coalition against France; and by augmenting the regular army, and restoring the navy, to afford the allies of Great Britain the surest prospects of support.

It was no easy task to repair the mischief which the late false system of economy had occasioned in the naval administration. The deficiency may be estimated from the single fact, that the naval stores, which the vigilance of the former admiralty had amassed, were sold at the peace, on the pretext that they were not worth the expense of warehouse room; and agents from France were the principal purchasers. The different convoys were unprotected; the commerce of Great Britain in every sea was exposed to the insults and depredations of the enemy; and the means for blockading the hostile ports were reduced to a shattered and mutilated fleet inadequately manned. On the appointment of lord Melville to the admiralty a total change of system took place; the arsenals were replenished; orders were given for the construction of men of war and frigates in the king's yards, and the practice was revived of contracting for the building of others in the merchant yards; the pressing urgency for a strong reinforcement to the fleets was supplied by the purchase of East India ships; and the most judicious preparations were made for restoring to each vessel in the service its full complement of men.

On the arrest and murder of the duke d'Enghien, the emperor of Russia caused a strong remonstrance to be presented to the French government, and called on the princes of the German empire to demand satisfaction for the violation of its neutrality. The French government replied by observing, that the emperor of Germany and the king of Prussia, most concerned in the fate of Germany, had understood that the French government were authorised in arresting, at two leagues from the frontier, French rebels, who by their conduct had placed themselves 'out of the protection of the law of nations;' a phrase which the French emperor did not afterwards forget teaching his enemies. He now further said, he had no account to render to the emperor of Russia, on a point which in no wise concerned his interests; and he was asked, what

need there could be of empty pretences, if the intentions of his imperial majesty were to form a new coalition?

The appeal of the emperor of Russia to the diet of Ratisbon, failed to rouse the spirit of the Germanic body. The king of Prussia, whose influence in the north of the empire was paramount, evinced no disposition to resist the aggressions of the ruler of France; and his minister, in conjunction with that of Baden, merely expressed a hope that the first consul would, of himself, give such a full and satisfactory explanation, respecting the seizure of the duke d'Enghien, as might entirely correspond with the views of the emperor of Russia. The other states, fearful of the renewal of a contest in which they might risk more than they could hope to gain, maintained an inflexible silence.

The king of Great Britain reminded the diet that a yet greater violation of the treaty of Lunéville, and of the independence of Germany, had been committed by France in her unjustifiable seizure of the electorate of Hanover. The king of Sweden, as duke of Pomerania, expressed in still stronger terms his abhorrence of the conduct of France, which he considered as doubly injurious to himself, in his quality of a member of the Germanic body, and in his sovereign capacity of guarantee for the treaty of Westphalia.

But the influence of France seemed paramount in Germany: yet it was not so absolute as to leave her at full liberty to direct her whole force against England. In protesting against the outrage committed against the law of nations, the emperor of Russia had pressed for the execution of a treaty, of which the objects were—a guarantee of the independence of Naples, and an indemnity to the king of Sardinia; and these demands provoked the first consul to remove into Italy some of the battalions destined for the invasion of England.

Austria, in the meanwhile, had been employed in repairing the losses which her armies had sustained in the late war, and in placing her military establishments on the best possible footing. She had been involved in a dispute with the elector of Bavaria, who, either stimulated by France, or calculating on her support, had oppressed the equestrian order in his newly acquired territories of Franconia. On the appeal of that body, the emperor sent a dignified and energetic remonstrance to the court of Munich, and at the same time assured the complainants of his support. This mark of decision served to convince the government of France that there was a line beyond which their aggression must not pass, so long as they deemed it expedient to remain at peace with Austria. France therefore expressed her displeasure at the conduct of the elector of Bavaria, and thus the affair terminated.

Spain, destined to be the first of European nations, who should effectively assail the gigantic power of France, now became involved in the contest. By the treaty of St. Ildefonso, signed in 1765, she had agreed to furnish France in time of war with a certain contingent of naval and military force. Yet this treaty had not been acted upon in the present war; and in the month of July, this year, the Spanish government gave assurances of

faithful and settled neutrality, and disavowed any orders to arm in their ports. In the following month, however, it was ascertained by the British admiral commanding the squadron off Ferrol, that reinforcements of soldiers and sailors had arrived through Spain for the French fleets at that port, and also at Toulon. On this intelligence Mr. Frere presented two notes to the Spanish ministers; but no answer was received to either of them. Towards the end of September it was discovered that very considerable armaments were preparing in the principal ports of Spain; that three first-rate ships of the line had been directed to sail from Cadiz; and that orders had been given to arm the packets, as in time of war.

To the enquiries and representations grounded on this intelligence, no satisfactory explanations were given; and strong measures of precaution were consequently adopted. In particular, the British admiral off Ferrol was instructed to prevent any Spanish ships of war from quitting that port, or any additional ships of war from entering it. At the same time orders were issued to all the British admirals and commanders, to exercise a scrupulous and indulgent forbearance towards the Spaniards, and official notice was given to the court of Madrid of these precautions, with an assurance that Great Britain still felt an earnest desire to maintain a good understanding.

The year 1804 was not signalised by any important naval or military achievements. In the month of January the English settlement at Goree, on the coast of Africa, was taken by a small French force under the chevalier Mahée. On the 7th of March captain Dixon, of his Majesty's frigate the *Inconstant*, with a store-ship and some sloops under his command, arrived off the island, and, suspecting that it had fallen into the hands of the enemy, sent his first lieutenant to ascertain the fact. As that officer neither returned nor made the preconcerted signal, the captain commenced hostilities by cutting a ship out of the harbour, and stationing his small force in such a position as to cut off all succours from Senegal. On the following morning, as he was preparing to attack the town, he was agreeably surprised to see the English colors hoisted over the French; and shortly afterwards received information, that the garrison had capitulated to the officer sent on shore. Thus, without a blow being struck, the settlement was recovered, and 300 black and white troops were captured.

In the Indian seas an affair took place, which afforded a gratifying proof of British spirit and intrepidity. Admiral Linois, who, after his escape from Pondicherry, had plundered the settlement of Bencoolen, and committed many depredations on the company's trading vessels in those seas, was encouraged by his uninterrupted successes to cruise near the Straits of Malacca, for the purpose of intercepting the homeward-bound China ships. On the 14th of February a fleet of fifteen company's ships and twelve country ships, under the command of captain Dance, who being senior acted as commodore, came in sight of this hostile squadron, consisting of a line-of-battle ship, three frigates, and a brig. Captain Dance immediately made signal to form a line of battle in close order. At sunset the

enemy were close up in the rear, and the country ships were then placed by the commodore on the lee-bow, for better protection. On the 15th at day break, the enemy were three miles to windward, lying to. Both fleets now hoisted their respective colors; and at one in the afternoon captain Dance, not wishing to wait an attack, and apprehensive that his rear might be cut off, made signal to tack, bear down upon the French line and engage them in succession. In prompt obedience to the orders of their commodore, the company's fleet bore down on the enemy under a press of sail. Admiral Linois then closed his line and opened a fire upon the headmost ships, which reserved theirs for a nearer approach; but, before the first three could get into action, the enemy's squadron hauled their wind, and stood away to the eastward under all the sail they could set. At two, the commodore made the signal for a general chase, and pursued his dismayed antagonist for two hours. He then continued his voyage to England, which he reached in safety with his whole fleet. For his gallant conduct, in having put to flight a French admiral commanding ships of war superior in force and in men, and thus preserving from capture a property valued at £1,500,000 sterling, he participated with the various commanders and their brave crews the munificent rewards of the East India Company, and received the honor of knighthood at his majesty's hands.

On the 5th of May the Dutch settlement of Surinam capitulated to a force sent against it from Barbadoes under the command of Sir Charles Green and commodore Hood. The colony, with the ships of war, artillery, stores, &c., was given up to his majesty; the troops were made prisoners of war; and the inhabitants, to their great satisfaction, were placed under the protection of the British government.

Several operations were undertaken against the enemy's armaments on the coast of France and Holland, but they were not crowned with much success. On the 16th of May an attempt was made by Sir Sidney Smith, in the *Antelope* frigate, with some sloops of war, to prevent the junction of the flotilla from Flushing with that at Ostend. The failure of success was attributed to the want of gun-boats. Fifty-nine sail of the Flushing division reached their destined port in safety; and the English force, after the falling of the tide, were obliged to haul off into deep water, with a loss of about fifty men killed and wounded.

In August an attack was made by captain Owen on the flotilla anchored in the road of Boulogne, but with little success; and those of captain Oliver, made about the same period at Havre, failed of their object, and produced no other result than some damage occasioned by the explosion of shells in the town. But the most mortifying failure to ministers was that of the catamarans as they were called. These were vessels designed to be towed and fastened under the bottoms of the enemy's gun-boats by a man in a small raft: the appearance of about 150 sail of the enemy's flotilla in the outer road of Boulogne seemed to present a favorable opportunity for trying them. Fire-ships of various constructions were to co-operate in the attack:

and the experiment was to be made under the direction of lord Keith, who was to cover the smaller force with his powerful squadron. On the 2d of October his lordship anchored at about about a league and a half from the north to the west of the port, and the requisite preparations were made for commencing the attack at night. So strongly were the English ministers interested in its success, that Mr Pitt, and several other members of the cabinet, were induced to witness the scene from the elevation of Walmer Castle. At a quarter past nine the first detachment of fire-ships was launched under a heavy fire from the advanced force, which was answered by a tremendous one from the hostile batteries. The vessels of the flotilla opened a passage for them as they approached, and so completely avoided them that they passed into the rear of the line without doing any damage. At half-past ten the first explosion-ship blew up, producing an immense column of fire but no mischief either to the ships or the batteries. A second, a third, and a fourth, succeeded no better; and at length, when twelve had been exploded, the engagement ceased about four in the morning, and the English smaller vessels drew off without the loss of a man. No perceptible destruction had been effected except of two brigs and some small craft, which seemed to be missing in the morning. The French acknowledged a loss of twenty-five men killed and wounded. Thus terminated, to the confusion of the projectors and the disappointment of the public, an expedition prepared at a greater expense than the merits of the plan, on examination, seems to have warranted.

The remonstrances with Spain having failed to rouse the court of Madrid from the abject state of vassalage to which it had been reduced by an imbecile and corrupt administration, the British government issued orders for the detention of such Spanish ships of war homeward-bound as contained bullion or treasure. Pursuant to these orders, captain Graham Moore was detached from the channel fleet to cruise off Cadiz with the *Indefatigable* and three other frigates. On the 5th of October he fell in with four large Spanish frigates steering for that port. At his approach they formed the line of battle a-head, and held on their course without regarding his summons to shorten sail, which he gave on placing each of his ships alongside of theirs. He fired a shot across the fore-poop of the second, which bore a rear-admiral's flag, and this had the desired effect of bringing them to parley. He then sent an officer to inform the admiral that his orders were to detain the squadron—that it was his earnest wish to execute those orders without bloodshed—but that the determination on the part of the Spaniards must be instantly made. An unsatisfactory answer having been returned, a close battle ensued, and in less than ten minutes the admiral's second astern, *Las Mercedes*, blew up with a tremendous explosion. The other Spanish frigates struck in succession, after a considerable loss in killed and wounded.

A most afflicting calamity attended the loss of the *Mercedes*. A gentleman of rank, who was going to Spain in that ship with his whole family, consisting of his lady, four daughters, and five

sons, had passed with one of the latter on board another frigate before the action commenced, and they had there the horror of witnessing the dreadful catastrophe which in an instant severed them from their dearest relatives, and deprived them of a fortune which had been saved during twenty-five years of service. The cargoes of the captured vessels were of immense value, consisting of gold and silver bullion and rich merchandise. Although this event did not at first occasion an interruption of the negotiations at Madrid, his Catholic majesty declared war against England on the 12th of December; and France had thus at her disposal the fleets of her tributary ally.

In the interim she had neglected no means of improving and augmenting her own marine. By a convention, concluded on the 20th of October, she obtained from the Ligurian republic, in exchange for some commercial advantages of a very equivocal nature, the services of 6000 men during the war, and the use of the harbours, arsenals, and dock-yards. Thus the port of Genoa was virtually ceded to her, under an engagement that the Ligurian republic should, at its own expense, enlarge the basin for the reception of ten sail of the line, which were to be immediately constructed.

The rising hostility of Russia and Sweden increased the jealousy of France against the influence of England on the continent; and, under the pretext of frustrating a conspiracy, she committed various insults on the rights of neutral states. On the 25th of October Sir George Rembold, the English chargé d'affaires in the circle of Lower Saxony, was seized at his country-house near Hamburg by a party of French troops, who had crossed the Elbe for that purpose. He was conveyed to Paris, imprisoned in the Temple, and released only on signing a parole not to return to Hamburg, or reside within a certain distance of the French territories. On the subject of this outrage, an application was in vain made by the British minister to the cabinet of Berlin.

In India the peace, which had crowned the success of the late glorious campaign, was interrupted by the intrigues and aggressions of Jeswunt Rao Holkar, an adventurer, who having usurped the dominions of his brother, and renounced his allegiance to the peishwa, laid claim to possessions which would have ensured to him an ascendancy in the Mahratta empire. After a fruitless negotiation, for the purpose of inducing him to withdraw within his own territories, the governor-general determined to chastise his arrogance by force of arms. The troops in the Deccan, under general Wellesley, reduced the fortress of Chandore, and other strong places which he held in that country; while lord Lake, who was commander-in-chief, by a series of skilful and rapid movements, compelled his cavalry and infantry to risk encounters, which ultimately led to his discomfiture. On the 13th of November a large body of his infantry, consisting of twenty-four battalions, occupying a strong position near Deeg, supported by a body of irregular cavalry, and by 160 pieces of ordnance, was totally routed by general Frazer, who fell in the

moment of victory. On the 17th, after a rapid and extraordinary march with the reserve of his army, lord Lake surprised the main force of the enemy's cavalry, commanded by Holkar in person, near the city of Ferruckabad, and obtained a complete victory, capturing the whole of his baggage, and destroying great numbers of his troops, while the chieftain himself escaped with great difficulty from the field. This splendid success would have decided the contest, had not the unexpected defection of the rajah of Bhurt-pore, in violation of a strict alliance with the British, enabled the fugitive to repair his desperate fortunes. At this period a change took place in the government of India. The marquis Wellesley had long expressed his desire to return to England, and was now waiting the arrival of his successor, the marquis Cornwallis, who was appointed governor-general on the 24th of December.

In the beginning of the year 1805 arrived in London a letter from the French emperor, addressed personally to his majesty. He professed 'peace' to be his first wish. 'The world,' said he, 'is sufficiently large for our two nations to live in it; and reason is sufficiently powerful to discover means of reconciling them when the wish for reconciliation exists on both sides. I have fulfilled a sacred duty, and trust your majesty will believe in the sincerity of my sentiments, and my wish to give you every proof of it.' The reply of the English government, dated January 14th, stated that 'there was no object that his majesty had more at heart, than to avail himself of the first opportunity to procure again for his subjects the advantages of a peace, which may not be incompatible with the permanent security and essential interests of his dominions.' 'His majesty is persuaded that this end,' it continued, 'can only be attained by arrangements, which may at the same time provide for the future safety and tranquillity of Europe, and prevent the recurrence of the dangers and calamities in which it is involved. Conformably to this sentiment, his majesty feels it is impossible for him to answer more particularly to the overture that has been made him, till he has had time to communicate with the powers on the continent, with whom he is engaged in confidential connexions and relations, and particularly the emperor of Russia.'

In the interval which elapsed between the date of the overture and the answer, Mr. Pitt was engaged in strengthening his administration, by means of a reconciliation with the minister whom he had so lately superseded. On the 12th of January Mr. Addington was created viscount Sidmouth, and appointed president of the council, on the resignation of the duke of Portland; lord Mulgrave foreign secretary; the earl of Buckinghamshire chancellor of the duchy of Lancaster; and Mr. Vansittart, with other friends of lord Sidmouth, were sworn of the privy council.

The session of parliament commenced on the 15th of January; the speech from the throne informing the two houses of the rupture with Spain, and the rejected overture of the French government.

Mr. Fox observed, that the speech left them entirely in the dark as to the grounds of his majesty's refusal to negotiate; and, after the censures thus passed on the violent and unjust conduct of France, he hoped that no imputation of a similar nature would be found chargeable on our own government. After some discussions, the addresses passed without a division.

Lord Grenville, in the house of peers, reproached, in a speech of great ability, the proceedings of ministers towards Spain. 'The laws of civilised war,' said his lordship, 'allowed no such act of violence as that which had been committed in assaulting the Spanish ships on the high seas. This had been assimilated to an embargo; but was there no difference between delaying merchant vessels, which might be delivered back, and destroying ships navigating the ocean in supposed security? Who can restore the innocent blood that has been spilt? No capture of treasure could wash away the stain thus brought upon our arms.' An amendment to the address, moved by earl Spencer, was negatived by 114 to thirty-six voices; the prince of Wales, through the medium of his proxy given to the earl of Moira, voting in the minority.

The supplies for the year amounted to about £44,000,000, of which £20,000,000 were raised by a loan, the subscribers to which received for £100 in money, £172 in 3 per cent. stock. Another loan of £3,500,000 was negotiated for Ireland. A considerable addition was made to the war taxes, and the property tax was raised to 6½ per cent. The new taxes imposed in perpetuity were estimated at £1,600,000; and the minister, while in the act of thus heavily adding to the weight of the public burdens, concluded an eloquent speech by congratulating the house on the increasing prosperity of the country.

In the course of this session proceedings were instituted against a member of administration, which for a long time engaged the public attention. In the month of April a charge was exhibited against lord Melville, first lord of the admiralty, founded on the tenth report of the commissioners of naval enquiry. It was brought before the house of commons by Mr. Whitbread, who, after referring to the act in 1785, for regulating the department of the treasurer of the navy, of which lord Melville, then occupying that post, was himself the supporter, and which advanced the salary of the place from £2000 to £4000, in lieu of all emoluments which might previously have been derived from the public money in the treasurer's hands, stated three heads of charge bearing upon him. These were: his applying the money of the public to other uses than those of the naval department; his conniving at a system of peculation in an individual (Mr. Trotter) for whose conduct he was responsible; and his having been a participator in that peculation. He concluded a speech, in which the particular circumstances of the case were laid open, by moving a number of resolutions founded upon it.

Mr. Pitt, on this occasion, objected to the method of proceeding now proposed, and thought the best course that could be pursued

would be to refer the report to a select committee. On a division of the house, there appeared for Mr. Whitbread's motion 216, against it 216, when the speaker gave his casting vote in its favor. Mr. Whitbread then moved an address to the king, requesting him to remove lord Melville from his councils and person for ever; but, at the desire of Mr. Pitt, he agreed to postpone the motion to a future day. When that day arrived the house was informed that lord Melville had resigned his office of first lord of the admiralty, and that Mr. Trotter had been dismissed. The debate then terminated in a unanimous vote, that the resolutions be laid before his majesty by the whole house. It was afterwards announced, that lord Melville's name had been erased from the list of the privy council; and Mr. Pitt assured the house there was no design of re-instating him.

His lordship now requested to be heard at the bar of the house of commons; and acknowledged having appropriated the public money intrusted to him to other public purposes, but solemnly denied having derived any benefit therefrom. He confessed, however, that he had applied the sum of £10,000 in a way which he could not reveal, consistently with private honor and public duty. When his lordship had withdrawn, Mr. Whitbread moved for his impeachment, which was negatived by a majority of 272 to 195; and an amendment moved by Mr. Bond, for a criminal prosecution, passed by the small majority of 238 to 229. His lordship's friends, however, soon after finding reason to prefer an impeachment, a motion for that purpose was made by Mr. Leycester, which, after Mr. Fox's motion for the previous question had been negatived, was carried without a division. Mr. Whitbread, accordingly, accompanied by a great number of members, on the 26th of June, impeached lord Melville, in the name of the commons of Great Britain, at the bar of the house of lords.

A singular bill was subsequently passed, to indemnify Alexander Trotter, and all others called upon to give evidence on the trial of lord Melville, from civil actions. The trial itself, however, on account of the lateness of the session, was postponed to the following year. Lord Melville was succeeded in the admiralty by Sir Charles Middleton, an officer long experienced in the department, upon whom was conferred the title of lord Barham. But the loss of so able a colleague as lord Melville caused deep and lasting chagrin to Mr. Pitt, upon whom almost the whole weight of business now devolved; and his health, previously infirm, manifestly suffered.

A petition from the Roman Catholics of Ireland, to be relieved from the civil disabilities under which they labored, was on the 10th of May introduced into the house of lords by lord Grenville, and into the commons by Mr. Fox. The principal speakers on each side took a part in the debate, but the result was a rejection of the petition in the upper house, by a majority of 178 against forty-nine; and in the commons of 336 against 124. Mr. Pitt having at this time asserted his opinion, that since the union of the

kingdoms he saw none of those dangers from granting the claims of the petitioners, which many seemed to apprehend, and that circumstances had rendered it impossible for him to bring forward the measure at the time he thought most favorable for it; added, that what those circumstances were it was neither now nor then necessary for him to explain; but, as long as they should continue to operate, he should feel it a duty, not only not to bring forward, but not to be a party in bringing forward, or in agitating this very important question. At present, he must say, that the prevailing sentiment was totally against it; and he should give a decided negative to the motion.

On the 19th of June a message from the throne was brought to parliament, the object of which was to acquaint the houses, that the communications which had taken place between his majesty and some of the continental powers had not yet been brought to such a point as to enable him to lay the result before parliament; but that, conceiving it might be of essential importance that he should have it in his power to avail himself of any favorable conjuncture for forming such a concert with other powers, as might afford the best means of resisting the inordinate ambition of France, his majesty recommended to parliament to consider of making provision for entering into such engagements as the exigency of affairs might require. The result of this message was the grant of a sum not exceeding £3,500,000, for that specific purpose. On the 12th of July parliament was prorogued by commission.

The public events of this year place it altogether among the most interesting in the history of the late war. In France the greatest activity was exerted in preparations for the menaced invasion of England. The flotilla of Boulogne was continually augmenting, and the troops encamped in its vicinity were accumulated to upwards of 100,000 men, perfectly disciplined, and placed under the command of some of the ablest generals in the French service. Squadrons of French ships, which had hitherto been cautiously kept in port, were now hazarded out to sea, in order to divide the British naval force; while greater enterprises were projected by the junction of the Spanish and French fleets. On the other hand, adequate means of resistance were provided on this side the channel. The coast on the south of England was fortified on the most exposed parts by a range of martello towers, and every effort was made for increasing the forces by sea and land.

One of the first enterprises of the French was an attempt on the island of Dominica, with an armament of five sail of the line and three frigates, having on board 4000 troops. A landing was effected on the 22nd of February, and the commander proceeded to Prince Rupert's, where the governor of the island, general Prevost, had posted himself with all the force he could muster. Having been summoned without effect, the French, who had levied a contribution on the inhabitants of Roseau, in the attack upon it set the town on fire, and then re-embarked on the 27th. The armament then proceeded to St. Christo-

pher's where a landing was made and a contribution exacted. The same was done at the island of Nevis; after which the squadron returned to France from an expedition, the success of which was by no means adequate to the equipment.

Napoleon set out early in the month of May for Milan, accompanied by his empress, and was received wherever he passed with the highest honors. On the 26th of that month he announced his compliance with the humble request of the states, that he would take upon him the title and authority of king of Italy; and his coronation was performed at Milan with the greatest pomp and solemnity. During the visit to Italy Napoleon accomplished the annexation of the Ligurian republic to the French empire.

A plan for a new constitution was, in the month of March, presented to the legislative body of the Batavian republic by the state directory, which was accepted by the people; and M. Schimmelpenninck being elected first pensionary, he opened the session of the states-general on the 15th of May. All the forms of an independent government were preserved; but the influence of France was apparent in a proclamation soon after issued, by which all commercial intercourse with Great Britain, and the admission, direct or indirect, of all articles of British manufacture, was strictly prohibited.

The negotiations between the courts of London and Petersburg, which were alluded to in the king's speech at the beginning of the year, terminated in a treaty, signed on the 11th of April, by which the emperor of Russia and the king of England reciprocally bound themselves to use the most efficacious means for forming a general league of the states of Europe, for the purpose of putting a stop to the encroachments of the French government, and securing the independence of the different states. Sweden and Austria had entered into the same views; but they declined proceeding to hostilities, till an attempt to attain the objects of the alliance by negotiation should have proved abortive. A Russian envoy was in consequence deputed to France, who had advanced as far as Berlin on his way, when the intelligence of the annexation of Genoa to France produced his immediate recall. This event determined Austria to become a member of the league; and a treaty for that purpose was signed by her plenipotentiary at Petersburg on the 9th of August. At the same time a note was addressed by the Austrian ambassador at Paris to the French minister for foreign affairs, expressing the desire of his court to concur with those of London and Petersburg in their endeavours to promote a general pacification. A correspondence followed, of reciprocal professions and accusations, which terminated in having recourse to arms as the only arbiter.

The emperor Napoleon now determined to strike a home blow at his Austrian antagonist before he could be joined by the Russians. Renouncing his project, therefore, of the invasion of England, he broke up the greater part of his camp at Boulogne; and, having augmented

his army in Italy, drew the bulk of his force from Holland and Hanover, and proceeded by rapid marches to meet the Austrians on the Danube. The armies of the latter had passed the Inn into Bavaria early in September, the elector of which had been summoned to join his forces to that of Austria. He withdrew, however, from Munich to Wurtzburg, whilst his troops retreated into Franconia; and, for this defection, his country was subjected to severe exactions.

The French armies, estimated at 150,000 men, advanced in six divisions, under the command of marshals Bernadotte, Marmont, Davoust, Soult, Ney, and Lannes; and, having all crossed the Rhine, were joined at the end of the month by Napoleon, who passed the border with his guards at Kehl. On this occasion he addressed them in a proclamation drawn up in his usual vaunting style, in which he told them—'You are but the van-guard of the great nation; if it be necessary, it will in a moment rise at my voice, to dissolve this new league which British gold and hatred have woven;' and unfortunately these were not vain words. While the details of his campaigns belong to the history of France, their issue was in the highest degree interesting to Great Britain.

By a series of bold manœuvres and successful actions, Buonaparte, by the middle of October, surrounded general Mack in Ulm with 30,000 men, who remained to him after the loss of several detached portions of his army. Preparations were immediately made for storming Ulm, but a summons was at the same time sent to Mack to capitulate, with which he thought it necessary to comply. On the 20th of October the whole of the Austrian troops in that city surrendered themselves prisoners of war, with all their artillery and magazines. Thus was almost annihilated the force with which the Austrians commenced the campaign.

Napoleon proceeding to Munich, at the head of his main body, drove before him a corps of Austrians and the first column of a Russian force. The French crossed the Inn in the face of these allies, who retreated step by step on the road to Vienna. The alarm in that capital was now extreme: the emperor Francis retired with all his court to Brann, while the greater part of the nobility took refuge in Hungary. On the 11th the main body of the French army arrived at Vienna, which they entered in triumph on the 13th, the advanced guard passing through by the bridge over the Danube without halting. On the 15th Napoleon joined the army which was advancing into Moravia to meet the Russians.

Massena had almost equal success against the archduke Charles in Italy; while, in the Tyrol, the archduke John was closely pressed by different French divisions.

The main army of the allies now consisted of about 50,000 Russians, with the emperor Alexander at their head, and 25,000 Austrians, chiefly of new levies. The French, when joined by the divisions of Bernadotte and Davoust, amounted to between 70,000 and 80,000 men, in the highest state of discipline, and full of confidence from past successes. Near Austerlitz, on the direct

road from Vienna to Olmutz, was fought, on the 2nd of December, the memorable battle of that name. It was distinguished also as the battle of the three emperors, from the presence of those of Russia, France, and Austria. Napoleon was his own general-in-chief; the Russians were commanded by general Kutusoff; and the Austrians by prince John of Lichtenstein. The French were decidedly victorious.

It was now stipulated by an armistice, that the Russian army was to evacuate Moravia and Bohemia within fifteen days, and Hungary within a month, and to retire by prescribed routes; also that there should be no extraordinary levy of troops in the Austrian dominions during this period. But to these conditions the emperor Alexander refused to become a party, and he commenced a retreat in his own manner on the 6th of December. The archduke Charles, likewise, who was advancing on the bank of the Danube from Hungary with a powerful force, was greatly mortified, on his arrival at Vienna, to find that he was reduced to a state of inaction.

Prussia maintained at this period a cautious neutrality. A violation of her territory by a march of Napoleon through a part of it, without asking permission, did indeed elicit some marks of resentment, but the capture of Mack's army caused the affront to be passed over. A scheme for the recovery of Hanover by Swedish troops in British pay, and commanded by their sovereign, in conjunction with English and Russian troops, was also frustrated by the battle of Austerlitz.

About this time a convention was signed between France and Prussia, by which Hanover was ceded to the latter, and a definitive treaty between France and Austria was concluded on the 26th of December at Presburg, by which the Venetian territory west of the Atlantic was united to the kingdom of Italy; and the Greek provinces east of the Gulf were ceded to France. The electors of Bavaria and Wirtemberg were advanced to the dignity of kings. The Tyrol and Burghausen, with the principality of Eichstadt, were ceded to Bavaria; and the Brisgau and Ortenau to Wirtemberg and Baden. In return the new electorate of Salzburg was incorporated with the Austrian empire, and Wurzburg assigned in compensation to the archduke Ferdinand.

A treaty of neutrality had been concluded in September between France and Naples; and the French force under general St. Cyr, previously stationed in the Neapolitan territory, joined the army in Lombardy. A combined armament of English and Russians, said to have on board 10,000 British and 14,000 Russian troops, disembarked soon afterwards in that kingdom, not only without opposition, but apparently with every degree of encouragement from the monarch, who was prevented from openly declaring himself only by the speedy termination of the contest. The emperor Alexander then recalled his forces to Corfu, and the British general, Sir James Craig, withdrew into Sicily.

Napoleon now attempted to realise the haughty menace, that the ocean was no longer to belong

to England. Early in the year a squadron of six sail of the line and two frigates, which had been blockaded for more than two years in Rochefort, had found means to elude the British force stationed off that port and put to sea. Soon after the sailing of that squadron an armament of far greater magnitude sailed from the harbour of Toulon. This fleet, commanded by admiral Villeneuve, consisted of eleven sail of the line, and a number of frigates and corvettes, on board of which about 10,000 land forces were embarked. On the 15th of March they quitted the harbour, without being perceived by lord Nelson's squadron, who, preferring active warfare to a rigorous blockade, was then cruising at some distance, in the hope of inviting the enemy to an open engagement. After touching at Carthagena, where there were six Spanish ships of the line, but not in a state of readiness for sea, the French admiral proceeded to Cadiz. That port was blockaded by Sir John Orde, with a British squadron of only five sail of the line, which being too weak to prevent the junction of the enemy, the Toulon fleet was reinforced by that of the Spanish admiral Gravina on the 9th of April, consisting of six ships of the line and a number of frigates. The combined fleets immediately stood out to sea, and before night a strong easterly wind carried them out of sight of Cadiz.

Lord Nelson, then cruising in the Mediterranean, now commenced his memorable pursuit of them. Under the impression that Egypt was their object, the British admiral directed his course thither: but was here surprised at not being able to obtain any intelligence of an enemy. He retraced his course therefore to Sicily, and continued cruising off that island, in the most anxious expectation, till the middle of April.

The British admiral now became satisfied that the enemy had proceeded for the West Indies, and therefore resolved to direct his pursuit towards that quarter. In the Bay of Lagos, he received certain information of the course which they had taken; and, inspired with fresh ardor, he steered with crowding sails for Barbadoes. On his arrival, he received information that they were gone to attack Trinidad. On the following day his lordship sailed for that island, and, successively visiting all the islands, still found himself once more disappointed.

The French admiral, having received intelligence of the arrival of British fleet in those seas, put into Martinique, and, having watered his ships and refreshed his men, on the 7th of June set sail towards Europe.

Lord Nelson, in the mean time, proceeded to Antigua, where, on his arrival, he found that the combined fleets had a few days before passed that island to the northward. He instantly despatched a fast sailing vessel to communicate advice to government, in order that proper measures might be taken to intercept them on their return.

In consequence of this information the fleets were met with off Ferrol by Sir Robert Calder, with fifteen sail of the line. The enemy's fleet consisted of not less than twenty sail; but the British commander did not hesitate a moment in

bringing them to action. On the 22nd of July the encounter took place; and the unequal contest terminated with the capture of two Spanish ships of the line, the *San Raphael* and the *Firra*, the former of eighty-four, and the latter seventy-four guns.

This result greatly disappointed the public mind, and the disapprobation was so loud and general, that the British admiral returned to England and demanded a court martial, by which he was reprimanded, not for having betrayed either fear or cowardice, but for an error in judgment, in not having made the most of the opportunity afforded him of destroying or capturing every ship of the enemy which it was his duty to engage. The hostile fleets having reached Ferrol in safety, and there augmented their force to twenty-seven sail of the line, next proceeded to Cadiz, and entered the port on the 27th of August.

Lord Nelson on his return from the West Indies proceeded to London, and received an appointment to the command of a fleet of sufficient force to cope with the enemy in any quarter of the world. On the 11th of September he hoisted his flag on board the *Victory* at Portsmouth, and put to sea on the following day, without waiting for five ships of the line which were preparing to sail with him. Having taken command of the fleet under lord Collingwood, on the coast of Spain, he resumed his former tactics, and, instead of blockading the port of Cadiz, stationed his main force near Cape St. Mary's, establishing a line of frigates to observe and communicate the movements of the enemy. In the middle of October, on being apprised that a reinforcement of seven sail of the line would speedily join him from England, he detached admiral Louis with six ships of the line on a particular service; and this bold manœuvre was performed in so open a manner, that it had the desired effect of inducing the enemy to put to sea.

On the 19th of October admiral Villeneuve, with thirty-two sail of the line, seven frigates, and eight corvettes, got under weigh, and sailed with a light breeze to the westward. On the morning of Monday, the 21st, about day-break, Cape Trafalgar bearing east by south distant about seven leagues, wind nearly west, the combined fleets were discovered six or seven miles to the eastward; and, lord Nelson having received the expected reinforcement, bore down upon them in two columns, containing twenty-seven sail of the line. In his instructions he directed the captains to look to their particular line as their rallying point; but, if the signals should not be clearly understood, no captain could do amiss in placing his ship alongside one of the enemy. The admiral himself, who headed the weather column, was to attack the hostile line near the centre, while lord Collingwood, who conducted the leeward column, was to break it, if possible, at a considerable distance from the extreme rear; and thus, it was hoped, the victory would be decided ere the van could be brought to succor the ships engaged. The last signal issued by this great commander, at the moment of going into action, was, 'England expects every man to do his duty.'

Admiral Villeneuve supposed that the English fleet consisted of only twenty-one sail, and he originally intended to attack them with an equal number of vessels, while twelve of his select ships, acting as a body of reserve, were to bear down and double upon the British line after the action had commenced. On perceiving, however, the real force with which he had to contend, he arranged his ships in one line, forming a crescent convexing to leeward. The conflict began about noon, when admiral Collingwood, in the *Royal Sovereign*, gallantly entered into action about the twelfth ship from the enemy's rear, leaving his van unoccupied. The succeeding ships broke through in all parts, astern of their leader, and engaged their antagonists at the muzzles of their guns. Lord Nelson, on board the *Victory*, directed his attack on the enemy's line, between the tenth and eleventh ships in the van; but, finding it so close that there was not room to pass, he ordered his ship to be run on board the *Redoubtable*, opposed to him; his second, the *Temeraire*, engaged the next ship in the enemy's line; and the others singled out their adversaries in succession, according to the order of battle. For the space of four hours the conflict was tremendous; particularly in that part of the line where the commander-in-chief had commenced the onset. The guns of his ship repeatedly set fire to the *Redoubtable*, and the British seamen were employed at intervals during the heat of the battle in throwing buckets of water on the spreading flames, which might otherwise have involved both ships in destruction.

Both the French and Spaniards fought with a degree of bravery and skill highly honorable to their officers and men; but the attack was irresistible. About three in the afternoon the Spanish admiral, with ten sail of the line, joining the frigates to leeward, bore away for Cadiz. Ten minutes afterwards five of the headmost ships of the enemy's van, under admiral Dumanoir, tacked, and stood to the windward of the British line; the sternmost was taken, but the others escaped. The heroic exertions of the British were rewarded by the capture of nineteen ships of the line, with the commander-in-chief, Villeneuve, and two Spanish admirals. The tempestuous weather, which came on after the action, rendered it necessary to destroy all the prizes but four, which were carried into Gibraltar. The fugitive ships, under Dumanoir, were captured off Ferrol on the 4th of November, by a squadron under the command of Sir Richard Strachan.

The loss of the British in the battle of Trafalgar was estimated at 1587 men, killed and wounded; but great as the victory was, and in importance and brilliancy it yields to none in the annals of naval warfare, it was purchased at an immense expense to the country. About the middle of the action, as lord Nelson was walking the quarter-deck, attentive to its progress, and anxiously expecting its issue, he received a shot in the left breast from a musket ball, which wounded him mortally, and he instantly fell. He was immediately carried to the cockpit, where he lived about an hour, employing the short space of time now allotted him in giving

orders, receiving reports, and making enquiries concerning the state of the action. The closing scene of his career was not unworthy of his former exploits. In the hour of death he displayed the magnanimity that had marked his character and conduct through life. Conscious of his approaching dissolution, he sent for admiral Collingwood, the second in command, to whom he communicated the particulars of his situation, and then gave the necessary orders to the officers by whom he was surrounded. On being told that the British flag was triumphant, and that fifteen sail of the line had struck, he appeared much consoled. A few moments before his death he said to Captain Hardy, 'I could have wished to live to enjoy this day; but God's will be done.' 'My lord,' replied the captain, 'you die in the midst of triumph!' Nelson replied, 'God be praised!' and almost instantly expired. Thus fell the hero of the Nile, of Copenhagen, and of Trafalgar, after a victory which utterly blasted the hopes of Napoleon for the subjugation and ruin of England. His mortal remains were conveyed to England, and interred in St. Paul's with the highest public honors. Having left no son, the title of earl Nelson, with a permanent revenue annexed, was, by an act of national and enthusiastic gratitude, conferred upon his brother, a private clergyman, all parties on this occasion vying in their expressions of grief and admiration.

Admiral Collingwood was raised to the peerage with a pension of £2000 per annum. The earl of Northesk was honored with the order of the Bath, and a pension. A liberal subscription was set on foot for the relief of those who suffered in the cause of their country; and hundreds of thousands of pounds were readily and cheerfully raised for the relief of the officers, seamen, and marines, who were wounded, and the widows, orphans, and relatives of such as were killed in this memorable action.

In the East Indies the war was continued between the East India Company and the rajah of Bhurtpore, aided by Holkar. Early in the year lord Lake made several successive attacks on the town of Bhurtpore, in all of which he was repulsed with loss. At length Holkar's general, Ameer Khan, having been entirely routed by general Smith, and himself so much reduced that he could give no assistance to his ally, whilst lord Lake was preparing for a new attack on Bhurtpore, the rajah offered proposals for peace, which were acceded to on the 10th of April, on the condition of his yielding to the company the fortress of Deeg, and restoring the districts which had been conferred upon him after the peace with Scindia, together with the payment of a sum of money. In July lord Cornwallis arrived at Madras to take upon him the office of governor-general, to which he had been appointed as successor to the marquis of Wellesley. His lordship, however, was in such a reduced state of health, that he died on the 5th of October, at Gazeepoor, in the province of Benares, in the sixty-seventh year of his age. British India will always be proud to associate with its happiness, its prosperity, and renown, the grateful remembrance of this its highly venerated chief; and the native powers

will long and sincerely regret a man who so deservedly possessed their unbounded confidence. As a patriot, a statesman, a warrior, and a man, the character of the marquis Cornwallis shines with distinguished lustre. Peace was signed with Holkar on the 24th of December; and thus a temporary calm was restored to that part of India.

Since the return of Mr. Pitt to office nothing, the great victory of Trafalgar excepted, had relieved the general disaster and disappointment that attended the measures of the cabinet. At the close of the former session of parliament this distinguished statesman had been compelled, by the visible decline of his health, to relinquish all active share in public business, and retire to Bath. It has been supposed, that the fatal intelligence of the battle of Austerlitz produced an agitation of spirits which powerfully increased his disorder; for on returning to his villa at Putney, near London, he breathed his last on the 23rd of January 1806, in the forty-seventh year of his age, having directed the affairs of his country for a longer period than any other minister. Under his auspices the maritime supremacy of England was confirmed by a series of most splendid victories; her colonial acquisitions were greatly extended; but her public burdens were also enormously augmented. He labored successfully to preserve his country from the contagion of the revolutionary principles that desolated France; and exerted himself with equal zeal, but with less success, in resisting the military despotism by which that power threatened to subjugate the continent. As a financier, he displayed great ability in the accumulation of public resources; but it may be fairly questioned, whether he displayed equal political wisdom in the distribution of them. In forming continental alliances, he relied too implicitly on the influence of money. Those who considered the revolutionary war as unnecessary regarded him as one of the principal authors of the tremendous evils which that contest brought upon Europe. While others, reflecting on the extensive spread and dangerous tendency of the principles of the French revolution, and on the extreme hazard to which Great Britain was exposed, by standing an indifferent spectator till France had subdued the continent, and increased her marine in proportion to her military strength, regard him as the saviour of his country. Every impartial person, indeed, must confess, that he long stood in a situation wholly unprecedented, and difficult beyond example; and the unprejudiced historian will not deny to Mr. Pitt the praise of being 'a man of firm purpose, honorable pride, and most disinterested principle. If ambition must be allowed to have been a prominent trait in his character, it was the ambition of a great mind. His political views were grand and comprehensive; and, if some of his most favorite plans proved unsuccessful during his life, his successors at last acted upon them perseveringly and won the victory of liberty and civilisation for a prostrate world.

Parliament was opened by commission on the 21st of January 1806. In the speech from the throne the recent victory of Trafalgar was

described as an exploit 'beyond all precedent;' and the king, while he deplored the necessity which the emperor of Germany had felt of withdrawing from the contest, was consoled in the prospect of the unshaken adherence of the emperor of Russia, and expressed his full confidence in the inexhausted resources of his dominions. In the debate which ensued, upon this address, lord Grenville remarked, that the state of the country imperiously called for investigation; but that circumstances painful to his feelings induced him to postpone the discussion. In the commons, lord Henry Petty acknowledged his intention of moving an amendment to the address; but, as the attendance of the individual most interested to defend the measures of government was impossible, he should make it the subject of a future motion. The addresses were presented on the 23rd, the day of Mr. Pitt's decease.

Mr. Lascelles now moved, that the late minister be interred at the public expense, and a monument, with a suitable inscription, erected to the memory of 'that excellent statesman.' Objections were instantly started to the motion thus worded, and it was opposed by many distinguished members, who avowed their conviction of his integrity and their admiration of his talents. Among these was Mr. Windham, who declared, that he could not concur in styling Mr. Pitt an excellent statesman, and that the motion did not rest on the basis of historical truth. Mr. Fox said that no one was more ready to acknowledge the private, and even in many respects the public, virtues of Mr. Pitt. His great eloquence, and splendid talents, cast a veil over the system upon which he acted, and concealed its deformity. And, however desirous he might be to bury in oblivion former contests, he could not consent to confer public honors on his memory, upon the ground of his being an excellent statesman.

Lord Castlereagh pronounced this to be a question of feeling rather than of argument; and he urged that the house would act inconsistently with its own opinion, repeatedly expressed, if it hesitated to recognise the merits of Mr. Pitt. He at the same time confessed, that, had he framed the motion, it would have been couched in much stronger terms. On a division of the house the numbers were 258 to eighty-nine. The sum of £40,000 was subsequently voted for the payment of Mr. Pitt's debts.

The death of this distinguished statesman caused a total change in the ministry. Lord Eldon resigned the seals, and the honorable Thomas Erskine was appointed lord chancellor, and constituted a peer of the realm by the title of lord Erskine. Lord Grenville, whom the king had sent for and empowered to form a new administration, including Mr. Fox, who had now been estranged from the royal councils more than twenty years, was appointed first lord of the treasury; and lord Henry Petty chancellor of the exchequer. Earl Fitzwilliam president of the council; Viscount Sidmouth lord privy seal. Mr. Fox was made secretary of state for foreign affairs; lord Spencer secretary for the home department; and Mr. Windham secretary at war.

Mr. Grey first lord of the admiralty, and Mr. Sheridan treasurer of the navy. Earl Moira master-general of the ordnance, and general Fitzpatrick secretary for the colonies. His grace the duke of Bedford was appointed lord-lieutenant of Ireland, and Mr. Elliott principal secretary. Lord Ellenborough, lord chief justice of the court of king's bench, was also appointed to a seat in the cabinet. Sir Arthur Pigot and Sir Samuel Romilly were nominated attorney and solicitor-generals.

On the 28th of March the new chancellor of the exchequer brought forward the budget for the year. The amount of the ways and means was £43,618,472, and of the supplies £43,530,000. The war taxes, amounting to £11,500,000, were to be increased to £19,500,000, and a new loan of £18,000,000 was proposed. Mr. Windham brought in a bill for enlisting the regular army for a term of years instead of for life, as heretofore. This regulation, which forms an epoch in the military history of England, met with general approbation. The infantry were to be enlisted for seven years, and the cavalry for ten. The plan, however, did not pass without much debate, in the course of which lord Castlereagh affirmed the state of the country to be prosperous and flourishing, and that the present ministers 'reposed on a bed of roses.'

Certainly, however, the country did not. On the 30th of January his Prussian majesty signified his intention of taking possession of Hanover, agreeably to the late convention with the emperor of France. This was followed by a second proclamation, dated the 28th of March, ordering the Prussian ports to be shut against the vessels of Great Britain. In consequence of these hostile proceedings, Mr. Fox, on the 21st of April, brought down a message from his majesty, informing the house of commons that he had thought it proper to adopt measures of retaliation, by issuing orders for the blockade of the Elbe, the Weser, and the Ems, and for the capture of Prussian vessels. We have seen that, from the year 1788 to the death of Mr. Pitt, the subject of the abolition of the slave trade was never lost sight of by Mr. Wilberforce. It was brought from time to time under the notice of parliament, with various degrees of success; and gradually gained ground: on the 28th of February, 1805, the bill for the abolition was lost in the house of commons, by a majority of only seven voices.

The honor of accomplishing this great object was reserved for Mr. Fox and his colleagues. On the 11th of June, 1806, Mr Fox carried a resolution in the house of commons, 'That this house, conceiving the African slave trade to be contrary to the principles of justice, humanity, and sound policy, will, with all practicable expedition, take effectual measures for abolishing the said trade, in such manner and at such period as may be deemed most desirable.'

The bill met with only a feeble opposition. It was strenuously supported by Mr. Wilberforce and all the members of administration, and carried by a majority of 115 against fifteen. In the course of the debate the solicitor-general

stated, from documents before the house, that since the year 1796, that is during the last ten years, upwards of 360,000 of the natives of Africa, torn from their country by Europeans, had either been sold into slavery, or had miserably perished in their passage to the West Indies. The crimes perpetrated in this traffic had equalled, if they had not exceeded, in horror and enormity, those of the French revolution, and had been constantly repeated during the space of three centuries.

The trial of lord Melville, on his impeachment by the commons, was a circumstance of considerable interest in the transactions of the year. It commenced in Westminster Hall on the 29th of April, before the lords, the members of the house of commons being present in a committee of the whole house. The articles of the charge were ten in number, but in substance were reducible to three. 1. That, as treasurer of the navy, he had applied divers sums of public money to his private use and profit. 2. That he had permitted his paymaster, Trotter, to take large sums of money from the bank of England, issued to it on account of the treasurer of the navy, and place it in his own name with his private banker. 3. That he had permitted Trotter to apply the money so abstracted to purposes of private emolument, and had himself derived profit therefrom. The trial was conducted with unusual despatch for a proceeding of that nature, the evidence and arguments on both sides being closed on the 17th of May, and sentence pronounced June 12th. The result was, that, by a majority, his lordship was pronounced not guilty upon each of the ten articles; but on four of them the majority for his acquittal was considerably less than double the number of those who gave a contrary judgment. The whole number of peers who voted was 135.

An important commercial law was passed during this session of parliament, namely, for permitting the free interchange of grain of every kind between Great Britain and Ireland without either bounty or duty: the good effects of which, to both countries, have since been amply experienced. An act also passed under the title of the American intercourse bill, though not without violent opposition, for legalising the trade for lumber and provisions carried on by neutrals to the West India Islands, which in time of war had generally been found indispensably necessary, though violating the navigation laws. It empowered the king in council, when such necessity should arise during the present war, to authorise his governors, under such restrictions as should seem fit, to permit this traffic, with the proviso, that neutrals should not import any commodities, staves and lumber excepted, which were not the produce of their own countries, and should not export sugar and other products of the islands.

On the 20th of March Joseph Buonaparte was proclaimed king of Naples, and the king and queen of that country retired to Palermo. An ineffectual attempt on Calabria was made by Sir Sydney Smith in April; and in July, at the urgent request of the court of Palermo, Sir John Stuart, who commanded the British troops in Sicily, em-

barked a body of about 4800 effective men, in the gulph of Euphemia. General Regnier with his troops being encamped some miles' distance at Maida, Sir John determined upon attacking him before he should be joined by his expected reinforcements.

The junction, however, had been made on the night before, and the enemy, to the number of about 7000, descended from the heights, and marched into the plain to meet the assailants. After firing for some time both armies rushed on with the bayonet, when the superior firmness of the British soldiers soon decided the contest. As soon as the weapons crossed, the French gave way, and were pursued with a dreadful slaughter. The consequence of this brilliant action was a general insurrection of the Calabrian peasantry, and the expulsion of the French from the province.

Efforts of this kind, however, were inadequate to the promoting of any permanent change; and Sir John Stuart, sensible that he could not long maintain his ground in Calabria, prepared for returning to Sicily. The French, soon after the battle, reduced the fortress of Gaeta; and general Fox, who took the command of the British troops in Sicily, refusing to concur in the hopeless plans of the court of Palermo for recovering Naples, the new government in that kingdom remained undisturbed, except by intestine disorders.

About this time an important present acquisition was made by the British arms in South America. After the reduction of the Cape of Good Hope, Sir Home Popham and general Beresford, who had been sent out in the autumn of 1805 with a force of about 5000 men, judging it expedient to make an attack on some of the Spanish settlements in South America, embarked a part of the land forces; and after a tedious passage arrived on the 6th of June at the mouth of the Rio de la Plata. The squadron, after having occupied nine days in proceeding about eighty miles, came to anchor off the point of Quilmay, about twelve miles from Buenos Ayres, which the British commanders had resolved to attack in preference to Monte Video.

On the 25th, in the course of the afternoon and night, a landing was effected without opposition; though a body of the enemy, consisting of about 2000 men, chiefly cavalry, with eight field-pieces, was posted at the village of Redaccion, on a height about two miles distant from the place where the troops disembarked, and directly in their front. The whole intermediate space, as well as to the right and left, was a swampy flat, where the artillery was of little service. On the British crossing the swamp, the Spaniards opened a fire from their field-pieces, which at first was well directed; but, part of the English troops having gained the heights, the enemy retired, leaving behind them four field-pieces and a tumbrel. Here the army halted for the night; and in the morning, finding the bridge over the Chuelo destroyed, general Beresford determined on forcing the passage of that river. He was now about three miles from Buenos Ayres, and the enemy opened an ill-directed fire of cannon and musketry; the former of which

was soon silenced, though the latter was kept up more than half an hour, but so as to do very little injury to the British.

About eleven o'clock in the forenoon the greatest part of the English troops, with some of their guns, had got over the river; and general Beresford, having learned that most of the troops had abandoned the city, sent a summons to the governor, who agreed to a capitulation, of which the principal articles were, security to their religious worship to the persons of the inhabitants, and to all private property. The amount of the public treasure taken at Buenos Ayres amounted to 1,291,323 dollars; of which 1,086,203 dollars were embarked on board the *Narcissus*, and the remaining, viz. 205,115 were left in the treasury.

Sir Home Popham, in the triumph of the moment, transmitted a circular letter to the chief commercial towns of Great Britain, informing them 'that a whole continent was laid open to the British trade;' and the most extravagant speculations were accordingly directed to this quarter: but, though so small a force had sufficed to acquire, it was wholly inadequate to retain this unwieldy conquest; and in a short time Buenos Ayres was recovered by the Spaniards, under the conduct of colonel Linieres, a French officer in the South American service; and our troops, with general Beresford their commander, were made prisoners of war. Sir Home Popham, nevertheless, continued to blockade the entrance of the river; and, on the arrival of reinforcements from the Cape, made an unsuccessful attempt on Monte Video.

The naval operations of the year were few, but uniformly successful. A French squadron of five sail of the line was encountered, in the month of February, off the coast of St. Domingo, by a superior force under admiral Duckworth. After a furious action three of them struck their flags, and the other two were driven on shore, and burnt. In the east, the French admiral Linois was captured by Sir John Borlase Warren, on board the *Marengo* of eighty guns, with the *Belle Poule* of forty guns, on his passage back to France, enriched with various plunder. A large convoy from Rochefort was intercepted by Sir Samuel Hood, and four out of five large frigates were taken, with troops on board destined for the West Indies. A remarkably gallant exploit was also achieved by lord Cochrane, who commanded the *Pallas*, in cutting out three Spanish vessels under a heavy fire from the protecting batteries of Avillos.

Negotiations in the interim were carrying on between the courts of France and England, which for a time afforded a prospect of peace. They originated in Mr. Fox having disclosed to M. Talleyrand a plot for the assassination of the French emperor. In reply an extract was enclosed to the British minister from a speech of the emperor to the legislative body, March 2: 'I desire,' it is said, 'peace with England. On my part I shall never delay it for a moment: I shall always be ready to conclude it, taking for its basis the treaty of Amiens.'

As this intimation was understood to be intended as an opening to negociation, Mr. Fox,

after a short interval, returned an answer expressive of 'the cordial disposition of the English government to treat on the general basis of a peace honorable to both countries, and to their allies,' adding, 'that the existing ties between England and Russia were such, that England could not treat, much less conclude, but in concert with the emperor Alexander.' M. Talleyrand replied, 'that the emperor Napoleon adopted the general principle laid down by Mr. Fox; but thought there was no necessity for the intervention of a foreign and distant power.'

It happened that among the English detained in France was a young nobleman, the earl of Yarmouth, in whose discretion and ability Mr. Fox could confide. Being invested with the requisite powers, this nobleman repaired to Paris, in order to open the negotiation; but the difficulty respecting Russia retarded his progress. Other subjects of difference were Hanover and Sicily. No exchange or indemnity for the first could be hearkened to; and, in his despatch of June 13th, lord Yarmouth informed the English minister of the declaration which M. Talleyrand had at length made, 'that, considering the extreme stress which was laid on this point, Hanover should make no difficulty. And, with regard to Sicily, M. Talleyrand after a time replied: 'You have it: we do not ask it. Had we the possession, difficulties would be much augmented.' In another conversation, however, M. Talleyrand insinuated, that Russia was inclined to treat separately; and also mentioned, that the emperor of France had received despatches from his brother and the general officers under his orders, stating, that Naples could not be held without Sicily, and the probability which they saw of gaining possession of that island.

On the 26th of June Mr. Fox, though at this time rapidly declining in health, addressed an excellent despatch to lord Yarmouth, expressing his astonishment at the tergiversation of M. Talleyrand. The recognition of the French emperor, and the other new potentates, he regarded as a full compensation for the restoration of Hanover. He transmitted to lord Yarmouth the full powers upon which the French minister had laid so much stress; but with orders fairly to state to M. Talleyrand, that he had no authority to make use of them until that minister returned to his former ground respecting Sicily. He remarked, that if D'Oubril, the Russian ambassador, had offered to treat separately, it was only in the way that lord Yarmouth himself treated; that is, in form, but substantially in concert. Naples and Istria, Mr. Fox admitted, were not to be conclusive against agreeing to provisional articles, subject to the approval of Russia; or, as he explained himself, 'that those articles should not have effect till a peace should be concluded between France and Russia.' On the 1st of July lord Yarmouth acknowledged his receipt of the full powers with which he was now vested by the British government; and mentioned his communication of the same to M. Talleyrand, who merely said, 'that change of circumstances during a negotiation, were always valid reasons for a change of terms: that had any confidential overture been made three months

ago, France would have been ready to settle the question of Naples in the manner most satisfactory to Great Britain: the same a month later with regard to Holland.' At the close of the conference, lord Yarmouth repeated, 'that it was impossible to proceed with the negotiation till every mode of seeking to obtain possession of Sicily was entirely relinquished.' On subsequently demanding his passports, M. Talleyrand took the opportunity of offering the Hanse towns as an establishment for the king of Naples. But on the 5th of July, being the very next day after the receipt of lord Yarmouth's letter, Mr. Fox peremptorily replied, 'that the abandonment of Sicily was a point which it was impossible for his majesty to concede. The demand of France was inconsistent with the whole principle on which the negotiation rests; and the proposal of M. Talleyrand is, of itself, quite inadmissible. To the original basis of the negotiation, therefore, lord Yarmouth was directed to advert; and, if this was not accepted, to state, in perfectly civil yet decided terms, that he was not at liberty to treat on any other ground, and therefore to desire his passports.' The earl of Yarmouth having strictly complied with his instructions, M. Talleyrand now offered a further proposition from the emperor, tendering Dalmatia, Albania, and Ragusa, as an indemnity for Sicily. This, he was assured, would not be accepted; however, the English negociator consented to wait the return of the messenger; M. Talleyrand adding, 'that, if peace was made, Germany should remain in its present state.' At this critical juncture, the indisposition of Mr. Fox had so alarmingly increased as to render him incapable of attending to business; and the succeeding despatches, transmitted under the sanction of his name, were fairly acknowledged, at a subsequent period, not to have proceeded from his pen. The elaborate answer of July 18th to lord Yarmouth's last despatch, most unhappily and unseasonably wavered upon the grand point of Sicily. 'An exchange,' says the writer of that despatch (generally ascribed to lord Grenville) 'is now offered for Sicily; and it is in that view, and not in that of an absolute and uncompensated cession, that the question is now to be considered; and to this the full and free consent of its sovereign is necessary, which is not likely to be obtained by the offer of Dalmatia.' The writer then suggests the addition of Istria, and of a large portion of the Venetian states, including, if possible, the city of Venice: and lord Yarmouth was directed to continue the conferences with M. Talleyrand, to ascertain whether any more practicable shape could be given to the exchange.

While matters were in this state a treaty for a separate peace was concluded between France and Russia: after which lord Lauderdale was united with lord Yarmouth in the negotiation; but, after several formal attempts, found it impossible to proceed upon any reasonable basis. At this critical moment, on which peace or war seemed to be suspended, Mr. Fox who had been for some time afflicted with a dropsy, expired on the 13th of September 1806, in the fifty-ninth year of his age; and thus, in the midst of tumultuous wars and of uncertain negotiations,

Great Britain was called to mourn the loss of a patriot and a statesman who has had few equals. See our article Fox. Here we need only add, while the subverters of thrones and the spoilers of kingdoms are crowned with triumphant laurels, and congratulated with applauding poems, it is to the honor of Mr. Fox, that he never gave a vote in the British senate by which one drop of human blood had been spilt, or the treasures of the nation lavished away. He,

'Midst jarring conflicts, stemmed the tide of blood,
And to the menaced world a sea-mark stood;
Whose wisdom bade the broils of nations cease,
And taught the world humanity and peace.

On the death of this lamented statesman some new arrangements became necessary among the members of administration. Lord Howick succeeded Mr. Fox in the office of secretary of state for foreign affairs, and Mr. Thomas Grenville succeeded him as first lord of the admiralty. Mr. Tierney became president of the board of control, to which the former gentleman had been appointed, on the nomination of lord Minto to the government of India. Lord Sidmouth was president of the council in the room of earl Fitzwilliam, who retired in ill health; and the vacant office of privy-seal was assigned to lord Holland. These changes were rather unexpectedly followed by a dissolution of parliament.

On the continent of Europe, at this crisis, the subversion and creation of kingdoms were become common operations. The territory of the Batavian republic being full of French troops, who garrisoned all the fortified towns, an edict of their emperor was all that was necessary to create a king, and furnish him with a kingdom. On the 9th of June this change in the constitution was notified to their high mightinesses the states-general, by M. Verneul, who, being just arrived from Paris, opened the special commission which he had received from prince Louis Buonaparte, as king of Holland. On the 24th the new king and queen made their public entrance into the Hague. The revolutions of Germany were equally remarkable. The fatal battle of Austerlitz had crippled the power of Austria, and virtually subverted the Germanic constitution, on the ruins of which was now formed the Confederation of the Rhine. See CONFEDERATION.

By this confederation the Germanic body was completely dissolved, and a very considerable part of its members ranged themselves under the banners of France. In consequence of this defection the emperor Francis II. resigned his high office of emperor of Germany. On the 7th of August a proclamation for that purpose was issued at Vienna, in which his imperial majesty the emperor of Austria declared, that, convinced as he was of the impossibility of being enabled any longer to fulfil the duties of his imperial functions as emperor of Germany, he owed it to his principles to renounce a dignity which was valuable in his eyes only whilst he was able to enjoy the confidence of the electors, princes, and other states of the empire; and that, considering the confederation of the Rhine as having dissolved the ties that united him to the Germanic

body, abolished the Germanic constitution, and annulled the office of emperor, he therefore resigned the imperial crown and government, and absolved the electors, princes, and states, the members of the supreme tribunal, the magistrates, and all others belonging to the empire, from their allegiance to him as chief. Thus was dissolved the German, or as it was styled in diplomatic language the Holy Roman Empire, 1000 years after Charlemagne had received the imperial title from the hands of the pope at Rome.

Prussia, however, still was determined on a struggle against the dominant genius of Buonaparte; and seemed at this time to glory in entering the lists alone with him. On the 9th of October appeared a declaration of Frederick William, filled with the most humiliating confessions of the lengths to which she had gone in subservience to France, and with expressions of resentment on being made its dupe and its victim. It nevertheless allows that 'the possession of Hanover, could it have been obtained under less unhappy circumstances, would have been of invaluable advantage to Prussia. The king therefore conceived, that he reconciled his wishes with his principles when he accepted of the proposed exchange only under the condition of delaying the fulfilment of the same till a general peace, with the consent of his Britannic majesty.'

Early in October the duke of Brunswick, to whom was committed the chief command of the army, fixed his head-quarters at Weimar, the army extending along the banks of the Saale. The Saxons served as auxiliaries under prince Hohenloe on the left, and the whole collected force exceeded 100,000 men. The French advanced from Bamberg in three divisions; and after various partial encounters, in one of which prince Louis, brother to the king of Prussia, lost his life; the two armies, nearly of equal strength, but very unequally commanded, seemed to assume an attitude of mutual defiance.

The French emperor, by superior manœuvres, now succeeded in turning the left of the Prussians, and in cutting off the communication with their magazines: on which he occupied in force the heights of Jena, which had been thought impracticable for artillery; and on the eve of the 13th of October the two armies encamped within cannon-shot of each other. The action commenced two hours after day-break, and quickly became general, exhibiting for some time reciprocal skill and bravery; but a fierce assault from the French cavalry and cuirassiers, under general Murat, at once decided the fortune of this memorable day. All attempts to restore order were in vain: universal consternation ensued. Nothing resembling even a regular retreat could be effected; and, in the flight of the Prussians towards Weimar and Naumburg, multitudes were slaughtered, and a still greater number made prisoners. The duke of Brunswick himself was mortally wounded, and the entire loss did not fall short of 40,000 men; while that of the French, if their own account may be credited, was below 5000. Further resistance seemed not to be thought of. Erfurt, Magdeburg, Stettin, Leipsic, and Spandau, sur-

rendered almost on the first summons; and on the 25th of October the marshals Davoust and Augereau entered Berlin.

From Berlin the French emperor issued a decree, dated 20th November, 1806, interdicting all commerce and correspondence between the countries under his government and the islands of Great Britain, which he declared to be in a state of blockade; denouncing all English property as lawful prize; and all vessels touching at any port in England, or any English colony, were excluded from the harbours of France, or the countries under its control. This was vindicated as a measure of retaliation for the flagrant violations of the laws of maritime neutrality by Great Britain; and, extravagant as the terms of the decree might seem, its effects were severely felt.

After the dreadful defeat of Jena, the king of Prussia had retired to Königsberg, where he was actively employed in collecting the scattered and feeble remains of his forces. In the mean time the French, under Jerome Buonaparte, made themselves masters of Silesia, and the barrier, which seemed to have wholly separated France and Russia, was now broken down. On this the emperor Alexander resolved to make a grand effort to protect his own dominions, as well as to support the throne of Prussia. While marshals Davoust and Lasnes entered Prussian Poland, a large force was collecting in different parts of the Russian empire, and began to move towards the frontier.

The Russians, having crossed the Vistula on the 26th November, met the French advanced posts, which finding themselves unequal to resist, they repassed that river; and two days after, the duke of Berg, with a division of the French army, entered Warsaw. About a month after the forces of these two great powers came into contact in the battle of Pultusk. The Russian general Benningsen, having taken a position at this place, was attacked by the French on the 26th December, led on by marshals Davoust and Lasnes, under the immediate direction of the emperor of France. Davoust, with 10,000 men, fell upon the left wing of the Russians; at the same time the attack on their right was extremely impetuous, and conducted by Napoleon in person. The conflict was extremely obstinate, and continued till night. The enemy was certainly repulsed; but the French and Russian accounts are extremely contradictory. Both sides laid claim to the victory, but neither gained ground. The loss was unquestionably great; and, from subsequent circumstances, it appears to have been nearly equal.

On reaching Eylau the Russian commander sent general Marcoff to take possession of the town, and a sanguinary conflict again ensued between his corps and several columns of the enemy. The Russians, after an obstinate contest, made themselves master of the town on the 7th of February, 1807; but the French advanced in such force that they were obliged to retreat. In consequence of this reverse general Benningsen ordered another division to advance, which, marching in three columns, bore down all opposition, and retook Eylau by assault.

On the following day the action was renew 3,

and became general. It would exceed the limits of this summary to follow the official accounts of the operations; but they assert that all the attempts of the French cavalry to break the Russian columns were defeated. 'In vain, says Benningsen, 'did the emperor of France lavish his last resources; in vain did he endeavour to excite the courage of his soldiers, and sacrifice so great a part of his army: the bravery and persevering courage of the Russians withstood all his efforts, and snatched from him a victory which had long remained doubtful.' At midnight the Russians remained masters of the field of battle; but in the morning retreated, and the French took possession of the town of Eylau.

After this the armies of France and Russia remained, for a considerable time, inactive. Warlike operations, however, continued in Swedish Pomerania, where, after a number of actions fought with various success, the Swedes were at last driven into Stralsund. In the month of April a division of the French army commenced the siege of Dantzic; and the houses of the suburbs were destroyed to the value of 9,000,000 of livres; the damages occasioned in the city itself, by the cannonade and bombardment, were estimated at 12,000,000. The Russians, notwithstanding their assumed victory at Eylau, could never make an effort for the relief of this city; which, on the 28th of May, surrendered to the French by capitulation.

The fatal day at length arrived which was to decide the mighty contest. That day was the 14th of June, the anniversary of the battle of Marengo. Having put his soldiers in mind of this circumstance, the emperor Napoleon prepared for an attack on the Russian position at Friedland. The battle did not commence till half past five in the evening, when marshal Ney and general Marchand advanced, while general Bisson's division supported their left. The Russians attempted to turn marshal Ney with several regiments of cavalry, preceded by a numerous body of Cossacks. But general Latour Mauberg immediately formed his division of dragoons, and, advancing to the right at full gallop, repelled their charge. In the mean while general Victor ordered a battery of thirty pieces of cannon to be placed in the front of his centre; and general Sumnermont having caused it to be moved about 400 paces forward, the Russians sustained a dreadful loss from its fire. The different movements which were made to effect a diversion proved useless. Several columns of the Russian infantry attacked the right of marshal Ney's division, but were charged with the bayonet and driven into the Alle, in which river several thousands found their death. While Ney advanced to the ravine which surrounds the town of Friedland, the Russian imperial guards made an impetuous attack on his left. This corps was for a moment shaken; but general Dupont's division, which formed the right of the reserve, marched against the guards, and routed them with dreadful slaughter. The Russians then drew several reinforcements from their centre, and other corps of reserve, to defend Friedland; but, in defiance of all their efforts, the town was forced, and its streets covered with dead bodies. At this

moment the centre of the French, commanded by marshal Lasnes, was attacked; but the Russians could make no impression. This sanguinary contest was decided chiefly by the bayonet, and the result was the total defeat of the Russians. The carnage that now ensued was dreadful. According to the French bulletins, the Russians left from 15,000 to 18,000 dead on the field, and the number does not appear to be greatly exaggerated. But it is difficult to give implicit credit to their relations, when they state their own loss at no more than 500 killed, and 6000 wounded. The French took eighty pieces of cannon, a great number of caissons, and several standards.

This sanguinary action was followed by an interview between the emperors of France and Russia and the king of Prussia, on the 7th of July, and a treaty of peace was concluded at Tilsit between France and Russia, and a few days afterwards between France and Prussia. The principal articles were, that a part of the Prussian dominions, especially on the eastern side of the Elbe, should be annexed to the new kingdom of Westphalia. Those parts which had been wrested from Poland, and become subject to Prussia, were ceded to the king of Saxony, under the title of the duchy of Warsaw, with a free communication with Saxony by a military road through the king of Prussia's dominions. The city of Dantzic, with a surrounding territory of two leagues, was restored to independence. The navigation of the Vistula was to be free. Russia acknowledged Joseph Buonaparte and his brother Louis, as kings of Naples and Holland, and Jerome as king of Westphalia. The emperor of all the Russias also acknowledged the confederation of the Rhine.

The French emperor also agreed to accept the mediation of the emperor of Russia, in order to negotiate and conclude a peace with Great Britain, under the condition, however, that this mediation should be accepted by England within a month after the conclusion of the treaty of Tilsit. By secret articles of this treaty, the ports of Prussia, as well as of Dantzic, were to be shut against the vessels and trade of Great Britain; and it is not certain whether the emperor of Russia was not bound by the same condition. By another secret article, Russia had consented to cede Corfu and the Seven Islands as an appendage to France. In the month of August a Russian officer, attended by French commissioners, arrived there; and, having convened the senate, opened a despatch from the emperor Alexander, in which his imperial majesty declared that he renounced all the rights which he possessed in quality of protector of the Seven Islands, and ceded them to his majesty the emperor of the French and king of Italy. The king of Sweden refused to accede to the treaty of Tilsit.

In December 1806 the new parliament was opened, and the great measure of the abolition of the Slave Trade finally accomplished.

On the 5th of January the papers relative to the late negotiation were taken into consideration in parliament. The conduct of government was ably vindicated by the chiefs of administration in both houses, and addresses voted without

a division. There were individuals, however who expressed their dissatisfaction on very opposite grounds. Mr. Whitbread, in the commons, in a masterly speech, declared, that war, eternal war, ought not to be waged for Sicily and Dalmatia; and he moved an amendment, expressive of the hope entertained by the house, that his majesty would make every arrangement, consistent with honor, for the restoration of peace. Lord Yarmouth declared his firm conviction, that the negotiation would have been brought to a favorable conclusion had it not been for the melancholy event of the death of Mr. Fox.

On the 20th of February lord Howick intimated his intention of preparing some additional and very necessary clauses for insertion in the mutiny bill. By the Irish mutiny act, passed in 1793, Catholics were allowed to hold any rank in the army under that of general on the staff in Ireland, though in Great Britain they were disqualified to serve under severe penalties; thus being deemed by law worthy of trust in one part of the United Kingdom, and unworthy in another. This anomaly it was the object of lord Howick to remedy, by making the provisions of the Irish act general. But on the 5th of March his lordship, in lieu of the proposed clauses, moved to bring in a bill for enabling his majesty to avail himself of the services of all his subjects, in his naval and military forces, on their taking the prescribed oath of allegiance; for to grant this privilege to Catholics and deny it to Protestants, would have been manifestly unjust. It might be thought that a law so salutary and equitable would sufficiently recommend itself by its mere statement; yet the motion of lord Howick was enforced with all the wisdom and eloquence of an accomplished statesman. Mr. Percival, late attorney-general, immediately rose to resist, what he styled one of the most dangerous measures that had ever been submitted to the judgment of the legislature. Our ancient and venerable establishment, he contended, could only be preserved by making a stand against every fresh attempt at innovation, which, if encouraged, would not stop short of abolishing all that the wisdom of our ancestors had thought necessary to enact in defence of our religion. The present question was simply, whether the legislature were prepared to give up the Protestant ascendancy in Ireland? This measure was, indeed, but a part of the principle of innovation which was gradually increasing; and these approaches were far more dangerous than if it were to come forward at once in all its frightful magnitude; and, what might be at first denied by the wisdom of parliament, would be ultimately extorted from its weakness. Such was the nature of the alarm sounded in parliament; and the spirit of bigotry instantly awoke from its slumber, and answered to the call. After an animated debate an early day was fixed for the second reading of the bill. This, however, was twice postponed; and on the 18th of March lord Howick gave notice, that the bill was not intended, under the present circumstances, to be proceeded upon. These circumstances were of a nature so singular, as to require a particular elucidation.

On the 4th of February, a despatch was received from the duke of Bedford, lord-lieutenant of Ireland, stating, that a disposition had been manifested by the Irish Catholics to prosecute their claims by petition to parliament. Desirous to prevent an application so unseasonable, and at the same time to assure the Catholics of their favorable disposition, an answer to the despatch of the lord-lieutenant was prepared by ministers, stating their intention relative to the mutiny bill, a copy of which was transmitted to the king, accompanied by a cabinet minute. To this proposition the king expressed a strong dissent; and, upon receiving his disapproval, the cabinet, on the 10th of February, made a respectful representation of the grounds of policy and principle upon which the measure in question was founded. Lord Sidmouth, who was president of the council, had fairly avowed his readiness to concur in the extension of the Irish act, so far as to legalise the services of the Irish Catholic officers in England, and no further. This he had made known to the king on being questioned by him, acknowledging, that there was no alternative but to repeal the Irish act, or make it operative in England. In consequence of this opinion corroborated by the lord chancellor, who described the measure as merely a corollary from the Irish act, the king replied to the cabinet minute, that, adverting to what had taken place in 1793, he would not prevent his ministers from submitting to the consideration of parliament the proposed clauses in the mutiny bill; but thought it necessary to declare, that he could not go one step farther; and trusted that this reluctance and concession would secure him from being distressed by any future proposal connected with the Catholic question. Under this frail and limited sanction, nevertheless, the majority of the cabinet transmitted a despatch to Ireland, exciting expectations far beyond the letter of the act of 1793, not only by removing the bar to higher military advancement, but extending the provisions of the act to the navy, and imparting the same privileges to English Protestant dissenters.

Lord Sidmouth, on being apprised of the import of the new clauses introduced into the bill, plainly declared the necessity he should feel of opposing the measure in parliament; and, in a cabinet council held on the 1st of March, he stated his conviction, that the extent of it was not understood by the king. Lord Grenville, however, expressing an opposite opinion, it was proposed by lord Howick to transmit to his majesty a copy of the clauses in question, which was done on the following day, accompanied by a despatch to the lord-lieutenant of the same tenor. These documents were returned without comment; but on the 4th of March the king, having previously conferred with lord Sidmouth, declared to lord Howick, at an audience held after the levee, his dislike and disapprobation of the measure, without however, in express words, withdrawing the consent which he had already given. The ministers, therefore, still acted under a delusion, and the obnoxious bill was ordered to be read a second time on the 12th of March.

During this interval lord Sidmouth gave no-

tice of his resolution to resign office, with a view to oppose the bill. But the king refused to accept his resignation; and mentioned in strong terms his surprise at the extent of the proposition made in the house of commons, after his declaration to lord Howick. On the same day lord Grenville was informed by the king, in a manner which could not possibly be mistaken, that to those parts of the bill which went beyond the limits of the act of 1793, he could not be induced to give his consent. Lord Sidmouth therefore prudently advised them to modify the bill, in such a manner as to free it from objections evidently insuperable. And lord Grenville, with the concurrence of his colleagues, respectfully apprised the king of the misconception that had prevailed, and their present purpose to modify the measure, so as to confine it precisely within those limits to which his majesty understood himself to have consented. This intimation was graciously received by the king, who gave the strongest assurances of his conviction, that the intentions of the ministers towards him were perfectly honorable. It was thus hoped that the difficulty was got over, and that ministers would be able to proceed with the bill, modified so as to meet the wishes of all parties; but, most unaccountably, at a subsequent cabinet meeting held on the 15th of March, to which neither the lord chancellor, the lord president, nor the lord chief justice were summoned, a resolution was taken to abandon the measure altogether. Nor was this the only, or the principal indiscretion. A minute was transmitted to the king, who now conceived that an amicable and final explanation had taken place, announcing the relinquishment of the measure; but at the same time asserting their right and intention to avow their opinions in parliament respecting their withdrawal of the bill, and in all future discussions relating to the Catholic question; and also to submit for his majesty's decision, from time to time, such advice respecting Ireland as the course of circumstances and the interests of the empire should require.

This superfluous declaration of rights which had never been controverted, excited in the breast of the king the greatest uneasiness. He began to think that the question was never to be at rest, and that he was to remain perpetually exposed to a recurrence of impertinence and anxiety. The royal answer, unadvisedly given, expressed some dissatisfaction at the parliamentary avowals which the ministers supposed to be necessary. It declared, that his majesty would never consent to any farther concessions; and demanded from ministers a positive and written assurance, that he should never again be distressed by a recurrence to this subject. With regard to a demand of this nature, there could be no hesitation; and it was in dutiful terms represented to the king, that those who were entrusted by him with the administration of the affairs of his extensive empire, were bound by every obligation to submit, without reserve, the best advice they could frame to meet the exigencies of the times; and that the situation of Ireland constituted the most formidable part of the present difficulties.

On the day succeeding this communication his majesty, with the most gracious expressions of his satisfaction in regard to every other part of their conduct, announced his intention of making a change of ministers; and on the 18th of March lord Howick was authorised to notify this intention to parliament. On the 25th of March his majesty's pleasure was signified, that the members of the present administration should deliver up their seals of office.

Before the end of March a new administration was formed. At the head of the treasury, after an interval of more than twenty years, was for the second time placed the duke of Portland, now from age and infirmity regarded as a cypher in office, the efficient power residing in Mr. Percival as chancellor of the exchequer. Lord Eldon resumed the great seal; the earl of Westmoreland the privy-seal; the earl of Camden was made president of the council; lord Mulgrave was appointed first lord of the admiralty; the earl of Chatham master of the ordnance; lords Castlereagh, Hawkesbury, and Mr. Canning, were the secretaries for the war, home, and foreign departments; Mr. Robert Dundas presided at the India board; Mr. George Rose was made treasurer of the navy; Sir James Pulteney secretary at war; Sir Vicary Gibbs, and Sir Thomas Plumer, attorney and solicitor-generals, and the duke of Richmond succeeded the duke of Bedford in the government of Ireland.

Both houses were at first adjourned to the 8th of April, when lords Grenville and Howick entered into ample explanations respecting the causes of the late change in administration; and Mr. Brand, member for the county of Herts, moved, 'That it was contrary to the first duties of the confidential servants of the crown to restrain themselves, by any pledge, express or implied, from offering to the king any advice that the course of circumstances may render necessary for the welfare and security of any part of his extensive empire.' Mr. Percival freely admitted the proposition as true in the abstract, but contended that it must be taken in conjunction with circumstances. Mr. Canning declared, that this was the first instance since the time of king Charles I. that a sovereign had been judged at the bar of that house. The house at length divided, on the motion of Mr. Osborne for the order of the day; in favor of which the numbers were 258 against 222 voices.

Two days after Mr. Lyttleton moved a resolution in the house of commons, at the close of a short and able speech, 'That this house considering a firm and efficient administration as necessary at the present crisis, feels deep regret at the late change in his majesty's councils. But the first division was decisive; and after a vehement debate the order of the day was carried by 244 against 198 voices.

In these contentions the prince of Wales did not appear to take any interest; since the decease of Mr. Fox, indeed, his communications with the late ministers were believed to be much less frequent and cordial. The marriage of this great personage had, from causes imperfectly developed, proved very unhappy; and an early separation had followed what was at the time

regarded as a forced and reluctant union. The subsequent conduct of the princess was far from being so discreet and guarded as was requisite, under circumstances which required on her part more than ordinary prudence. In consequence of representations made to his royal highness, and by him to the king, a committee of council was appointed to investigate the charges against her, consisting of the law lords, Erskine and Ellenborough, with other distinguished peers. Their report acquitted the princess of serious culpability, though it admitted, as the evidence subjoined but too plainly proved, that her conduct was liable to the imputation of levity and indiscretion.

On the 27th of April 1807 the parliament was prorogued by commission, and dissolved on the 29th. It was not surprising that, on the general election which succeeded the dissolution of parliament, the cry of 'no Popery,' and 'the danger of the church,' was made use of for political purposes, and was found capable of inflaming the minds of the multitude.

It will be necessary now to revert back a little in our narrative, for the purpose of noticing some very important military and naval occurrences which took place during the year 1807, and in which England bore a conspicuous part.

The emperor of Russia having refused to ratify the treaty of D'Oubril, general Sebastiani was sent to Constantinople with a commission from the French government, to induce the Sublime Porte to declare war against Russia; in consequence of which an edict was issued prohibiting Russian ships of war the passage of the Dardanelles: when the British squadron, under Sir John Duckworth, received orders to force that passage, which he accomplished, and presented himself in hostile array before Constantinople. On the 20th of February one of the Turkish ministers came on board, professing an earnest desire on the part of the sultan of giving satisfaction; but the demand of the British admiral was no less than the delivery of all the ships of war belonging to the Porte. The negotiation continued till the 27th, and this interval was diligently employed by the Turks, under the direction of French engineers, in erecting batteries on both sides of the long and narrow strait. The English admiral, now finding himself out-manœuvred even by Turkish artifice, thought only of retreat; and weighing anchor on the 1st of March he succeeded in forcing his passage through the straits, though not without incurring the most imminent peril. The castles of Sestos and Abydos, saluted him with the fire of vast blocks of marble, one of which, weighing 800 lbs., cut in two the main-mast of the Windsor man of war. The only effect produced by this attempt was to confirm the influence of France at the Porte.

But another attempt on the Ottoman power was more successful. On the 5th of March a force of about 5000 men was sent from Messina, under the command of general Fraser, of which, on the 16th a part anchored to the westward of Alexandria; and the troops having taken possession of the castle of Aboukir, and the cut between lakes Maadie and Mareotis, Alexandria capitulated on the 20th.

On the 27th general Fraser detached a body of 1500 men to take possession of Rosetta; but their commander incautiously marching into the town, without previous examination, the troops received so brisk a fire from the roofs and windows, that, after the loss of 300 killed and wounded, they found it necessary to retreat to Aboukir. Another corps of about 2500, under general Stewart, was now sent to erect batteries against the place; and, as a succour of Mamelukes was expected by the British, lieutenant-colonel Macleod was detached to seize a post in order to facilitate their junction. Many days passed in fruitless expectation; at length a great number of vessels were descried sailing down the Nile, which were not doubted to contain a reinforcement to the enemy from Cairo. Orders were immediately sent to colonel Macleod to return from his position; but they were unfortunately intercepted, and his detachment was cut off. General Stewart retreated, fighting all the way, to Alexandria; and this attempt on Rosetta cost 1000 men in killed, wounded, and missing. A formidable force of the enemy now approaching Alexandria, the inhabitants of which were also disaffected, a flag of truce was sent by general Fraser, offering immediately to quit Egypt with his army on condition that the British prisoners should be liberated, which was readily agreed to, and on the 23d of September the troops sailed for Sicily.

Reinforcements, under the command of general Sir Samuel Achmuty and admiral Stirling, having landed in the month of January near Monte Video, the general resolved to make an attempt on that place; and on January the 18th commenced the siege. The works were found strong, and were ably defended; but, a practicable breach being made on the 2d of February, it was resolved no longer to delay an assault. This was effected before day break on the next morning; and after a severe action, in which 560 of the assailants were killed or wounded, and more than double that number of the defenders, every thing was carried except the citadel, which soon after surrendered. The general, in his despatches mentions a circumstance highly to the credit of his troops, as well as of their commander, that 'early in the morning the town was quiet, and the women were peaceably walking the streets.' The prizes captured here were fifty-seven West Indians and merchantmen, besides several gun-boats and armed vessels.

About this time the ministry resolved to send out an expedition for the reduction of the whole province of Chili. For this purpose a force of 4200 men was placed under the command of brigadier-general Crawford, which sailed in the end of October 1806, accompanied by a naval force under admiral Murray. Intelligence of the re-capture of Buenos Ayres, however, having been received, an order was afterwards despatched for the expedition to change its object, and proceed to the river La Plata.

General Whitelocke had in the mean time been nominated to the supreme command of the forces in South America, and, leaving England in March, took with him an additional force of 1600 men, making the British in that quarter

amount to 11,000 rank and file; the object now intended being the reduction of the whole province of Buenos Ayres.

On the 28th of June the united force, to the number of 1800 men, was landed about thirty miles to the eastward of Buenos Ayres; and, after a fatiguing march, the different divisions assembled in the suburbs. On the morning of July 5th a general attack was ordered, each corps to enter by the streets opposite to it, and all with unloaded muskets. The greatest intrepidity was displayed in the attempt to execute this plan, which was so far successful that two strong posts were gained in the town, but at the expense of 2500 men in killed, wounded, and prisoners; the fire from the tops of the houses, and every advantageous position, upon the exposed and defenceless troops, having been most murderous.

On the following morning general Linieres sent a letter to the English commander, offering to give up all the prisoners taken in this bloody encounter, and also all those made with general Beresford, if he would desist from any further attack, and withdraw the British armament from La Plata; intimating, that such was the exasperation of the populace, he could not answer for the safety of the prisoners if offensive operations were persisted in. Whitelocke, influenced, as he said, by this consideration, and reflecting on the little advantage to be obtained from the possession of a country absolutely hostile, agreed to the proposal. On his return home he was tried by a court-martial, whose sentence was, 'that he be cashiered, and declared totally unfit and unworthy to serve his majesty in any military capacity whatever.' In balance of these disasters, the Dutch island of Curaçoa was early in the year 1807 reduced by a small squadron under the command of captain Brisbane.

The new parliament assembled on the 22d of June 1807. The address from the throne was viewed in the light of a manifesto against a party in the state, and it therefore was not to be expected that it should pass without animadversion. Accordingly, in the house of lords, lord Fortescue moved an amendment, strongly censuring the measure of the dissolution of parliament, and the reasons which the new ministers had offered for its justification, which upon a division was rejected by a majority of 160 to sixty-seven. A similar amendment, moved in the house of commons by lord Howick, was negatived by 350 to 155; and a subsequent motion of enquiry into the state of the nation was negatived by 322 to 136 voices. In consequence of the distracted state of Ireland, bills were now moved for by Sir Arthur Wellesley, secretary to the lord-lieutenant, for the suppression of insurrection in that country, and to prevent the disturbance of the peace. Their necessity was admitted by Mr. Grattan. Lord Castlereagh at this time brought forward in the commons a new military plan, the object of which was to augment the regular army from the militia, and to supply the deficiencies accruing to the latter by a supplementary militia. A bill sent up from the lower house, against granting reversions of offices, was, on a division of fifteen peers to nine, ordered to be read a second time that day three months. This,

however, was accompanied by a strong protest. On the 14th of August the parliament was pro-rogued by commission.

In the course of the summer an affair arose, which occasioned a painful misunderstanding between Great Britain and the United States of America. The Chesapeake, American frigate of forty-four guns, being known to have several English deserters on board, representations of the fact were made to the American secretary, to which no satisfactory answer was given. Captain Humphreys, in the *Leopard*, was therefore ordered to search the American vessels for deserters, a liberty which was to be reciprocal. Having, on the 28th of June, come up with the Chesapeake, he sent a boat with advice of the information which he had received concerning the deserters, and of his orders to search the ship. This being refused by commodore Barron, the British commander fired several shots, to which no attention was paid; he then fired a broadside into the Chesapeake, which she returned by some scattered shot, and, on receiving a second broadside, immediately struck her colors. On examining the American frigate the deserters were found; but in the encounter the Chesapeake had six men killed and twenty-one wounded; with the latter she returned to port in a very shattered state, and a proclamation was issued by the president, Mr. Jefferson, prohibiting all intercourse between the American states and the armed vessels of Great Britain. A negotiation was now long carried on between the two countries; but the disputes were revived by circumstances hereafter to be mentioned.

From the conclusion of the treaty of Tilsit it became evident, that Denmark could not long maintain her neutrality; and the British ministry had strong suspicions, or rather positive assurance, that a naval force now augmenting in the ports of that country was to be directed against England. In every view of the subject it was thought expedient, in order to prevent the Danish fleet from falling into the hands of the French government, to request from the court of Denmark the temporary deposit of the Danish ships of the line in some of the British ports. This proposal was made in a friendly manner, representing the indispensable necessity of the measure, under the relative circumstances of the powers of Europe.

To give weight to the application a naval and military force, under admiral Gambier and lord Cathcart, was sent to the Baltic, with the view of protecting Denmark against the resentment of France in case of an amicable result, or to enforce compliance should her government reject the proposal. But the Danish cabinet refused all terms of accommodation: and all the preparations being completed, on the 1st of September the city was summoned, and the offers renewed which at different times had been made to the crown-prince and the governor. This producing no effect, the bombardment both from the land batteries and the shipping commenced on the following day, and continued till the evening of the 5th, when a proposal for capitulating was made by the garrison. On the following day the Danish navy was agreed to be delivered up

to our force. It consisted of eighteen ships of the line; one of ninety-six, two of eighty-four, twelve of seventy-four, and three of sixty-four guns; fifteen frigates, five brigs, and twenty-five gun-boats; a force which, in the hands of the emperor of the French, might have proved a means of great annoyance to Great Britain. The capitulation, however, was not ratified by the crown-prince; and the Danish government, rejecting every conciliatory proposal, issued a formal declaration of war against England. Notwithstanding, however, these demonstrations of hostility, the occupation of Zealand requiring a greater number of troops than Great Britain could spare from other services, the country was evacuated according to the convention; and from that period the war with Denmark produced no important events. The peace of Tilsit having freed the French emperor from all apprehensions in the north, his armies entered Spain, with threats of invading Portugal, the autumn of this year, and so far intimidated the court of Lisbon that a decree for shutting the ports of that kingdom against the ships and commerce of Great Britain was issued 22d of October, 1807.

In consequence of these proceedings his Britannic majesty deemed it expedient to send a squadron to the mouth of the Tagus, to act as circumstances might render necessary: when the appearance of a French army on the frontier of Portugal induced the prince regent to sign an order for the detention of all British subjects, and the sequestration of British property. This decree bears date November 8th, 1807; but the event had been foreseen, and most of the British subjects had previously removed their effects. Such measures, however, although the effect of compulsion, placed England and Portugal virtually in a state of hostility. Lord Strangford, the British ambassador, demanded his passports; presented a final remonstrance against the conduct of the court of Lisbon; and, proceeding to the squadron of Sir Sidney Smith, a rigorous blockade was established at the mouth of the Tagus. Still the rapacity of the French emperor could not be satisfied. He declared, 'that the house of Braganza should cease to reign;' and the French army had entered Portugal, when lord Strangford, having received fresh instructions, returned on the 27th of November to Lisbon to renew negotiations. The issue was that, after receiving the most positive assurances of protection from the British navy, his royal highness the prince regent came to the resolution of removing the royal family and the seat of government to Brasil, and the embarkation was so expeditiously performed, that on the morning of the 29th the Portuguese fleet sailed out of the Tagus, having on board the prince, with the whole of the royal family, together with a number of persons attached to its fortunes. The French troops arrived in the vicinity of Lisbon, just in time to gain from the hills a view of the fleet as it dropped down the river. Sir Sidney Smith, with a British squadron, accompanied the royal emigrants to Rio de Janeiro.

In the commencement of 1808 Austria,

hitherto the principal ally of Great Britain, having vainly offered her mediation between Great Britain and France, went over to the ranks of the latter. The month of February of this year was also memorable for the subversion of the temporal power of the pope. The city of Rome was seized by the French, and, together with the whole of the ecclesiastical states, incorporated with the kingdom of Italy.

The king of Sweden, engaged in a war against Russia, Denmark, and France, magnanimously prepared to repel the dangers with which he was menaced by so powerful a combination. In his efforts he was seconded by the loyalty and zeal of his subjects; and rarely had any nation afforded a more striking display of patriotic enthusiasm. But, as the resources of his kingdom were inadequate to the contest, the British government granted to his Swedish majesty a subsidy of £100,000 per month, and sent a squadron to the Baltic with 10,000 land forces on board, under general Moore, to co-operate as circumstances should require.

The imbecile court of Spain was at this time fast hastening to that state of internal dissension and degradation, which soon after occasioned the deposition of the royal family. On the 30th of October 1807 an extraordinary decree or manifesto was issued by the king of Spain, acquainting his subjects that his life and crown had been brought into danger by a conspiracy, of which his son was the author, whom, in consequence, he had caused to be arrested. The foundation of this charge was a clandestine correspondence carried on by the prince of Asturias with the French emperor. Through the interposition of the prince of Peace, Godoy, a reconciliation was effected; the prince of Asturias having been induced to write penitential letters to his father and mother. A treaty was soon afterwards concluded between the sovereigns of France and Spain, the object of which was a partition of the kingdom of Portugal; but, in return for the portion which was to devolve on the king of Etruria, his kingdom of Tuscany was to be ceded to Napoleon in quality of king of Italy. By a secret convention, French troops were to be admitted into Spain, and others were to be assembled at Bayonne, to assist in the conquest of Portugal. Thus a handle was given for placing Spain at the disposal of the emperor of France.

The attention of all Europe was at this time turned towards the Peninsula. A perfect harmony seemed to reign between the French and Spanish cabinets; and the popular reports of the approaching annexation of Portugal and Gibraltar to Spain, were well calculated to allay the suspicions which the entrance of the French armies must naturally have tended to excite among the people. But it appears that his Catholic majesty had formed the design of removing the seat of government to Mexico. The motives which led to this project are enveloped in mystery; as are indeed all the affairs of the court of Madrid, from the period of the alleged conspiracy of the prince of Asturias, till the journey of the royal family to Bayonne. It seems, however, that the design of emigrating

beyond the Atlantic had originated with the prince of Peace, whose views in this affair are not fully ascertained.

No sooner had the intended emigration of the royal family been hinted, than the Spanish capital presented a scene of confusion and turbulence; and the inhabitants of Madrid rushed in crowds to the road near the palace to prevent their departure. At the same time several of the ministers and grandees, who disapproved of the emigration, circulated hand-bills in the surrounding country, stating the designs of the court. The night of the 17th of March was a scene of tumult, and on the following day immense crowds of people hurried to Aranjuez. The palace of the prince of Peace was forcibly opened, and his brother, Don Diego Godoy, commandant of the life-guards arrested. On the 19th of March issued a royal decree by which Charles IV. abdicated the throne of Spain in favor of his son, the prince of Asturias; one of the first acts of whose sovereignty was the confiscation of the estates and property of Godoy, who had been discovered and made prisoner in the place of his concealment. These events, however, were soon succeeded by a counter-revolution. The duke of Berg, with the French army, had entered Madrid, and was in full possession of that capital; when the two kings of Spain, Charles IV. and Ferdinand VII. formerly prince of Asturias, with the whole of the royal family, and some of the principal grandees, were allured by various pretexts to Bayonne, to meet the French emperor. Ferdinand declared, that the circumstances in which he assumed the reins of government dictated the propriety of the measure. Unfortunately, however, this proved eventually to be the most imprudent step he could have taken. It was followed by terrible commotions throughout the country, and in Madrid, in particular, the most dreadful disorders prevailed. The French were insulted daily; numerous assemblies were held by the populace; and every thing indicated a dreadful explosion. At length, on the 2d of May, a general insurrection took place. The grand duke of Berg, commander-in-chief of the French armies in Spain, in coming from the palace, was surrounded by the populace, and, after defending himself for some time, was on the point of falling when he was rescued by his grenadiers. The street of Alcala, and the great square, were crowded with insurgents. The grand duke fled to his post, and a battalion of the French, with some cannon, repaired to the palace. Volleys of grape-shot, and charges of cavalry, cleared the streets and the square; but, the insurgents continuing to fire from the houses, generals Daubrin and Guillot, with their divisions, broke open the doors, and all who were found in arms were put to the sword. A body of the insurgents, in the meanwhile, pushed forward to the arsenal, and had already broke in, when general Lafrain just arrived in time to save the arms and ammunition. The loss sustained on each side was variously represented: but there can be no doubt of its having been very considerable. In consequence of these disorders, the grand duke of Berg was

constituted lieutenant general of the kingdom. At last, on the 25th of May, an imperial decree was issued, declaring the throne of Spain vacant by the abdication of the reigning family, and ordering an assembly of notables, consisting of the prelates, grandes, &c., to be held at Bayonne, for the purpose of fixing the basis of a new government. This was communicated to the council of Castile, by the duke of Berg; and a commission was established for secularising the lands of the church. A spirit of discontent had long pervaded the kingdom; but now the public exasperation was indescribable. Except the partisans of France, few Spaniards attended the junta at Bayonne. The consummation of the whole plan, however, proceeded: it was that the French emperor, on the 6th of June, conferred the crown of Spain on his brother, Joseph Buonaparte, who abdicated his kingdom of Naples in favor of the grand-duke of Berg, otherwise Joachim Murat, who had married the sister of Napoleon. The news of these renunciations was the signal for a general insurrection in Spain. The patriotic flame burst forth in Asturia; whence it spread into Galicia, and into several districts of Leon. An assembly, convened at Oviedo, published a formal declaration of war against the French government; and, having appointed the marquis of Santa Cruz generalissimo of the patriotic army, sent deputies to request the assistance of England. This request was immediately acceded to; and on the 4th of July his majesty issued a proclamation, declaring that Great Britain was at peace with the Spanish nation. In every quarter of Spain the inhabitants now flew to arms. The council of Seville proclaimed Ferdinand VII.; and published an appeal to the Spanish nation. Provincial assemblies were formed in most of the principal towns, and depôts established in the most suitable situations. In Andalusia above 15,000 regular troops were collected; arms were put into the hands of 60,000 peasants; and general Castanos was appointed commander-in-chief. The French general Dupont, with about 20,000 men, was at this time sent to secure a position at Cordova, whence he might readily move upon Seville, Carthagena, or Cadiz. Monecy, with upwards of 12,000 men, was detached to the provinces of Valencia and Murcia. Le Febvre, with about 13,000, was stationed in Arragon, for the purpose of obtaining possession of Saragossa, and keeping open the communication with Barcelona: and the French army in the north-western parts, consisting of between 40,000 and 50,000 men, commanded by marshal Bessieres, who had his principal station at Burgos.

The city of Cadiz was among the first to show its zeal for the patriotic cause. The French squadron, consisting of five ships of the line and one frigate, lying in the harbour, was obliged to surrender, on the 14th of June, to the Spanish arms. This was followed by the defeat and almost total destruction of the French army near Almanza. General Monecy, having assaulted the city of Valencia, was repulsed with an almost incredible slaughter. Saragossa vied with Valencia in patriotic enthusiasm. On the 1st of

July, about midnight, the French made a vigorous attack on the latter, but the courageous conduct of the brave general Palafox, who commanded, with the valor of the troops and armed inhabitants, completely baffled their efforts. Several succeeding attempts were equally ineffectual; and the enemy is said to have lost no fewer than 12,000 men in their various attacks. But the most important transaction took place in the province of Andalusia. The French general Dupont took a strong position on the heights of Andujar, near the banks of the Guadalquivir; when general Castanos, at the head of the Andalusian patriots immediately advanced upon him; and having received intelligence that a detachment of 8000 French, from the headquarters at Madrid, was already on its march to Andujar, resolved to attack Dupont before he could receive this reinforcement. An obstinate and bloody action ensued; but the patriots at length prevailed, and their victory was decisive. The French general, in order to save the remains of his army from total destruction, on the 20th of July surrendered himself and his troops prisoners of war. The detachment that was on the way to join him was included in the capitulation, but with this difference, that they should not be considered as prisoners, but be conveyed by sea to France. This victory was of incalculable importance to the patriotic cause.

While these events were transpiring in the provinces, Joseph Buonaparte was preparing to take possession of his kingdom, and, by a very singular coincidence, made his public entrance into his capital on the 20th of July, the identical day that was signalled by the defeat and surrender of Dupont. The splendid illusion, however, was not of long duration. After a short stay of seven days, on the 27th of July he began his retreat from Madrid towards France, while the patriots advanced and took possession of the capital. The French now began to retreat from the different provinces towards Vittoria; and concentrated the remainder of their forces on the banks of the Ebro.

About the middle of August an event took place which brought to the patriotic cause a considerable accession of strength. Several bodies of Spanish troops had been furnished by the court of Madrid as auxiliaries to the French emperor: of these 8000 were stationed in the Danish island of Funen, and 2000 in that of Langeland. A negotiation being entered into between their commander, the marquis del Romana, and admiral Keats, then commanding a British squadron in the North Seas, in order to effect their liberation, the Spaniards in Funen seized the vessels and small craft, the Danish troops in that island being inadequate to oppose them, and conveyed themselves to Langeland, where their countrymen had seized the battery at the mouth of the harbour. By this excellent manœuvre 10,000 Spanish troops were rescued from the power of Buonaparte, and conveyed by the British ships to Spain, where they joined their brethren in arms in maintaining the cause of their country.

The patriotic spirit was now communicated to Portugal. A general insurrection took place in

the provinces of *Tras los Montes* and *Entre Douro e Minho*, which rapidly spread throughout the whole kingdom. After some severe contests, the French under general Loison were driven out of Oporto, and nearly cut off in their retreat towards Lisbon. The clergy, and particularly the monks of Oporto, distinguished themselves by their courage and patriotism; and partly by their exhortations, and partly by their example, encouraged the people to take up arms against their invaders, the plunderers of their churches, and the oppressors of their country. The result was, that the French were expelled from Coimbra and several other places, and general Junot was obliged to concentrate his troops in and about Lisbon. About the end of July a force of 14,000 men, under the command of Sir Arthur Wellesley, was despatched to Portugal: and, having effected a landing, at once commenced operations. The French general Laborde was posted on the heights near Roleia; and as there was reason to apprehend he might be joined by general Loison, who was then at Rio Major, the British general resolved to attack his position. The army advanced from Caldas in three columns, the right being composed of the Portuguese, and the two others of British troops, led on by major-generals Ferguson and Hill, and brigadier-generals Nightingale, Crauford, and Fane. The enemy's positions were formidable, and defended with great bravery and skill; but the attack made by the British columns proved irresistible. After an obstinate engagement the French were compelled to retire with the loss of a considerable number of men, and three pieces of cannon. The loss of the English was 479 killed, wounded, and missing. Lieutenant-colonel Lake fell gallantly in the heat of the action. In the course of the succeeding night the French generals Loison and Laborde effected a junction at Torres Vedras and both began their march towards Lisbon. The British army was also reinforced by a body of troops commanded by brigadier-general Anstruther, being part of a force sent from England under brigadier-general Ackland.

The moment was now approaching which was to decide the fate of the French army in Portugal, and of the Russian fleet in the Tagus. Junot, on whom the emperor of France had conferred the title of *duc d'Abrantes*, having collected all his detachments, attacked the British army on the 21st of August, in its strong position at the village of Vimiera. The attack was made in several columns, and with great impetuosity, till the French were driven back by the bayonet; and, being at the same time annoyed on their flank by a cannonade from the artillery placed on the heights, they were obliged, after a severe contest, to retire in confusion. At length the enemy, being every where repulsed, were obliged to retire with the loss of about 3500 men killed, wounded, and prisoners, thirteen pieces of cannon, and twenty-three tumbrils of ammunition. One French general, Beniere, was taken prisoner, and another, supposed to be general Thebauld, was found dead on the field of battle. The loss of the English, as stated in the returns, was 740

men killed, wounded, and missing, in which were included many valuable officers.

On the day after the battle of Vimiera, general Dalrymple landed, and took the chief command of the army. On the 30th of August a cessation of hostilities was agreed on, and eight days afterwards a definitive convention signed by the French and British commanders. By this treaty the French were to carry off all their arms, ammunition, artillery, carriages, and horses, with their military chest, and all the plunder acquired by contributions, and to be conveyed to France in British vessels, without any restrictions in regard to future service. The Portuguese artillery, &c., with the military and naval arsenals, were to be surrendered to the British army and navy. No Portuguese was to be molested on account of the part which he had taken with the French invaders; and the British commanders engaged to prevail on the Spaniards to release all the French who were arrested in Spain, and were not *bona fide* military men. The Russian fleet in the Tagus, consisting of nine ships of the line and a frigate, surrendered to the British government as a deposit, to be given up six months after the conclusion of a peace; but the officers and seamen, above 5600 in number, were to be immediately carried to Russia.

The reasons assigned by our commanders for consenting to this extraordinary convention were, the apprehended difficulty of obtaining provisions, the importance of time, and the means which the enemy had of protracting his defence. These, however, were far from being satisfactory either to the British or Portuguese nation. A court of enquiry was instituted, but on a minute investigation of the case, nothing appeared that had a tendency to criminate any of the generals. It is requisite to observe, that the convention of Cintra probably saved the city of Lisbon.

While the public attention was directed towards the affairs of Portugal and Spain, an abortive effort at negotiation was made by the emperor of France. As a basis, it required the exclusion of the supreme government of Spain acting in the name of Ferdinand VII. from the negotiation. But his Britannic majesty totally reprobated this idea, and, when a few notes had passed, the negotiation broke off, as might have been expected.

The British army now commenced its march for Spain, under the command of Sir John Moore. Sir David Baird had, on the 13th of October, landed a strong body of troops at Corunna, and, after many delays and innumerable difficulties, on the 19th of November arrived at Astorga. In the mean while the emperor of France personally entered Spain, and the patriotic armies under generals Belvidere, Blake, and Castanos, being successively defeated at Burgos, Espinosa, and Tudela, the French army forced the pass of Somma Sierra: on the 2d of December it advanced to Madrid, which it entered on the 4th.

The French emperor having settled the affairs of the capital, hastened to endeavour to cut off the retreat of the English army. He himself departed from Madrid on the 18th of December,

with an army of 32,000 infantry, and 8000 cavalry.

In the mean time, the British general meditated a junction with the marquis Romana, with the view of making an attack on the duke of Dalmatia. He therefore marched to Majorga, where he was joined by general Buira with the troops from Corunna. The whole British army, which was now found to consist of 23,000 infantry and upwards of 2000 cavalry, besides some small detachments, advanced to Sahagan. But general Moore was no sooner arrived at his station than he received intelligence of the movements of the enemy; and judging it impossible to make an effectual resistance against the formidable force that was coming against him, on the 24th of December commenced a precipitate retreat through Galicia. Napoleon made forced marches after him as far as Astorga; but, finding that his prey had eluded his grasp, he resigned the further operations into the hands of the dukes of Dalmatia and Abrantes.

The disasters of this retreat of the British army were great: great numbers of men, unable to keep up with the rest, were left on the line of march; many of their horses were also left behind; and no fewer than 1400 were killed to prevent them from falling into the hands of the enemy. General Anstruther died through excessive fatigue. The valor and perseverance of the troops were never more conspicuous than on this occasion. At length, after fourteen days of precipitate and harassing marches, the army reached Corunna on the 11th of January, 1809; and had the transports been ready, might have embarked without further loss. But these had been sent to Vigo; and it was not till the 13th that the first division of transports arrived. We have described the memorable battle that took place on the 16th in our article CORUNNA.

The expedition to Denmark was the leading topic of debate in both houses, when parliament met 31st of January, 1808. Mr. Ponsonby proposed to take a view of the subject in three distinct relations of Denmark, Russia, and France, and moved for certain documents to be laid before the house, but the motion was negatived by 253 votes against 103. It was, however admitted, that there was no evidence of the hostile intention of Denmark towards Great Britain before the aggression; and all that the ministers of the crown labored to establish on that head was, that it was probable, from past experience, that Denmark would be induced by inclination, or compelled by force, to join the enemy.

Lord Sidmouth moved for an address to the king, praying that the Danish fleet might be kept in such a state as not to preclude the possibility of restoring it, should circumstances occur under which it might be expedient so to do. This was powerfully supported by lord Grenville. It was, however, negatived by 105 votes to fifty-one. The orders in council, which had been issued subsequently to Napoleon's decree of blockade, also occupied the attention of both houses. A great variety of argument with respect to the policy of these measures was employed on each side, during the debates on a bill brought in by

the chancellor of the exchequer for making these orders valid; but, on the 25th of March, the bill finally passed both houses. It was accompanied by a bill for commercial intercourse with America, which was intended to afford time for making arrangements with that country.

At this period of the session lord Folkestone introduced his attack on the marquis Wellesley, respecting his transactions with the nabob of Oude. The marquis was defended in an elaborate reply by Sir John Anstruther, who had held a high judicial office in India. After a long and interesting debate the previous question was put on all the resolutions except the last; in lieu of which Sir John Anstruther moved, that 'the marquis Wellesley, in his proceedings in the province of Oude, was actuated by an ardent zeal for the public service, and by an anxious desire to provide more effectually for the safety and prosperity of the British empire in India.' This was carried by 180 to twenty-nine voices.

On the 11th of April Mr. Percival brought forward his project of finance for the year. The war taxes he estimated at £20,000,000. and he proposed a loan of £8,000,000 in addition to £4,000,000 already funded of exchequer bills. Additional taxes were also voted to the amount of £300,000. The supplies required were £43,000,000 for England, and £5,500,000 for Ireland. A new financial plan, introduced by him, was that of enabling the holders of three per cent. stock to transfer their stock to the commissioners for the reduction of the national debt, and to receive equivalent annuities in its stead.

The house of commons, having on the 8th of March gone into a committee on the mutiny bill, the introduction of a bill for establishing a local militia of 200,000 men was also introduced by lord Castlereagh in April, and passed into a law. The men were to be trained for twenty-eight days annually. On the 4th of July parliament was prorogued by commission.

On the continent of Europe during this year (1808) the emperor of France, before he set out for Spain, had an interview with the emperor of Russia, over whose mind he flattered himself that he had acquired a lasting ascendancy. The meeting took place at Erfurt on the 27th of September, each sovereign being accompanied by a numerous and splendid suite. As it was the obvious purpose of Napoleon to place matters upon such footing that he could withdraw his troops from Germany, and employ them in the Peninsula, he rendered the Russian monarch the mediator of a negotiation, by which he engaged to evacuate the Prussian territory as soon as the contributions should be paid, which he reduced to one-third of their amount; and he wrote, with his own hand, an obliging letter to the queen of Prussia. The only other part of Europe in which war-like operations were carrying on this year was Sweden.

The Russians in the month of March took possession of Abo, the capital of Finland, and declared its annexation to the Russian empire; on which the king of Sweden suddenly abandoned the farther defence of that province, and undertook the invasion of Norway. Sir John

Moore having proceeded to Stockholm to concert measures of co-operation with the Swedish troops, and refusing to concur in some of the king's extravagant plans, the monarch's resentment was so much excited that he was obliged to escape in disguise, and brought back his troops amounting to 10,000 men, without landing them.

The Russians now directed their force against the fortress of Sweaborg, the Gibraltar of the north; and so feeble was the defence that was made of it, that it induced a suspicion of treachery. They also made descents on the islands of Gothland and Aland. An engagement between the flotillas of the two powers ended to the disadvantage of the Swedes. In Finland an armistice was concluded on the 27th of September, which consigned the greatest part of the province to the possession of Russia.

The naval occurrences of the year 1808 were not of much importance; but in such as occurred the British ships maintained their usual maritime superiority.

An extraordinary instance of the naval inferiority of the Turks was shown by an engagement in the Archipelago on the 5th of July. The Seahorse English frigate deservyng, off the island of Scopelo, a Turkish ship of fifty-two guns, a corvette of twenty-four guns, and a galley, by dint of manœuvring brought the corvette first to action, and in a short time reduced her to a wreck. She then engaged in close fight with the large ship, and after an obstinate resistance compelled her to strike, with the loss of 360 men killed and wounded, that of the Seahorse being only five killed and ten wounded.

Mr. Rose, who had been sent to the United States for the purpose of restoring the relations of amity between the two countries, returned without success.

In the month of August this year arrived in England Louis XVIII., nominal king of France, with the queen and the daughter of the late king, married to the duke d'Angoulême; but only acknowledged here under the title of the count de Lisle. A liberal provision was, nevertheless, made for himself and his household; and in the delightful seclusion of Hartwell, near Aylesbury, he passed almost the only tranquil and peaceful years he had known.

The British parliament was convened on the 19th of January, 1809. The speech adverted to the late overture for peace; in relation to which his majesty expressed his persuasion, that the two houses would participate in the feelings expressed in his declaration. He informed them that his engagements with Spain were reduced into the form of a treaty of alliance. The peculiar claim of the king of Sweden to his majesty's support was also insisted on; but the debates on the affairs of Portugal and Spain took the precedence in point of interest. Earls St. Vincent, Grenville, and Moira, reprobated the idea of sending an army to Portugal when Spain was at stake. In the commons, Mr. Ponsonby adopted the same train of reasoning; but they were ably answered by lords Hawkesbury and Castlereagh, and by Mr. secretary Canning. Lord Hawkesbury declared, that the sending of a British force to Portugal, in preference to Spain, was a measure

adopted in compliance with the representations of the Spanish juntas. Mr. Canning endeavoured to justify the principles on which his majesty's ministers had acted, by developing the state of Spain at the commencement of the grand insurrection. 'When the whole Spanish nation,' said he, 'rose unanimously, and with a concert almost miraculous, the consequence was, the sudden creation of various local authorities, acknowledging no head; jealous, watchful, and extremely suspicious of any attempt on the part of one to obtain ascendancy over the others.' The supreme central junta was not erected till the last week in September. To these circumstances Mr. Canning ascribed the direction of the expedition, and the delay of the advance of the British army.

No inconsiderable portion of the present session was occupied in an extraordinary investigation of the conduct of the duke of York. So early as the 27th of January, colonel Wardle, an officer of militia, asserted the existence of a system of abuses in the military promotions. The substance of the charge was, that an intriguing female, Mary Anne Clarke, who during several years had been a favorite with his royal highness, but then discarded, had carried on a traffic in commissions, not only with the knowledge, but also the participation of the duke. After various observations had been offered by different members, the chancellor of the exchequer proposed that the enquiry should take place in a committee of the whole house, in which it appeared that the duke's knowledge of her transactions, and participation in her gains, were circumstances, the proof of which depended chiefly on the testimony of Mrs. Clarke herself.

On the 23rd of February his royal highness addressed a letter to the speaker of the house of commons, in which he not only denied all personal participation, but the slightest knowledge of these abuses. 'But,' added his royal highness, 'if upon such evidence as has been adduced against me, the house of commons can think my innocence questionable, I claim of their justice that I shall not be condemned without trial, nor be deprived of the benefit and protection which is afforded to every British subject, by those sanctions under which alone evidence is received in the ordinary administration of the law.'

It now became necessary to put an end to the present anomalous proceedings, or to frame regular articles of impeachment. With a view to the first alternative, Mr. Percival on the 17th of March moved a resolution, 'that the house having examined the evidence, and having found that personal corruption, and connivance at corruption, had been imputed to the duke of York, were of opinion that the imputation was wholly unfounded.' This was carried by 278 against 196 voices. His royal highness, however, found it expedient to resign his high office, which was transferred to Sir David Dundas.

During this ferment of the public mind, a charge of corruption was also brought against lord Castlereagh. While that nobleman presided at the India board he had been complimented with the disposal of a writership, and,

desirous of a seat in parliament for a friend, he was recommended to a 'trafficking broker,' who pretended to be able to obtain one in exchange. With this man lord Castlereagh imprudently assented to an interview, but the treaty broke off. Lord Castlereagh, in his defence, 'disclaimed being actuated by any corrupt motive, or the exertion of any official influence, though he much regretted that he had inadvertently been led to converse on such a subject with such a man; and said, that if the house deemed the action, or rather the intention, which was all that the accusation amounted to, unparliamentary, he should bow to any censure which he might be thought to deserve.'

A resolution of censure was moved by lord Archibald Hamilton on the 25th of April; but this being an offence that was only contemplated, the chancellor of the exchequer moved the order of the day; in voting for which, Mr. Canning took occasion to remark, 'that he would by no means be understood thereby to pronounce the case submitted to them as not of very serious importance.' This opinion having apparently more weight than the vote, the order of the day was negatived, and Mr. Canning himself moved, 'that the house, on considering the whole of the case, saw no necessity for a criminating resolution,' which was carried by a majority of 214 to 167 voices.

Soon after the battle of Corunna the emperor Napoleon set out on his return to France. In the month of March, 1809, orders were issued for the French armies to recross the Rhine. The troops of Austria were assembled under the archduke Charles as commander-in-chief. On the side of Italy, the viceroy Eugene Beauharnois collected a numerous army. Early in April, the Austrians having passed the Inn near Scharding, the king of Bavaria quitted his capital, and retired to Augsburg. On the 18th Napoleon arrived at Ingolstadt. The first considerable action took place at Ebersberg, where the archduke Louis was surprised, and his division of troops dispersed or destroyed.

In the mean time the grand army under the archduke Charles took possession of Ratisbon, making the French garrison prisoners of war. On the 22nd of April the two armies met at Eckmühl. The battle commenced at two in the afternoon, and was long and obstinate; but towards evening the Austrians were driven from their positions, and attempted to take refuge under the walls of Ratisbon, but the city was forced with great slaughter, and the Austrians retreated to the left bank of the Danube. Napoleon, following the course of that river, advanced to Vienna; into which capital, on the 10th of May, he once more entered as conqueror, the emperor Francis having previously retired to Moravia.

In the north of Germany a strong disposition to rise in opposition to the tyranny of France at this time manifested itself, had any rallying point existed. Colonel Schill, an officer late in the Prussian service, raised the standard of independence at Luneburg, and was joined by great numbers; but he was opposed and overpowered by a far superior force under Jerome Buonaparte.

He then retired to Stralsund, in which place he sustained a siege, and was killed in the defence of it. The duke of Brunswick also, whose efforts, combined with those of Schill, and supported by Great Britain, might have been attended with the happiest results, took up arms when the cause was hopeless, and, after some temporary success, was compelled towards the close of August to embark on board a British squadron at the mouth of the Weser.

In Poland, the archduke Ferdinand being resisted by a very inferior force under prince Poniatowski, nephew to the late king Stanislaus, and whose great qualities made him the object of his country's secret hope and warm attachment, took possession of Warsaw, but was recalled in consequence of the early disasters of the Austrian arms. The Russians, then joining the Poles, occupied nearly the whole of the Austro-Polish provinces; but the emperor Alexander showed no disposition to push the war with vigor.

In Italy, where the archduke John commanded, the first operations of the Austrians were also successful, and he captured the cities of Padua and Vicenza; but, subsequently to the battle of Eckmühl, he was also recalled to the defence of Austria. In his retreat the archduke was closely followed by the viceroy, prince Eugene Beauharnois, who obtained several advantages over him; and on the auspicious anniversary of the battle of Marengo, the two armies coming to a general engagement near Raab in Hungary, the Austrians were totally defeated, and that great bulwark of the kingdom fell into the hands of the enemy.

During an interval of repose, which passed after the indecisive battle of Essling, all the demonstrations of the French seemed to be pointed against that position, which was, in the expectation of attack, rendered almost impregnable by redoubts and intrenchments. But, on the night of July 4th, a bridge of vast dimensions was thrown across the river, with almost magical expedition and skill, opposite the left wing of the Austrians stationed at Wagram. Early next morning the whole French army had crossed the river, and appeared in order of battle. Thus surprised and disconcerted, the archduke Charles spent the day in manœuvring and altering his dispositions. On the 6th of July, at sunrise, the long expected contest commenced. In his efforts to outflank the enemy, the archduke dangerously weakened his centre, upon which an assault was made with accumulated force. The Austrians, unable to withstand the shock, gave way, though by slow degrees, retreating finally near a league from the ground, leaving the wings exposed to an attack from the dukes of Rivoli and Auerstadt (Massena and Davoust). The village of Wagram being also forced by the enemy, the Austrians, perceiving the fate of the battle decided, fled with precipitation, and were pursued as far as Znaim in Moravia.

Napoleon now received a proposal from the emperor Francis to treat of peace; and a definitive treaty was concluded much less unfavorable to Austria than might have been expected. To Bavaria the emperor Francis was obliged to

yield the important territory of Saltzburg, with other districts in the vicinity. To France were ceded Fiume and Trieste, with the entire line of coast connecting the dominions of France on both sides of the Adriatic. In Poland the king of Saxony obtained, in addition to the provinces constituting the duchy of Warsaw, the Western Galicia, with the city of Cracow. Another portion of Austrian Poland was assigned to Russia.

After the British army had embarked from Corunna, the French emperor bent all his efforts to the subjugation of Spain. A number of fugitives from the army of Castanos, which was defeated at Tudela on the 23d of November, 1809, had retreated to Saragossa, and, together with its martial citizens and armed peasants from the country, composed a body of 50,000 men, under the command of the renowned Palafox. The siege was conducted by the duke of Montebello, one of the ablest of the French generals. On the 26th of January the French made their grand attack. About noon on the following day the breaches were practicable, and the assailants entered the city. General Lacoste, and a great number of their bravest officers and men, fell in the assault. The determined resolution of the inhabitants, who disputed every inch of ground, and converted every house into a fortress, reduced the French to the necessity of mining and blowing up the houses. The Spaniards, on their part, had recourse to counter-mining; and the effects of this subterraneous war were dreadfully destructive. During these tremendous operations the batteries kept up an incessant fire; and, by mining and blowing up the houses as they proceeded, the French, on the 17th of February, at length became masters of the city. No fewer than 20,000 of its brave defenders were at this time buried under its ruins.

A series of disasters now fell on the patriot cause. The French army in Catalonia made three powerful attacks on that of the Spaniards under general Reding. In the last of these the Spanish general, after an obstinate conflict, in which he was severely wounded, was, on the 12th of March, driven from his position, and compelled to retire to Tarragona. Soon after general Cuesta was defeated 29th of March, at Medellin, and obliged to retreat to Monasterio. The patriots about this time recovered Vigo; but their casual advantages were sunk in the long train of disasters, and the French made themselves masters of the centre of Spain.

On the 22d of April Sir Arthur Wellesley once more landed at Lisbon with large reinforcements. Instantly repairing to Coimbra, he put himself at the head of the allied forces, and advanced against Oporto; at the same time detaching marshal Beresford to occupy the fords of the Upper Douro. Here marshal Soult, finding himself in danger of being insulated, judged it necessary to retreat into Galicia. Meanwhile marshal Victor had made himself master of Alcantara; upon which the British commander returned to the south, and Victor retired to his former station at Guadiana.

Sir Arthur Wellesley on the 20th of July effected his junction with Cuesta at Oropesa;

but marshal Victor, aware of his danger, had by this time crossed the Tagus. The British and Portuguese army now marched along the banks of the river towards Olalla, and took an advantageous position near Talavera de la Reyna. Early on the morning of the 28th the enemy attacked the British in force, making a demonstration also on the opposite quarter. The battle continued at intervals during the whole day, and ended in the final repulse of the enemy.

Marshals Ney, Soult, and Mortier, now advanced in great force upon the rear of the allies, and it became necessary for them to retreat to Badajos. On the eastern side of the peninsula, general Blake, after a fruitless attempt to recover Saragossa, was attacked and totally routed by the duke of Albufera (marshal Suchet) on the 19th of June;—and this disaster was followed by a much greater; for the central army, said to consist of 50,000 men, under the marquis Arizaga, advancing upon Madrid, with the view of passing the Tagus at Aranjuez, was encountered 19th of November, by the French under king Joseph, assisted by the marshals Soult, Mortier, and Victor, at Ocana, near the south bank of that river, when the action terminated in a signal victory on the part of the enemy. The vanquished army retreated in confusion beyond the mountains. In the month of December the strong and important fortress of Gerona, after a long resistance, surrendered to marshal Augereau.

The king of Sweden persisted in the war with Russia, with what his subjects deemed insensate obstinacy. On the morning of the 13th of March, as he was preparing to leave Stockholm for his country residence, he was suddenly arrested in his own palace. He drew his sword in rage, but was immediately overpowered, and sent a prisoner to the fortress of Drottningholm. The duke of Sudermania issued a proclamation, in quality of administrator, declaring the incapacity and deposition of the king. This resulted in an act of abdication, signed by Gustavus IV., and a decree was passed, that he and his issue, born and not born, were for ever excluded from the throne of Sweden. The duke ascended the throne as Charles XIII., and a treaty of peace followed, 17th of September, with Russia. An accommodation between Sweden and France took place in December, in consequence of which the former recovered Pomerania, and the Isle of Rugen.

In the early part of June Sir John Stewart, commander of the British army in Sicily, undertook an expedition against the kingdom and capital of Naples, and landed with 15,000 British troops, afterwards joined by a body of Sicilians on the coast of Calabria. On the 24th the advanced division of the fleet anchored off Cape Miseno, and preparations were made for an attack on the Isle of Ischia. A descent being effected, in the face of a formidable chain of batteries, the defences of the enemy were turned, and their principal force retired to the castle, which surrendered on the 30th. The adjacent garrison of Procida was also summoned, and submitted; which paved the way for the capture of forty gun-boats in their passage from Gaeta to

Naples. But such a force was now assembled for the defence of Naples, that Sir John Stuart saw no prospect of success in an attempt against that capital. An unsuccessful attempt on the castle of Scylla, which the enemy afterwards abandoned, blowing up the works, concluded the military operations of the British in this quarter.

An undertaking of much greater moment occupied the attention of the British ministry during the summer of 1809: the memorable Walcheren expedition. Towards the end of July an army of 40,000 men was collected under the command of the earl of Chatham, assisted by a naval force, under the direction of Sir Richard Strachan. The principal object of the expedition was to gain possession of the islands commanding the entrance of the Scheldt, and the port of Flushing.

The armament invested Flushing on the 1st of August. A dreadful cannonade and bombardment commenced on the 13th, which on the 15th produced from the commander of the garrison, general Monnet, a request for a suspension of arms. This was followed by a surrender, which yielded nearly 6000 men prisoners of war. During the siege of this place, a great number of troops from the Belgic and nearest French provinces were assembled for the defence of Antwerp; so that an attack upon that important place, and the fleet lying under its fortifications, whatever might have been its success at the commencement of the enterprise, was now thought too hazardous. The troops likewise were becoming sickly, and lord Chatham was induced to depart for England on the 14th of September, with the greatest part of his army. The opinions of the ministry relative to the retaining or abandoning Walcheren itself were in a state of fluctuation. In the middle of September a requisition was made for a number of the peasantry of the island to repair and strengthen the fortifications of Flushing; and, near the end of October, 100 artificers arrived from England with brick and lime. Towards the middle of November, however, the demolition of the works and basin for shipping was begun; and on the 23d of December Walcheren was completely evacuated by the relics of the British army, one-half of which were either dead, or on the sick list.

Martinique and Cayenne were added to our conquests: and a French fleet of nine sail of the line, lying in the road of Aix, protected by the forts of that island, lord Cochrane, who was acting under the orders of admiral Gambier, proposed to make an attack upon it with a squadron of five ships, frigates, and smaller armed vessels. Standing in with a favorable wind, on the 11th of April, a boom laid across the entrance was broken through by the leading ship, and the greater part of the French ships slipped their cables, and ran for the shore. On the following day lord Cochrane gave information by telegraph to the admiral, that seven of the enemy's ships were on shore, in a situation which afforded an opportunity of destroying them. It being, however, found that the state of the wind rendered it hazardous to enter the roads, in which the water was shallow, with the large ships, admiral Gambier, who had unmoored,

anchored again three miles from the forts, and sent all the small vessels to the attack. Lord Cochrane, leading the way, opened a fire on a ship of fifty-six guns, which struck, and this was followed by three others of the line, which were also forced to strike; all of which were set on fire and destroyed. The other French ships being got into deep water, moved up the Charente, where it was impracticable to molest them; but it was doubtful whether they could be again got out to sea.

Lord Collingwood, who had succeeded Nelson in the chief command of the ships in the Mediterranean, having proposed to general Stuart an expedition against the islands of Zante, Cephalonia, and others, whilst the French should be occupied with the defence of Naples, a joint force from Messina, Malta, and Corfu, was arranged for this purpose, and on the 1st of October it anchored in the bay of Zante. On the following day a capitulation was agreed on, by which all that group of islands surrendered to the British arms, and the government of the septinsular republic was restored.

On the 23rd of October three French ships of the line and four frigates, with a convoy of about twenty vessels, were descried coming from Toulon. Lord Collingwood directed rear admiral Martin to proceed with a squadron in chase of them; and on the 25th, off the mouth of the Rhone, two of the French ships of the line were chased on shore, and set on fire by the crews; while a third, with a frigate, ran on shore at the entrance of the port of Cette, with little chance of being got off. The convoy mostly escaped at the time into the bay of Rosas; but on the 30th some ships, with the boats of the fleet, under the orders of captain Hallowell, entering into the bay, most gallantly overcame all the resistance made, as well from the vessels as from the castle of Rosas and the forts, and captured or destroyed the whole.

Mr. Jefferson having been succeeded, in the office of president of the United States of America, by Mr. Maddison, the embargo, which had been severely felt from its long continuance, was repealed, and an act substituted prohibiting all intercourse with France and England, with a proviso, that, if either nation rescinded its obnoxious decrees, the prohibition relative to that nation should cease. Mr. Erskine, the English envoy in America, was consequently empowered to promise, that, if the American interdiction of July 1807 were withdrawn, the commerce of America with the French colonies should be placed on the same footing as in times of peace, the British cruisers being allowed to capture all vessels trading contrary to this restriction. But Mr. Erskine ventured also, without proper authority, to declare the orders in council rescinded from the 10th of June 1809, on the general engagement 'that an envoy extraordinary would be received by the president, with a disposition correspondent to that of his Britannic majesty.' The British government, however, refused its ratification to this agreement.

On the 16th of December Napoleon announced to the senate his intention of divorcing his empress; and the archduchess Maria Louisa,

daughter of the emperor Francis, was pointed out as the future empress. This had been arranged at Vienna during the preceding summer, and the marriage was celebrated at Paris in the ensuing month of March, with great pomp and festivity.

In the course of this year several changes had taken place in the English cabinet. Mr. Canning did not enter very cordially into the defence of lord Castlereagh on the charge relative to the India writership; but it was not then known that he had previously applied to the duke of Portland for the removal of that nobleman from the war department, recommending the marquis Wellesley as his successor; obtaining a promise from the premier to that effect, though not for its immediate execution.

The melancholy termination of the Walcheren expedition, however, brought this state of masked hostility between these ministers to a crisis. Mr. Canning again urging his suit was surprised to find that no communication had been made to lord Castlereagh by the duke of Portland, and gave in his resignation. Lord Castlereagh, on the other hand, being now informed of all the circumstances, so highly resented the interference as to make an immediate demand of satisfaction. A duel accordingly took place on the 21st of September, in which Mr. Canning was wounded.

On the 23d of September Mr. Perceval, upon whom (in consequence of the resignation of the premier and the two secretaries) the chief, it may be said the sole, weight of the government now devolved, wrote to earl Grey and lord Grenville stating, 'that his majesty had authorised the earl of Liverpool (late lord Hawkesbury), and himself, to communicate with their lordships for the purpose of forming an extended and combined administration; and requesting their presence in London.' Lord Grenville on this repaired to town, in obedience to what he considered to be an intimation of the king's pleasure; but in his answer to Mr. Perceval, dated the 29th of September, he peremptorily declined the communication proposed, declaring, 'that it could not be considered in any other light than as a dereliction of public principle.' Earl Grey, writing from his seat in Northumberland, declared 'his attendance in town unnecessary, unless he had received the king's commands to that effect.' Mr. Perceval now accepted the office of first lord of the treasury: marquis Wellesley, who had superseded Mr. Frere in Spain, was recalled to receive the seals of the foreign department: lord Liverpool succeeded lord Castlereagh as minister at war; and the honorable Richard Ryder, lord Liverpool in the home department.

The 25th of October of this year, being the fiftieth celebration of his accession to the throne, was distinguished throughout the united kingdom as a jubilee, and was marked by every demonstration of loyal attachment and reverence.

The parliament of the united kingdom was convened on the 23d of January, 1810, and never did the political atmosphere exhibit a deeper gloom. Russia, the only continental power which could singly cope with France, was in

strict alliance with the French emperor. Austria had been once more prostrate at his feet. The resistance of Spain, in the general opinion, had become almost hopeless; and all the other powers of Europe were in a state of vassalage. Yet under these unfavorable circumstances the speech delivered by the lord chancellor, in his majesty's name, expressed 'his just confidence, under divine providence, in the wisdom of his parliament, the valor of his forces, and the spirit of his people. His majesty hoped that material advantages would be found to result from the demolition of the docks and arsenals of Flushing. The expulsion of the French from Portugal, and the glorious victory obtained by lord viscount Wellington at Talavera, had contributed to check the progress of their arms in the peninsula. Assurances had been received of the friendly disposition of America; and his majesty had much satisfaction in declaring the flourishing state of the national commerce, and increasing produce of the revenue.'

In parliament the speech of Mr. Perceval on the subject of the late overtures to lords Grenville and Grey, was particularly modest and conciliatory. In adverting to the overture made by the command of the king to lords Grey and Grenville, he protested that he did not wish for the situation which he then occupied. The circumstances of the times required a strong and extended administration; and he hoped that the application would have been successful. Had he been at liberty to state his proposals, the first would have been to resign the treasury to their disposal.

After a variety of other proceedings, in which the same subjects were indirectly brought under discussion, on the 26th of January lord Porchester moved in the house of commons, 'that a committee be appointed to enquire into the policy and the conduct of the late expedition to the Scheldt.' This motion was carried by the small majority of 195 to 186; and a committee of the whole house was fixed on for the purpose. His lordship afterwards moved for an address to the king for copies of instructions given to the commanders, and other papers, which was agreed to; and a secret committee was nominated for the inspection of such communications as were deemed improper to be made public.

Among the papers thus moved for was 'A copy of the earl of Chatham's statement of his proceedings, dated October 15th, 1809, and presented to the king February 14th 1810.' This document appeared, from its contents, to be an appeal to his majesty by the commander of one part of the expedition against the conduct of the commander of another part, and the circumstance occasioned much debate. A motion being made by Mr. Whitbread for an address to his majesty, requesting that there might be laid before the house copies of all reports and other papers submitted at any time to his majesty by the earl of Chatham, relative to the late expedition, was carried, on a division, by 178 to 171 votes. The answer returned to the address signified, that the king had received a report from lord Chatham on the 15th of January, which he had kept till February the 10th, when it was returned

to the earl in consequence of his desire to make some alterations in it: that the report thus altered, having been again presented to the king on the 14th, was directed by his majesty to be delivered to the secretary of state, and no copy of it was kept by the king. Mr. Whitbread, on the 2d of March, moved two resolutions respecting this matter: one stating the fact as above mentioned; the other a strong censure of the same. After a long debate the previous question was moved, but negatived by 221 to 183 voices; and, the first resolution being then carried, Mr. Whitbread waived the second, and admitted a modification of it proposed by Mr. Canning. It was then determined that the resolution should be entered on the journals of the house; the consequence of which was that Lord Chatham resigned his office of master-general of the ordnance.

When the proceedings relative to the Walcheren expedition first came before the house Mr. Yorke moved an enforcement of the standing order for the exclusion of strangers, and continued to move it from day to day. Mr. Sheridan therefore moved a revision of the standing order, which was vehemently opposed by Mr. Windham, who launched into a furious invective against the reporters. This singular tirade was answered with spirit and temper by Mr. Stephens, an eminent civilian, who had himself in his earlier days, he acknowledged, been a reporter of the debates.

There was at this time a debating society in London, under the name of the British Forum, the president of which was John Gale Jones. On the 19th of February a placard appeared, informing the public that a question had been debated at the British Forum, 'Which was the greater outrage on the public feeling, Mr. Yorke's enforcement of the standing order of the house of commons for the exclusion of strangers, or Mr. Windham's attack on the liberty of the press? And that it was unanimously decided, that the enforcement of the standing order ought to be censured as an insidious and ill-timed attack on the liberties of the press.'

Jones was accordingly cited, on Mr. Yorke's motion, before the honorable house on the 21st of February, when he avowed himself the author of the paper, and, notwithstanding an apology, was committed to Newgate.

On the 12th of March Sir Francis Burdett, who had not been present at the former proceedings, called the attention of the house to this subject in a speech in which he ventured to deny altogether the power of the house to commit: and on the 24th of March there appeared in Cobbett's Weekly Register a letter, entitled 'Sir Francis Burdett to his constituents, denying the power of the house of commons to imprison the people of England.' This publication was brought before the house on the 26th by Mr. Lethbridge, and Sir Francis acknowledging himself to be the author, Mr. Lethbridge on the following day moved that the publication in question was a libellous and scandalous paper, reflecting upon the just rights and liberties of the house; and that Sir Francis Burdett, who suffered this paper to be printed with his name, had been guilty of a violation of

those privileges. These resolutions being agreed to without a division, a motion was made by Sir Robert Salisbury for his commitment to the tower; and an amendment, softening the sentence to a reprimand, was rejected by 190 votes to 152. On the 6th of April the warrants for commitment were delivered to the serjeant at arms. That officer, on going to the house of Sir Francis, was informed that he would be ready to receive him the next morning; which being construed by that officer as implying that he would go with him peaceably to the tower, he retired. He however returned, accompanied by a messenger, who said that the serjeant had been severely reprimanded by the speaker for not having executed the warrant; the legality of which Sir Francis now denied. He declared his determination not to go unless compelled by actual force.

After a delay occasioned by the speaker's consulting the attorney-general respecting his authority, the serjeant went on the morning of the 9th of April, attended by a number of police officers, and a detachment of cavalry and infantry, to convey Sir Francis to the tower. An entrance being forced into his house, he repeated his objections to the warrant, and declared that he would yield only to force. The constables, on this, advanced to seize him, when he was led by his brother and a friend, taking his arms, and conducted to the carriage in waiting, whence he was conveyed to the tower. As the escort returned, a numerous mob assembled in Eastcheap, and attacked them with stones and brick-bats. At length, the attack becoming serious, some shots were fired, by which two or three lives were lost, and several persons wounded.

On his liberation, Sir Francis Burdett brought actions at law against the speaker of the house of commons for issuing his warrant, against the serjeant-at-arms for executing it, and against the constable of the tower for keeping him in custody, in all which he failed, on the plea of the legality of the warrant. His confinement was not terminated till the prorogation of parliament.

On the 16th of May the chancellor of exchequer brought before the house of commons his annual budget of finance. The supplies voted were stated at £50,500,000 for Great Britain and Ireland; and among the ways and means for the former were the war-taxes, estimated at £19,500,000, and a loan of £8,000,000. No new taxes were proposed; and a very favorable report was made of the commerce and general prosperity of the country. The foreign subsidies of the year were £400,000 to Sicily, and £900,000 to Portugal; and a vote of credit for £3,000,000 was passed to meet emergencies.

At the beginning of this year the cause of Spanish independence, as far as it depended on the people of Spain, was almost hopeless. The most interesting events of the campaign occurred on the side of Portugal. The great effort of France was to obtain the entire possession of that country. For this purpose it had been determined to commence with the reduction of the fortress of Ciudad Rodrigo and Almeida. As soon, therefore, as the capture of Oviado and

Astorga had set at liberty a part of the French troops employed to keep in check the Spaniards of the northern provinces, marshal Ney began to invest the former, and it surrendered July 10th. In the mean time marshal Massena arrived from France, to take the command of the army destined for the conquest of Portugal, and consisting of about 80,000 men.

Almeida was next invested, and the trenches were opened in the middle of August. It was garrisoned by 5000 men, partly English and partly Portuguese, commanded by British officers, and its governor was brigadier-general Cox. The vigor of the defence would probably have long retarded its fall, had not a bomb alighted on the principal magazine, which occasioned a terrible and most destructive explosion. Massena now withheld his fire, and sent a flag of truce offering terms of capitulation, which, on the 27th of August, were acceded to. The great contest for the possession of the country was now to commence. During the siege of Ciudad Rodrigo the principal post of the British army was at Guarda, whence the French lines might be descried, but nothing of consequence could be undertaken for its relief. After the surrender of Almeida, lord Wellington concentrated the different divisions of the allied army, and began his retreat towards Lisbon. He had formed a defensive plan, to which he steadily adhered. At the same time he put fully into practice the efficacious, though severe policy, of rendering all the country in the line of march entirely inhospitable to the French. On the 21st of September all the force under Massena was concentrated at Viseu, where it halted for a time; during which lord Wellington passed to the right of the Mondego, and occupied with his centre and left wing the Sierra Buzaco, which extends to that river. Massena, on arriving in front of his position on the 26th, resolved upon an attack. The French pushed up the heights with great courage in different parts, and one division reached the summit of the ridge: they were, however, met with equal resolution at the point of the bayonet, and were finally repulsed with great loss, 2000 men being left on the field. The loss of the English and Portuguese was also considerable. Massena now made a circuitous march upon Coimbra; but lord Wellington anticipated his object, and arrived there before him. The place, however, affording no advantages for defence, he continued his retreat to the strong lines of Torres Vedras.

The French emperor was now at the zenith of his glory, and the Seven Provinces of Holland were inseparably annexed to the French empire. The Valais of Piedmont were also annexed to France, for the purpose of securing the passage of the Alps by the Simplon; and possession was taken of the Hanse towns, and of the whole course from the Elbe to the Ems,—commanded, it was said, by circumstances. The electorate of Hanover was annexed to the kingdom of Westphalia, and its very name was abolished; and to that country, and all the other dependent kingdoms, the conscription laws were extended. In France, the chains of despotic power were rivetted by spies, arbitrary imprisonments, a

rigorous police, and restrictions on the liberty of the press.

An event took place this year in Sweden, which may be ranked among the most extraordinary occurrences in European history. On the 29th of May the prince of Augustenburg, presumptive heir to the crown of Sweden, died suddenly; and a diet was assembled in August, 1810, to fill the vacancy. In consequence of a strong letter of recommendation from Napoleon, the king of Sweden proposed marshal Bernadotte as the person on whom he wished the choice to fall; and, on the 1st of November, Bernadotte was installed.

The isles of Bourbon and France, in the Indian Ocean, which had so long been a great annoyance to our East India trade, were this year brought under the dominion of Great Britain. Lord Minto, governor-general of India, having laid the plan for their reduction, a body of Europeans and Sepoys, about 1600 of each, sailed from Madras, and being joined by about 1000 more from the island of Rodriguez, the whole under the command of lieutenant-colonel Keating, with a fleet of men-of-war and transports, the expedition arrived early in July off the island of Bourbon. Dispositions were made for an attack on the principal town, St. Denis, but it was prevented, on the 8th, by an offer to capitulate on honorable terms, which were granted. The other town, St. Paul, was taken possession of on the 10th, and the whole island submitted.

In the month of November a body of troops, consisting of 8,000 or 10,000, from India and the Cape of Good Hope, commanded by major-general Sir John Abercromby, and a fleet under admiral Bertie, took possession of the Mauritius, or Isle of France. The garrison was sent to France, and to be at their own disposal. This was the most valuable of the remaining French possessions to the eastward of the Cape of Good Hope. Three frigates were afterwards despatched to destroy the French batteries on the coast of Madagascar, which being effected, there was not left to France, at the beginning of the following year, a slip of land in either Indies, nor a ship on the Indian Ocean.

On the 17th of February the Dutch settlement of Amboyna, with its dependent islands, was surrendered to a British force from Madras. A party of seamen also, commanded by captain Cole of the *Carolina* frigate, having on the 8th of August carried a fort upon Banda Neira, the whole island of Banda, the principal of the Spice Islands, with its dependencies, though protected by 700 regular troops and 300 militia, surrendered unconditionally, and afforded a rich prize to the captors.

The differences between the governments of Great Britain and the United States of America still remained unadjusted. On the recall of Mr. Erskine, Mr. Jackson had been sent to succeed him; but the firm and unyielding tone taken by him, with the disavowal of Mr. Erskine's agreement, contributed to render him unacceptable; and the American resident in London was instructed to demand his recall. Mr. Galatin, treasurer of the States, now sent letters to the different collectors

of the customs, announcing the abolition of the restrictions with regard to France, she having revoked her edicts, but declaring that they would be revived in full force with regard to Great Britain on the ensuing 2d day of February, should she not in like manner have revoked her decrees. By a second letter he gave his opinion, that, in the case above-mentioned, all British goods arriving subsequently to the 2d of February would be forfeited.

The princess Amelia expired on the 2d of November 1810; and the king's mind received a shock from the illness and death of the princess from which he never recovered. The parliament had been prorogued to the 1st of that month, and a commission prepared by the lord chancellor, under an order in council, for a further prorogation to the 29th; but, as the sign-manual was wanting, the two houses met on the day previously fixed. The illness and inability of the king to open the session being announced, an adjournment of a fortnight was agreed to; and the members of both houses were summoned for the 15th. This was followed by a second adjournment to the 29th, and again by a third to the 13th day of December. The physicians, on examination before the lords of council, and afterwards before a committee of both houses, accorded in their firm belief of his majesty's recovery; grounding this expectation on the general state of his health, and the precedents of 1788, 1801, and 1804. At length Mr. Perceval, adopting the mode of procedure of 1788-9, moved three resolutions, affirming, 1. The incapacity of the king; 2. The right of the two houses to provide the means of supplying the defect; 3. The necessity of determining upon the means of giving the royal assent to a bill for that purpose. The opposition, waiving altogether the question respecting the right of the prince of Wales to the regency, merely proposed that the prince be addressed to take upon him the executive duties. This was negatived in the house of peers by 100 to seventy-four, and in the commons by 269 to 157 voices.

The resolutions moved by Mr. Perceval having been carried by great majorities, that minister apprised the prince, by letter, of the restrictions he meant to propose; and, in a brief reply, the prince referred to the letter which he addressed to Mr. Pitt in 1789. The other members of the royal family also transmitted to Mr. Perceval their protest against the restrictions. The grand division on the question of restrictions was carried, on the 31st of December, in favor of ministers, by 224 to 200 voices. The regency finally passed into an act on the 5th of February 1811. The restrictions were to remain in force to the 1st of February 1812. The restoration of the king was provided for by a simple notification to the privy-council, by the queen and her assistant counsellors, viz. the two archbishops, the lord-chancellor, the lord chief-justice, the master of the rolls, the duke of Montrose, and the earls of Winchelsea and Aylesford.

11. *From the Regency to the death of George III.*—From the avowed sentiments of the prince, it was generally expected that a total change of

administration would take place; and in a letter to Mr. Percival, announcing his intention of continuing the present ministers in office, he explicitly stated, that duty and affection for his beloved and afflicted parent alone had dictated his decision. So strong, indeed, were the prepossessions at this period respecting the king's recovery, that the leaders of opposition themselves were believed to be indifferent to the acceptance of office. The first measure submitted to the regency parliament opened on the 12th of February 1811, respected the Catholic committee of Ireland; a standing delegation, consisting of ten persons elected from each county, charged with the management of the affairs of that body.

This kind of organisation gave an alarm to government, and produced a circular letter from Mr. Wellesley Pole, secretary to the lord-lieutenant, requiring the magistrates of Ireland, in pursuance of an act of the thirty-third of the king, to cause to be arrested and committed to prison, unless bail should be given, all persons within his jurisdiction guilty of having been in any way concerned in issuing notices for such election or appointment. On the 18th of February the earl of Moira brought the matter before the house of lords; and asked ministers, whether the measure had been settled by them before Mr. Pole's departure for Ireland? The earl of Liverpool replied that they knew nothing of the matter until the news arrived, but that it was accompanied with reasons for the procedure which justified it. The subject was introduced in a similar manner into the house of commons by Mr. Ponsonby, when Mr. Perceval made the same assertion. In the mean time Mr. Pole having arrived from Ireland explained in his place in the house of commons the whole transaction. His principal object was to show in what respect the proceedings of the Catholic committee of 1809, which had not been interfered with, differed from those which produced this act of government.

In answer to a question from Mr. Ponsonby, whether the law officers had been consulted on the occasion, he affirmed that the lord-lieutenant had taken the opinions of the lord-chancellor and the attorney and solicitor-general, and that the latter had drawn up the letter issued by himself. In conclusion, Mr. Ponsonby's motion was negatived by 133 against forty-eight votes.

The Catholic petition was presented to the house of commons by Mr. Grattan on the 20th of May; and on the 31st he moved that the same should be read, and also the votes of the house conveying thanks to the armies under lord Wellington and general Graham, in which were many Irish Catholics. From these documents he took his ground, to show that there was nothing in the Roman Catholic religion itself which encouraged disaffection, but that the manner in which the Catholics had been treated by government was the true cause of their discontents. After enlarging with great force on these heads, he concluded with moving that the petition be referred to a committee of the whole house. The motion was ably supported by other speakers; and, on the other hand, it was opposed on the grounds of a supposed inherent principle of intolerance

in the religion of Rome, of the apprehension that the Catholics would still be rising in their demands, and of danger to the Protestant establishment should their claims be allowed. On a division, there appeared for the motion eighty-three, against it 146.

Lord Donoughmore introduced the petition into the house of lords on the 18th of June, when he moved for referring it to a committee. But the division on the motion gave, contents sixty-two, non-contents 121.

The Irish Catholics were too zealous and confident in their cause to regard their parliamentary defeat as a reason for renouncing their plans; and the summer was actively employed in meetings for the nomination of delegates, several of which were attended by Protestant gentlemen, who regarded Catholic emancipation as a branch of the general liberty of Ireland. On the other hand, government resolved not to submit passively to the violation of its injunctions. An aggregate meeting being held at Dublin, July 9th, for the appointment of delegates to the general committee of Catholics, five persons were apprehended by a warrant from the lord chief-justice for a breach of the convention act; one of whom, Dr. Sheridan, was put upon his trial before the court of king's-bench in Dublin; but the jury brought in a verdict of not guilty.

In the debates relating to the regency bill, in the house of lords, earl Grey had taken notice of the circumstance of the king's having been suffered to perform some of the functions of royalty in 1804; and Mr. Whitbread brought forward in the commons a motion for a committee to examine the lords' journals for the evidence of the physicians respecting his majesty's health in 1804, and to report the same to the house. Lord Castlereagh rose in defence of the chancellor, at the same time declaring his readiness to share the responsibility of the transaction referred to. The defence turned upon the unanimous declaration of the physicians as to the king's competency to transact business on February 27th, though none was submitted to him till March 5th. On the 9th it was necessary to obtain his sign-manual to the mutiny act, which could not be deferred without danger. In these and other instances the physicians had sanctioned the application to him. Mr. Whitbread, in reply, pledged himself to make out the whole charge, if opportunity were given him of cross-examining the physicians. His motion, however, was negatived by 198 against eighty-one.

The operation of the Berlin and Milan decrees, enforced as they were by the orders in council, had now produced the most fatal consequences to the mercantile interest. The loan for the last year had sustained a ruinous depreciation; and, the foreign demand for British manufactures being greatly reduced, numerous failures were the inevitable and melancholy result. A select committee was appointed to enquire into the state of commercial credit, who recommended as a temporary expedient an issue of exchequer bills, to the amount of £6,000,000, for the relief of such persons as could give satisfactory security for repayment.

It has been mentioned that the regent, con-

sidering himself as the possessor of only a restricted and temporary authority, declined taking any part in public transactions, and allowed the ministers whom he found in office to pursue their own plans without interference. Yet one act, which soon followed his accession to power, was certainly regarded as a spontaneous exertion on his part; this was the re-appointment of the duke of York to the office of commander-in-chief of the army.

Lord Milton, on the 6th June, after various observations relative to this transaction, moved the following resolution:—That, upon a deliberate consideration of the recent circumstances under which the duke of York retired from the army in March 1809, it appears to the house that it has been highly improper and indecorous in the advisers of the Prince Regent to have recommended to his royal highness the re-appointment of the duke of York to the office of commander-in-chief.' The chancellor of the exchequer fully acknowledged the responsibility of ministers for the measure, but contended that, when Sir David Dundas had expressed a wish to retire, they could have no doubt or hesitation as to whom they should recommend to supply the vacancy; and no vote had passed the house to preclude the duke of York's restoration. It appears that a considerable change had, by this time, taken place in the minds of the majority of the members relative to this matter, as the votes against it, on a division, were 296 to forty-seven.

The measure of an interchange of the militias of Great Britain and Ireland was introduced into the house of commons, on the 17th of May, by Mr. secretary Ryder, who moved for a bill to invest the crown with a power to that effect. By a clause of this bill Irish Catholics serving in England were entitled to all the civil, military, and religious exemptions which they possessed in Ireland. This, in fact, was the measure in relation to which the cry of 'No popery' had been raised against the late ministers.

Parliament was prorogued on the 24th July, with a speech in the Prince Regent's name, delivered by commission, in which great satisfaction was expressed with all the measures of the session.

The peninsula of Spain and Portugal still continued the grand theatre on which the contest for the liberties of Europe was maintained. The campaign commenced at a very early part of the year.

On the 25th of February an armament was sent out from Cadiz, under the command of lieutenant-general Sir Thomas Graham, who disembarked a body of English, Spaniards, and Portuguese, at Algeiras. The object of the expedition was to attack the French who were employed in the siege; and, the landing being effected on the 28th, the allied army arrived, on the morning of the 5th of March, on the ridge of Barossa, about four miles to the southward of the river of Santi Petri. Here the French army consisted of about 3000 men, formed in two divisions, and in a high state of discipline and equipment. The allied force scarcely amounted to 6000 men, of whom about one-half were English. A battery of ten pieces of cannon, under the direc-

tion of major Duncan, opened on the enemy's centre, and the right of the allies attacked general Rufin's division on the heights; while lieutenant-colonel Barnard's battalion, and a detachment of Portuguese, were engaged with the enemy's tirailleurs. But Laval's division, notwithstanding the havoc made by major Duncan's battery, advanced in imposing masses, and opened a destructive fire of musketry. The left wing of the allies now advanced, keeping up a constant fire; and a most determined charge of the sixty-seventh regiment and the three companies of guards, supported by all the rest of the wing, decided the fate of general Laval's division. The eagle of one of the regiments of light infantry was taken by major Gough.

The right wing of the allies was equally successful. The French lost, on this occasion, about 3000 in killed, wounded, and prisoners, with one eagle, six pieces of cannon, their ammunition waggons, and a number of horses. General Bellegarde, chief of the staff, an aide-du-camp of marshal Victor, and several other officers, were killed, and many were wounded and taken prisoners, among whom were the general of division, Rufin, who soon after died. The loss of the allies amounted to about 1240 killed and wounded.

About the same time that the British arms were so successful on the heights of Barossa, marshal Massena commenced his retreat from Sartarem, where he had never been able to attack lord Wellington. Scarcity of provisions obliged him to retire. The British general, having the Tagus on his right and Lisbon in his rear, was in a commanding position which ensured ample supplies. Massena was closely followed by lord Wellington, whose van attacked the rear of the French on the 11th of March, and gained a considerable advantage. But this success was more than counterbalanced by the loss of Badajoz, which surrendered on the same day to the duke of Dalmatia.

Lord Wellington now made arrangements for the blockade of Almeida, and employed the interval of active operations in a visit to the corps under the command of marshal Beresford in Spanish Estremadura, consisting of a united force of British and Portuguese. After repulsing an attack from the French on the 7th of April, near Olivença, he took a position whence he could invest that place and Badajoz. Olivença surrendered to the marshal on the 15th; and lord Wellington having had an interview with him, during which they established the blockade of Badajoz, returned to his army.

On the 15th of April the fortress of Olivença surrendered to the allied arms; and it was determined to lay siege to Badajoz with vigor. But on the 12th May the re-advance of marshal Soult was announced by general Blake, and the three commanders resolved to give battle to the enemy. With this view the siege was raised, and the army took a strong position fronting the banks of the Albuera.

Early on the morning of the 16th of May the French passed the stream, designing to attack the Spaniards under Blake, and to turn the right wing of the allies. After an obstinate resistance

the enemy gained the heights, but, Sir Lowry Cole bringing up the reserve, the enemy were driven from them with great slaughter. Their attack on the village and the bridge in the centre was likewise successfully repelled by baron Alten of the German legion, which, with the division of general Hamilton, defended that post; and the whole French army, after six hours' fighting, repassed the Albuera with precipitation. Soult is said to have acknowledged, 'that, in the long course of his military service, he had never before witnessed so desperate and sanguinary a contest.' The siege of Badajoz now re-commenced.

Towards the close of September the British troops again took the field, threatening Ciudad Rodrigo; but, before lord Wellington could complete his preparations, Marmont assembled a vast force, amounting to 60,000 men, with a view of turning the left of his position. His able antagonist, aware of this design, made a timely movement beyond the Coa; on which Marmont withdrew. During these operations general Hill, being joined by a Spanish force, on the 28th of October, surprised and totally defeated a corps of the French under general Girard, at Arroyo del Molino, the enemy losing 2000 men, with their artillery and baggage.

The principal event of the summer campaign in Spain was the siege and reduction of Tarragona. Marshal Suchet marched against this important sea-port of Catalonia about the end of April; and on the 5th of May he completed the investment of it as far as the sea. A furious assault on the 21st, after great slaughter on both sides, put the lower part of the town, which the besiegers had got access to through the capture of an outwork, in the power of the French. The garrison, however, still held out, till, on the 28th, a practicable breach being made, the assailants rushed in, and almost immediately carried the place. Suchet, who appears not to have been unwilling that a terrible example should be given by its fate for the purpose of intimidation, related, in his account of the transaction, that 4000 persons were put to death in the city, and of 10,000 or 12,000 more, who endeavoured to escape over the walls, 1000 were sabred or drowned, and 10,000 made prisoners. By this conquest, the French became possessed of the whole coast of Catalonia. In the month of September Suchet entered Valencia, and on the 27th took possession of Murviedro. He then opened trenches against its fortress, and made several vain attempts to carry it. In the mean time general Blake, collecting all the disposable force in that quarter, occupied the heights above the besieging army, where on the 25th of October he was attacked, and, after a well contested battle, was defeated. On the following day the fortress of Murviedro capitulated. Suchet then advanced to the suburbs of Valencia. On the 26th of November he attacked Blake's protecting army, the cavalry of which being routed, the infantry took shelter in their intrenched camp. This was afterwards forced; on the 25th of December Valencia was invested on every side.

In the beginning of 1811 the Spanish Cortes issued a proclamation, declaring that they would not recognise any act of Ferdinand VII. while

deprived of his liberty. In April they passed a decree abolishing the torture. Other proceedings of that assembly, tending to the removal of old grievances, were—the admission of plebeians as well as nobles into the military colleges; the application to the use of the military hospitals of sums destined for the use of religious fraternities; and the abolition of jurisdictional seigniories and vassalage. The doctrine of the sovereignty of the nation, however, met with opposition from the royal council, which circulated a paper expressly denying it.

Russia continued throughout the year to waste its population and revenues in its war with the Ottoman Porte.

The state of affairs between Great Britain and the United States still remained unadjusted. Early in the year Mr. Forster was sent over as envoy extraordinary and plenipotentiary. But so long as the English government was determined to maintain the fatal orders in council, nothing could be effected. In the month of May an accidental encounter, originating in some point of naval etiquette, occurred between a British and an American frigate. The two governments equally disavowed intentional hostility; but all these things tended to mutual irritation. On the meeting of congress, on the 4th of November, president Madison announced the necessity of putting the United States into an armour and attitude demanded by the crisis, and corresponding with the national spirit and expectation.

South America was now involved in all the miseries of civil war. In Mexico several sanguinary engagements during the last and present year terminated in a decided superiority of the royalists. The confederacy of Venezuela placed general Miranda at the head of their forces, and felt themselves strong enough to meet in congress and issue a declaration of independence, conceived in language not less forcible than that of the North Americans on their separation from Great Britain. In the viceroyalty of Buenos Ayres, the capital, with the greater part of the province, had adopted the cause of independence; while Monte Video held firm to the interest of the mother country.

The most splendid naval achievement of this year was the conquest of the Isle of Java, by an armament fitted out from Madras, under the auspices of lord Minto. The small island of Madura also submitted; and thus not a vestige was left of the eastern dominion of the Gallo-Bata-vian empire.

Opposing fleets were now no longer to be found on the ocean; but, in the absence of the pride and pomp of war, the public attention was arrested by a remarkably gallant action of an English squadron of four frigates, of which captain Hoste was the commodore. It occurred off the north point of the island of Lesina on the coast of Dalmatia, which the enemy had been sent to fortify and garrison. On the 18th of March the English commodore desiered a French force of five frigates and six smaller vessels, with 500 troops on board. Confiding in his superiority the French commodore bore down in two

divisions to attack the English, who formed in a close line to receive him. The action commenced by an attempt of the French commander to practise the manœuvre of breaking the line, in which he failed; and, endeavouring afterwards to round the English van, he was so roughly treated that his ship became unmanageable and ran on the rocks. The action was still maintained with great fury, till two of the French frigates struck. Two others crowded sail for the port of Lessina, and the small vessels dispersed in all directions. The result of this action, which ranks among the most brilliant achievements of the British navy, was the burning of the ship of the brave French commodore, who was killed in the engagement, and the capture of two others. A fourth, which had struck her colors, took an opportunity of stealing away, and was in vain reclaimed as lawful prize by captain Hoste. The loss of the English amounted to 200 in killed and wounded.

The close of this year was remarkable for violent storms occasioning great losses at sea of which the British navy partook in full proportion. Among the domestic occurrences of the year it may be interesting to mention, that a census of the population of Great Britain was taken this year, exhibiting a result highly favorable to the prosperity of the kingdom. The total of the population returned in 1801 was 10,942,646; that of 1811 was 12,552,144; exhibiting an increase of 1,611,882, of which almost every town and district numbered had a share.

The interior tranquillity of England was little disturbed during the greater part of the year, but towards the close of it serious tumults broke out in the districts of the hosiery manufactory, particularly in the county of Nottingham; occasioned by the invention of a wide frame for weaving stockings, and the discharge of many workmen in consequence.

The year on the history of which we are now about to enter will long be distinguished in the annals of Great Britain. The parliament was opened by commission on the 7th of January 1812. The council appointed to assist the queen, acknowledged, that in the opinion of all the physicians, his majesty's complete and final recovery was improbable.

At an early period of the session, Mr. Perceval proposed a plan for the arrangement of the royal household, and recommended such an addition to the civil list as might support the separate establishments. The state of Ireland, with reference to the Roman Catholics, was brought early in the session under the discussion of both houses, but all concession to the Catholic claims was negatived in the house of lords by 162 to seventy-nine; in the commons by 229 to 135.

In a committee of supply, 13th of April, the sum of £554,441 was moved for as the expense of the barrack department for the current year. Among other items in the estimate, which were thought extravagant, particular exception was taken to the charge of £138,000 for a barrack to be built for the second regiment of life guards, in a piece of ground newly taken in under the

name of the regent's park, and which was generally understood to be designed for an ornament to the park. In repeated debates, on the subject of the barrack estimates, objections were made to this and some other articles; and an amendment proposed for a reduction of the sum was rejected by no greater majority than 134 to 112. This public discussion was not without its effect; for, when the budget was brought forward by the new chancellor of the exchequer, it was announced that the treasury had struck off an additional vote of £90,000 for the barrack department, it having been resolved to postpone the execution of the projected barracks at Marylebone park, Bristol, and Liverpool.

Early in the year the cabinet sustained a considerable loss by the resignation of the marquis of Wellesley. The motives of this step were stated to have been a difference with his colleagues as to the scale on which the war in Spain and Portugal was to be carried on. He declared, that on certain principles he would be ready to serve with Mr. Perceval, but that he would never serve under him: his resignation was accepted on the 19th of February, lord Castlereagh succeeding him in the post of secretary for foreign affairs.

On the 13th of February the prince regent addressed a singular letter to the duke of York, in which he declared, 'that, the restrictions of the regency act being about to expire, he must make his arrangements for the future administration; his sentiments relative to which he had hitherto withheld, from his earnest desire that the expected motion on the affairs of Ireland might undergo the deliberate discussion of parliament, unmix'd with any other consideration. He could not reflect without pleasure on the events which had distinguished the short period of his restricted regency: and in regard to the war in the Peninsula, I shall,' said his royal highness, 'be most anxious to avoid any measure that can lead my allies to suppose that I mean to depart from the present system; and I cannot withhold my approbation from those who have honorably distinguished themselves in support of it. I have no predilections to indulge, no resentments to gratify. Having made this communication, I cannot conclude without expressing the gratification I should feel, if some of those persons with whom the early habits of my public life were formed, would strengthen my hands, and constitute a part of my government. You are authorised to communicate these sentiments to lord Grey, who I have no doubt will communicate them to lord Grenville.'

This letter excited no little surprise. It seemed particularly strange, that his royal highness could for a moment indulge the expectation that the lords Grey and Grenville, who had rejected with disdain the far more respectful overture of 1809, should now condescend to constitute a part of Mr. Perceval's administration. On the failure of the negotiation, which was the result, lord Boringdon, on the 19th of March, moved in the house of lords for an address to the prince regent, beseeching him to form an administration so composed as to unite the con-

fidence and good-will of all classes of his majesty's subjects. In the debate, lord Grey stated the points on which lord Grenville and himself had declined a union with the present ministers. These were principally the conduct to be pursued towards the Catholics and towards America.

The existing administration now proceeded unchanged, and without any symptom of want of stability, till it was deprived of its leader by a most tragical incident. On the 11th of May, as Mr. Perceval was entering the lobby of the house of commons about five in the afternoon, a person of the name of Bellingham fired a pistol at him, the ball of which entered his left breast and pierced his heart. He staggered, fell, and almost instantly expired. Nothing could surpass the consternation excited in both houses by this catastrophe. It was however soon discovered, that the act was merely in revenge of some supposed private injury; and that Bellingham, having in a commercial visit to Russia sustained some heavy losses, resolved to make a sacrifice of some conspicuous member of the government which he thought had neglected him. He was tried and executed for the offence; while the general regard entertained for Mr. Perceval's character as a man, even by those who widely differed from him in political opinions, was testified by an ample provision unanimously voted for his widow and family. The earl of Liverpool, on whom the post of leader in the cabinet now devolved, was directed by the prince regent to endeavour to acquire an accession of strength by the association of the marquis Wellesley and Mr. Canning. But his negotiation for this purpose failed, on the perplexing topic of the measures to be pursued with regard to the Catholics, and the scale on which the war in the Peninsula was to be carried on. Mr. Stuart Wortley, on the 21st of May, brought a motion before the house of commons for an address to the prince regent, praying him to take such steps as might be the best calculated to form an efficient administration; and an attempt to set it aside by the order of the day was defeated by 174 to 170. Mr. Wortley next moved, that the address should be presented by such members as were of the privy council: to his great surprise it was rejected by a majority of two. At length it was agreed upon, that it should be presented by lord Milton and himself. The answer was that his royal highness would take the address into his serious and immediate consideration.

The marquis Wellesley, and the earl Moira, now each in vain endeavoured to form a stronger ministry. In the house of lords, on the 3d of June, the former stated 'that the most dreadful personal animosities, and the most terrible difficulties arising out of questions the most complicated and important, interposed obstacles to an arrangement.' These strong expressions he afterwards explained as not referring to the prince regent, but to the earl of Liverpool and his colleagues, who, however, disdained the imputation.

At length on the 9th of June the prince regent appointed the earl of Liverpool first lord of the

treasury, and Mr. Vansittart chancellor of the exchequer. The earl of Harrowby (late Mr. Ryder) became president of the council; lords Bathurst, Sidmouth, and Castlereagh, were secretaries of state. Viscount Melville was promoted to the admiralty, in the room of Mr. Yorke, who was gratified with the tellership of the exchequer. Lord Eldon continued chancellor, lord Westmoreland privy seal; and the earl of Moira, now honored with the garter, was appointed governor-general of India.

Soon after his accession to office Mr. Vansittart brought forward his plan of finance, or rather, as he said, that of his lamented predecessor, for the current year. The whole of the supply demanded for the United Kingdom was £58,000,000. Of this grand aggregate the sum of £15,650,000 was raised by loan for Great Britain; and for Ireland a separate loan of £4,350,000. Nearly £10,000,000 were funded of exchequer bills; the war taxes were estimated at £20,400,000; a vote of credit was passed for £3,000,000; and the urgent necessities of the East India Company required the sum of £2,500,000. The annual taxes, and consolidated fund, furnished the remainder of the supply, and new taxes were imposed to the amount of nearly £2,000,000.

On the 22d of June Mr. Canning moved a resolution, 'That this house will, early in the next session, take into consideration the state of the laws respecting the Catholics.' This was supported by lord Castlereagh, who observed, 'that, the obstacles which formerly existed having been removed, the time was now arrived when it was highly proper to take the claims of the Catholics into consideration.' On this joint recommendation the motion was carried by a decisive majority of 225 to 106 members. On a similar resolution proposed in the upper house, by marquis Wellesley, the previous question was put by the lord chancellor, and carried by 126 to 125 peers.

Towards the close of the session Mr. Brougham, in a very able speech on the subject of the orders in council, moved an address to the prince regent, 'beseeching him to recall or suspend those orders, and to adopt such measures as might tend to conciliate neutral powers.' Lord Castlereagh, after deprecating the attempt to urge the house to 'a precipitate decision,' intimated, that government had in view the adoption of conciliatory measures respecting America. The motion of Mr. Brougham was in consequence withdrawn; and on the 23d of June appeared a proclamation announcing the suspension of the orders in council of January 1807 and April 1809, as far as regarded American property, from the 1st of August following, on the condition that America should, on the regular notification of the same, also rescind or suspend its prohibitory decrees. Unhappily this tardy concession, like all the former conciliatory measures respecting America for forty years past, came too late to be of any avail. On the 30th of July the parliament was prorogued by commission; and on the 29th September it was unexpectedly dissolved.

In Spain, towards the close of the last year, the town of Tariffa in Andalusia, garrisoned by

1000 British infantry, with a detachment of artillery, and a body of Spaniards, was invested by the French with an army of 10,000 men. A breach being made in the wall, the enemy advanced to the assault on the 31st December, when they were obliged to retreat; and, on January 5th, their columns were seen retiring, having left behind them their ammunition, artillery, and stores. This defence was thought to confer great honor on the garrison and its commander, who held out with only 1800 men, behind a weak wall, against a marshal of France. Badajoz was reduced to the utmost extremity. The siege of Ciudad Rodrigo was now pressed; and on the 19th an attack was made in five separate columns, which proved completely successful. The garrison, after a desperate conflict, surrendered to the number of 1700 men besides officers, thus placing in the hands of the captors the heavy train and stores of the French army. The British sustained a severe loss in the death of major-general Mackinnon, who fell at the head of his storming party, and the number of killed and wounded, which was not less than 1200. After strengthening the fortifications, lord Wellington moved the greater part of his army to the southward for the support of general Hill, who was blockading Badajoz with about 12,000 men. On the 6th of April three practicable breaches were made, and a resolution was instantly taken to storm the place. The conduct of a false attack was entrusted to lieutenant-general Leith, with instructions to convert it into a real one, should circumstances prove favorable. General Picton in the mean time was to attack the castle by escalade. In an hour and a half he was master of the castle. The light division under Colville, after repeated attempts, was unable to gain the bastions; but the false attack under general Leith, and the other operations of the besiegers, entirely succeeded. The French governor retired into Fort St. Christoval, and surrendered on the following day. The garrison, which originally amounted to 5000 men, had lost in killed and wounded 1200. The British and Portuguese had 800 killed and 2000 wounded. Marmont, after in vain attempting to surprise Ciudad Rodrigo and Almeida, now penetrated into Portugal as far as Castello Branco, where he no sooner learnt the result of the siege than he commenced a retreat. Soult, who had reached Villa Franca, also fell back with equal alacrity, pursued by the British cavalry under Sir Stapleton Cotton. On the 11th of April the dragoons under major-general Le Marchant charged the rear-guard of the French with impetuosity, and drove them with the utmost confusion into Llerena.

Lord Wellington appeared before Salamanca with his main army on the 16th of June, when the French general, leaving a force to defend the fortifications, retired with his troops across the Tormes. He afterwards attempted to relieve the forts, which from their strength had been formed into a depot of stores; but the British general, by a masterly manœuvre, compelled him to abandon them to their fate. Lord Wellington then put his army in motion against Marmont, who retired across the Douro, destroyed the bridges, and concentrated his forces at Tordesillas. Lord Wellington now menaced the Spanish

capital ; and a series of skilful movements ensued on both sides, until the 21st of July, when the allied army was concentrated on the Tormes. On the same day the French crossed the river, and appeared to threaten Ciudad Rodrigo. During the 22d and 23d Marmont practised a variety of evolutions to distract the attention of the British general from his real plan, which was to enclose the allies in their position on a peninsula formed by the river, and to cut off their retreat. In aiming to surround the British, he extended and weakened his own line ; and lord Wellington, watching the progress of this error, seized the favorable moment for striking a decisive blow.

Major-general Pakenham, with the third division, commenced a furious assault on the flanks of the enemy's left, in which he was supported by brigadier-general Bradford's brigade, by the fourth and fifth divisions, and by the cavalry under Sir Stapleton Cotton in front. The French, though finely posted and supported by cannon, were overthrown. Three entire battalions surrendered ; and large quantities of stores, baggage, and ammunition, fell into the hands of the conquerors. Eleven pieces of cannon, two eagles, and six stands of colors were taken ; five generals, three lieutenant-colonels, 130 officers of different ranks, and 7000 soldiers, were made prisoners.

Leaving a force under general Paget, to watch the motions of the enemy, lord Wellington now advanced with the main body of his army to the Spanish capital. King Joseph, who with 20,000 men under his command had reached Segovia, hearing of the defeat of Marmont, hastily retreated through Madrid to Almanza, a position from which he could communicate either with Suchet or Soult. On the 12th of August the allied army entered the capital. Aware that their losses had been aggravated by a want of concert, the commanders of the French forces now co-operated in order to retrieve them. On the 21th of August, Soult relinquished the siege of Cadiz, and began to evacuate Andalusia, for the purpose of uniting his forces with those of king Joseph and Suchet. On the 1st of September lord Wellington quitted Madrid, and advanced to Valladolid, the enemy retiring before him across the Puycerga. He pursued them to Burgos, through which city they retired during the night of the 17th, leaving a strong garrison in the castle. Preparations were immediately made for besieging this important place ; but the heavy artillery had not arrived, and the uncertain process of sapping and storming failed. On the 21st advices were received, that an army of 70,000 men, under the direction of Soult, Suchet, and the new king, were fast approaching the passes against general Hill, whose force was inadequate to oppose them. This induced lord Wellington to raise the siege of Burgos, to retire towards the Douro, recall his troops from Madrid, and direct general Hill to proceed northward. He moved upon Salamanca, where he hoped to establish himself ; but Soult advancing from Madrid, and uniting his forces with Souham, obliged him to continue his retreat. On the 24th of November he fixed his head-quarters at

Freynada, on the Portuguese frontier, after a masterly retreat before an army of 90 000 men, against which he could oppose only 52,000.

The Spanish extraordinary cortes on the 18th of March completed the great work which had so long employed their labors, by the public signature of the constitutional act. Deputies from all parts of the kingdom were present at this ceremony. A commission was appointed to carry the instrument thus signed to the regency ; and on the 20th all the deputies assembled in the hall of congress to swear to the constitution ; after which the regency entered the hall, and took the oath of office.

Almost from the commencement of the year 1812 the attention of Europe had been directed towards a new scene, which was opening in the north. The emperor Alexander, indignant at the ruin of the trade of his empire, disdained any longer to submit to the restraints of a system, which, though planned solely for the impoverishment of Great Britain, was highly injurious to his subjects. The overthrow of this system was evidently also the interest of Sweden and Prussia : but the resources of Sweden were inconsiderable, and Prussia was in vassalage to France. Russia was the only power that could take the lead in an attempt of that nature, in which, however, she was certain of being supported by Great Britain.

Whatever might be the views of the emperor of France, he began very early in the spring of this year to move numerous bodies of troops into Germany. The Russian monarch, in the mean while, prepared to meet the impending storm ; and after issuing a declaration of war, put his armies in motion, and by an imperial ukase, dated the 23rd of March 1812, ordered a levy of two men in 500 throughout his extensive dominions. In the mean time great numbers of French troops joined by the contingents of the Rhenish confederation, proceeded towards the Vistula. The French concluded treaties of alliance with Prussia and Austria ; the emperor of Russia concluded also a treaty of peace with the Ottoman Porte, and all matters of dispute were settled between Russia and Great Britain. Such were the preparations for the decisive contest which was destined to produce events wholly unparalleled in history. On the 8th of May the French emperor, accompanied by his empress Maria Louisa, set out from Paris, and, on the 11th of that month, arrived at Mentz.

On the 29th of May the emperors of France and Austria departed from Dresden : the former towards the Vistula to take the command of his army, the latter returned to Vienna. The king of Prussia, who had attended at the interview, left that city on the following day : the empress of France, after remaining a few days at Dresden, returned to Paris.

On the 6th of June Napoleon passed the Vistula, announcing his determination of restoring the kingdom of Poland. He, however, attempted to the last to bring the Russian monarch into his views by negotiation : but the latter, adhering to his former declaration, made by prince Kurakin, insisted on the evacuation of Prussia by the French troops.

At two o'clock in the morning of the 22nd of June the emperor Napoleon, accompanied by a general of engineers, inspected the banks of the Niemen. The different corps commanded by the viceroy of Italy, and prince of Eckmühl, the duke d'Elchingen, the duke de Reggio, the duke of Tarentum, and the prince Poniatowski, made corresponding movements; and the pontoon train arrived. The fifth, seventh, and eighth corps, commanded by the king of Westphalia, had proceeded no farther than Novogorod, about half way between the Vistula and the Niemen; and the first Austrian corps, under the prince Schwartzenberg, was near Lublin, at an almost equal distance between Lemberg and Warsaw. The duke of Belluno, with the 9th corps and some other troops, remained in reserve.

At this crisis a Polish diet was held at Warsaw under the sanction of the French emperor, which, resolving itself into 'a general confederation of Poland,' published on the 1st of July a memorable declaration, announcing that the kingdom of Poland and the Polish nation were re-established, and appointing a council of state, consisting of eleven members, for the administration of affairs.

The plan which the Russians had formed, and according to which they resolved to conduct the present campaign, was, to resist the progress of the invader at all points where a stand could be made without risking a general engagement; to lay waste the country through which he should penetrate; to harass him as he advanced, and to cut off his supplies. Napoleon advanced rapidly to Wilna, the capital of Russian Poland, which he entered on the 28th of June; but a division of the French army under Macdonald received a severe check from general Essen, to whom the defence of Riga was entrusted. Count Witzenstein also defeated marshal Oudinot and the Bavarian general Wrede, at Polotsk, after a conflict of twelve hours.

The emperor of France directed his attention to the main Russian army, which, on the 17th of August, he attacked at Smolensko. After a furious contest the Russians retired from the city, which the French, on their entrance, found burning. Napoleon gave vent to his chagrin by exclaiming,—'Never was a war prosecuted with such ferocity. These people treat their own country as if they were its enemies!'

The Russian army now retired upon Viasma, and this place the French entered on the 30th of August: they did not advance till the 4th of September. The interval of preparation, however, was no longer than was necessary for a conflict between two armies, each amounting to more than 120,000 men. It commenced on the morning of the 7th of September, by a tremendous attack on the Russian left, against which nearly one-half of the French force was directed; while marshal Ney bore down on the centre, and Beauharnois assailed the right. Kutusoff finding that his left, after a combat of three hours, was giving way, reinforced it with grenadiers and cavalry from the reserve, when a desperate effort was made to recover the lost position, from which the French were at length driven. Beauharnois made repeated efforts to carry the village of

Borodino and the redoubts which covered it, but he was ultimately repulsed with great loss. The Russians were then enabled to reinforce their centre, where the battle raged with great fury until night, when the French withdrew at all points, leaving them masters of the field. They estimated their own loss at 40,000 in killed and wounded, and that of the enemy at 60,000.

After this dearly purchased victory Kutusoff found himself unable to make head against the fresh troops which his antagonist was enabled to bring forward. He therefore ordered Moscow to be evacuated, and retired with his army beyond it. The painful but necessary measure of withdrawing from their homes in Moscow 200,000 human beings of both sexes, and of every age, was carried into effect by count Rostopchin, who placed himself at the head of 40,000 of its inhabitants, and proceeded to join the army. Rostopchin had a villa in the neighbourhood of Moscow, to which he set fire with his own hands.

The advanced guard of the French, under Murat and Beauharnois, entered Moscow on the 14th of September, and soon overpowered the small band which had lingered in the Kremlin, the ancient palace of the czars. The deserted city was discovered to be on fire in several places; and the French soldiers, eagerly seeking their long-promised plunder, rather increased than checked the conflagration. Napoleon was waiting at the barrier on the Smolensko road, to receive the homage of the constituted authorities ere he made his triumphal entry. A Polish general, whom he sent to remind the citizens of their duty, returned with information that there were no authorities, and that Moscow would soon be a heap of ruins. The conqueror entered without parade on the following day, and took up his residence in the Kremlin. 'I ventured, into the midst of the flames,' he said to O'Meara, 'and had my hair and eye-brows singed, and my clothes burned off my back; but it was in vain, as they had destroyed most of the pumps, of which there were above 1000: out of all these, I believe that we could only find one that was serviceable. Besides, the wretches that had been hired by Rostopchin ran about in every quarter, disseminating fire with their matches, in which they were but too much assisted by the wind. This terrible conflagration ruined every thing. I was prepared for all but this: it was unforeseen; who would have thought that a nation would have set its capital on fire!'

This event was evidently a severe disappointment to the French emperor, who lingered about this devoted city as if it had still been his intention to retain it. At length, however, the unshaken resolution of the Russians to persist in their system of making all sacrifices rather than submit; the assemblies of fresh bodies of their troops around Moscow, and the approach of inclement seasons, reminded him of the necessity of a prompt retreat. Urged by the clamors of his soldiers, he sent Lauriston with a flag of truce to the Russian head-quarters, announcing his readiness to treat. The answer returned was, that no terms could be entered into while an enemy remained in the Russian territory.

The roads leading to Moscow were now occupied by detached corps, who cut off the supplies, and dispersed the straggling parties of the French.

Napoleon sent Lauriston a second time to demand, that the Russian general would forward a letter to the emperor Alexander. 'I will do that,' replied Kutusoff, 'provided the word *peace* is not expressed in the letter. I would not be a party to such an insult on my sovereign, by forwarding a proposal which he would order to be instantly destroyed. You already know on what terms offers of peace shall be attended to.' Napoleon soon afterwards announced his intention of leading his army into other provinces until the return of spring, when he would advance on St. Petersburg, and erase the name of Russia from the list of European nations. He then indulged his soldiers with an eight days' pillage of Moscow, and commenced his retreat, leaving a force to blow up the Kremlin. General Iliavsky, however, arrived in time to prevent the completion of this outrage.

Dividing his forces, Murat and Beauharnois, with 50,000 men, were ordered to attack the grand army of the Russians under Kutusoff; while the emperor himself, with the remainder, took the route to Minsk. The former met with a severe repulse, and nothing was now thought of but how to quit the country. Scarcely could they hazard a march without a battle. A stand was attempted at Viasma, but without success; and the French, dispirited and weary, were driven from their positions with great slaughter. The ensuing night was rendered dreadfully memorable by a prodigious fall of snow; and from this period ensued a series of terrible disasters.

'I was a few days too late,' says Napoleon; 'I had made a calculation of the weather for fifty years before, and the extreme cold had never commenced until about the 20th of December, twenty days later than it began this time. On the march the thermometer sunk eighteen degrees, and consequently nearly all the horses perished. In one night I lost 30,000. The artillery, of which I had 500 pieces, was in a great measure obliged to be abandoned. Parties, when sent out on duty in advance, abandoning their posts, went to seek the means of warming themselves. They separated in all directions, became helpless, and fell an easy prey to the enemy. Others lay down, fell asleep, and a little blood came from their nostrils, and sleeping they died. In this manner thousands perished.'

Napoleon reached Smolensko on the 9th of November, and remained there until the 15th, when he set out for Krasnoi. Davoust, who followed him, after blowing up the ramparts, was beaten by Milorodavich on the 15th, and escaped with the loss of 4000 killed and wounded, and 9000 taken prisoners, with seventy pieces of cannon. He also lost the whole of his baggage, three standards, and his *bâton de maréchal*. Ney, who left Smolensko with the rear-guard on the day of battle, was surprised by the victorious Russians, and compelled to fly with a small proportion of his staff, leaving 11,000 of his troops in the hands of his pursuers. In the

mean time the Russian general Witgenstein advanced from Polotsk, and on the 8th of November reached Vitepsk, where he was informed of the retreat of the grand French army. On the 18th he was informed of the flight of the Austrian and Saxon auxiliaries, and of the rapid advance of the Russians. The whole force of the empire was now directly co-operating against the retreating enemy.

To secure his escape, Buonaparte ordered two bridges to be thrown over the Beresina at Studenzi and Vasselova. Scarcely had he passed the river with his guard, at the latter point, when Witgenstein opened a cannonade on the troops who were preparing to follow. They rushed in crowds towards the bridge: it was blown up by Napoleon's order. A shout of despair followed the explosion. Numbers plunged into the stream and disappeared amidst the floating masses of ice; 5000 lost their lives, and 13,000 were taken prisoners. The artillery, baggage, and ammunition, fell into the hands of the Russians.

Having repaired the bridges the Russian armies advanced, and on the 12th of December prince Kutusoff established his head-quarters at Wilna. The retreat of the French from the Beresina to the Niemen was attended with horrors to which no parallel can be found in the annals of the world.

Napoleon did not remain to witness the last scene of the tragedy. He reached Wilna on the 7th of December, and, having appointed Murat to the chief command, departed for Warsaw, accompanied by Caulincourt; whence he made a rapid journey to Paris. He was the herald of his own discomfiture; and proclaimed with circumstantial precision the results of a campaign which did equal credit to his foresight as a politician, and to his skill as a general. The wars of modern Europe had furnished no instance of so extensive and complete a destruction.

The destruction of the French army was made known to the people of England while engaged in the ferment of an election, and the new parliament assembled, on the 24th of November, 1812, under the happiest auspices. On the 30th the prince regent delivered, for the first time, a speech from the throne, containing a triumphant review of the political and military events of the year. A grant of £100,000 was voted to the duke of Wellington, and £200,000 for the relief of the sufferers in Russia.

After the Christmas recess, the attention of parliament was called to the origin and causes of the war between this country and the United States. After refuting the various charges adduced by the American government against that of Great Britain, ministers ascribed the origin of the contest to that spirit which had long actuated the councils of the United States, and which had induced them with marked partiality to palliate and assist the aggressive tyranny of France.

The annual discussion of the Catholic claims commenced on the 25th of February, with a motion by Mr. Grattan for referring them to a committee of the whole house, which was carried by 264 votes against 224. On the 30th of

April Mr. Grattan introduced a bill for the removal of the Catholic disabilities, which encountered little opposition in the first and second reading; but, on its passage through a committee, Mr. Abbot, the speaker, objected to that clause by which Catholic gentlemen were permitted to sit in parliament. The clause was rejected by a majority of 251 against 247, and the bill was abandoned.

On the 5th of May a measure was instituted for extending the provisions of the toleration act, by granting 'further relief to persons differing in opinion from the church of England, with respect to certain penalties imposed by law on those who impugn the doctrine of the Holy Trinity.' The bill introduced for this object by Mr. William Smith was read a third time in the house of lords, on the 30th of July, when the archbishop of Canterbury, and the bishop of Chester, disclaiming all intention of opposing it, observed, that it had not been called for by any attempt to impede the worship of Unitarians, or inflict penalties upon them.

Lord Castlereagh brought forward, in a committee of the whole house, his plan of regulation, including the prolongation of the East India Company's charter for the further term of twenty years from the 10th of April, 1814. The first resolution moved by this minister secured to the Company all its Indian territories north of the equator, with the exclusive trade to China; leaving the commerce of Hindostan open to the public on certain conditions, and to certain ports, by license from the company. An ecclesiastical establishment was also founded in India, consisting of a bishop and three archdeacons; and a wide scope was given to the zealous efforts of missionaries. The dividends of the company were limited to 10½ per cent., and the number of king's troops to be paid by the company was restricted to 20,000, unless a larger force was required by the directors.

On the subject of finance an important measure was proposed by Mr. Vansittart on the 3rd of March, in a committee of the whole house. By the original constitution of this fund, the stock purchased by the commissioners was not cancelled, but considered to be their property; and the interest was regularly applied by them to the further discharge of the debt. This arrangement, securing an accumulation by compound interest, was now abolished; and the whole stock purchased by the commissioners, which was now stated at £238,000,000, an amount exceeding that of the national debt when the fund was instituted, was to be cancelled, and the interest become disposable for current services: £867,963 was at the same time proposed to be added to the sinking fund. It was also proposed, that, when the new loans should in any year exceed the amount of the sinking fund, a new fund of 2½ per cent. instead of 1 per cent. should be created to provide for that surplus.

The treaty with Sweden was laid before parliament on the 11th of June; from which it appeared, that, in the recent convention between Russia and Sweden, the emperor Alexander had not hesitated, when his own interests were at stake, to engage that Norway, which had been

for ages united in a federal league with Denmark, should be transferred to Sweden in compensation for Finland. To this compact Great Britain also had by the present treaty become a party.

The campaign of this year in Spain commenced with an attack of Suchet's (13th of April) on the line of the allies; in which, however, he was repulsed. Before the end of May lord Wellington moved in great force by the route of Salamanca towards Madrid, the new king once more evacuating the capital. On the approach of the British, the enemy continued his march towards the Ebro. The allies, by a sudden movement to the left, having crossed that river near its source, found the French encamped in front of the town of Vittoria, under the command of Joseph Buonaparte and marshal Jourdan, Soult having been summoned to the aid of Napoleon. On the 21st of June lord Wellington resolved upon attacking them. The battle began with a severe contest for the heights of Arlanzon, on the left of the French. These being at length carried by general Hill, he passed a rivulet which ran through the valley, as did general Picton at the head of another division. Nearly at the same time general Graham on the opposite wing forced his passage over two bridges thrown across the stream; on which, after a severe contest, the whole French army retreated in good order on Vittoria; whence they continued their march toward Pampeluna. A great number of cannon, and stores of all kinds to a vast amount, now fell into the hands of the allies, and the retreat of the French became so rapid as not to permit them to carry off their baggage: 151 pieces of cannon, and 415 waggons of ammunition, fell into the hands of the victors.

The centre of the French retreating army having still maintained itself on the Spanish side of the frontier, general Hill made an attack upon them with a combined force of British and Portuguese, and obliged them to withdraw into France. Marshal Soult joined the army on the 13th of July. On the 24th he collected his right and left wings, and a part of his centre, at St. Jean Pied de Port, to the amount of 30,000 or 40,000 men; and made an attack on an English post at Roncesvallos, in which he succeeded, and other posts were consequently withdrawn. Various operations of attack and defence were now carried on during some days. The siege of St. Sebastian had, in the mean time, been proceeding under the conduct of Sir Thomas Graham; and an unsuccessful attempt to storm had been made on the 25th of July, which occasioned a severe loss. On the 31st of August another attempt was undertaken by order of lord Wellington, which, though attended with peculiar and unseen difficulties, succeeded, at the cost of 2300 in killed and wounded.

On the 7th of October lord Wellington entered France, by crossing the Bidassoa at different fords. The strong fortress of Pampeluna, which had been blockaded from the time of the battle of Vittoria, was induced to accept of a capitulation on the 31st. Lord Wellington now put in execution a plan which he had projected to force

the centre of the enemy, and establish the allied army in the rear of their right. The attack was made on the 10th of November, and, after a variety of actions which occupied the whole day, the purpose was attained. The French during the night quitted all their works and posts in front of St. Jean de Leon; and, being pursued on the next day, retired to an intrenched camp in front of Bayonne. On the 9th of December the river Nive was crossed by a part of the allied army; and on the four following days several desperate attacks were made by the French during the completion of this passage, which were finally repelled, and the enemy, after great loss, withdrew to his intrenchments. The British and Portuguese, during these days, lost between 4000 and 5000 in killed, wounded, and missing. The year closed with lord Wellington's obtaining a firm footing on the French territory.

In the north of Europe the Prussians, as allies to the French, had acted chiefly on the coast of the Baltic. On the retreat of marshal Macdonald from that place, the Russian general Witgenstein, advancing along the Niemen, succeeded in cutting off from the marshal a body of Prussians of about 15,000 men, under the command of general D'Yorck, who entered into a convention, by which he agreed to remain neutral.

Witgenstein, pursuing Macdonald, entered Königsberg on the 6th of January. Elbing, Marienburg, and other towns in that quarter, were deserted by the French and occupied by the Russians. At Königsberg a regency was established in the name of the king of Prussia, which issued a proclamation, calling on the people to come forward for the rescue of their prince and country from French bondage; and a number of young men joined the troops under D'Yorck, who had been declared commander-in-chief of the patriotic army. The king himself in the end of January suddenly removed to Breslau. His purpose was become so manifest, that the viceroy of Italy, Eugene Beauharnois, then at Berlin, forbade recruiting in that capital.

The emperor of Russia had now put himself at the head of his main army; and on the 22nd a treaty of alliance, offensive and defensive, was concluded between Prussia and Russia. The two sovereigns had an interview at Breslau in March, from which city the king of Prussia issued a proclamation to his subjects, touching upon the motives which had induced him to join his arms to those of Russia.

On the 3rd of March the French troops evacuated Berlin, which was entered by the Russians on the following day. General Morand, who had occupied Swedish Pomerania with a small body of troops, now followed the French main army, joined by those who had left Hamburg, which city was entered by the Russian general Tettenborne on the 18th. The king of Saxony had quitted Dresden on the approach of the Russians, a corps of whom took possession of the part of the city on the right bank of the Elbe. A Swedish force advanced to Stralsund; and in April Thorn surrendered to the Russians. Napoleon, with unabated activity and confidence, was at this time busily employed at Paris in mustering all the force of the great dominion of

which he was still master, for a powerful effort. By a senatus consultum, of the 11th of January, 350,000 men were placed at his disposal. He caused the empress to be declared regent during his absence, published a flattering exposé of the state of the French empire; and, having thus re-animated the spirits of the nation, he on the 15th of April set out for the army.

The march of the divisions was directed so as to form a junction near Jena and upon the Saale. The allied armies of Russians and Prussians had for some time been concentrating near Leipsic. The French having crossed the Saale, a junction was made of the Russians and Prussians between Leipsic and Altenburg, the sovereign of each being present with his troops. On the 2nd of May a general engagement occurred at Gross Groschen, near the plain of Lutzen, of which the result, after much slaughter, was, that the allies kept the field. The consequences, however, were, the subsequent advance of the French to the Elbe, which they crossed at Dresden and Meissen. The king of Saxony at this time joined his forces to those of France. The advance of the French divisions, through Silesia towards the Oder, met with no effectual resistance, and on the 1st of June Lauriston entered Breslau.

While these things were transacting, Sweden acceded to the league against France. The French emperor was not insensible of the dangers that were now accumulating round him. He consequently, through the medium of Austria, transmitted to the emperor Alexander proposals for an armistice, preparatory to a congress to be holden at Prague. The armistice was mutually ratified on the 4th of June, and the negotiations at Prague proceeded; and a prolongation of the armistice took place, which carried it to the 10th of August. All Germany in the mean time resounded with preparations for war. The armistice at length terminated; and on the 11th of August count Metternich, the Austrian minister at the congress of Prague, delivered to the French minister a declaration of war on the part of his court. The plan of the allies now was to drive back the French from their forward position on the right bank of the Elbe, and in Lusatia and Silesia, by attacks on their front and flank; and after various actions they so far succeeded, that on the 26th the advanced guards of the allies encamped on the heights above Dresden. During several months their engineers had been occupied in adding to the fortifications of the place, and Napoleon was within the walls with a force estimated at 130,000 men; it therefore seems to have been an injudicious measure on the part of the allies to make an attempt for carrying it. This, however, was attempted on the 27th, and, though conducted with undaunted valor, was repulsed with a great loss of men. On the following day Napoleon led out his troops, supported by an immense artillery, to the attack of the allies. One of the incidents of the bloody action which ensued was a mortal wound received by the celebrated general Moreau, who had left his retreat in America to join the party whose cause he considered as that of public liberty. At the conclusion of a most severe combat the

allies retired, followed by a large division of the French army, which received an effectual check in an action in which general Vandamme was taken prisoner with 10,000 men. The allies now beat back the French, and the crown-prince of Sweden joined in their operations. Silesia and Saxony were entered by the Russians and Prussians; the Austrians advanced from Bohemia; and at length the French measured back their steps to the Elbe. At this period an important accession was made to the strength of the allies by a treaty between Austria and Bavaria, in virtue of which 55,000 Bavarian troops were to act in conjunction with the Austrians. A stronger proof could not be given of the general concurrence of Germany to throw off the yoke of Napoleon.

After various partial encounters and bold efforts to surround the French, a most sanguinary engagement took place on the 16th of October, which, after much slaughter, left the opposing armies in nearly the same position they held at its commencement. The 17th passed chiefly in preparation for the great action of the next day, which was directed upon the town itself. At its conclusion the French had lost 40,000 men in killed, wounded, and prisoners, with sixty-five pieces of cannon. The engagement was still raging when seventeen battalions of Westphalian and Saxon troops, the latter bringing with them twenty-two pieces of cannon, deserted to the allies, and, ranging themselves under the standard of the crown-prince of Sweden, requested to be led against the French. This was decisive of the event; and it demonstrated the extravagance of that policy, which could transform the circles of Germany into provinces of the French empire. The victorious army remained that night on their ground. On the morning of the 19th the king of Saxony sent a flag to the emperor Alexander, entreating him to spare the town; but, it being regarded as a feint to gain time, an assault was ordered. Leipzig was carried after a short resistance, and the allies entered two hours after Napoleon had made his escape. The king of Saxony with all his court, the French garrison, with the rear guard of 30,000 men, and the sick and wounded computed at 22,000, with the magazines, stores, and artillery, were taken in the city. No success could be more complete. Immense magazines were found in Leipzig.

The king of Wirtemberg, imitating the example of Bavaria, now renounced the confederation of the Rhine, and united his troops with those of the allies. But that which was of more consequence, and less to be expected, was the revolution which at this time took place in Holland. On the 15th of November the people of Amsterdam, as it were by one consent, hoisted the Orange colors, and amidst enthusiastic shouts proclaimed the restoration of the ancient government. A change now unavoidably took place in the Danish councils; and Frederick VI., as his only resource, concluded a treaty with Great Britain and Sweden. It was signed at Kiel on the 14th of January 1814, agreeably to which Swedish Pomerania was ceded in exchange for Norway. England retained possession of the fleet which she had so dearly purchased, and

10,000 Danes joined the army of the crown-prince. In the south of Germany the arms of Austria had during this interval been no less successful. In October general Hillier crossed the Alps with an army of 60,000 men; and Trieste, Fiume, with the whole Dalmatian coast, were reduced, in which the English force in the Adriatic materially assisted.

On the retreat of Napoleon from Leipsic, the French troops left in Dresden under the command of marshal St. Cyr were augmented by fugitives from Vandamme's army, but they were soon reduced to a wretched condition by disease and want. On the 12th of November they surrendered as prisoners of war, to the amount of more than 40,000 men. In the same month the French garrisons in Stettin and its forts also capitulated, on the same condition, to the number of 7000 or 8000. An Austrian army entered Switzerland, with a declaration that its neutrality could not be permitted by the allied powers. At Bern the ancient government of the canton was restored. Geneva was afterwards occupied by the allies; and the Austrians, advancing to Basle and Schaffhausen, crossed the Rhine, and proceeded to the French frontier. They also passed that river at other parts, and spread in Alsace and Franche-Comté. France was now completely in a state of invasion.

On his return to Paris Buonaparte caused the senate to pass decrees for levying 300,000 men, and for doubling the public contributions. The unfortunate war between Great Britain and the United States of America in this year was productive of a variety of events, though for the most part on a small scale.

The temper of the government of the United States, at the commencement of the year, rendered it evident that nothing could prevent extremities with Great Britain. The spring passed away in the discussion of various measures of preparation by the congress, in which the war party displayed a manifest preponderance. An act for an embargo on all the shipping of the United States, for the term of ninety days from its date, passed the congress in the beginning of April, the purpose of which was to expedite the fitting out of the American ships of war, and to prevent any more pledges from remaining in the power of an enemy on the commencement of hostilities. Efforts were still made by the moderate party to retard a breach; and on the 29th of May Mr. Randolph brought the matter to a decision, by moving in the house of representatives a resolution, 'that, under the present circumstances, it is inexpedient to resort to a war with Great Britain.' This was negatived by sixty-two votes against thirty-seven.

The result of the subsequent discussions in congress was an act passed on the 18th June declaring the actual existence of war between the United States and Great Britain. This determination was carried in the house of representatives by a majority of seventy-nine against forty-nine.

Their operations against Canada commenced early in July 1812. General Hull entered the province of Upper Canada above Fort Detroit, and issued a proclamation to the Canadians, in a style of great confidence. He proceeded against

Fort Malden, but was foiled in his attempts to invest it; and retired to Detroit. Hull was there besieged in his turn, and on the 16th of August entered into a capitulation, by which he surrendered the fort, with 2500 men and thirty-three pieces of ordnance. The plan for the invasion of Canada, however, was by no means renounced; a considerable American force being assembled in the neighbourhood of Niagara, general Wadsworth, on October 13th, made an attack upon the British position of Queenstown. General Brock, who hastened to its defence, was killed while cheering on his men, and the position was for a time taken; but a reinforcement being brought up, by major-general Sheaffe, the Americans were defeated, and general Wadsworth, with 900 men, surrendered himself prisoner on the field.

These disgraces to the American arms by land were in some degree compensated by their successes at sea. Their navy consisted of a few frigates, of a rate corresponding to the largest British, but in size, weight of metal, and number of men, nearly equal to ships of the line. Hence, when encountered by British frigates, the latter found themselves, as it were, surprised into a conflict with antagonists of superior force. The first action of this kind took place on August 19th between the English frigate *Guerriere*, captain Dacres, and the American frigate *Constitution*, captain Hull, in which the former, being soon totally disabled by the enemy's very superior fire, was obliged to strike. The injury she had received was so great, that the captors set her on fire. On October 25th the Macedonian, English frigate, captain Carden, despoiling a large frigate under American colors, bore down, and an action ensued which was continued with great bravery for more than two hours; when the English ship being reduced to the condition of a perfect wreck, and having incurred a heavy loss of men, to save the rest it was found necessary to surrender. Her antagonist proved to be the United States, commodore Decatur, ranking as a frigate, with the scantling of a seventy-four gun ship. In an action between two sloops of war the advantage also was on the American side; and these events, so unusual to the British navy, though easily to be accounted for, were the source of as much mortification to one party, as triumph to the other. Numerous captures made by the American privateers, among the West India islands, gave rise to complaints from the merchants and planters of Jamaica. Such were the principal circumstance of the first year of the American war.

The lakes of Canada now became the most active scene of warfare, and a number of spirited actions took place on the coasts and waters which we cannot detail.

The enterprising spirit of the British navy was displayed, not only in occasional attacks on the towns situate on the American coast, but also in some contests with the enemy's vessels of war. —His majesty's frigate the *Shannon*, captain Broke, stationed off the port of Boston, had been brought to a state of the most perfect discipline by her commander, who assiduously exercised his men in the use of great and small arms. On

the 1st of June captain Broke stood close in with the Boston light-house, by way of a challenge to the United States' frigate the *Chesapeake*, a fine ship of forty-nine guns, full manned. The American accepted the proffered combat, and, standing out of the harbour, confidently bore down on his foe. The ships were soon in close contact, when captain Broke, perceiving a favorable opportunity, gave orders to board the *Chesapeake*, himself setting the example. The conflict was severe, but short: in two minutes the American's decks were cleared, her colors were hauled down, and the British flag hoisted over them; and she was led away in triumph, in the sight of a number of the inhabitants of Boston, who witnessed the action, and were expecting her victorious return.

As Great Britain was deeply interested in giving timely and efficient aid to her allies at this great crisis, parliament assembled for the despatch of business so early as the 4th of November, when it was opened by the prince regent in a speech from the throne. Its topics were chiefly the new alliances against the power of France, together with their successes, and the war with America.

A loan at this early period of £22,000,000, proposed by the chancellor of the exchequer, received the accustomed sanction of the house; and the foreign subsidies moved by Mr. Vansittart passed without a dissentient voice.

Blucher, who beside the grand Prussian army had under his command some Russian and Saxon divisions, commenced the new year 1814 with an invasion of the French empire. General Bismarck had led the way, and, having forced the entrenchments near the Lahn, he crossed the Rhine, and took possession of Coblenz. Baron Sacken passed over near Mannheim, and count Langeron near Bingen; and in three days they killed or took prisoners 1500 men. They were received with joy by the people; and marched to the Moselle, and the Marne, without any formidable opposit on.

The Austrian army, strengthened by Russian, Bavarian, and Wirtemberg divisions, invaded Alsace, under the direction of the prince of Schwartzberg, and, while he was making arrangements to co-operate with Blucher, the emperor Alexander and king of Prussia crossed the Rhine near Basle, with their respective bodies of reserve.

Napoleon being informed that marshal Mortier had been attacked at Bar-sur-Aube, and compelled to retreat, dexterously contrived to convert this disaster to his own purpose, by affirming that the French were victorious. On his approach to St. Dizier, which the Prussians had seized, he ordered that village to be assaulted; and, as it was occupied by only a small force, it was retaken without difficulty. This trivial exploit was also extolled in his usual style.

Other trials of strength and courage quickly, however, followed. On the 1st of February prince Blucher, having received a reinforcement from the prince of Schwartzberg, advanced with about 75,000 men, and engaged a nearly equal number of the enemy at La Rothière. That village formed the centre and the key of

the French position: the right wing was stationed at Dienville, and the left at Chaumenil and Giberie. The prince of Wirtemberg, on this occasion, strenuously contended with marshal Victor; drove him from the left, was dislodged in his turn, but recovered and maintained the post. Count Guilay attacked the right, but could not force it before midnight. Sacken's movements were directed against the centre, and with great difficulty and loss he expelled the enemy from La Rothière, which he defended against a personal attempt of the French emperor for its recovery. The French, after a considerable loss, made a retrograde movement towards Troyes and Arcis.

The Austrian and Prussian armies now continued their advance towards Paris, prince Schwartzberg proceeding along the banks of the Seine, while Blücher chiefly guided his course by the Marne. General D'York overtook the rear-guard of Macdonald's army, and gained such an advantage as led to the capture of Châlons. Napoleon having retreated to Nogent, the prince of Wirtemberg took possession of Troyes and Sens.

Alarmed at the progress of Blücher, whose troops were within three marches of the capital, Napoleon resolved to make a bold attempt to save it. He attacked and defeated at Champ-Aubert the division of general Alsfieff, too distantly situate to be assisted. General Sacken now advanced; and his division, aided by that of York, fought with obstinacy at Montmirail, but with doubtful success.

Blücher, when apprised of the advance of Marmont, determined on attacking that general at Etoges; recalled by this movement, Napoleon encouraged Marmont to face his adversary at Vauchamp. The battle which ensued on the 14th of February was almost entirely a contest between the French cavalry and the allied infantry, and Blücher found a retreat expedient.

Napoleon, elated with his success, now turned his arms with redoubled confidence against the prince of Schwartzberg, who had sent detachments within forty miles of Paris. Count Wittenstein was also attacked at Nangis, by a force which he was too weak to withstand. Three attacks were made on the army which occupied Montreuil and its vicinity, and all were repelled by the prince of Wirtemberg; but a fourth assault compelled him to retreat.

Blücher, now sensible of the danger of a march not sufficiently connected with the Austrian army, moved from Châlons with 55,000 men, with a view to a more effectual co-operation with it.

At this juncture (1st of March) a new treaty of alliance and subsidy was signed at Chaumont, by lord viscount Castlereagh, the representative of England, with prince Metternich, count Nesselrode, and baron Hardenberg, the ministers of Austria, Russia, and Prussia. Negotiations with Napoleon were opened at Chatillon, but his ultimatum was peremptorily rejected.

Napoleon now crossed the Aisne, and attacked the left wing of the allies with such vigor as to make a considerable impression; the con-

sequence was a retreat to Laon. In the front of that town Blücher concentrated his army, which considerably exceeded that of the French. Bulow occupied the town and an adjacent conical hill. The corps of Winzengerode, Sacken, and Langeron, formed the right; and the left positions were defended by York and Kleist. Napoleon, having failed in an attack on this position, now retired to Soissons.

In the south-west of France lord Wellington resumed offensive operations by the seizure of Orthes, and the whole British army passed the Adour, when the citadel of Bayonne was closely invested.

On the 12th of March the important city of Bourdeaux was occupied by a detachment under the command of marshal Beresford. This event was the result of a counter-revolutionary movement, favored by the mayor and principal inhabitants, who, mounting the white cockade, declared for the Bourbons. The duke d'Angoulême, nephew to Louis XVI., entered Bourdeaux with the British troops. Lord Wellington then marching against Soult, the latter proceeded to Tarbes, from which place he was driven with considerable loss.

We left Napoleon making his second advance against Blücher, whose army (3rd of March) effected a junction with Winzengerode and Bulow at Soissons. On the 9th he repulsed Napoleon, who, after a severe action on that and the following day, retreated at all points, with the loss of forty-eight pieces of cannon, and between 5000 and 6000 prisoners. This success induced Schwartzberg again to advance, and the Austrian and French armies now made a desperate struggle for the possession of Vitry. Napoleon, however, took the road to St. Dizier with his whole army, his plan being, as discovered by an intercepted letter, to push between the two allied armies. The discovery of his intentions produced an immediate determination of the allied generals to unite their forces, and march to Paris.

On the 27th of March the grand allied army had its head-quarters at Coulmieu. On the following day Blücher passed the Marne at Meaux. On the 29th the corps of Marmont and Mortier entered Paris, in which there had been previously assembled a body of regular troops, with 30,000 national guards.

The allies were posted with their right towards Montmartre, and their left towards the wood of Vincennes, when prince Schwartzberg addressed a proclamation to the people of Paris, in which, acquainting them with the presence of the army of the allies before their city, whose object was a sincere and lasting reconciliation with France, he said, 'The attempts hitherto made to put an end to so many calamities have been fruitless, because there exists in the very power of the government which oppresses you an insurmountable obstacle to peace.'

But the fate of the French emperor was not to be decided without another struggle. On the 30th of March, the French army, under the command of Joseph Buonaparte, assisted by marshals Marmont and Mortier, took a position on the heights near Paris, in a long line, the

centre of which was protected by several redoubts, and more than 150 pieces of cannon. An attack was immediately determined on by the allies, and it was commenced by the two princes of Wirtemberg. After an obstinate resistance the heights were carried : the success of the day, however, was for some time retarded by an accident which delayed the advance of Blücher; but at length the positions gained by the allies, and the losses of the French, induced the latter to send a flag of truce proposing a cessation of hostilities. By the capitulation that followed, Paris was evacuated on the morning of the 31st of March by the troops of Marmont and Mortier, carrying with them all their military appurtenances. On the same day the allied sovereigns entered Paris, attended by their guards. The emperor of Russia then issued a declaration, expressing the intentions of himself and his colleagues. It affirmed, that they would no more treat with Napoleon Buonaparte, nor with any of his family; that they respected the integrity of France as it existed under its legitimate kings; and that they would recognise and guarantee the constitution which France should adopt. The senate assembled on the 1st of April, Talleyrand, prince of Benevento, being appointed president. Their first act was to pass a decree for a provisional government, consisting of five persons, the president himself being at their head. By a second decree it was asserted, that in a constitutional monarchy the monarch exists only in virtue of the constitution or social compact. It then proceeds to prove the violation of that compact by Napoleon Buonaparte in various specified articles; and pronounced, 'that he had forfeited the throne, and that the hereditary right established in his family was abolished.'

Napoleon, thus out-manœuvred both in his military and political capacity, moved his army from Troyes by the way of Sens; and, arriving at Fromont on the 30th, retired in confusion to Fontainebleau, whence, on the 4th of April, he sent a deputation to the senate, offering to submit to its decision. The emperor of Russia afterwards proposed to him to name a place which he should choose as a residence for himself and his family, when he nominated Elba, an island lying on the coast of Tuscany. On the 11th of April a treaty was signed between him and the allied powers, by the articles of which he and his spouse Maria Louisa were to retain the imperial title, with the isle of Elba in full sovereignty; the empress likewise was to be put in possession of the duchies of Parma and Placentia, with succession to her son and descendants. A pension of 2,000,000 of francs was assigned to Napoleon from the revenues of France, with the reversion of 1,000,000 to the empress, and 2,500,000 in various proportions to his relatives. To this treaty, however, the British ministry refused its concurrence, farther than respected the assignment of Elba to Napoleon, and of the Italian duchies to Maria Louisa.

The war, however, did not immediately cease. In a contest for the possession of Toulouse much blood was shed: the allies, however, obtained it. In a sortie from Bayonne some loss

was also sustained; but these hostilities at length yielded to an armistice. In Italy, an expedition was undertaken by lord William Bentinck early in the spring, whose object was to annihilate the French influence over the Genoese. With the aid of commodore Rowley he reduced the city of Genoa, and left it at the disposal of those powers which were proceeding to a settlement of the affairs of Europe.

Louis XVIII. now repaired to London, and, having received from the good citizens the most gratifying marks of respect, proceeded to Dover, and on the 24th of April embarked in a royal yacht, convoyed by the duke of Clarence. For his reception in France, see FRANCE.

A definitive treaty of peace between France and the allied powers was signed at Paris on the 30th of May 1814. This famous treaty, in conformity to the liberal professions of those powers, was, in respect to France, equitable and honorable; guaranteeing to her the boundaries existing on the 1st of January 1792, with some slight additions of territory on the side of Belgium and Germany, and a considerable portion of Savoy, including Chambéry and Annecy. The navigation of the Rhine was declared free; the house of Orange was recognised in its newly assumed sovereign capacity; and the German states were united in a federal league. Switzerland was destined to remain independent; but Italy was once more doomed to receive the yoke of despotism. Great Britain restored her conquests to France, with the exception of Tobago, St. Lucia, and the Mauritius. Malta was confirmed to England; and France engaged to erect no fortifications in India: she also engaged to co-operate with Great Britain in the abolition of the slave trade.

Before the allies reached Paris, the impossibility of preserving Spain had prompted Napoleon to release Ferdinand from captivity; and, trusting to his authority and influence, that prince quietly entered Spain by a different route from that which the regency had recommended, and proceeded to Valencia. Here he issued two decrees stigmatising the existing cortes as illegally framed and composed; and, having condemned the new constitution, dissolved the assembly.

The parliament of Great Britain, which, pursuant to their adjournment, assembled on the 1st of March 1814, again adjourned to the 21st of that month; but the business of the session possessed comparatively little interest.

The war between Great Britain and the United States of America was in this year carried on with an increase of vigor and force, which indicated a serious intention of bringing it to a speedy termination; in fact, that intention was first displayed by measures towards a pacific negotiation. On the 7th of January the president communicated to congress copies of letters which had passed between lord Castlereagh and Mr. Monroe, in which the former proposed the appointment of plenipotentiaries to treat on terms of peace, either at London or Gottenburg; which proposal was accepted by the president, who made choice of Gottenburg. Such a step was rendered the more expedient to the American government, by the open opposition to the war manifested in the northern states.

The military operations on the coasts of the southern American states had hitherto been rather of a harassing and predatory kind, than directed to any important purpose; but it was now resolved to strike a blow in this quarter, which might exert an influence on the fate of the war. A large naval force under the command of vice-admiral Sir Alexander Cochrane, having on board a strong body of troops commanded by major-general Robert Ross, was in the Chesapeake the beginning of August, waiting for the arrival of the rear-admiral Malcolm with an expedition from Bermuda. On their junction the admiral was informed, by rear-admiral Cockburn, that the American commodore Barney, with the Baltimore flotilla, had taken shelter at the head of the Patuxent. Of this circumstance they determined to take advantage for ascending the river, with the declared purpose of an attack upon Barney, while their real object was the city of Washington, the American capital.

On the 19th and 20th of August, the army being landed at that place, general Ross began his march to Washington; the force of the Americans for its protection having been ascertained to be such as would justify an attempt to take it by a coup de main. Arriving on the 24th within five miles of the capital, he found the Americans, to the number of 8000 or 9000, strongly posted to dispute his advance. An attack on them was immediately directed; and it was made with so much impetuosity, that they were in a short time wholly dispersed, and the British army reached Washington in the evening of the same day. No time was lost in commencing the work of destruction, which was the main purpose of the expedition. The public buildings, &c. committed to the flames were, the capitol, including the senate-house and house of representatives, the president's palace, the arsenal, the dock-yard, treasury, war office, rope-walk, the great bridge across the Potomac, a frigate ready to be launched, and a sloop of war, in the dock-yard. On the following night a retreat was commenced, and the army, having met with no molestation on its return, was on the 30th reimbarked.

The American president on this issued a proclamation, in which he spoke of the devastation at Washington as a measure of extreme and barbarous severity; and mentioned that the British naval commander on the station had avowed his purpose of destroying and laying waste such towns and districts on the coast as should be found assailable, under the pretext of retaliation for the ravages committed in Upper Canada, though none such occurred but what had been shown to be unauthorised. He then called upon all officers to be alert and vigilant in providing the means of defence.

The negotiations for peace, which had been removed from Gottenburg to Ghent, commenced in August 1814; and on the 24th of December a treaty of peace and amity between Great Britain and the United States was signed, which afterwards received a ratification from both governments. The articles of this treaty chiefly related to the disputes respecting boundaries, for the determination of which it was agreed that

commissioners should reciprocally be appointed. Both parties shrank to continue their efforts for the abolition of the slave trade. No notice whatever was taken of the circumstances which had occasioned the war.

This year was rendered memorable by a concourse of visitors to the English capital, surpassing in number and rank any modern example. In the beginning of June arrived the emperor of Russia, with his sister the duchess of Oldenburg, and the king of Prussia and his two sons, attended by various persons of high distinction. Prince Metternich, prince Czernicheff, and generals Blucher, Barclay de Tolly, Platoff the hetman of the cossacks, &c., were among the number. The king of Prussia appeared to labor under deep dejection. After a residence of some weeks, in the course of which the sovereigns were magnificently entertained by the city of London, these illustrious guests returned to the continent, much gratified. For the circumstances in France leading to the return of Napoleon, see FRANCE.

When the allied powers had received certain information of Napoleon's descent, they issued a manifesto, dated the 13th of March, in which they declared, 'that Napoleon Buonaparte, by violating the convention which had established him at Elba, had placed himself out of the pale of civil and social relations; and, as an enemy and disturber of the tranquillity of the world, had rendered himself liable to public vengeance.' They therefore announced, without reserve, their determination of uniting their efforts to secure Europe against any attempt which might threaten to replunge it into revolutionary disorders.

Nor was this a mere menace. The declaration was confirmed by a treaty, dated March 25th, which bound each of the four powers to bring 150,000 men into the field, and not desist from their exertions until they should have rendered Napoleon wholly incapable of disturbing the tranquillity of Europe. England was permitted to substitute pecuniary payment for a part of the stipulated force.

The whole of France now seemed to unite in favor of the emperor, who, having mustered his resources (see FRANCE), quitted Paris to meet his enemies for the last time early in June.

The close of the last year had left the whole fortified frontier of the Belgic provinces, on the side of France, occupied by strong garrisons, chiefly of British troops, or of such as were in British pay. From the commencement of the alarm excited by Napoleon's attempt, reinforcements had been unremittently sent from England, and the duke of Wellington had arrived to take the supreme command of the British and foreign troops. In the latter part of May the Prussian army, commanded by prince Blucher, arrived in the neighbourhood, and frequent conferences relative to co-operation were held by the two generals. The principal French army was at this period posted near Avesnes in Flanders, and preparations for defence against invasion had been made at Laon and the castle of Guise.

On the 12th of June Napoleon proceeded to Laon. In strict conformity with his usual plan

of pushing forward at once to the most important point, he resolved on attacking the British and Prussian armies, whilst the Russians and Austrians were still remote. At the head of a numerous and well-appointed army, composed of the flower of the French regulars, animated with enthusiastic confidence in their leader, at daylight of the 15th he made his first attack on the Prussian posts on the Sambre. Charleroi being carried, general Ziethen retired upon Fleurus, where he was attacked, and sustained considerable loss. Blücher concentrated the rest of the Prussian army at Sombref; and the French, continuing their advance on the road to Brussels, drove back a brigade of the Belgian army, under the prince of Weimar, to the position of a farmhouse named Quatre Bras.

Through some defect of intelligence, the duke of Wellington was not informed of these events till the evening, when he immediately ordered such of his troops as were in readiness to march to the left and support the Prussians. On the 16th Blücher, who was posted on the heights between Brie and Sombref, awaited the attack of the French. The battle raged with great fury from three in the afternoon till late in the evening, when the Prussians, pressed by superior numbers, and receiving no succor, were forced to retire, leaving behind them sixteen pieces of cannon, and a great number of killed and wounded. They however formed again at a short distance, and were not pursued. Their veteran commander made extraordinary exertions, and was brought into imminent personal danger.

Lord Wellington, in the mean time, had directed his whole army to advance upon Quatre Bras, where the fifth division, under general Picton, arrived early in the afternoon of the 16th, and was followed by the corps under the command of the duke of Brunswick and the contingent of Nassau. It was the wish of the duke of Wellington to afford assistance to Blücher; but he was himself attacked by a large body of cavalry and infantry, with a powerful artillery, while his own cavalry had not yet joined. The repeated charges of the French were steadily repulsed, but a considerable loss was incurred, including that of the duke of Brunswick.

Blücher found himself so much weakened by the day's action, that he fell back during the night to Wavre; and this caused the duke of Wellington to retire, on the morning of the 17th, upon Gemappe, and thence to Waterloo, in order to maintain the communication. The chain of heights occupied by the British army, two miles in front of the village of Waterloo, traversed the high roads leading from Charleroi and Nivelles to Brussels, and uniting at the hamlet of St. Jean in the rear of the British position. The results of the battle which followed were so important, and it constitutes in all its details such an example of British military skill and valor, that it merits distinct notice. See our article *WATERLOO*.

The consternation of Napoleon is said to have been extreme. When he saw the rout become too apparent to be mistaken, he exclaimed to the persons near him, 'It is all over; we must now

look to our own safety.' See *FRANCE* and *NAPOLEON*.

After the victory, the allies came to the determination of treating with the French only under the walls of Paris. On the 23d lord Wellington sent a detachment against Cambrai, which was taken by escalade without much loss; and Louis XVIII. soon after removed from Ghent. The march of the allied army was now one continued triumph.

Blücher met with considerable opposition in establishing himself on the left of the Seine, but he ultimately succeeded; and Paris being now exposed, on its most vulnerable side, a request came for the cessation of hostilities. A convention was concluded on the 3rd of July between prince Blücher and the duke of Wellington on the one part, and Davoust (prince of Eckmühl) on the other, referring merely to military points. By its stipulation, the French army was on the following day to commence its march for the Loire, and was in three days completely to evacuate Paris; all the posts around the city, and its barriers, were to be given up; the duty of Paris was to be performed by the national guards and the municipal gendarmerie; public property was to be respected, with the exception of what related to war; and all individuals continuing in the capital were to enjoy their rights and liberties, 'without being called to account, either for the situations they may have held, or as to their conduct or political opinions.' This last clause is worthy of observation, because it was afterwards adduced on the trial of marshal Ney as a promise of a general amnesty.

At Paris the chambers continued their sittings until they were closed by order of the military; and on the 8th of July Louis XVIII. once more made his entry into the capital under the most gloomy omens. Its military positions were all occupied by the allied troops. For the sequel of the ex-emperor's history, see *NAPOLEON*.

Weighed down by mental suffering, and the disorders incident to a tropical climate, he expired at St. Helena on the 5th of May, 1821.

After a long and anxious suspense the congress held at Vienna made publicly known the conditions on which France was permitted to keep her station in the European community. This, however, was definitively settled at Paris, by a treaty signed November 20th, which stipulated that Louis should cede to the allies the important fortresses of Landau, Saar-Louis, Philippeville, and Marienburg, with the duchy of Bouillon. Versoix, and part of the territory of Gex, were yielded to the Helvetic confederacy; the works of Huningen were dismantled; and France engaged to erect no others within the distance of three leagues from Basle, thus leaving a free passage into the heart of France. Seventeen of the principal towns on the frontiers of French Flanders, Champagne, Lorraine, and Alsace, among which were Conde, Valenciennes, Cambrai, &c., the bulwarks of her Flemish and Germanic frontier, were to be delivered up to the allies, to be held in trust for five years by an army of occupation, consisting of 150,000 men, to be maintained solely at the expense of France. An assessment was also levied upon the latter of

700,000,000 of francs, to be divided among the allies, and defrayed by modes and at periods specified in a separate convention. Conditions so degrading Marlborough and Eugene had never offered to impose after ten victorious campaigns. Such, however, was the mode adopted by the allies to maintain the imbecile monarch on his inglorious and improvident throne;—such the bitter cup of humiliation to be drained by that country, after so many triumphs over her neighbours, enjoyed with so little moderation.

Since the assumption of the regal title by the house of Orange its prudence and moderation had been conspicuous. Subsequent to the battle of Waterloo, in which the prince had displayed all the heroism of his ancient house, a committee had been appointed to draw up a constitution for the Seventeen Provinces. This was afterwards laid before an extraordinary assembly of the States of the United Netherlands, by whom it was unanimously accepted. In September the ceremonial of the king's inauguration took place at Brussels, with every mark of general satisfaction.

It is now time that we glance at the domestic concerns of Great Britain during 1815. In the parliamentary discussions which arose on the royal message of the 22nd of May, and its concomitant documents, lord Castlereagh stated, 'that Austria, Russia, and Prussia had engaged to furnish contingents in the following proportion:—Austria 300,000, Russia 225,000, Prussia 236,000 men; and the other states of Germany 150,000. Great Britain and Holland 50,000 each; and Britain to advance the sum of £5,000,000 in subsidies.' The measures of the ministry were supported by vast majorities in both houses, and the almost unanimous voice of the nation. Yet there were a few individuals in each house, distinguished for talent and integrity, who deprecated this warlike policy.

The estimate of expenditure for the present year was of a magnitude exceeding all precedent; the amount being £80,000,000 for Great Britain, and £10,000,000 more for Ireland. To meet this astonishing demand, the war taxes were continued to the height. Two successive loans were negotiated for £45,500,000, and a vote of credit passed for £6,000,000. Subsequent to the victory of Waterloo the additional sum of £200,000 was voted to the duke of Wellington; and, in addition to the parliamentary and royal honors and rewards conferred on the conquerors of Waterloo, a national and truly noble subscription of nearly £500,000 was raised for the relief of the soldiers disabled by wounds, and the widows of the slain. On presenting the money bills for the royal assent, the speaker of the house of commons addressed the prince regent in terms of the highest exultation. Parliament was prorogued 11th July.

After a long recess, the parliament re-assembled on the 1st of February, 1816. The return of peace, though it brought security in its train, did not diminish the burdens of the nation in that degree which was expected. A large standing army was maintained; and it was the intention of the ministry to continue the odious tax on property, not altogether at its full amount,

but with a reduction of five per cent. This excited a general alarm. Notwithstanding the presentation of numerous petitions against the impost, the chancellor of the exchequer ventured to propose its continuance; but the spirit of the house revolted from it; and when it was exploded, by a majority of thirty-seven votes, the shouts which arose from the unexpected popular triumph resounded over the whole neighbourhood.

The debates respecting the new settlement of the civil list were warm and acrimonious.

Soon after the opening of the session Mr. Brougham moved for the production of a copy of a treaty entered into at Paris, on the 26th of September, 1815, between the sovereigns of Austria, Russia, and Prussia, and which had received the sign-manual of those potentates. By the tenor of this singular document, which received the name of 'The Holy Alliance,' being couched in the most devout and solemn language, the high contracting parties declared their resolution to take for their sole guide, both in their domestic administration and foreign relations, the precepts of the holy religion of Christ their Saviour. Politicians were much perplexed to comprehend the meaning of an engagement at once so vague and so serious, and the production of it was resisted by lord Castlereagh, though he admitted that the prince regent had been urged by a joint letter of the three sovereigns to accede to it, and had in reply expressed his satisfaction with the nature of the treaty, and given an assurance, that the British government would not be one of the least disposed to act up to its principles. Subsequent events seem to indicate, that a resolution to support the authority of each other against any revolutionary movement among their own subjects, was the true object of this mystical combination.

During the session a message from the prince regent announced the approaching marriage, with his consent, of his daughter the princess Charlotte Augusta, with his serene highness Leopold George Frederick, prince of Saxe Coburg-Saalfeld, who had visited England in the train of the confederate sovereigns. His royal highness expressed his persuasion of the concurrence of the house in enabling him to make such provision on the occasion, as might correspond with the dignity and honor of the country. It was consequently proposed by the chancellor of the exchequer, and unanimously agreed to by the house, that an income of £60,000 should be settled on the illustrious pair; of which £10,000 were to form a sort of privy purse for her royal highness, and the remainder was to defray the domestic expenses of the prince of Coburg; this sum to be settled on them for their joint lives. Should the prince of Coburg die first, the whole was to be continued to her royal highness; if he should be the survivor, the sum of £50,000 was to be continued to him. The allowance to the princess from the civil list of £30,000 a-year was to cease.

From the period of the restoration of king Ferdinand VII. to the Spanish throne, his reign had been characterised by a series of uncontrolled bigotry, cruelty, and despotism.

Mr. Brougham, the able and intrepid advocate of freedom, now drew the attention of the British public to the proceedings in Spain; and during the session of 1816 brought forward a motion for an address to the prince regent, 'humbly intreating him to take into his gracious consideration the sufferings of the late Spanish regency and cortes; and representing that the alliance at present subsisting between his royal highness and his Catholic majesty affords the most favorable opportunity for interposing the good offices of Great Britain in their behalf, with the weight that belongs to her, and to the sentiments of this house and of the people.'

The distresses of the agricultural interests produced a number of petitions to parliament for relief. One member attributed the pressure to a combination of causes, but chiefly to the enormity of taxation; another to an overtrading in the bounty of the soil, and a consequent redundancy of produce: but all were at a loss to devise a promising remedy. The manufacturers at the same time complained of that want of employment which was occasioned by the general impoverishment of their countrymen. Riots arose in several counties from the discontent which this state of affairs produced.

Near the close of the year a popular meeting took place in Spa-fields, Islington, and resolutions of reform, suggested by Mr. Henry Hunt, were voted by acclamation. An apothecary of the name of Watson also harangued the rabble in the same neighbourhood; and the subsequent operations of those who listened to his oratory excited a temporary alarm in the metropolis. The rioters paraded the streets, carried off fire-arms from the shops of several gunsmiths, marched to the Royal Exchange, where they had a short contest with the lord mayor and some officers of the police; but they at length dispersed from the fear of a military attack. These disturbances did not seriously encroach, however, on the general tranquillity of the realm.

In the midst of the tranquillity of Europe, an unexpected war arose on the coast of Africa in the course of this year, which gave occasion for a display of the undaunted valor of the British navy, not less honorable in its principle than splendid and triumphant in its results. The conduct of the Algerines, and other barbarians on that coast, had long excited general indignation; and, as even British vessels were occasionally attacked by them, lord Exmouth, being ordered by the prince regent to try the effect of temperate expostulation, sailed to Algiers, and submitted to the dey's consideration, that he should treat the Ionian Isles as if they were British colonies; that he should conclude peace with the kings of Naples and Sardinia; and that he should abolish Christian slavery in his dominions. Promises were given on the first two heads, but the other request was considered by the dey too important to be hastily settled. The rulers of Tunis and Tripoli, who were also addressed by the admiral, were more compliant; they promised that they would not consign prisoners of war to the miseries or disgrace of slavery, but would treat them according to the practice of Christian nations.

Returning to Algiers, his lordship renewed his remonstrances, but without effect; and, while he was thus employed, a brutal massacre was perpetrated at Bona upon many coral fishers, acting under the supposed security of the British flag. A fresh squadron, adapted to a bold enterprise, was therefore put under lord Exmouth's command; and he was joined by vice-admiral Capellen, of the Netherlands.

The session of parliament was opened, January the 28th, 1817, by the prince regent in person. The speech from the throne stated the anxious desire of government to make every reduction which the safety of the empire and true policy would allow; the deficiency in the revenue was acknowledged, but ascribed to temporary causes; continued assurances of amity from foreign powers were mentioned; but the most remarkable passages of this speech are those which relate to the state of the country as drawn in the late petitions. 'I am too well convinced,' said his royal highness, 'of the loyalty and good sense of the great body of his majesty's subjects, to believe them to be capable of being perverted by the arts which are employed to seduce them.'

On the return of the prince regent from the house of peers an immense crowd had assembled in the park, by whom he was received with marked demonstrations of popular resentment; and on passing Carlton-house the glass of the carriage was broken by a stone; nor was it without some difficulty that he at length reached the palace. This flagrant outrage being on the same day reported by lord Sidmouth to parliament, the two houses joined in an address suitable to the occasion; moreover, £1000 reward was offered, but in vain, for the discovery of the offender.

On the 3d of February a message was brought down from the prince regent to both houses of parliament, announcing that he had ordered papers to be laid before parliament, containing information of certain practices, meetings, and combinations, in the metropolis and in different parts of the kingdom, evidently calculated to endanger the public tranquillity, to alienate the affections of his majesty's subjects from his person and government, and to bring into hatred and contempt the whole system of our laws and government. On the motion of ministers these papers were referred by each house to a secret committee of the members. The reports of the two committees were delivered to their respective houses on the 18th and 19th of February; and through them some alarming statements were made to the public.

The first result of these proceedings was a motion by lord Sidmouth in the upper house, for a suspension of the habeas corpus act until the 1st of July ensuing; which was carried by a great majority, though not without strong opposition from several eminent noblemen, and a protest signed by eighteen. In the house of commons, lord Castlereagh made a motion to a similar effect; giving notice at the same time of farther measures for the protection of the country against the machinations of the disaffected. These were,—first, the extending of the act of 1795, for the security of his majesty's person to

that of his royal highness the prince regent; secondly, the embodying into one act the provisions of the act of 1795, relative to tumultuous meetings and debating societies, and the provisions of the act of the 39th of the king, which declared the illegality of all societies bound together by secret oaths, and of such as extended themselves by fraternised branches over the kingdom; and, lastly, the making of enactments to punish with the utmost rigor any attempt to gain over soldiers or sailors to act with any association or set of men, or to withdraw them from their allegiance.

Imputing the distress of the people to misgovernment, and the want of reform, a person resident in the county of Nottingham, whose name was Brandreth, aided by several other manufacturers, strenuously exerted themselves to organise an insurrection in that county; yet, with all their clamor and persuasion, they could muster only a very small party: and the result was, that these infatuated men only deluded themselves, and precipitated their own ruin.

Mr. Wilberforce embraced an opportunity, before the close of the session, to call the attention of the house of commons to the slave trade, which was still carried on without molestation by the subjects of France, Spain, and more especially Portugal, which had extended its traffic along the whole coast of Africa; so that the accession of these powers to the eventual abolition was a mere dead letter. He consequently moved an address to the prince regent, praying 'that he would be pleased to pursue with unremitting activity the negotiations into which he had already entered on this important subject.' Lord Castlereagh suggested the danger of interfering with pending negotiations; but, as the house betrayed no symptoms of alarm on that head, he acquiesced in the motion, which passed unanimously.

Towards the close of the session Mr. Abbot, who had held the office of speaker in five successive parliaments with distinguished reputation, intimated his intention of resigning, on account of indisposition; and was soon afterwards called to the house of lords, by the title of lord Colchester; an annuity of £4000 being granted to him for his meritorious services. The right honorable Charles Manners Sutton was elected in his place; and the parliament was prorogued in person by the prince regent on the 12th of July.

In the month of August arrived at Portsmouth, from his embassy to China, lord Amherst, who had left England in 1816, and arrived off the Chinese coast in the following July. Whatever were the advantages anticipated from this expensive equipment, of which indeed the prospect, after the total failure of the former embassy by lord Macartney, must have been very faint, they were entirely frustrated by the refusal of lord Amherst to submit to the degrading ceremonial of prostration now required by the court of Peking, though dispensed with in the person of his predecessor. The emperor, however, in his 'imperial mandate to the king of England,' for such was the language of the court of Peking, expressed his satisfaction 'at the dis-

position of profound respect, and due obedience, which were visible in sending this embassy.' 'I therefore,' says he, 'thought proper to take from the articles of tribute a few maps, with some prints and portraits. In return, I ordered to be given to you, O king, a *jouée* (a string of imperial beads), two large silk purses, and eight small ones, as a proof of our tender and indulgent conduct. Your country is too remote from the central and flourishing empire. Besides your ambassador, it would seem, does not know how to practise the rites and ceremonies of the central empire. There will be no occasion hereafter for you to send an ambassador from so great a distance, and to give him the trouble of passing over mountains, and crossing the ocean. If you do but pour out the heart in dutiful obedience, it is by no means necessary, at any stated time, to come to the celestial presence.' Such was the haughty language of rebuke in which the emperor of China thought proper to address the king of England, after which, it can hardly be expected that a third embassy to China will speedily take place.

The 6th of November this year was rendered fatally memorable by the sudden and melancholy demise of the princess Charlotte of Wales, presumptive heiress of the crown, immediately after the birth of a still-born infant.

The general regret had not entirely subsided when, on the 28th of January, the British parliament re-assembled. The prince regent then declared, that it was a soothing consolation to his heart to receive from all descriptions of his Majesty's subjects the most cordial assurances, both of their just sense of the loss which they had sustained, and of their sympathy with his parental sorrow; and that, amidst his own sufferings, he had not been unmindful of the effect which this sad event must have on the interests and future prospects of the kingdom. The affairs of this session were not remarkably interesting. The first bill that was brought forward provided for a repeal of the act which suspended the *habeas corpus*. As ministers could not deny that some irregularities had been committed in the exercise of the great powers which had been allowed to them, they also demanded from the two houses a bill of indemnity for themselves, and for all who had acted under them.

The subject of education, particularly that of the poor, occasioned some debates in parliament. It was generally believed that shameful abuses and embezzlements had disgraced the characters of many trustees, appointed to superintend the application of those funds which were destined to aid the purposes of public instruction. Mr. Brougham therefore proposed, that persons of learning, judgment, and respectability, should be authorised to make a strict enquiry into the execution of every trust of this kind. A bill to that effect received the royal assent.

The diffusion of religious knowledge also occupied the attention of both houses of parliament. A message was brought down from the prince regent, desiring them to direct their attention 'to the deficiency which had so long existed in the number of places of worship belonging to the established church, when com-

pared with the increasing population of the country,' and £1,000,000 sterling was voted for the building of new churches. Lord Holland suggested the expediency of drawing a large sum for this purpose from the richly endowed church of England; but this idea was instantly exploded by the higher clergy, although the archbishop of Canterbury and some of his brethren contributed by individual donations to the increase of the fund.

A royal message, on the 13th of April, announced the intended marriages of the dukes of Clarence and Cambridge, to the princesses of Saxe Meiningen and Hesse-Cassel; and, soon after, that of the duke of Kent to the dowager-princess of Saxe Leiningen, sister of prince Leopold of Saxe Coburg. The prince regent at the same time expressed 'his reliance on the readiness of parliament to make the necessary provision for the same,' which gave rise to a memorable debate. Parliament therefore granted an addition of £10,000 to the income of the duke of Clarence, and £6000 to the other dukes. The latter sum was not objected to; but, no reason being assigned why the house should show any partiality to the duke of Clarence, Mr. H. Sumner moved an amendment, placing him on the same level, which was carried by 193 to 184 voices.

In April the princess Elizabeth, third daughter of the king, was married to the hereditary prince of Hesse Homberg; but no application was made to parliament on that account.

A treaty, alluded to in the speech from the throne, between England and Spain, relative to the slave trade, was laid before the house by lord Castlereagh. Conformably to the articles of this treaty, Spain, in consideration of the sum of £400,000, to be paid her by England, in compensation of the losses which had been or might be sustained by the subjects of his Catholic majesty engaged in that traffic, consented to its abolition on all the coasts of Africa, north of the line, still leaving it open to the south! A convention was also concluded with Portugal to the same effect.

On the 4th of November the plenipotentiaries of the courts of Austria, Great Britain, Prussia, and Russia, assembled at Aix-la-Chapelle, where they addressed to the duke of Richelieu, the French minister, the following important document:—That their august masters being called upon, by the twentieth article of the treaty of Paris, to examine, in concert with the king of France, whether the military occupation of a part of the French territory, stipulated by that treaty, ought to cease at the termination of the third year, or be prolonged to that of the fifth; had recognised, with satisfaction, that the order of things established by the restoration of the legitimate and constitutional monarchy of that country, gave assurance of the consolidation of that state of tranquillity in France necessary to the repose of Europe; and that in consequence they had commanded the immediate discontinuance of such military occupation,—a measure which they regarded as the complement of the peace.

Her majesty queen Charlotte expired at Kew

palace on the 7th of November, in the seventy-fifth year of her age, after a lingering decline, attended with much suffering, which is said to have been sustained with great fortitude. She merited the respect of the nation by her conjugal and maternal character, by the uniform propriety of her conduct, and by the strict decorum which she maintained at court. Her ruling passion in the decline of life was believed to be the accumulation of riches; the political influence which she acquired during the illness of the king, in 1788, she maintained to the last.

The new parliament was convened for the despatch of business on the 14th of January, 1819. On the 21st, the speech delivered by the lord chancellor, stated that his royal highness was persuaded that parliament would view with peculiar satisfaction the intimate union which so happily subsisted among the powers who were parties to the late congress of Aix-la-Chapelle. His royal highness had the greatest pleasure in being able to inform the parliament, that the trade, commerce, and manufactures of the country were in a very flourishing condition! In adverting to the papers relative to India, which the prince regent had directed to be laid before the two houses, the lords commissioners had the commands of his royal highness to inform them, that the operations undertaken against the Pindarees were dictated by the strictest principles of self defence; and that, in the extended hostilities which followed, the Mahratta princes were in every instance the aggressors.' The addresses in answer to the regent's speech were voted without opposition, and both houses condoled with his royal highness on the death of his venerable parent. It was now proposed that the duke of York should have the custody of the royal person; and that he should be remunerated with an annual grant of £10,000, for the great trouble and extraordinary expense which must unavoidably attend his occasional journeys to Windsor. After warm debates this allowance was voted; but the Windsor establishment was at the same time reduced.

A topic deeply interesting to the friends of humanity occupied the early attention of the new parliament. This was the state of the criminal code. On the 9th of February Mr. Wilberforce presented a petition, from the people called Quakers, praying for a revival of it. A petition was also presented from the corporation of London, complaining of the increase of crimes, and pointing out the commutation of capital punishment as a remedy. Ministers on the 1st of March proposed to refer the subject to a committee; and on the following day Sir James Mackintosh rose to make a motion to this effect.

He divided capital felonies into three classes; those on which the punishment of death was always, those on which it was very often, and those on which it was never put in force. The first and second divisions he proposed for the present to leave untouched: the last, consisting of no less than 150 different crimes, ought, he conceived, to be expunged entirely from the list, as the relic of barbarous times, and disgraceful to the character of a thinking and en-

lightened people. Lord Castlereagh passed many compliments on the candid and moderate spirit in which the honorable and learned gentleman had brought forward his motion; but he persisted in opposing the appointment of a separate committee. Other members, however, strenuously supported the measure, and it was finally carried by a majority of 147 to 128 voices.

During this session of parliament, and the succeeding months, the political horizon of Great Britain wore a clouded aspect. A numerous part of the community, chiefly of the operative class of citizens, became clamorous for what they termed a radical reform, as the only remedy for grievances that were become intolerable; and their tone had risen to such an elevation at the time of the prorogation, that the speech from the throne noticed, in the language of asperity, the 'attempts which had been made in some of the manufacturing districts, to take advantage of circumstances of local distress to excite a spirit of disaffection to the institutions and government of the country.' Meetings took place in various parts, and strong resolutions were voted. At Manchester, Leeds, Stockport, &c., multitudes of artisans and manufacturers were convened to listen to speeches from popular orators, and to pass by acclamation resolutions for annual parliaments, universal suffrage, and voting by ballot. In general these assemblages were regularly convoked and dissolved without any tumultuous proceedings, though with minds greatly inflamed by wild declamation against what were called the usurpations of the higher orders, and the intolerable sufferings of the poor. It afterwards appeared, that some of the most violent of these harangues were made by spies of government.

On the 16th of August, pursuant to notice given by means of hand-bills and placards, a meeting was held in an open space called St. Petersfield, near a church of that name in Manchester. During the whole morning large bodies of reformers, arrayed in regular order, continued marching in from the neighbouring towns and villages. Each party or division had its own banner, bearing some short inscription or motto, such as 'no corn laws,' 'universal suffrage,' 'vote by ballot,' 'liberty or death,' &c. &c. The numbers collected on this occasion were estimated at 50,000 or 60,000. The chairman of this meeting was a Mr. Henry Hunt, a person of more talent than principle. Having ascended the platform, he harangued the mob, expressing his full confidence in their orderly and peaceable demeanor; nor was any offensive weapon to be seen in the whole assemblage. While he was engaged in making his speech, a troop of the Manchester yeomanry cavalry suddenly appeared at the extremity of the field. Making their way to the hustings, the commanding officer told Hunt he was his prisoner; and immediately took him into custody, with several others who were standing beside him. The yeomanry then began to strike at the banners, charging right and left with their drawn swords, and dashing through all that obstructed their passage. A dreadful scene of confusion and terror ensued; numbers being trampled under the feet of the

horses, or cut down, men and women indiscriminately, by the sabres. The Manchester magistrates, who viewed this bloody scene from the windows of a house at a convenient distance, are said to have read the riot act; but, if they actually did so, the fact was known to very few; and it is certain that no time was allowed for dispersion, conformably to the requisition of the act. The number of killed and wounded was estimated at between 300 and 400.

Among other places that held meetings for the purpose of petitioning the legislature to enquire into the late proceedings at Manchester, a numerous one was convened at York by the high-sheriff, and sanctioned by the presence of earl Fitzwilliam, as well as many other persons of rank and consequence. At this meeting appropriate resolutions were passed, and a petition was voted to the prince regent, to institute an enquiry; the only effect of which was the dismissal of that highly respected nobleman from his lieutenantancy. In the reply to the city of London, the regent referred the sufferers 'to the tribunals of the country, if any injury had been sustained;' but the Lancashire grand jury threw out all the bills preferred against those concerned in the outrages and enormities perpetrated. This was afterwards a topic of great debate in parliament.

It was now announced that the health of the king, which had hitherto been good for his age, was on the decline; and that decline, proved to be rapid. On the 23d of January, 1820, the public mind received a severe shock by the death of his fourth son, the duke of Kent, who expired at Sidmouth, in Devonshire, after a very short illness, much esteemed and lamented, leaving an infant daughter. The regrets excited by the loss of this illustrious prince were speedily absorbed in the greater interest excited by the tidings from Windsor, which foretold the approaching dissolution of his august father: the prince regent himself was also seriously indisposed.

On Saturday, the 29th of January, the long and eventful career of the monarch, who had attained his eighty-second year, terminated by a quiet and almost insensible dissolution, about thirty-five minutes past eight in the evening. The duchess of Gloucester, and the princesses Augusta and Sophia, who had been unremitting in their attentions to their venerable parent, were at this time in the palace; and the duke of York watched with filial solicitude by the side of his couch. On that prince devolved the duty of announcing the mournful event to the regent, who on the 31st of January was proclaimed king with the usual solemnities.

The venerable age, the protracted sufferings, the private and personal virtues of George III. with his still recent demise, render it both a difficult and an invidious task to attempt to sketch the political features of his reign with historic fidelity. It has been said of him on high authority, and we believe with equal truth, that 'he would never do wrong, except when he mistook wrong for right.' The notions of government originally infused into his mind by the earl of Bute, probably differed little from those which Charles I. learned from archbishop Laud, however modified

in practice by the necessity of circumstances. A distinguished foreigner says, 'The accession of George III. was an actual political revolution in England. Pretenders were no more. The house of Hanover was established. The whigs were dismissed from administration, as troublesome observers no longer wanted. The government was again seized by the Tories, those friends of power, who have ever since kept it, to the great detriment of public liberty. Yet the king was personally a friend to law and justice, and sincerely wished the welfare and prosperity of the country.'

The reign of George IV., with regard to Europe and the Western world, at least, has been wholly peaceful; and all the great relations of the empire have remained undisturbed. The wars of India will be given under HINDOSTAN, or INDIAN EMPIRE: with regard to the other transactions of this reign, *Nemo nisi post mortem beatus*, they are of too recent date to become, as yet, materials of history.

Great Britain has been subject to two dynasties and the commonwealth. By the house of Stuart she was taught the tendency of a monarchy to arbitrary power; by the commonwealth the evils of a democracy, 'the madness of the people!' Her second dynasty has not failed to exhibit both lessons. May the Almighty Guardian of her rights and liberties preserve her mindful of both of them!

PART II.

MISCELLANEOUS STATISTICS, &c.

BRITAIN, and particularly ENGLAND, as the seat of the government, are articles under which the most important geographical and statistical features of the country have been treated. We find remaining only a few particulars relating to the commerce, navy, geology, state of the arts, colonial dependencies, &c., of Great Britain.

1. *Historical Sketch of the Commerce of Great Britain.*—We have mentioned the early visits of the Phenicians to this country. Cæsar, however, found the Britons in that state of barbarity which proves that their commerce could never previously have been more than that which attaches to the very first stage of civilisation, i. e. when tillage and agriculture have begun to supersede the hunter and shepherd state. In the south parts of the island the Britons had arrived at this first stage; but in the other parts they still lived by pasture, clothed themselves with the skins of beasts killed in the chase, and dwelt in the temporary huts of the forests and marshes. Their commerce with the Phenicians and Carthaginians was therefore confined to the barter of tin, lead, and skins, for brass trinkets and other trifles. According to Diodorus, the Greeks, after the voyage of Pytheas, also visited the coasts of Britain for the purposes of commerce, and Cæsar found some commerce existing between the Britons of Kent and the opposite Gauls. Under the imperial government, while the Britons lost their savage independence, they rose in the scale of civilisation, by the adoption of useful arts, and their commerce increased in proportion. The articles exported from Britain to Rome were tin, lead, hides, lime, chalk,

pearls, horses, oxen, dogs, and slaves, for at this early period of our history, the merchants of Bristol dealt in human flesh, purchasing men and women in all parts of the island, and selling them abroad as slaves; and it is even recorded that they first rendered the women pregnant to increase their value!

The inroads of the Scots and Picts, on the departure of the Romans, threw the Britons back into the state of barbarity from which they had begun to emerge; nor was the confusion attendant on the Heptarchy much more calculated to elicit improvement; no sooner, however, were the kingdoms united under one sovereign, in the person of Egbert, than commerce and manufactures revived in spite of the descents and ravages of the Danes; and under the Saxon monarchs London, Exeter, and Bristol, are recorded as considerable trading cities.

At the end of the ninth century, when the Great Alfred had purged the country of its Danish invaders, a regular system of barter took place with the neighbouring nations, and Athelstan, the grandson of Alfred, passed a law remarkable for the age, by which a merchant who had made three foreign voyages on his own account was admitted to the rank of athane or gentleman. Ethelred in 979 granted a free trade to a society of German merchants, established in England under the name of Emperor's Men, on condition of paying certain tolls, and presenting the king at Christmas and Easter with two pieces of gray cloth and one of brown, ten pounds of pepper, two vessels of vinegar, and five pairs of gloves.

The Conquest again produced an unfavorable revolution in commerce, by the introduction of the feudal system, which paralysed enterprise by destroying the liberty of the subject, at the same time that it rendered trade ignoble in the privileged class. Hence the chief trade of England was engrossed by the Jews, who began to settle in the country about the time of the Conquest, and who, though oppressed in every possible way, amassed vast fortunes by usury. In the year 1100 a number of Flemings, driven from their own country by an irruption of the sea, settled in England and introduced manufactures of wool. At the same period the people of Bristol traded to Ireland, but the principal seats of commerce were London and the cinque ports from their proximity to the continent. The exports, at this time, were horses, wool, woollen cloths, leather, corn, lead, and tin. The imports were, linens, fine woollens, silks (for the royal family only), steel, iron, spices, and other productions of India.

The cinque ports were originally five havens, to which were granted certain privileges, on condition of defending the coast from invasion. The origin of these establishments may be traced to the Romans, who, though they possessed a superiority of naval force, found it necessary to adopt measures of defence against the Norman pirates, who assumed the titles of Sea Kings of the North, and for this purpose nine stations on the coast opposite Gaul were fortified. The same necessity continuing long after the departure of the Romans, gave rise to the foundation of the

cinque ports, which took place in the reign of Edward the Confessor or William I. To each of the chief ports were attached several subordinate members, in the following series:—1. *Hastings*, with Seaford, Pevensey, Hidney, Rye, Winchelsea, Beakesbourne, Bulverheath, and Grange, as members.—2. *Sandwich*, with Fordwick, Reculver, Sarre, Walmer, Ramsgate, and Deal.—3. *Dover*, with Faversham, St. Margaret, Woodchurch, Goresend, Kingdown, Birchington, Margate, Ringwold, and Folkstone.—4. *Romney*, with Lydd, Romehill, and Ringwold.—5. *Hythe*, with Westmeath. Rye and Winchelsea were afterwards raised to the rank of cinque ports, with Teasterden and Excove as members of the former. The principal condition on which the cinque ports held their privileges was, the furnishing a certain number of ships and mariners for military service.

Under Edward I. coal mines first began to be worked in England, and so rapid was the progress, that in 1379 a duty of sixpence per ton was levied on the ships employed in the coal trade, to be applied to their protection. At this same period the English traded to Italy, Spain, and Portugal, as well as to all the countries of the north, and in 1381 the principle of the act of navigation was introduced into the legislation of the kingdom, by a law declaring that 'none of the king's subjects shall carry forth or bring in merchandise, but only in ships of the king's allegiance.' This law, however, seemed to have but little effect in turning the king's subjects to the profession of commerce, and the trade continued to be principally carried on in the ships of foreigners and by foreign merchants, residing in England and licensed by the kings under different denominations. Such were the German merchants chartered by Henry III. (1259); the Steelyard Company, a branch of the Hanse Association, whose privileges were confirmed by Edward IV., &c. Indeed, as we have already had occasion to notice, the carrying trade of England was almost entirely engrossed by the Hanse Association until the reign of Edward VI., when the English merchants first began to complain of the monopolies granted to foreigners, and particularly to the Steelyard Company, which in one year exported 50,000 pieces of cloth, while the English merchants exported only 1100. Edward, feeling the justice of these complaints, revoked the privileges of this company; and though foreigners again received favors from the bigoted Mary, at the instigation of her Spanish husband, they again fell into discredit under Elizabeth, from whose reign may be dated the origin of English commerce, in the just sense of the term.

The Reformation, which was only firmly established by this princess, was attended with the most happy consequences on the population and energies of the nation; for by it 150,000 persons, who had been restrained from marriage, were, if we may use the expression, put into circulation; and 50,000 others, who had been maintained in idleness by the convents, were obliged to seek a livelihood by industry.

In this reign were chartered the African, East-India, Russia, Eastland and Turkey Companies:

and, though such institutions are generally allowed to be injurious in an advanced state of commerce, they must also be admitted to be the best nurses of its infancy. The threatened invasion, by the Spanish Armada, gave the first grand impulse to the marine of England by the purchase of ships from foreigners, and by the formation of national seamen; and so rapid was the progress, that, after the destruction of the Armada, a census being taken of the merchant vessels in England, it was found that Norfolk, Suffolk, Essex, Kent, and Sussex, possessed 471 ships, or more than half the number in the whole kingdom thirty years before. The peaceable James I. gave great encouragement to trade and ship-building, and in his reign British colonisation began in America, and opened a new theatre of industry and enterprize. At this period 400 vessels were employed in the coal trade of Newcastle.

The merchant vessels of England were, however, still of small burden, and it continued customary to hire large ones from foreigners for distant voyages or extensive transactions. At length, in 1616, an order from the king and council was issued on the petition of the merchants of London, prohibiting the export of British commodities in any but British bottoms; and the effect was such, that the whole nation applied itself to the creation of a merchant marine, at the same time that the ships, being built of a larger size, were capable of long voyages, and the British merchant flag was now first seen in the Mediterranean. So great was the impulse, that from a ship of 100 tons, being a kind of prodigy at the commencement of the reign of James I., a number of ships of 300, 400, and even 500 tons, were now launched from the British docks. In 1615 there were not ten vessels above 100 tons out of London: and, in 1622, Newcastle had 100 sail, each exceeding that tonnage.

During the first part of the reign of Charles I., commerce continued to flourish, when the trade to the west coast of Africa and East Indies received a great extension, and the whole commerce of Spain was in the hands of the English, who also sent a great quantity of woollen cloths to Turkey.

Under the commonwealth, the English began to dispute with the Dutch the dominion of the seas, and hence arose the famous Navigation Act, by which it was prohibited to all foreign ships to trade to the English colonies, without license; and at the same time the merchandise of Asia, Africa, and America was forbidden to be imported into England, except in British bottoms, or merchandise from any part of Europe except in vessels belonging to the country of which the merchandise was the produce or manufacture. An additional article added after the Restoration, obliging the master and three-fourths of the crews of vessels sailing under the English flag to be English subjects, completed this great monument of maritime legislation.

Such were the effects of the navigation act, added to the increasing population of the American colonies, and consequent increase of their

trade, that, between the Restoration and Revolution, the English merchant marine was doubled. While at the same epoch the revocation of the edict of Nantz, which ruined the manufactures of France, caused a great and rapid improvement in those of England, by the influx of the persecuted Protestants, who introduced or perfected the manufacture of silk, cotton, linen, hats, jewellery, cutlery, and clock-work, and thereby freed England from an onerous dependence on France for these objects. The Revolution, by securing liberty, gave a new impulse to every kind of industry; and the union of Scotland, by identifying the interests of the two kingdoms, proved equally advantageous to each, and to the empire in general.

From this epoch commerce continued in a constant progression, unchecked by frequent wars, or even by the separation of those colonies, which were once thought to be the grand basis of the commercial fabric, until it reached a height that drew down on us the envy and animosity of all Europe; and in a great measure caused, while it most essentially aided us to support, those wars which have desolated Europe for the last twenty years, and to which the energies of Great Britain at length happily put an end.

2. *Historical Sketch of the Progress of the British Navy.*—The natural defence of Great Britain is her naval force; as necessary to secure her coasts from invasion as for the protection of her commerce. The history of the progress of the navy may be divided into three periods; the first comprehending the period previous to the reign of Henry VIII; the second ending with the Restoration; and the last from that epoch to the present time.

1. Caesar only notices particularly the boats of the Britons, formed of withies and covered with skins, in which they crossed the English and Irish channels in summer: it seems probable, however, that they had even at this time vessels of a more stable construction, for he tells us that the Veneti of the opposite coast of Gaul obtained auxiliaries from Britain against the Romans, and that the fleet of the Veneti and Britons, which engaged that of the Romans off the coast of Armorica (Britany), consisted of 230 large and strong ships, which were totally destroyed by the Romans. This defeat sufficiently accounts for the Britons being unable to resist the invasion of the Romans next year by sea.

While the Romans remained masters of the island they kept up large fleets to protect the coasts and commerce, and the whole naval force was commanded by an officer styled *Archigubernus Classis Britannicæ*, or High Admiral of the British fleet. When they abandoned the island they withdrew their ships, and those few which remained to the Britons fell an easy prey to the Frank and Saxon pirates, so that the island was again totally deprived of its natural defence.

Of the confusion of the heptarchy the naval power of the country partook so largely, that it was not until the reign of the great Alfred that it again resumed an existence. The first fleet collected by this prince consisted only of five or six ships, with which he attacked and defeated

six Danish pirates: encouraged by this success, he increased his fleets to 120 ships, which he distributed in proper stations round the island, where they were sure to meet the Danes, either in their approach or retreat, and generally were successful. The navy did not again decline under the successors of Alfred; and Edgar, in particular, kept up a large naval force, divided into three squadrons. Some English historians make the number of vessels amount to 3,000 or 4,000; but probably, as Mr. Henry observes, there is here an error of an added cypher.

The successors of Edgar allowed the navy to decline, and the Danes again ravaged the coasts with impunity. In 1007 a fleet was raised by requisition, on the proprietors of land, of 800 vessels; but this force being either dispersed or destroyed, by the treachery and jealousy of its chiefs, the way was opened for the Danish conquest. During the period of this dominion, there being no foreign enemies to resist, both the naval and military force of the kingdom were neglected; and hence there was no adequate navy to resist the invasion of William of Normandy, which was made in 3,000 vessels, many of which, however, were doubtless only open boats, for in the short passage across the channel several vessels were lost.

We have noticed the establishment of the cinque ports, and their being obliged to furnish ships for the public service; this force consisted of fifty-seven ships, each with twenty-seven men and boys, and the following was the proportion furnished by each:—

Hastings and its members	21
Dover and its members	21
And each of the other three ports and their members	5

This long continued to be the only standing navy of England; and, when necessary to increase it, ships were hired or pressed from the merchants, and armed by the crown.

From the epoch of the Norman Conquest the shipping of England increased both in number and in size; and the fleet that conveyed Richard I. to the Holy Land is described, by contemporary historians, as excelling every thing before seen in the number, magnitude, and beauty of the ships. It was composed of thirteen of the largest class of vessels, named *dromones*, 150 of the second class, called *busses*, fifty-three row galleys, and a great number of tenders. In the great battle between the English and French fleets, in the reign of John and Philip II., the English fleet consisted of 500 ships; and at this same epoch William of Malmesbury describes the English seamen as 'excelling all others both in the art of navigation and in fighting.' Nevertheless the ships of war still continued of very small dimensions, the largest in 1304 carrying only forty men.

It will not then appear extraordinary that Henry III. should require 1000 such vessels for his expedition to Gascony, nor that Edward III. should have 700 English vessels, and thirty-eight foreign, at the siege of Calais, the average crews of this fleet being but twenty men. In 1359, when Edward again invaded France with 1100

vessels, it is probable this was the whole shipping of England pressed for the occasion into the king's service.

Henry IV. maintained the dominion of the narrow seas, and chastised the French and Flemings, who had presumed to insult the coasts, and interrupt the trade:—under his successors the navy lost nothing of its renown. Henry V. was victorious by sea and land, and seems to be the first prince who had any ships his own property. In his first invasion of France he had 'two large and beautiful ships, with purple sails, called the King's Chamber and King's Hall.'

During the disastrous reign of Henry VI. the naval and military strength of England declined, and the French insulted the coasts, and burned the town of Sandwich. The dominion of the narrow seas was however regained by the great earl of Warwick, who was declared lord high admiral. Edward IV. paid great attention to the navy; and, in 1475, invaded France with a large fleet. This prince had also several ships of his own, which he employed both in war and commerce on his own account.

Henry VII. patronised the navy, and, though the kingdom enjoyed peace, a fleet was always kept ready to act. The first ship of war, in the proper sense of the term, expressly built for the public service, seems to have been in the reign of this prince, and was called the 'Harry Grace de Dieu': she was 1000 tons burden, cost £14,000, and was probably the first two-decked ship, as well as the first with more than two masts, and she had four.

II. The second period of our naval history commences with the reign of Henry VIII., when the sea service first became a distinct profession, and during which the Admiralty and Navy Boards, and the dock yards of Deptford, Woolwich, and Portsmouth, were established. This prince also brought shipwrights from Italy to instruct his subjects in the art of construction, and the rules drawn up by his order, for the civil regulation of the navy, form the basis of its present government. The ships belonging to the crown, however, still formed but a very insignificant portion of the naval force; at the death of Henry the royal tonnage being but 12,000. During the reign of his successor, Edward VI., it continued nearly stationary; the amount being at the death of this prince fifty-three king's ships, of which twenty-eight only were above eighty tons, and the total tonnage 11,000. During the unhappy reign of Mary the fleet declined, and at her death consisted of but twenty-seven vessels, and from 6000 to 7000 tons, and 3565 men. Its expenses at this epoch were estimated at £10,000 per annum.

Elizabeth, soon began to increase the navy, both by the building of ships expressly for it, as well as by encouraging merchants to build large ships, proper on occasion to serve as ships of war; she also brought foreign ship-builders into the kingdom, filled the arsenals with naval stores, cast iron and brass ordnance, manufactured gunpowder, and in short acquired the title of The Restorer of Naval Power, and the Sovereign of the Northern Seas.

The greater part of the naval force, however, still continued to be hired on the spur of the occasion from merchants; and of the fleet that destroyed the Spanish armada, consisting of 176 ships, 31,985 tons, and 15,000 men, there only belonged to the crown, thirty-four ships, 12,590 tons, and 6279 men. The largest of these vessels was 1100 tons, and mounted sixty or sixty-five guns. At the death of Elizabeth the royal ships were forty-two, the tonnage 17,055, and 8346 men, and the expense of the fleet had increased to £30,000 per annum. A contemporary writer thus describes her navy in 1577. 'The queen's highness hath at this present already made and furnished to the number of one and twenty great ships, which lie for the most part in Gillingham Road. Besides these her grace hath others in hand also. She hath likewise three notable galleys, with the sight whereof, and the rest of the navy royal, it is incredible to say how marvellously her grace is delighted. I add, to the end that all men should understand somewhat of the great masses of treasure daily employed upon our navy, how there are few merchant ships of the first and second sort, that being apparelled and made ready to sail, are not worthy one thousand pounds at the least, if they should presently be sold. What then shall we think of the navy royal, of which some one vessel is worth two of the other, as the shipwrights have often told me.'—*Harrison's Description of Britain*, 1577.

In the American war Liverpool alone sent more tonnage to sea in privateers, than the whole royal navy of England contained at this memorable epoch; the number of privateers being 120, the tonnage 30,787, guns 1986, and men 8754.

The defeat of the Spanish armada transferred the sceptre of the sea to the Dutch, for France and England, occupied solely by the humiliation of the House of Austria, considered without jealousy the maritime superiority of the republic; and, there being no occupation for a fleet during the peaceable reign of James I., the navy, though it was not neglected, was not much augmented; indeed the number of ships decreased, but their size was considerably increased, the fleet at the death of James being composed of thirty-two or three ships of nearly 20,000 tons. 'In my own time,' says Sir Walter Raleigh, 'the shape of our English ships hath been greatly bettered. It is not long since the striking of the topmast hath been devised. Together with the chain-pump, we have lately added the bonnet and drabber. To the courses we have devised studding-sails, top-gallant-sails, sprit-sails, and top-sails. The weighing of anchors by the capstan is also new.'

Charles I. paid considerable attention to the navy in the early part of his reign, particularly in the increase of size; and in 1637 was launched from Woolwich, the 'Sovereign of the Seas,' the first three-decker constructed in England; and in this reign ships were first classed in rates. This ship was 128 feet keel, and forty-eight feet beam; length over all 232 feet. She had five lanterns, the biggest of which would carry ten people upright; had three flush decks, a fore-castle, half deck, quarter deck, and round-house. Her lower

tier had thirty ports for cannon and demi-cannon. Middle tier, thirty for culverins and demi-culverins. Third tier, twenty-six for other ordnance. Forecastle, twelve; and the two half decks had thirteen or fourteen more ports within board for murdering pieces, besides ten pieces of chase ordnance forward, and ten right aft, and many loop-holes in the cabins for musquet shot. She had eleven anchors, one of 4100 lb. She was of the burden of 1637 tons.

At the breaking out of the Rebellion the navy consisted of forty-two ships of 22,411 tons. The civil wars which deluged the kingdom with blood, and brought her misguided monarch to the block, caused a temporary neglect of the navy, and it was also greatly reduced by prince Rupert's carrying off twenty-five ships in 1648.

The measures of Cromwell, however, soon replaced this loss, and in five years his navy was increased to 150 ships, of which more than the third were two and three deckers. The Dutch now feeling that to divide the empire of the seas was to lose it, opposed their maritime pretensions to those of the English, and continued to dispute this empire during a bloody war, which, though for some time indecisive, terminated in their being obliged to give up the contest, and sue for peace, which was granted on the express condition of their acknowledging the superiority of the British flag in the British Seas. This war greatly added to the number of the navy by captures from the enemy, and also improved the skill of the seamen. Hitherto the naval commanders were chiefly noblemen, but little acquainted with the profession, and who, content with the honors of command, left the management of the vessels to the pilots. During the commonwealth, few nobles were found in the public service, and the ships of war were generally commanded by persons bred in the merchant service, who, however they might fall short in polished education, were expert seamen. Cromwell raised the pay of seamen from nineteen to twenty-four shillings a month; and at his death the fleet consisted of three first rates of 100, eighty, and seventy guns; five second rates of sixty-six to fifty-two guns; four third rates of fifty-two to forty-four guns; eight fourth rates of forty to twenty-eight; ten fifth rates of thirty-four to sixteen; and nine sixth rates of sixteen to two.—Total 157 ships, 4390 guns, and 21,910

men. The annual grant for the service of the fleet during the protectorate was £400,000.

The duke of York, on the Restoration, was appointed to the post of lord high admiral; and by his knowledge of naval affairs, and his partiality to the service, the marine was considerably improved, and increased in efficient force by the greater size of the vessels. On the removal of this prince from the naval administration, in 1673, the fleet was again neglected, and the profligate Charles dissipated the money voted for its support on his pleasures, so that on the duke of York's being again placed at the head of the navy, in 1684, only twenty-two ships were fit for sea, the rest being totally out of repair or rotten, and the arsenals empty of the materials for their refitting. The exertions of this prince after his resuming the administration, and also after his accession to the crown, being found incapable of restoring the fleet by the ordinary course, he suspended the navy board and created a commission of naval affairs, by whose exertions the fleet was soon restored; and from a state of absolute impotency the fleet at the Revolution consisted of 173 serviceable vessels of 101,892 tons, 6903 guns, and 42,003 men. The arsenals were at the same time abundantly stored.

William III., in his war with France, found it necessary to increase the fleet of England. A number of line of battle ships were accordingly built, and at the close of the war the navy was composed of 323 ships and vessels, of which five were three deckers. In 1700 half pay was established for the classes of commissioned officers.

During the reigns of Anne and George I. the number of vessels decreased; but they were built of larger dimensions, and the tonnage considerably increased. At the death of the former the ships were 247, and the tonnage 167,219; and, at the death of the latter, ships 233, and tonnage 170,862.

The wars with Spain and France, during the reign of George II., necessitated an increased marine; and, at the accession of the late king, the number of vessels was 412, and the tonnage 321,104.

The following Table will enable the reader to inspect the further progress of the navy, which in modern times has often had to cope with the maritime strength of almost all other civilised nations.

TABULAR VIEW of the PROGRESSIVE INCREASE of the ROYAL NAVY.

Year.	Ships.	Tons.	Men voted.	Expense ordinary	Wear and Tear.
1521	16	7,260	—	—	—
1548	53	11,268	7,731	—	—
1578	24	10,506	6,570	—	—
1603	42	17,055	8,346	30,000	—
1624	33	19,400	—	—	—
1641	42	22,411	—	—	—
1658	157	57,000	21,910	—	—
1675	151	70,587	30,260	—	—
1688	173	101,892	42,003	—	—
1702	272	159,020	40,000	129,314	—
1714	247	167,219	10,000	245,700	—
1727	233	170,862	20,000	200,000	—
1753	291	234,924	10,000	280,206	—
1760	412	321,104	70,000	432,629	364,000
1783	617	500,781	110,000	1,763,832	5,406,000
1789*	452	413,667	20,000	1,288,570	1,040,000
1793	498	433,226	45,000	1,056,915	2,304,000
1801	—	—	135,000	1,371,318	9,450,000
1806	—	—	120,000	3,026,183	14,113,000
1813	—	—	145,000	3,021,721	11,534,687

* In 1789 the peace establishment of ships in commission was two second rates, fifteen third-rates, one fourth-rate, five fifty-gun ships, six two-decked forty-fours, thirty-one frigates of thirty-six to twenty guns, and one sloop, besides cutters.

In the ordinary estimates of the navy are included the expenses of the Admiralty, Navy, and Victualling offices, the half-pay, superannuation, and pensions to naval officers, superannuation to civil officers, buildings, repairs and building of ships. In the estimate of the expenses of ships in commission are included wages, wear and tear of ships, victuals, and ordnance.

3. *Light-houses* being of the greatest utility, both to commercial and naval enterprise, the coasting trade in particular, have been multiplied on all the coasts of the British islands, and their construction successively improved, until nothing is left to wish for. At first they were coal, or wood fires, entirely exposed to the weather, and consequently very defective. Towers, with glass casements, were afterwards erected, but the smoke of the fuel soon dimmed the windows and rendered them almost useless. At length, in 1763, oil lamps and reflectors were introduced, which have been brought to the highest perfection.

The light-houses and buoys on shoals are generally under the inspection of the Trinity-House of London, a corporation established in the reign of Henry VIII. by the title of The Master, Warden, and Jurats of the Guild, of the most glorious and undivided Trinity of St. Clement and of Deptford Stroud. The Thames river pilots are also within the supervisorship of this corporation. The Dover and Deal pilots form two chartered corporations.

The light houses on the coasts of the British islands are as follows:—

SOUTH COAST.

Longships.
Lizard, two lights.
Eddystone.
Portland, two lights.
Needles, Isle of Wight.

SOUTH COAST.

Hurst Castle.
Owers, floating.
Dungeness.
South Foreland, two lights.

SOUTH COAST.

Goodwin Sands, two floating lights horizontal.
Gull Stream, floating.
Ramsgate Pier.
North Foreland.
Gallopier Sand, floating, two lights.
Sunk floating light, entrance of the Thames.
Nore floating light.

EAST COAST.

Harwich, two lights.
Orford Ness, two lights.
Newarp Sand, floating.
Lowestoft, two lights.
Wintertonness.

Haseborough, two lights.

Cromer revolving light,

shows a face a minute.

Lynn.

Dudgeon, floating.

Hunstanton.

Spurnhead, two lights.

Flamborough Head, revolving light, shows

a face every two minutes.

Humber, two lights.

Sunderland Pier.

Tinmouth revolving

light every minute.

Fern Island.

Isle of May.

Inch Keith.

Pettycur Harbour.

Tay River, two lights.

Bell Rock.

Kinnaird's Head.

Pentland Skerries, two lights.

North Ronaldsay Island.

WEST COAST.

Ilfracomb.

Fathom Island, Severn

Mumbles Head.

Milford, two lights.

Snails.

South Stack, Holyhead.

Skerries.

Anglesea.

Point of Air two lights

Sea lights, two. } Liver-

Lake lights, two } pool

St. Bee's Head.

Walney Island revolving

light.

WEST COAST.

Port Patrick, from 1st of

September to 1st of

May.

Cumbray Island, Clyde

Pladda Island, Arran.

Mull of Kintyre.

Glash Island, Hebrides.

St. Agnes, Scilly.

Caskets, Guernsey.

Isle of Man, Point of Air.

— Douglas from Aug-

ust to April.

IRELAND.

Old Head of Kinsale.

Waterford.

Wicklow.

Frith of Dublin, Pigeon House.

— Howth Head.

Balligan.

Donaghadee.

Copland Island, Belfast.

Loophal, Shannon.

The following TABLE of GEOGRAPHICAL POSITIONS includes most of the LIGHTS round the coasts of GREAT BRITAIN and IRELAND.

4. *Of the geology of Great Britain.*—Since we have sent to press the article *Geology*, Mr. Brande's 'Outlines' have fallen into our hands. He observes that no country furnishes a better selection of geological formations for the attention of the student than our own.

'A section of the south of England, from the coast of Cornwall, for instance,' he says, 'in the west, to London in the east, will furnish a good exhibition of the phenomena of stratification. It will begin at the Land's End with primitive rocks; massive and amorphous. Upon this rest several species of transition rocks, especially slates of different kinds, having various inclinations; and these are succeeded by secondary strata, deviating more and more from the vertical, and acquiring the horizontal position; and ultimately we attain the alluvial matter upon which the metropolis stands. It is principally clay, and has once perhaps formed the mud at the bottom of a salt water lake. Tracing this section from the metropolis to the Land's End,' he says, in explanation of his plate, 'the upper section commences with the blue clay of London, and proceeding westward through the counties of Berkshire, Hampshire, Wiltshire, Dorsetshire, and Devonshire, terminates at the Land's End in Cornwall. The rocks presented in this line are chalk, sandstone, oolite or freestone, lias or argillaceous and magnesian limestone, red sandstone, mountain limestone or secondary marble, slate, greenstone, serpentine, and granite. The latter frequently penetrates the slaty veins, and is itself pervaded by greenstone.'

Proceeding from London northwards towards the Scotch border, the order of stratification is reversed, and, traversing a highly interesting series of secondary rocks, we arrive in Cumberland at some of the primitive series. This second section (in his plate) commences with the coal strata, and limestone resting upon slate and granite in Cumberland, and thence proceeds towards the metropolis by Yorkshire, Derbyshire, Leicestershire, Northamptonshire, Bedfordshire and Hertfordshire. The passage is here exhibited, from the primary rocks of Cumberland, to the secondary hills of the southern counties. It shows the grit and sandstone containing coal, which lies upon the mountain limestone of Derbyshire, which rock is singularly penetrated by toadstone. In Leicestershire slate and granite again occur, and are succeeded by red sandstone, lias, oolite, sandstone, and chalk, upon which the blue clay of Middlesex is deposited, and of which the valley of the Thames in that county, principally consists. 'The whole arrangement is such as to include the highest and oldest rocks upon the west side of England, forming a chain extending from the Land's End in Cornwall, to Cumberland, and thence to the northern extremity of Scotland. So that the length of Great Britain, and its general shape, appear in a considerable degree dependent upon this chain of mountainous land, and upon two lower ridges, which extend in one direction from Devonshire, through Dorsetshire, Hampshire, and Sussex, into Kent; and, in another, nearly from the same point, to the east of Yorkshire.

'The western ridge is broken in upon in

several places by plains and rivers, giving rise to so many chasms in the great chain.

On the subject of the secondary or flötz formations of Werner, Mr. Weaver, a pupil of this great geologist, thus exhibits the confirmation which his theory receives from the geology of Great Britain.

'It follows, from the whole of these premises, that the flötz formations of Werner strictly commence with the old red sandstone of England: and not, as has been stated, with the new or calcareous conglomerate. It follows, also, that the charge of confusion in the views of that naturalist is obviated, and that so far from the flötz formations which came under his consideration having been few in number, they comprehended the whole series, from the old red sandstone up to the chalk, and above the chalk, gravel, sand, clay, wood-coal, and the newest flötz trap formation. His arrangement of formations in Germany is, when duly construed, quite in accordance with their succession in the British Isles. There is no hiatus. We travel from the primary to the transition, and thence through the whole series of the flötz: in which last, let it be observed, that, though the carboniferous series be less fully displayed, yet other formations are in much greater force in Germany, and afford a greater variety of character than is to be found in the British Isles; and here we may perceive the compensating power of nature.

'I have, therefore, yet to learn that more modern enquiries have at all invalidated the general positions of Werner. His grand outlines of the structure of the globe remain unshaken, from the fundamental granite up to the newest flötz trap. The labors of his followers, and of other geologists pursuing a similar path, have tended more and more to fill up those outlines.

'The Comparative View of flötz formations, which I submitted to the public in the *Annals of Philosophy*, October 1821, is consistent with the main positions of Werner, though, from the mode of considering them, there may seem to be some difference: this however is rather apparent than real. It arises from the following circumstances:—1. In the carboniferous series, producing the limestone and the coal as distinct formations, while Werner considered them only as members of his first flötz sandstone, or rather *totliegende* formation: 2. In like manner, in the gypseous and saliferous series, producing the *weissliegende* or calcareous conglomerate as a distinct formation; while, by Friesleben and others, it is included in the magnesian limestone formation: 3. As a consequence of the foregoing, in considering the magnesian limestone as belonging to the second flötz series: and, 4. From distributing the flötz formations into four principal series, founded, as I conceive, on natural distinctions; namely, on their relative position in the order of succession, their mineralogical characters, the organic remains which they respectively contain, and the mutual affinities of the formations which constitute each series or group. In this view there is no real incongruity; for, in fact, had the carboniferous limestone appeared in force in the north of Germany, it certainly would have been designated by Werner as the

first flint limestone; and this according to the established method of that naturalist, who, in arranging the mineral masses of the globe, was led to distribute the predominant into principal formations, and the incidental into subordinate. Bearing this in mind, the carboniferous limestone would have been his first flint limestone formation; and, as a necessary consequence, the magnesian limestone would have become his second flint limestone. The whole difference, therefore, is a mere question of enumeration.

'In conclusion, I must observe, that, in awarding the meed of praise due to the services of Werner, French writers appear in general to have been more just than the English. Not a few of the latter seem to forget, or not to consider, that, though others might before his time have hit upon the general division of rocks into primary and secondary, yet geology, as a science, had no existence. To Werner belongs, in the first place, the merit of introducing a nicer discrimination in the examination of simple minerals, and of inventing an appropriate language by which they might be described and distinguished, previous to which mineralogical science was quite in its infancy. And, in the second place, to him also belongs the chief merit, not merely of distinguishing and giving names to rocks, but of accurately marking out both the grand distinctions of primary, transition, and flint classes, and the various principal formations of which those classes consist. If, then, it be the glory of the Saxon to have laid the broad foundations of the edifice, let that of the Briton and Frank be to complete the structure.'

It has been long doubted whether a genuine crocodile was ever found among the fossil animals of this country. In 1823, however, this question seems to have been set at rest by a specimen discovered in the alum shale near Whitby. We can only copy the following description from the pen of the Rev. George Young, in the Edinburgh Philosophical Journal of 1823, and refer the reader to the work for further particulars accompanied by a drawing.

'The length of the animal, following the curvature of the spine, is fourteen feet six inches; but in its entire state it must have been about eighteen feet long: as the snout is considerably mutilated, and a small portion of the tail also was left in the cliff, owing to the difficulty of extracting the vertebrae. The mutilated state of the snout has been occasioned by its exposure to the atmosphere; in consequence of which successive portions of the muzzle must have been detached, and have dropped down on the beach. Fortunately, another specimen of the head of this animal, having the muzzle complete, is also in the Whitby museum; and it is figured in the drawing, to show the entire length and form of the head. The dimensions of the latter, compared with what we have of the new discovered specimen, show that it has belonged to a specimen only half its size; and hence, to make it correspond with the other, it is drawn on a scale twice as large. The entire head measures two feet three inches; and the imperfect one must, therefore, have been about four feet six inches long; so that, as it now measures only nineteen

inches, it must have lost about a yard of its length. The cranium, towards the upper part, is a foot broad in the larger specimen, and half a foot in the smaller. The orbits of the eyes approach near to each other, and look upwards, as in the recent crocodile. They are much smaller than those of the ichthyosaurus. Behind them are two very deep fossæ, of an oblong form, separated only by a thin septum. Before them, at a short distance, are seen the nostrils; in the position of which the animal differs greatly from the common crocodile, which has its nostrils near the end of the muzzle. The great length of the snout is another point of difference; our fossil animal, being, in this respect, more nearly allied to the gavia. The region of the nostrils being injured in the smaller head, they cannot be discerned; but they are very conspicuous in the larger, and in another head of the same animal, in the collection of Thomas Hinderswell, esq., of Scarborough, published in the Geological Survey of the Yorkshire coast, plate XVI., fig. 2, as the head of an ichthyosaurus. The teeth are small and very numerous, and they are arranged in straight lines, as in the ichthyosaurus, and not in the bending or curved form, in which those of the recent crocodile are placed.

'The discovery of this valuable relic of a former world, is not only highly interesting of itself,' says Mr. Young, 'but serves to throw light on other discoveries. When the geological survey of the Yorkshire coast was published, I was inclined to think that no genuine crocodile had been found in our alumshale; but that the fossil animals, so called, had all been fishes, or marine animals furnished with fins; except, perhaps, a few very imperfect specimens. But on comparing this new discovered animal with the one found by Messrs. Chapman and Wooller, in January, 1758, described and figured in the Philosophical Transactions, vol. i., in the Gentleman's Magazine, vol. xxx., and in the Scarborough Catalogue, it would appear that both animals have belonged to one family, and probably to one species, as the head and vertebrae (as far as can be ascertained from Wooller's incorrect drawing), seem to correspond, and as the gentlemen who discovered the animal of 1758 assure us that they observed part of an os femoris, with other bones belonging to a quadruped. The fossil animal of 1791, found between Staiths and Runswick, as noticed in the Geological Survey, p. 263, appears to have been another crocodile.'

Professor Buckland's description of the cave at Kirkdale, in Yorkshire, supposed to contain bones of numerous hyænas, is also a recent contribution to the geology of Great Britain. The professor considers these as establishing the fact that these animals were once natives of this country. The first thing that is observed on entering the cavern is a sediment of argillaceous and slightly micaceous mud, covering the whole of its bottom to the average depth of about a foot, and concealing the actual floor. Upon advancing some way into the cave, the roof and sides are partially studded and cased over with a coating of stalactite, which descends to the sur-

face of the mud, and forms over it a plate or crust, spreading horizontally over its surface like ice over a surface of water. The thickness and quantity of this crust varied with that on the roof and sides, in some places covering the mud entirely, when the stalactite on the sides was most abundant, and in other places being totally wanting, both in the roof and the surface of the mud. A great part of this crust had been destroyed in digging up the mud to extract the bones; but professor Buckland saw several places where the stalactitic crust was very thick, and formed a continuous bridge across the mud. In some cases insulated stalagmites, have been formed on the surface of the sediments by drops from the roof, but they are commonly not larger

than a cow's pap, the name by which the workmen distinguish them.

The bones have been found enclosed in the stalagmites, formed before the introduction of the mud, but principally in the lower part of the sediment. A few perfect bones have been obtained, but most of them are broken into small angular fragments and chips, lying separately in the mud, whilst others are wholly or partially invested with stalactite. The action of this mud in preserving the bones from decomposition is very remarkable, and professor Buckland found that almost the whole of their gelatine was preserved. The following table will show the nature of the bones which have been discovered, and the animals to which they have belonged

Hyæna
Tiger
Bear
Wolf
Fox
Weasel
Unknown animal, of the size of the wolf .	.
Elephant
Rhinoceros
Hippopotamus
Horse
Ox, (two species)
Three species of deer
Rabbit
Water rat
Mouse
Raven
Pigeon
Lark
A small species of duck

Forty fragments of jaw-bones; several hundred canine teeth, which must have belonged to more than 100 individuals.

Two large canine teeth, four inches long, and one under tooth.

One tusk, like that of the *ursus spelæus* of the German caves.

Many teeth.

Many teeth.

A few jaws and teeth.

Several teeth.

Two teeth.

Forty or fifty teeth.

Six molar teeth, and fragments of its canine and incisor teeth.

Two or three teeth; coronary bone.

Astragalus, phalangeal bone, and several teeth.

Several teeth; remains of horns.

A few teeth and bones.

A great number of teeth and bones.

A few teeth and bones.

Right ulna.

Left ulna.

Right ulna.

Right coracoid process of the scapula.

Upon first removing the mud the bottom of the cave was strewed all over like a dog-kennel, from end to end, with hundreds of teeth and bones, or rather broken and splintered fragments of the bones of all the animals above enumerated. They were found most abundantly near its mouth; those of the larger animals, such as the elephant, rhinoceros, &c., occurring as extensively as all the rest, even in the inmost and smallest recesses. With the exception of the hard and solid bones, scarcely a single bone has escaped fracture; and in some of them marks may be traced, which, on applying one to the other, appear exactly to fit the form of the canine teeth of the hyænas that occur in the cave.

From this comminuted and gnawed condition of the bones, professor Buckland concludes that the cave at Kirkdale had been inhabited during a long succession of years as a den, by hyænas, who had dragged into its recesses the other animal bodies whose remains are found mixed with their own. This conjecture received a very interesting confirmation from the discovery made by professor Buckland, of many small balls of the solid calcareous excrement of an animal

that had fed on bones. This substance was at first sight recognised by the keeper of the menagerie at Exeter Change, as resembling, both in form and appearance, the faeces of the Cape hyæna which was greedy of bones beyond all other beasts under his care. As the bones of the hyænas are as much broken to pieces as those of the other animals, professor Buckland likewise infers, that the carcases even of the hyænas themselves have been eaten by the survivors. The modern hyæna is about one-third smaller than the fossil animal.

5. *The state of the arts in Great Britain* requires some further attention than we have as yet bestowed upon the subject.

While the continental nations were cultivating the imitative arts, England was engaged with those more solid pursuits of science which became the basis of her modern fame, and manufactures. Then arose her Newton, her Boyle, and her Locke; then were founded her Royal Society and various kindred institutions, all of which have fostered her genius for the application of science to practical life. In no country have equally laborious and persevering efforts been made to abridge labor, produce superior articles

at the least expense; and turn to the fullest account the productions of the surface, and the most remote depths of the earth. Even her Davy willingly attaches his fame to the invention of a *jetty-lamp* for miners.

This peculiar bias of the country towards the useful rather than the fine arts has been well illustrated in a late number of the Edinburgh Review. Speaking of the French periodical 'exhibitions' of the products of their industry, this writer observes, 'No body of British manufacturers, we are persuaded, would submit to be actors in such a theatrical pageant. The only exhibition about which an Englishman cares is the diffusion of wealth and comfort in all its shapes; and he measures it, not by its surface or its brilliancy, but by its depth and its solidity. He does not collect rare specimens into palaces, that princes may gaze at them; he spreads out his every-day productions over the world, that men may imitate and enjoy them. The cottages and hamlets of the peasants, the neat mansions of the yeomanry, the larger habitations of the more wealthy, and all the gradations of dwellings up to the palace of the monarch, are the places where the products of British industry are to be found, not exhibited, but in use; and where active comfort reigns in every due proportion. To a Frenchman, indeed, exhibition is the limit of ambition; and the industry of which he can make a parade is that which he will ever most value. Even while we look back—and forward—on the changes of empires and the overthrow of states, the rise of some upon the ruins of others, and the dread and interminable rotations of the wheel of fortune, we cannot but feel there are characters inscribed on the hearts of nations which fortune can never wholly erase. What has long been among multitudes has, for the most part, wisely been; and it is allowing too little to habit, to say, that it is our second nature. It is more commonly the symbol of our first impulses, and our first feelings; the expression of an original bias, no matter how or when impressed, but continued to our latest years. Of this kind is the industry of England, together with the habit of reflection, by which it has been matured; not a result from any of the fortuitous events which chance has brought to light, and may again overwhelm in darkness; but a deep and indestructible proclivity, more long and lasting than her power itself. The splendor of nations may pass away; their wealth may be swallowed up in the vortex of revolutions; and the strength of to-day may be weakness to-morrow. But their characters are not thus to be effaced, nor their genius to be extinguished. With the power of Greece, the characteristic vivacity of her intellect did not perish: and when the martial ardor of Rome, the last of all her virtues which forsook her, had become the dream of past ages, another spirit of glory, more peaceful, though not less ambitious, took possession of her soul; and the world beheld with admiration, a successive sceptre in her hands. The seat of the useful arts, of those which mankind bless, and by which they are blessed, of those which the heart reveres, and the understanding approves, is Britain:—and should her armies be laid low,—should wars or tempests

sweep her fleets from the ocean,—should even her star of liberty grow dim; she may yet hold her empire over the mind, and maintain a place among the nations, by the united influence of sense, industry, and beneficence.'

But, in the fine arts, those nations who have cultivated them more have allowed Great Britain to have some claims to distinction. Do we include in them the higher departments of literature? Of the present state of English poetry Madame de Stael has said:—'English poetry, which is fostered neither by irreligion, nor the spirit of faction, nor licentiousness of manners, is still rich and animated, experiencing nothing of that decline which threatens successively the literature of most other countries in Europe. Sensibility and imagination preserve an immortal youth of mind. A second age of poetry has arisen in England, because enthusiasm is not there extinct, and because nature, love, and country, always exercise great power there. Cowper lately, and now Rogers, Moore, Thomas Campbell, Walter Scott, lord Byron, in different departments and degrees, are preparing a new age of glory for English poetry; and, while every thing on the continent is in a state of degradation, the eternal fountain of beauty still flows from the land of freedom.' She further remarks, that 'English works on criticism, and in particular most of their treatises on poetry and the imitative arts, are distinguished by greater freedom, originality, and knowledge of the antique, and bear on these accounts a greater affinity to our own (German) modes of thinking, than those of the French.'

'Of all the works connected with elegant literature, which the English produced during the last century,' says M. Schlegel 'by far the most important are their great historical writings. They have in this department surpassed all the other European nations; they had at all events the start in point of time; and have become the standard models both in France and Germany.'

Speaking of painting, and similar topics, 'In the commencement of the reign of George I.,' says Horace Walpole, 'the arts of England were sunk almost to the lowest ebb.' Portraiture, it is true, had been at this time successfully practised by Dobson, Riley, Cooper, Greenhill, Jervas, and Richardson, but by none with any remarkable eminence. It was not, however, to continue always thus: the time at length arrived when the English artists appeared not only desirous but capable of raising the character of their country, in this respect, to a level with that of any other nation.

The principal difficulty was to rescue the art from the degrading influence of a vicious taste, to retrace the steps of our predecessors (or rather to burst the bandages in which they had enthralled us), and resort at once to the original principle of imitation; which, when pure and select, is the only sound basis of the art. The first step towards this reformation was the establishment of a school for drawing from the living figure. This had been begun by Sir James Thornhill, in conjunction with Sir Godfrey Kneller, who, however, one would imagine, from his latter works, had left all consideration

of the value of such a thing far behind. He certainly assisted, however, in laying the foundation of a remedy for the evil which he, more than any other man, had occasioned. This school Sir James continued at his own house in the Piazza for some years. His death, in 1734, obliged the artists to procure another situation, which was not effected without some difficulty; for the people at first regarded the study from the naked figure as immoral. Another school was at length formed by Michael Moser, a native of Schaffhausen, and a chaser by profession, and six other artists, principally foreigners, the management resting with Moser. After a while, they were visited by Hogarth and others, and a larger body was formed in consequence, who established themselves in Peter's Court, St. Martin's-lane, in the year 1739. Having acquired some property by combined exhibitions of their works, they solicited a charter of incorporation, and, the scheme being sanctioned by his late majesty, their charter was granted in 1765. But, dissensions arising in the body, a secession of many of its principal members took place, and the result was the establishment of the Royal Academy in 1768, under the more immediate patronage of the king; Sir Joshua Reynolds being nominated its first president.

On the success of Hogarth, Reynolds, and Wilson, several other societies were also formed throughout the kingdom, for the avowed purpose of patronising and cultivating the imitative art.

Richardson, whose tracts ought to be known to every student and amateur of painting, died in 1745, at the advanced age of eighty. He was a bad painter, but his treatises on the art are full of enthusiasm, and of judicious observations on the theory of the art. Of one of these Sir Joshua Reynolds declared, that it had confirmed him in his love of the art, and elevated his ideas of its professors. Richardson contended strenuously for the propriety of painting portraits in the costume of their time; thus striking at the absurd system of flowing robes, which had been adopted by Kneller.

This period may be denominated the infancy of English art; and it is not a little curious, that, at the time when painting was verging towards a state of hopeless decline all over the continent of Europe, it should have revived, and that to no small purpose, in these islands, the inhabitants of which had been frequently taunted by foreigners as unable to execute a fine painting. We shall not dwell on its incipient state of improvement; indeed, the commendations bestowed on the painters alluded to above regard the principle of imitation rather than the thing imitated, since nothing could possibly be more untasteful or repulsive than the stiff, starch, and unsightly uniform (both male and female) of those days. But, the principle of attention to actual representation once established, it soon produced the fruits of a better taste in the art generally; and, accordingly, it was not long before the matchless talent of Hogarth beamed forth in unapproachable splendor to gild the onward progress of the muse of painting, and to herald the appearance of a kindred genius in the person of Sir Joshua Reynolds.

Sir Joshua was the first president of the Royal Academy; and on his return from Rome, at a previous part of his life, carried the art (at least as far as regards portrait-painting) to its very highest point of perfection.

What Reynolds did for portrait-painting, his distinguished contemporary, Wilson, did for landscape. He also had studied at Rome, and brought home from thence a refined taste, and a power of execution at once chaste, glowing, and brilliant: while, in the historical department, Sir Joshua's successor, the late lamented Mr. West, without rivalling either of the three great names just mentioned, yet displayed sufficient ability to throw completely into the back ground what had been previously produced by the successors of Sir James Thornhill, Hayman, Pine, and Whale. Besides West, honorable mention must ever be made of the names of Romney, Opie, Barry, and Fuseli.

The present state of painting in this country is certainly encouraging to the lover of art. In portrait, besides the highly-gifted president of the academy, Sir Thomas Lawrence, we have several other eminent professors: in landscape, and marine subjects, Turner and Callcott are at the head of a numerous body of followers. The pencil of Wilkie throws a brilliant lustre over both the humorous and pathetic departments of art; and in the arduous walk of history (a walk of art which, although it is entitled, when successfully pursued, to the highest honors, is too often followed without either profit or distinction), there are several names which we might select, whose bearers appear to us qualified to elevate the national reputation far higher than it has ever hitherto been raised. For the truth of these observations, we need only appeal to the annual exhibitions both at Somerset House and at the British Institution.

In sculpture, England, down to the Reformation, kept pace, at least, with her continental neighbours, as the west front of the cathedral of Wells (executed in the reign of Henry III.), Exeter, Litchfield, and Salisbury cathedrals, but more especially Henry VII's chapel in Westminster Abbey may testify. After this period we became for a time superstitiously afraid of superstition; and whatever painting or statuary was required for the decoration of houses, tombs, &c., was supplied from abroad. The best existing specimens of this imported skill is found in the statues of raving and melancholy madness at the New Bedlam gates, the bas relief on the pedestal of the London column, the kings in the Royal Exchange, &c.: Roubilliac executed several of the best monuments for Westminster Abbey.

The establishment of the Royal Academy has been the resurrection of this art. Banks, Bacon, and Flaxman need only be named to prove this; and many of the works of living sculptors may be with advantage compared with the best productions of the continent.

Before the Reformation there was but one kind of music in Europe worth notice, the plain sacred chant, and the descant built upon it.—That music likewise was applied to one language only, the Latin. Hence the compositions of

Italy, France, Spain, Germany, Flanders, and England, kept pace with each other in style and excellence. All the arts seem to have been the companions of successful commerce, and during the sixteenth century became general in every part of Europe. In this century music was an indispensable part of polite education. There is a collection preserved in MS. called Queen Elizabeth's Virginal Book. Tallis, profound in musical composition, and Bird his admirable scholar, were two of the authors of this collection.

In the seventeenth century musical writers and composers, who acquired fame in England, were, Dr. N. Giles, Thomas Tomkins and his son, Elway Bevin, Dr. Orlando Gibbons, William Lawes, Dr. John Wilson, Hilton, Playford, captain Henry Cook, Humphrey, Dr. Blow, Dr. Turner, Dr. Christopher Gibbons, Dr. Benjamin Rogers, and Henry Purcell. About the end of the reign of James I. a music lecture or professorship was founded in the university of Oxford by Dr. William Hychin. In the reign of Charles I. a charter was granted to the musicians of Westminster, incorporating them as the king's musicians, into a body politic, with powers to prosecute and fine all who, except themselves, should 'attempt to make any benefit or advantage of music in England or Wales.'

About the end of the reign of Charles II. a passion was excited in England for the violin, and for pieces composed for it, in the Italian manner. Prior to 1600 there was little other music except masses and madrigals; but, from that time to the present, dramatic music became the chief object. The year 1710 is distinguished in the annals of music by the arrival in Britain of George Frederic Handel. See *HANDEL*. The fame of this great musician, if not altogether the property, may redeem the musical taste of this country from that utter contempt in which some foreign writers hold it: for here he was cherished and enriched. Since Purcell's time the chief composers for the church in England have been Clark, Dr. Holder, Dr. Creighton, Tucker, Dr. Aldrich, Goldwin, Weldon, Dr. Croft, Dr. Greene, Dr. Boyce, Dr. Nares, Kent, and Stanley, and finer cathedral music is known in no part of the world. On the state of *ENGRAVING* in England, see that article.

6. *Our colonial establishments and dependencies* may be thus exhibited:—

IN EUROPE.

Guernsey,	Gibraltar,
Jersey,	Malta,
Isle of Man,	Heligoland.

IN ASIA.

India,
Ceylon,
Prince of Wales's Island,
Bencoolen,
Isle of France,
New South Wales, or Botany Bay.

IN AFRICA.

Cape of Good Hope,	Cape Coast,
Sierra Leone,	St. Helena.

IN AMERICA.

Continent.—Canada, Upper and Lower,
New Brunswick,
Nova Scotia.

Islands.—Cape Breton.
St. John's,
Newfoundland,
Bermuda.

IN THE WEST INDIES.

Jamaica,
The Leeward Islands,
The Windward Islands,
The Bahamas,
The Virgin Islands,
On the Continent.—Demerara, Essequibo,
Berbice, Honduras.

The territorial extent of our Indian Empire is taken at 350,000 square miles, and the population at 50,000,000. The average of exports from England to India (exclusive of China), in a series of six years, ending 1811, was

On account of the East India Com- pany	£1,371,666
— of private merchants trading to India	453,666
— of the captains and offi- cers of the company's shipping.	418,333
	<hr/> £2,243,665

Including the specie exported.

The value of goods imported is increased by the freight, interest of money, expected profit, &c.; and, though fluctuating, may be averaged at this period at £3,000,000 sterling; and the seamen employed, at 6000. Since the trade has been laid open to the out-ports, it has been much altered, and has been so fluctuating as at present to be altogether uncertain in amount. The tonnage of shipping cleared outwards to the East Indies, was, according to the custom-house returns, dated 1st of May, 1818:—

	1815.	1816.	1817.
From London . .	78,431	87,866	83,172
— Liverpool and other ports in Britain . .	1,549	10,655	19,456
	<hr/> £79,980	<hr/> £98,521	<hr/> 104,628

The China trade still remains exclusively in the East India Company. The annual exports, chiefly in broad cloth, are from £1,000,000 to £1,200,000: the imports are tea, in vast quantities; nankeens, and silk. This trade employs about 20,000 tons of shipping, and 2000 seamen.

To Canada, the settlements on Hudson's Bay, Nova Scotia, and New Brunswick, with the islands of Newfoundland, St. John, and Cape Breton, contain a surface of 220,000 square miles, but not above 500,000 inhabitants. Our exports vary from £1,000,000 to £2,000,000 sterling. Our imports from Canada consist of furs and skins. From Nova Scotia and New Brunswick we receive timber; from Newfoundland,

fish, and seal skins. The commerce is considerable between our West India and North American colonies; fish, flour, and staves, being exchanged in great quantities for rum, coffee, and sugar. The shipping employed between Great Britain and the North American Colonies, were

	Ships.	Tons.	Men.
In 1805 . .	288	52,412	2,707
1814 . .	392	81,939	4,277
1815 . .	672	145,448	7,241

The imports into Britain from, and exports to the West Indies, in official value, were in the years following:—

Years.	Imports.	Vessels entered Inwards.		Exports.
		Ships.	Tons.	
1763	2,349,006			1,154,109
1773	2,836,093			1,335,773
1783	2,891,805	614	124,239	1,796,982
1793	4,392,158	689	156,962	2,695,220
1798	5,411,962	637	163,399	5,197,913
1803	6,040,067	614	180,950	2,344,647
1808	8,716,918	805	228,082	5,850,773
1814	8,200,506	685	212,776	6,284,353
1815	8,371,193	701	223,246	6,862,371
1816	7,428,617	680	219,042	4,559,665

But the average size of a West Indianman, which, in 1783, was only 200 tons (registry), is now fully 320. The revenue arising from West India imports is £5,000,000, annually, of which about £3,000,000 are from sugar; the rest chiefly from rum. The trade of these colonies has been long exposed to great fluctuations.

On the whole it has been calculated, that the authority of Britain extends over nearly two-thirds of the globe, with respect to longitude. There are consequently, various places within these limits that have noon and midnight at the same moment, and the sun never sinks below the horizon of the whole. Stretching also from the sixty-first degree of north latitude to the thirty-third of south, the four seasons of the year prevail at the same time. 'It appears, in fact,' says a modern writer, 'that at this time the British possess more territory, more wealth, greater variety of produce, greater population, superior religion, as much liberty, greater security, more commerce, superior agriculture, and greater revenues, than ever were possessed by any other nation, ancient or modern.'

GREAT ISLAND, an island in Bass's Strait, between New Holland and Van Diemen's Land, about forty miles long, and from fifteen to twenty in breadth. The soil is shallow, and vegetation low. The shore is frequented by immense quantities of seals and sea-fowl. Long. 148° E., lat. 40° S.

GREAT ISLAND, an island on the coast of Ireland, in the county of Cork, five miles long, and from one to three broad. It is formed by the river Lee in Cork harbour.

GREAVE, *n. s.* Sax. *græf* A grove.

This chorle was hid there in the *grees*
Yeovired with grasse and leves.

Chaucer. Romaunt of the Rose.

Yet when there haps a honey-fall,
We'll lick the sirupt leaves,

And tell the bees that theirs is gall

To that upon the *greaves*. *M. Drayton.*

GREAVES, *n. s.* From Fr. *grèves*. Armour for the legs; a sort of boots. It wants the singular number.

He had *greaves* of brass upon his legs. 1 *Sam.* xvii.

A shield make for him, and a helu, fair *greaves*,
and cures such

As may renown thy workmanship, and honour him
as much. *Chapman's Iliads.*

GREAVES (John), an eminent physician and antiquary, was born in 1602, and educated at Baliol College, Oxford, from which he removed to Merton. He was afterwards chosen professor of geometry, in Gresham College. His ardent thirst of knowledge led him to travel into several parts of Europe. He next undertook a voyage to the east, where, with indefatigable industry, and even at the peril of his life, he collected a considerable number of Arabic, Persic, and Greek MSS. for archbishop Laud. He also collected for that prelate many oriental gems and coins, and took a more accurate survey of the pyramids than any traveller who went before him. On his return from the east he visited several parts of Italy a second time. Soon after he finished his second voyage he was chosen Savilian professor of astronomy at Oxford, for which he was eminently qualified. His books relating to Oriental learning, his Pyramidographia, or a description of the pyramids in Egypt, and his Epochæ Celebriores, prove him to have been a man of no small literary attainments. He died in 1652.

GREBNA, a town of European Turkey, in Thessaly, situated at the junction of a number of roads leading from Albania, Livadia, and the north-east of Macedon. It is a place of considerable traffic, and the country adjacent is fertile. Fifty miles north by east of Joannina, and fifty-six south-west of Salonica.

GRE'CISM, *n. s.* Lat. *græcismus*. An idiom of the Greek language.

GRECOURT (Jean Baptiste Joseph Villart de), a French ecclesiastic and poet, was born in 1683 at Tours, in which city he obtained the benefice of St. Martin. But he was found more commonly at Paris, where he had received his education, and associated with most of the leading wits of his day, particularly with the marshal d'Estriées. He excelled in epigrams, tales, and sonnets, a collection of which was made and published, in three octavo volumes, about twenty years after his decease, in 1743.

GREE, *n. s.* Fr. *gré*, probably from *gratia*. Good will; favor; good graces. Obsolete.

For sith a woman was so patient,

Unto a mortal man, wel, more, we ought

Receiven all in *gree* that God us sent.

Chaucer. The Clerkes Tale.

And falling her before on lowly knee,

To her makes present of his service seen,

Which she accepts with thanks and goodly *gree*.

Spenser.

G R E E C E.

GREECE, *n. s.* Corrupted from degrees. It is written likewise greeze or grice. A flight of steps. Obsolete.

Every *greece* of fortune

Is smothered by that below. *Shakspeare.*

After the procession, the king himself remaining seated in the quire, the lord archbishop, upon the *greece* of the quire, made a long oration. *Bacon.*

GREECE, in many respects the most deservedly celebrated country in the world, was anciently bounded on the north by Macedonia and the river Strymon; on the west by the Ionian Sea; on the south by the Mediterranean; on the east by the Egean Sea and Archipelago. It extended from the Strymon, by which it was parted from Thrace, to the promontory of Tænarus, the south-most point of the Peloponnesus, now the Morea, about 6° 20' of latitude, or nearly 440 English miles, and in breadth from east to west about 359 miles.

The general names by which the inhabitants of this country were known to the ancients were those of Graïoi, or Graicoi, whence the name of Greece is plainly derived. These are thought to come from Græcus, the father, or (according to some) the son, of Thessalus, who gave name to Thessaly; but some modern critics derive them from Iraga, the same with Reu, the son of Peleg, by the transposition of a letter to soften the sound. These names were afterwards changed for Achæi or Achivi, and Hellenes; the first, as is supposed, from Achæus, the son of Xuthus, the son of Hellen, and father of Ion; or, according to the fable, the son of Jupiter: the other from Hellen, above mentioned, the son of Deucalion, and father of Dorus, from whom came the Diores, afterwards a famous nation among the Greeks. Another name by which the Greeks were known, in some parts of the country, was that of Pelasgi, which the Arcadians, the most ancient people in Greece, deduced from their pretended founder Pelasgus; who is said to have obtained such footing in Peloponnesus, that the whole peninsula from him was called Pelasgia. But the most ancient name of all is universally allowed to have been that of Iones, which the Greeks themselves derived from Ion, the son of Xuthus; or, as the fable has it, of Apollo, by Creusa the daughter of Erechtheus the grandson of Deucalion. Josephus, however, affirms, that their original is of much older date; and that Javan, the son of Japhet, and grandson of Noah, was the first who peopled these countries; which Bochart has also rendered very probable. It is true, indeed, that among the Greeks themselves, only the Athenians and such colonies as sprung from them, were called Iones; but it is also plain beyond exception, that other nations gave this name to all the inhabitants of Greece.

The inhabitants of Greece in the first ages, according to their own historians, appear to have been perfectly barbarous. They lived indifferently on every fruit, herb, or root that came in their way; and lay either in the open fields, or

at best sheltered themselves in dens, caves, and hollow trees: while the country itself remained one uncultivated desert. The first improvement they made, was the exchanging of their old food for the more wholesome acorns, building huts for themselves to sleep in, and covering their bodies with the skins of beasts. For all this, it seems, they were beholden to Pelasgus, above mentioned (supposed by some to be the Peleg of Scripture), and who was highly revered by them on that account. This reformation in their way of life, however, it seems, wrought none in their manners. On the contrary, they who had nothing to fight for but a hole to sleep in, began now to envy and rob one another. This, in process of time, put them under a necessity of joining themselves into companies under some head, that they might either more safely plunder their neighbours, or preserve what they had got. Laws they had none except that of the sword; so that those only lived in safety who inhabited the most barren and craggy places; and hence Greece for a long time had no settled inhabitants, the weak being always expelled by the strong. Their gigantic size and strength, if we may believe Plutarch, added so much to their insolence and cruelty, that they seemed to glory in committing the greatest acts of violence and barbarity on those that unhappily fell into their hands.

The next advance towards civilisation was their forming themselves into regular societies to cultivate the lands, and build towns and cities. But their original barbarity and mutual violence prevented them from uniting as one nation, or even into any considerable community: and hence the great number of states into which Greece was originally divided. The most remarkable of these small principalities mentioned in history are the following: in Peloponnesus were those of Sicyon, Argos, Corinth, Messenia, Arcadia, and Lacedæmon. In Græcia Propria (that part of Greece which lay without Peloponnesus), were those of Attica, Megaris, Bœotia, Locris, Epicnemidia, Doris, Phocis, Ozolæa, and Ætolia. In Epirus, were the Molossi, Amphiloichi, Cassiopæi, Dryopes, Chaones, Thesproti, Almeni, and Acarnanes. In Thessaly were those of Thessaliotis, Estiacotis, Pelasgiotis, Magnesia, and Phthiotis. All these were at one time or other severally governed by kings of their own, though we only find the names of some of them mentioned in the histories of the more considerable kingdoms of Sparta, Attica, Thebes, &c.

The erection of these kingdoms, however, for some time, did not much alter their manners; the inhabitants of the new kingdoms plundered and destroyed one another without mercy. Attica was the only place in any degree free from these incursions, because it was naturally destitute of every thing that could invite a plundering enemy; but those cities fared much worse which were situated on the sea-coasts; because they were in continual danger of being plundered either by sea or land; for pirates at that

time did not less infest all those seas than robbers did the land. And this was one main cause why most of the ancient cities of Greece were situated at some considerable distance from the shore; but even in these, as all their safety consisted in the resistance they could make against an invader, their inhabitants were under a necessity of going constantly armed, and being ever on their guard. Another mischief arising from these continual piracies and robberies was, that they occasioned the far greater part of the lands to lie uncultivated, so that the people only planted and sowed as much as was barely necessary for their support; and, where there was so great a neglect of agriculture, there could be little room for any discoveries in other useful arts and trades. Hence when other nations, as the Jews, Egyptians, Midianites, Phœnicians, &c. had improved themselves to a very high degree, the Greeks seem to have been utter strangers to every useful art. During this period of savage barbarity, the most renowned Grecian heroes as Hercules, Theseus, &c., performed their exploits; which, however exaggerated by poetic fiction, no doubt had a foundation in truth. Some, indeed, are of opinion, that the Grecian heroes are entirely fictitious beings. Yet, considering the extreme degree of barbarity which at that time prevailed throughout Greece, it seems not improbable, that some persons of extraordinary strength and courage might undertake the cause of the oppressed, and travel about like the more modern knights errant in quest of adventures.

The first expedition in which we find the Greeks united, was that against Troy, for the particulars of which, see *TROJA* and *TROY*. Their success in this war (which happened about A. C. 1184), cost them very dear; vast numbers of their bravest warriors being slain, and great numbers of the survivors cast away on their return. It is probable, however, that their having staid for such a long time in Asia, might contribute to civilise the Greeks somewhat sooner than they otherwise would have been; and accordingly, from this time, we find their history somewhat less obscure. The continual wars, indeed, in which they were engaged among themselves for a long time, prevented them from making any considerable progress in the arts; while they preserved their liberty, and rendered them brave, and skilful in military affairs: at the same time they effectually prevented them from making permanent conquests, and confined them within the bounds of their own country. The states, too, were so equally balanced, that scarcely one of them was able perfectly to subdue another. The Spartans, however, having with great difficulty reduced the kingdom of Messene, and added its territories to their own, became the leading people in Greece. Their superiority was long disputed by Athens; but the Peloponnesian war at last determined that point in favor of the Spartans, when the city of Athens was taken, and its walls demolished by Lysander the Spartan general. See *ATTICA* and *SPARTA*.

By the battle of Leuctra, the Spartans lost that superiority which they had maintained for 500

years, and which now devolved on the Thebans. After the death of Epaminondas, the celebrated Theban general, however, as no person was found possessed of his abilities, the Thebans were again obliged to yield the superiority to the Spartans. But by this time the Greeks had become acquainted with the luxuries and elegancies of life; and all the rigor of their original laws could not prevent them from valuing these as highly as other people. This did not indeed abate their valor, but it heightened their mutual animosities; at the same time that, for the sake of a more easy and comfortable life, they became more disposed to submit to a master. The Persians, whose power they had long dreaded, and who were unable to subdue them by force of arms, at last found out, by the advice of Alcibiades, the proper method of reducing the Grecian power, namely, by assisting them by turns, and supplying one state with money to fight against another, till they should all be so much reduced, that they might become an easy prey. Thus the Greeks were weakened, though the Persians did not reap any benefit from their weakness. Philip of Macedon entered into the same political views; and partly by intrigue, partly by force, was declared generalissimo of Greece. His successor, Alexander the Great, completed their subjection; and by destroying the city of Thebes, and exterminating its inhabitants, struck such a terror throughout Greece, that he was as fully obeyed by all the states as by any of the rest of his subjects.

During the absence of Alexander in Persia the Greeks attempted to shake off the Macedonian yoke, but were quelled by his general Antipater. The news of Alexander's death was to them a matter of the utmost joy; but their mutual animosities prevented them from joining in any solid plan for the recovery of their liberties, and hence they continued to be oppressed by Alexander's successors, or other tyrants, till Aratus, the Achæan, about 268 B. C., formed a design of setting his country free from these oppressors. He persuaded a number of the small republics to enter into a league for their own defence, which was called the Achæan league; and notwithstanding that the republics, taken singly, had very little strength, they not only maintained their independency, but soon became formidable when united. This association continued to become daily more and more powerful; but received a severe check from Cleomenes III. king of Sparta, which obliged them to call in Antigonus to their assistance. This prince overcame Cleomenes at the battle of Sellasia, and afterwards made himself master of Sparta. Thus he became a more formidable enemy than the one he had conquered, and the recovery of the Grecian liberties was incomplete. Soon after this the Greeks began to feel the weight of a power more formidable than any which they had yet experienced; namely, that of the Romans. That insidious and haughty republic first intermeddled with the Grecian affairs, under pretence of setting them at liberty from the oppression of Philip VI. of Macedon. This, by a proper union among themselves, they might have accomplished: but they acted as

though they had been infatuated : receiving with the utmost joy the decree of the Roman consul, who declared them free ; without considering, that he who had thus given them liberty, might take it away at his pleasure. This lesson, however, they were soon taught, by the total reduction of their country to a Roman province ; yet this can scarcely be called a misfortune, when we look back to their history, and consider their outrages upon one another : nor can we sympathise with them for the loss of that liberty which they only made use of to fill their country with slaughter and blood. After their conquest by the Romans, they made no united effort to recover their liberty ; but continued in quiet subjection till the beginning of the fifteenth century. About that time they began to suffer under the tyranny of the Turks, and their sufferings were completed by the taking of Constantinople in 1453. Since that time they have groaned under the yoke of this most despotic government.

GREECE, MODERN. Of this country, so intensely interesting to the scholar, the artist, and the antiquary, we have been, as lord Byron observes, ' more neglectful than it deserves ;' ancient recollections and associations have so much influence, as completely to absorb the attention of the traveller, and render him almost unconscious of the present race of mortals, and careless of the existing state of Greece.

Yet are her skies as blue, her crags as wild,
Sweet are her groves and verdant are her fields,
Her olive ripe as when Minerva smiled,
And still his honied wealth Hymettus yields ;
There the blythe bee his fragrant fortress builds,
The free-born wanderer of her mountain air ;
Apollo still her long, long summer gilds,
Still in his beam Mendeli's marbles glare :
Art, glory, freedom fail, but nature still is fair.

As a proof of the little attention that has been paid to this country and the want of taste and feeling prevalent in some quarters, it has been observed that Pinkerton has devoted only one page of his three huge quarto volumes to the whole of Greece, about six lines to the description of Attica, and half a line to inform the reader that Atini, the ancient Athens, is thinly populated.

A general sympathy was manifested from one end of Europe to the other, when, in the year 1820, the first symptoms appeared of a rising of the enslaved Greeks ; all civilised nations seemed disposed to aid the oppressed, and to pay back to the descendants some part of what the world owes to their ancestors. If, indeed, this movement has not at present produced much of permanent effect, we may attribute it to the insensibility of statesmen, whom the voice of humanity can only move when it accords with their political views : we may observe that the same policy, which in 1813 and 1814 sympathised with an oppressed people, and encouraged them to shake off the yoke, in 1822 doomed them to submit to a prolongation of their calamities under pain of being declared rebels. The wish of certain cabinets to furnish a counterpoise to American liberty, in fact, has paralysed this noble effort of humanity. ' In vain,' as one of her eloquent French advocates observes,

' ravaged and ruined Greece stretched its imploring hands towards Europe, and entreated its compassion, in the name of that merciful religion which is common to all Christians ; in vain it exhibited to the view of independent nations its degradation and misery ; it was abandoned to despair. Posterity will hardly believe that, in an age in which statesmen have made so much parade about peace and order, men, to whom it would have been easy to stop the fury of the Turks, have insulted misfortune by disgracing with the name of rebellion the patriotism of the Greeks, and suffered the barbarians to assuage their thirst of vengeance on a handful of Christians already crushed by their exactions. Can it seem astonishing that the Greeks should sink in a struggle, in which Turks and Christians were leagued against them ?' It must be left to time to disclose the issue of this struggle ; in the mean while it is interesting to retrace its past events, to examine this classic soil, on which the ancients exhibited so many sublime examples of patriotism and all the civic virtues, to contemplate the ruins which recal to our minds their civilisation, their arts, their superstitions, and their exploits ; and to gain some tolerably exact idea of the theatre of so many great events, and which is destined perhaps to present others not less astonishing.

We shall then give, I. A rapid and general description of the countries inhabited by the Greeks ; then treat of Greece properly so called under the divisions. II. Of Great Greece, or Livadia. III. Of the Peloponnesus or the Morea ; and IV. Of the Archipelago, of which our notice must be very slight.

I. The peninsula of Greece juts out into the Mediterranean Sea, like the peninsula of Italy, but extends several degrees farther to the south. It may be assumed to be contained between the parallels of 41° 30' and 36° 20' N. lat., and 18° 10' and 22° E. long., commencing from the head of the gulf of Salonica on the east, and that of Aulona on the west, and reaching to Cape Matapan on the south. It consists properly of two peninsulas, one extending from the northern limits already mentioned to Cape Colonna (the ancient Sunium) in the south, being about 200 miles in length, and 100 in breadth, with an area of about 20,000 square miles, and united to the other, or that of the Morea (the ancient Peloponnesus) by the isthmus of Corinth ; this peninsula contains a surface rather less than half of the former country. The islands of the Archipelago may be about equal in extent to the Morea, stretching more than four degrees farther to the east. The entire district is bounded on the north by the Turkish provinces of Roumelia and Albania (see ALBANIA) ; on the west by the Adriatic Sea, which separates it from the south-eastern part of Italy ; on the south by the Mediterranean Sea, and on the east by the Archipelago.

An uninterrupted range of mountains runs down the middle of the greater peninsula, in a parallel line to its eastern and western coasts, varying in elevation from 7000 to 8000 feet in the northern and central part, to those in the south, which are about 700 or 800 : among the former may be reckoned the loftiest ridge of

Pindus and Parnassus; and, among the latter, Parnes, Pentelicus and Hymettus, in Attica. From this central chain different ridges branch off towards the coast on either side; eastward the celebrated Olympus, near the northern part of the gulf of Salonica, rising to the height of 6000 feet, forms part of an interior chain, extending through the island of Negropont, consisting of Ossa and Pelion, Ota and Othrys, and mount Delphis the most remarkable of them all. The mountainous countries of Epirus, Ætolia, and Acarnania, constituted part of what is now called Albania. In the Morea, near the western coast, is the lofty Cyllenian range, while towards the south rises the Taygetus. These mountains enclose plains of considerable elevation, of which Thessaly, Bœotia, and Arcadia, still maintain their ancient appearance, and are watered by mountain streams and the numerous branches of the Peneus and Salymperia, which, after intersecting the plain of Thessaly, unite, and flowing through the famous valley of Tempe, discharge themselves into the Gulf of Salonica; while the Alpheus fertilises the verdant plains of Arcadia, Elis, and Achaia. To these may be added a multitude of other streams of less importance, which would not have been noticed in any other country than Greece, where every rivulet has its verse, and as Spon observes, these smaller rivers make more noise, 'dans les livres que dans leurs lits.'

There is but one lake of any considerable extent, the Copais, now called Topoglias, which receives the waters of the Cephisa, after they have traversed the plains of Phocis, besides those of a number of other rivers. It is situated near the north-eastern coast of Bœotia, and its incessantly increasing waters would long since have inundated the country, and rendered it uninhabitable, had it not been for the gulf of Katabathron, which, at the foot of a chain of chalk hills, receives the overflowsings, and this lake probably finds a passage under the hills; for the waters spring up abundantly on the opposite side, and form a river, which at a short distance discharges itself into the sea between plantations of cotton. The inhabitants call this river Iarmi: it may be regarded as the outlet of the Cephisa, which, after crossing the lake, runs about a league under ground. It is uncertain whether the Katabathron be the work of nature alone, or whether art has completed what nature has begun; this subterraneous canal was obstructed in its course, under the reign of Alexander, by earthquakes and the crumbling of the ground; and there are still visible the extremely deep wells, which were then dug to facilitate the course of the waters. Another operation of this kind will perhaps soon become necessary, as the banks of the Copais, continually assailed by the winter torrents, present nothing but a series of unhealthy marshes. Surrounded by rocks and half-cultivated hills, behind which, on the western side, the mountains of Phocis are seen rising in different shades of coloring, the Copais presents one of the finest scenes in Bœotia; in summer the roses almost cover its banks; the river Hercyna, dashing from rock to rock, falls into this vast basin, foaming over the blocks of

stone which arrest its progress. Precipitous rocks, covered with wood, rise on either side of the bay, into which the waters of the lake discharge themselves on issuing from their subterraneous abyss. Buzzards and other birds are seen constantly flitting over this liquid plain, while the vultures are ever hovering on the mountains which bound it to the west.

The coast of the peninsula, especially in the southern part, is considerably indented with gulfs and bays, several of which afford commodious and sheltered anchorage for vessels, and furnish great facilities for maritime commerce. The principal of these are the gulfs of Salonica, Talanta, Athens, and Napoli on the east; those of Aulona, Prevesa, Lepanto, and Arcadia on the west; and those of Coron and Kolokythia on the southern coast; that of Talanta is more properly a channel, separating the island of Negropont from the mainland, to which it makes so near an approach, that Chalcis, the principal town, almost touches it. Of course there are many capes or headlands, some of them projecting far into the sea; the most remarkable of these are capes Lingua, Leucadia or St. Maura, and Konella on the west; capes Gallo, Matapan, and Malœa to the south; and capes Sunium or Calona, Manteio, and Phalasia, on the east.

The climate of Greece, according to the latitude in which it is placed, and its exposure to the sea, which almost surrounds it, should be similar to that of Italy; it is, however, in many parts colder in winter, and warmer in summer. In the centre of the country the tops of the mountains are for three parts of the year covered with snow, which in some of their deeper recesses may be always discovered. Mount Parnassus was formerly thought to be impassable on account of its perennial snow, but Dr. Sibthorp relates that it was perfectly free when he crossed it in the month of July. Some plains of considerable elevation are said to be as cold as the west of England, particularly that of Ionnina, about 200 feet above the level of the sea, between the middle range of mountains and the western coast; in the Morea, further to the south, the elevated plains are still colder, and Tripolitza is said to be sometimes covered with snow to the depth of eighteen inches. At no great distance from Tripolitza, the capital, Dr. Holland found the temperature at six in the morning as low as 16° of Fahrenheit. He adds, 'the degree and continuance of cold were such as I scarcely recollect to have experienced in England, and this in the very centre of Arcadia; but this was in 1813, a winter remarkable for its severity in every part of Europe. In summer, however, the blooming vales of Arcadia present a continuance of scenery equal to any thing which has been described or imagined in poetic song. Luxuriance and beauty may be pronounced to be the general characteristics; flowering valleys, winding streams, and hills shrouded nearly to their summits with wood, are the objects which commonly awaken our admiration.' —Haygarth. In the lower regions of Attica the air is more moderate, and the climate more equable, the cold being less intense, the heat less oppressive, and the rain less abundant. In

Athens the temperature seldom rises above 80° or 90°, and it is very rarely so low as the freezing point; it is therefore generally healthy, while on the contrary, many parts of Livadia, which, in ancient times were the site of populous cities, are become infectious marshes, spreading death among those who are hardly enough to establish themselves in their neighbourhood.

The soil of Greece is generally good; that of Bœotia especially is very rich, producing wheat, Indian corn, barley, kidney-beans, rice, and sesamum, with a great quantity of cotton; while its lakes still supply Athens and other parts of the country with eels, waterfowls, and rushes for baskets, mats, and lamp-wicks. Not fewer than eight different sorts of wheat are cultivated with great success, and produce in good soils from ten to twelve for one, and in the best from fifteen to eighteen for one, and this mostly in unmanured ground; barley, millet, and tobacco are also general throughout Greece. In the plains of Thessaly are extensive groves of mulberry-trees, cultivated principally for the silk-worm, which is there an object of much attention; the trees are carefully cut down, watered, and hoed. The silk of Attica is remarkable for its whiteness; but that of the Morea, deriving its name probably from the mulberry, is the most celebrated; there is also abundance of excellent corn, wine, and figs, and the wheat yields thirty-fold, and two crops in a year. The cactus or Indian-fig forms an impenetrable hedge with its thorny coats round the plantations in many places; but most of the lands are open. Cotton is produced in most parts of the country, but in the greatest abundance in the plains of Tricala in Thessaly, where not less than 600,000 pounds of the wool are grown annually. The fig-tree is cultivated with much attention and success, and the olive forms the greatest part of the exports and riches of Attica, yet this oil, once so fine and so highly esteemed, is now only used for the manufacture of soap. Their knowledge of agriculture is not very far advanced, and the simple instruments they use bear every mark of a very ancient origin; in some parts, as in the isles of the Archipelago, they use the spade instead of the plough, the lands being divided into parcels too small to require the use of the latter instrument. Of the wines of this country, ten different sorts have been enumerated by Dr. Sibthorp, but none of them can be called fine except those made on a few of the islands of the Archipelago; the practice also which generally prevails of mixing with them turpentine, from the species of fir called *pinus maritima*, in order to prevent them from becoming acid, renders the flavor not very agreeable. This fir is one of the most useful trees in Greece, furnishing pitch and tar for all maritime and domestic purposes; of the resinous parts are made candles or torches, the cones are put into the wine casks, the wood serves for the carpenter, and the bark for tanning. Honey is produced in considerable quantities, and much valued by the Athenians, especially that of Hymettus, in Attica, which has been celebrated from time immemorial, and is still so much in esteem, that a present of 1000 pounds

weight of it is annually sent to Constantinople. Articles of the first necessity are all manufactured in Greece; tanning, dyeing, cotton and silk weaving, and other mechanical arts, are carried on with tolerable skill in every family; and the Greeks have no need of importing any thing but what contributes to convenience or luxury; articles of this description they can easily procure by giving in exchange the superfluity of their produce, as grain, oil, wine, fruits, &c. This exchange sometimes affords a very lucrative commerce, but, in order to turn the balance decidedly in favor of the Greeks, agriculture must be carried to a higher state of perfection, so that the quantity of their productions may be increased, and the quality of their goods improved.

To produce these beneficial effects the laborer must be rescued from the iron hand of oppression, and brought under the dominion of just laws; but the despotism of the Turks has paralysed every thing in Greece. To live in abject wretchedness, to have no appearance of wealth or comfort in their dwellings, or any thing which may tempt the cupidity of these savage masters, is the only safeguard that the miserable Greeks possess. Owing to this cause, and the unwholesome state of the atmosphere in some places, arising from the numerous marshes near the coast, the population of the country is much diminished. The whole of Greece does not perhaps now contain more than 4,000,000 of inhabitants, allowing to the

Peninsula in the north	2,000,000
The Morea and Negropont	1,000,000
The islands	1,000,000

The Greeks constitute three-fourths of this population; the rest are Turks, Mussulmans, Albanians, Jews, and the mixed descendants of Romans, Venetians, Neapolitans, and other Europeans, generally called Franks. The Turks are, however, quite ignorant of the state of the population; it is, therefore, not surprising that strangers should have but an imperfect knowledge of it. As of old, the people may be said to be divided into four classes, cultivators of the soil, [craftsmen, soldiers, and priests. In the manners of the Greeks we may observe many defects and vices; but these are, for the most part, the natural effect of their long and hard bondage, and should make us detest the barbarous despotism which has so long oppressed a people gifted with every disposition necessary to render them great, happy, and worthy of their ancestors. They are indeed naturally lively, and this appears in the excessive joy which they manifest in their panégiris or church-festivals, in which they drink and sing and dance in honor of their patron saint, till they fall into a state of weariness and stupefaction. It is said, that a Greek before he enters again into his enslaved village, sometimes takes a week, a month, or a year to rejoice in; but this is not gaiety; it is frenzy; they appear in this like the unfortunate negroes, who pass the whole night in dancing, in order to forget the toils of the day. If the men are immoderate in their exhibitions of joy, the women are so in

their grief. The loss of her husband terminates for ever the happiness of the widow; she utters dreadful lamentations, tears her hair, disfigures her countenance, retires from society, neglects the care of her person, and takes no part in social avocations; she seldom marries again. In well regulated towns this excessive mourning has been rather tempered by the prevalent manners, but, in the country parts and the islands, it is still inordinate. At their funerals, mourners are hired for the purpose, and the disgusting spectacle is exhibited of a factitious despair, mingled with the most extravagant panegyrics on the deceased; in many places they expose the dead in the churches, where they are visited by the relations and friends, who come to give them the last kiss. A woman is considered as of little value in society, when her husband is dead: in the higher ranks, as among the ancients, the Greek females are sequestered and shut up in their seraglios, from which they never go out without their veils, and that only to visit their female relations, or to frequent the churches. Embroidery, music, and story-telling are their chief occupations in their retirement, and their minds thus left without culture, would become torpid were it not for their natural vivacity, which discovers itself in the brightness of their eyes, in the flexibility of their agreeable countenances, and in the agility of all their limbs; but these women, who in the most simple dress always appear even handsome, disfigure themselves by the heavy costume in which they are muffled up, and the thick paint with which they cover their faces. Frequent bathing, and that languor inseparable from idleness, impair in early life those charms, which begin to disclose themselves at a very tender age, and all the marks of a premature old age appear before they have reached what is commonly considered the prime of life; among the lower classes, the fatigues of labor generally produce the same effect. With an excessive love for dress, and great fondness of perfumery, the Greek women manifest great negligence in regard to the cleanliness of their apparel, and their dwellings are destitute of neatness, though it would be most easy to keep them in order; since all their moveables consist in a few sofas, some presses or chests to contain their clothes, the mattresses which they spread in the evening to sleep on, some stools about two feet high which serve them for tables and chairs, and the brazier near which the women in winter spend the whole day, and which is about the same height: some images complete the decoration of their rooms. In the cities and the islands, where more intercourse with the European nations prevails, there is less uniformity and insipidity in the life of the females; they are not excluded from society; gay and affable, they often charm the traveller by the most gracious and easy hospitality. 'What stranger,' says a popular French advocate of the Greeks, 'can resist the invitations and offers of hospitality which are frequently addressed to him in a sweet and harmonious language by groups of lively and black-eyed females seated before their houses, and occupied in the labors

of embroidery and spinning, under the fine climate of the Archipelago?' Education furnishes them with scarcely any means of dissipating their weariness; their husbands either leave them alone while they go to navigate the ocean, or treat them with a lordliness equal to that of the Turks. Among the superstitions to which they are much devoted may be mentioned their using of various charms, their consulting with sorceresses, and their reliance on dreams, which interest them exceedingly, and by which the young females endeavour to discover what sort of a husband they are likely to have, and whether they are destined to be happy in their future life. Their marriages are celebrated with rejoicings, in which whole villages take a part. The proposals are made in some of the islands by proxenets or match-makers; at church the newly married couple are adorned with crowns; and, on entering the bridegroom's house, the bride is carried over the threshold, as to touch it would be counted a bad omen. Almonds, walnuts, and other fruits are distributed among the people; the repast is commonly very abundant, and they drink moderately as is customary in Greece, where drunkenness is seldom met with, and their manner of living is generally very simple.

In vain in this country do Helicon and Parnassus still rear their summits to the clouds, the genius of the fine arts no longer resides there: how indeed could they develop themselves under a government which makes every appearance of riches a signal for fresh exactions? Neither architecture, nor painting, nor sculpture, is to be found in any perfection; the churches even are small and mean, and those which are in any respect remarkable in their construction take their date from the times of the latter empire, or of the Italians, or have been composed of the fragments of antiquity; besides these there are no public edifices, except the monasteries, built without taste, and often without any symmetry. This country, once the richest in the productions of the fine arts, is now the poorest in the civilised world; and, to equal other nations, it will be necessary for the Greeks to study the very first principles, since these have fallen into oblivion. Music is among them less an art than a means of amusement and diversion; in their churches the clergy content themselves with miserable psalmody, which they never dream of improving; and, in their social meetings, a bad instrument, some favorite air, and a poor player, are sufficient to excite their gaiety. Their songs sometimes produce emotions of the most moving kind, but this is hardly to be attributed to their music; indeed, buried in slavery and poverty, how can the art of harmony inspire any people?

The language of the ancient Greeks has undergone many alterations in the course of time; and these, as may be observed, commenced with the decline of the eastern empire. The irruption of the barbarians hastened the corruption of the language, as well as the fall of the empire; and ages have passed in which this nation had no literature but that of its ancestors. About the twelfth century some taste for learning arose;

the crusades then commenced, which brought the East into relation with the West, the Greeks with the Latins and Saracens; and though there was a striking distinction between the supple and artful character of the Greeks, and the barbarous rudeness of the Latins, new ideas were inspired into the mind of the nation, and new expressions were introduced into its language. The Italians particularly had great influence over the Romæic, or modern Greek, which was then formed; poets and prose writers availed themselves of this new language; which, though as remote from the ancient Greek as the Italian is from the tongue of ancient Rome, soon became the national idiom. Had not their liturgy, from the earliest times of Christianity, maintained the use of the ancient harmonious language of their ancestors, the Greeks probably would have been much farther distant from its purity; and to this same preventive cause may be attributed the uniformity which prevails in the modern language in all the different districts, how remote soever they may be from the centre of Greece. In some of the islands also, which are very little addicted to trade, more of the words and turns of expression of the ancient Greek are preserved than in the rest of the country. The Albanians, who have been settled in Greece only six centuries, have adopted the language of the Greeks, though they differ from them in other respects, and treat them with great contempt. Independently of words and expressions derived from the European tongues, the ancient Greek grammar has undergone various alterations; the accents, which the nice ear of an Athenian distinguished with so much care, have been confounded; the aspirations, though still marked, are no longer pronounced; several vowels and diphthongs, that the ancients distinguished, have now the same sound given to them, *ει, οι, η, υ*, being pronounced by the Greeks as *ē*; and this, they pretend, is the true pronunciation. With the words of the ancient language the moderns have taken great liberties, lengthening some, shortening others, interpolating or retrenching the vowels or consonants in the middle of words, changing one letter for another; in fine, confounding their significations, and using the ancient words in new senses. In the grammar, the dual number, peculiar to the ancient Greek, and the oblique cases, are lost; the auxiliaries *to have* and *to will*, employed in modern languages to indicate the past and the future, as well as the use of the personal pronouns in the verbs, are all derived from European sources. It is remarkable, that the mariners and fishermen of the nation have retained more of the ancient words than others; the names which they give to plants and fishes bear a strong resemblance to those by which Dioscorides, and other naturalists, called them. On the other hand, the most corrupt dialect is used in Attica, where once the most pure and chastened style prevailed. The orthography varies much, and, indeed, has no fixed rules.

We cannot expect any brilliant progress in literature from a people oppressed for so many centuries, who possess no capital, or any great establishments for education; who, until this

century, had not even a single printing press, and received from Venice and Trieste the only books generally saleable, that is, the formularies of devotion. The Athenians have lost all traces of those dramatic exhibitions of which their ancestors were so fond. Only three poems have been produced among them before the eighteenth century; but since that time their poets have multiplied, and their productions have become more numerous and varied. Songs, in which all nations delight, are become a favorite amusement with the Greeks. At first they had two kinds of them, viz. *erotic*, or love songs, and the *clephtica tragoudia*, that is, songs celebrating the great exploits of some klephites, a name simply signifying a robber, but by no means dishonorable in some parts of Greece, where the most respectable people make no scruple of taking to the highway, and subsisting on the booty they have acquired, especially if they have regularly made their offering at the shrine of some saint or madonna. We shall quote two of these klephitic songs in the original, as a specimen of the Romæic generally spoken, with subjoined translations, which will give some idea of the tone that breathes through many of these mountain strains.

Ο ΤΑΦΟΣ ΤΟΥ ΔΗΜΟΥ.

Ο ἥλιος ἐβασίλευε, κ' ὁ Δῆμος διατάζει
 ' Σὺρτε, παῖδιά μου, σ' τὸ νερόν, ψυμὶ νὰ φάτ' ἀπόψε.
 Καὶ σὺ Λαμπσάκη μ' ἀνεψί, κάθον ἐδῶ κοντὰ μου
 Νὰ! τ' ἄρματα μου φέρεσε, νὰ ἴσαι καπετάνος.
 Καὶ εἰς, παῖδιά μου, πάρετε τὸ ἔρημον σπαθί μου,
 Πράσινα κόψετε κλαδιά, στρώστέ μου νὰ καθήσω,
 Καὶ φέρετε τὸν πνευματικὸν νὰ μ' ἐξομολογήσῃ
 Νὰ τὸν εἰπῶ τὰ κρίματα ὅσα "χω κατωμένα"
 Τριάντα χροῖά ἄρματα ὡδὸς, κ' εἰκοσι ἔχω κλέφτης.
 Καὶ τώρα μ' ἤρθε θάνατος, καὶ θέλω ν' ἀπαθάνω.
 Κάμετε τὸ κυβόρι μου πλατὺ, ψηλὸν νὰ γένη,
 Νὰ στέκ' ὀρθὸς νὰ πολεμῶ, καὶ εἴπα νὰ γερμίζω.
 Κι' ἀπὸ τὸ μέρος τὸ δεξιὸν ἀφήστε παραθύρι,
 Τὰ χελιδόνια νὰ ὀρχονται, τὴν ἀνοιξὶν νὰ φέροντ.
 Καὶ τ' ἡγήσῃα τὸν καλὸν Μάην νὰ μέ μαθαίνοντ.'

THE TOMB OF THE KLEPHITES.

Darkness drew near, and day was fading fast,
 Like death and life, when Demes spoke his last:—
 ' Leave me awhile, my children!—hence, and bring
 Our draught for evening from the crystal spring;
 My brother's son, Lampsakis! come and wear
 These arms—my arms—henceforth be chieftain here—
 My comrades, take my now forsaken sword—
 Cut me green boughs, and let its blade afford
 Once more a couch to rest its weary lord!
 Call me a priest to whom I may confess
 All my past errors—would the list were less—
 A Klephites long! an Armatolos longer,
 Terror of Turks—but now the foe is stronger—
 'Tis Death! prepare my tomb—but broad and high!
 When o'er it sounds the Moslem's battle-cry,
 Let me have space to raise my mouldering corpse,
 Appall with death, yet strike with living force!
 And leave one crevice—where the rustling wing
 Of swallows and of nightingales that sing
 The lovely May, may tell me when 'tis Spring!'

ΤΟΥ ΣΤΕΡΓΙΟΥ.

Κ' ἂν τὰ δερβένα τούρκεσαν, τὰ πῆραν Ἀρβα-
νίτες,
'Ο Στέργιος εἶναι ζωντανός, πασάδες δὲν ψυφάει.
'Όσον χιονίζουν τὰ βουνά, Τούρκους μὴ προσκυ-
νοῦμεν.
Πᾶμεν νὰ λιμεριάζωμεν, ὅπου φωλεύουν λύκοι
Σταῖς χώρας σκλάβοι κατοκοῦν τοὺς κάμπους μὲ
τοὺς Τούρκους,
Χώρας λαγκάδια κ' ἐρημιαῖς ἔχουν τὰ παλληκάρια.
Παρά μὲ Τούρκους, μὲ θηριά καλῆτερα νὰ ζοῦμεν.

STERGHIOS.

Tho' the Turks and Albanians our passes may
hold,
Our Sterghios will scorn them, though many and
bold;
And as long as the snows on the mountains shall be,
Though we live with the wolves, we will live to be
free,
The towns, and the plains, are the home of the slave
Where they herd with their Mussulman tyrants—the
brave
Have their cities in rocks, cliffs, and solitudes, so
We will dwell among beasts—but with infidels—
No!

A little while before the insurrection of the
Greeks a printing press was established in the
island of Scio; by this means learning began to
spread rapidly; the classic works of ancient
Greece were republished; libraries, colleges,
and schools, were established among themselves,
and the young Greeks were encouraged to fre-
quent the foreign universities. Of all the losses
suffered by this interesting country, that of her
universities at Buchorest, Aivali, Scio, Yanina,
and Athens, will be long felt; the very seeds of
their restoration perished with the 500 Greek
students, 'the sacred band,' who fell at the fatal
battle of Drageschan. The Anglo-Ionian uni-
versity of Corfu is now the only sanctuary for
Greek literature; and this, perhaps, is destined
ever long to shed the beams of learning and virtue
over the regions of the Levant.

The character of the Grecian people, as of all
other civilised nations, has been strongly in-
fluenced by the principles and practices of its
religion. In ancient times, notwithstanding the
lights that philosophy afforded, they were com-
pletely under the dominion of their priests; their
treasures were lavished at their altars, their lives
were often sacrificed in their temples, and the
fables of their mythology, and the various festi-
vals of their worship, some of them horrid for their
cruelty and others abominable for their licen-
tiousness, were the themes of their finest works
of imagination. However free they were in the
conduct of their civil affairs, they were really
slaves in their religious opinions. When at
length the prevalence of Christianity wrought the
downfall of this ancient system of superstition
and imposture, the national spirit transferred to
the new worship the ardent imagination, the vi-
vacity, and the puerile superstition, that had
been derived from the ancients. Miserable con-
troversies, and scholastic subtleties, distracted
the minds of the people; a breach took place

with the church of Rome; pagan doctrines rela-
tive to magic, the curse pronounced by the
priests, and the efficacy of some religious ser-
vices, were propagated almost without alteration;
but, incredible as it may seem, the doctrine of
purgatory, so profitable to the Latins, and which
has conferred such immense influence and riches
on their clergy, never gained access among the
Greeks. The usurpation of temporal power by
the clergy, which has constituted the disgrace
of the Latin church, is unknown to them; the
Greeks are astonished how a bishop of Rome,
who, say they, is no more than a bishop of
Alexandria, of Antioch, or of Nice, should dare
to usurp the supremacy over the whole Christian
world, and domineer over the clergy and laity.
There has always been something of the repub-
lican forms of antiquity preserved in the Greek
church; they consider the priestly power as re-
siding chiefly in the patriarchs, metropolitans,
archbishops, and bishops; and say, that the first
seven councils have settled every thing that re-
lates to doctrine, the decisions of which nothing
should, or can, affect. As to discipline, they
consider it as the business of the synods, and
that the assistance of a pope is altogether unneces-
sary. Four patriarchs, elected by the synods,
and residing at Constantinople, Antioch, Jerusa-
lem, and Alexandria, have nearly the same
power, that of Constantinople being merely re-
garded as the chief, and exercising some temporal
authority in a council of archimandrites, arch-
deacons, and other priests and monks, at which
he presides; every bishop among the Greeks de-
cides matters in dispute, according to the codes
of Justinian and Theodosius, and the laws of
Basil of Macedonia. But this temporal authority
is rather the result of the civil, than the religious
state of the people, who, having no other superior
authorities than their patriarchs and bishops,
would rather refer to these national judges, than
to the tribunals of their Turkish oppressors. The
manners of the superior Greek clergy are very
simple: as they are mostly taken from the mo-
nastic order, their lives partake very much of
the uniformity of the cloister; while monachism
itself does not, as in the Romish church, exhibit
any thing of that pomp, predominant influence,
and cruel authority, which have been displayed
by the Jesuits, the Dominicans, and Cisterians,
of the West. The Greek monks are all of the
order of St. Basil, preserving much of the sim-
plicity of their primitive institution; it is in soli-
tary places, in the midst of rocks and deserts,
that the caloyers take up their abode. It must
not, however, be concealed, that the inhabitants
of the Greek cloisters are generally very ignorant;
being condemned to a contemplative mode of
life, they seem as if they imagined they had
nothing more to do with their reason; and some
of them, not content with the sacrifice of thought,
submit to the mortifications, and austere life of
anchorites, and become almost walking spectres.
Ambitious, notwithstanding this, of ecclesiastical
honors, their conduct is often greedy and op-
pressive; the patriarch, obliged to pay a tax to
the Turks for his place, exacts upon the metro-
politans, these squeeze the bishops, and the
bishops lay the monks and parishes under con-

tribution; they frequently sell the furniture of those who do not pay these exactions, and contract debts at the cost of the people. The lower clergy, that is to say the papas, having no prospect of advancement, betake themselves to occupations of the meanest kind, in order to support their families; for, happily for the population of the country, they are not forbidden to marry. They are frequently husbandmen or farmers, who, having learned a few of the formularies and ceremonies of the church, have purchased the priestly office of some accommodating bishop, and, becoming all at once papas, make money of every thing; they sell absolutions, sacraments, exorcisms, relics, &c. They promote all kinds of superstition; they have covered all Greece with their little chapels, each of which has its officiating priest; ignorant and fanatical, and miserably paid, they are often the disgrace of the religion they profess, and pursue trades by no means honorable, in order to obtain their subsistence. 'All Greece,' says the Count de Choiseul-Gouffier, 'is filled with these monks, scarcely any of whom can read; but they know how far the influence of religious fear extends over superstitious minds. Every pirate has with him a caloyer, or papas, to absolve him from a crime the very moment he has committed it; after having massacred the people in the buildings they take by surprise, after having plundered and razed them to their foundations, they immediately prostrate themselves at the foot of their minister, when the repeating of a few words reconciles them to the Deity, as they suppose, calms their consciences, and encourages them to the commission of new crimes. Numberless ceremonies and superstitions constitute the whole of the religion of the papas and the laity; and there is not one superstitious opinion or practice of the ancient Greeks which is not prevalent among their descendants in some form or other; they have even augmented the number. They acknowledge the influence of evil genii every where; they have protecting saints against every species of misfortune and accident; they have peopled nature with invisible spirits; the dead have no rest among them, they appear again in the form of vampires or broucalakas; the whole village is thrown into confusion, and they make use of every charm to quiet the restlessness of these phantoms. In no place has sorcery so completely enthroned itself as in Greece; not only do they believe in it, but they see its effects every where. Dreams are ever furnishing fresh food for superstition; they attribute periodical fevers, and other diseases, to malignant influences, and to envy; they write the name of the malady on a triangular paper, and stick it on the entrance of the sick man's chamber in order to obtain his cure; they fix the nail of a coffin on the doors of their houses to drive away the apparitions; they tremble at the screeching of an owl, or the shaking of a leaf; the osprey spreads alarm in every direction, when its cries interrupt the silence of the night; a whole caravan is stopped, if a hare cross its path, until some one comes up, who has not seen it, and breaks the charm; to hear the braying of an ass on a fast day, to meet a papas, or monk, at the rising of

the sun, are portentous omens; lightning is dreaded by the husbandmen, and eclipses are considered as the precursors of calamities; in fine, the number five is held as one of the worst of auguries, so that they believe themselves bewitched if they utter it, or if any one extend to them their hand with the five fingers.

Should another Luther make his appearance in the Eastern church, he would have a multitude of these things to reform, and he would render a great service to the people by suppressing the useless fasts, which are imposed on them during a great part of the year. The fast on the Epiphany, at the great ceremony of the blessing of the waters, every Wednesday and Friday in honor of the Passion, at the Ascension, and at Christmas; but it is in Lent especially, that every body, even the sick and women with child, observe a rigorous fast: to see the miserable food, and even polypuses and other marine animals, some of them half putrified, on which they then support themselves, we have the greatest difficulty to conceive how these intrepid fasters can sustain life. At the approach of Easter they make themselves amends for this severe abstinence; on Palm Sunday they decorate the churches with the boughs of odoriferous shrubs; they purchase on the following days absolution from their sins; on Holy Thursday they partake of the Communion according to the rites of the primitive church, observing this ceremony as a banquet of peace and brotherly love; Ash Wednesday is a day of entire fasting, and they continue their devotions till late at night; but on Easter eve all is bustle and preparation for the next day's festival; they clean the house, throw out of the windows the old earthen vessels, which have been used during Lent; the best apparel is taken out of the family chest; the paschal lamb is purchased for the solemn repast, and they resume the harp and the tambourine, which had been laid aside during the fast. The dawn of the Sabbath is hailed by volleys of musketry and cries of joy; they make presents to their friends of painted eggs and cakes, the paschal lamb is eaten by the whole family, and copious libations of wine spread everywhere a noisy pleasure, which is kept up during eight days, and often degenerates into extreme licentiousness. In many respects these orgies resemble the Saturnalia of the ancient Greeks.

Baptism among the Greeks is administered by immersion, and they accuse the Latins of having altered this institution by practising sprinkling. Their communion is a distribution of wheaten bread and wine; to which on particular festivals a lamb is added; this simple repast seems very much to resemble the agapai of the first Christians. In their churches they have only pictures painted on wood, miserably executed; in the country of Phidias and Praxiteles they have proscribed without pity statues and sacred sculpture, for fear of falling into idolatry, but they have no fear of this kind from exposing to view the wretched images painted by the monks. These paintings pass among them as miraculous; and most of the Greek monasteries possess one of them, which the cre-

dulity of the laity renders very profitable to the clergy; pilgrims repair to those that are most renowned, especially on the festivals, which are celebrated near fountains held sacred in the days of republican Greece.

II. Under the name of Great Greece or Livadia are comprehended the provinces situated between the sea, on the east, south, and west, and Macedonia and Albania on the north; that is to say Aearnania, Ætolia, Phocis, Bœotia, Thessaly, and Attica. There are few remains of the multitude of cities which once filled this country, and its population is perhaps not more than one-tenth of what it was in ancient times. The mountains on the side of Albania afford a covert for some warlike tribes, whose chief occupation is robbing, and who attack one another, when they are not engaged with the neighbouring nations; the presence of the Turks, too, has been sufficient to depopulate these once flourishing provinces. The soil still continues fertile, and the traveller is charmed with the luxuriant pasturage of the plains, the thick forests of the mountains, the fruitful fields and plantations of the valleys, the delightful orchards round the towns, the fisheries of the coast, and the cultivation of the silkworm, the vine, and the olive, all flourishing under a climate remarkable for its mildness.

The richest, most prosperous, and best people, province of ancient Greece is Attica; but it has lost all the advantages, which human genius and industry had conferred upon it; nothing now remains but a serene sky, a fine climate, and a soil suited to every species of culture; yet badly tilled, it exhibits in some places a naked sterility, producing only degenerated vegetables. The population had been in 1820 reduced to 25,000 souls, including Greeks, Turks, and Albanians; among the two latter foreign nations, the Greeks themselves seem like foreigners; bowed down under the degrading yoke of these barbarians, the Greek of Attica has none of the airy vivacity of the ancient Athenian, who could bear neither slavery nor liberty, and in whom the love of glory and a taste for the fine arts incessantly gave birth to the most lively emotions. Deprived of their cities, their industry, and their commerce, the inhabitants have been reduced to a rustic and pastoral life; in winter these wandering shepherds descend from the mountains of Thessaly, to find under a softer climate pasturage for their large flocks of goats and sheep. The former of these animals are more numerous in these provinces than the latter, and almost equally serviceable; of their hair are manufactured sacks and large carpets; their milk, either by itself, or mixed with that of the cow, makes good cheese, and their skins, converted into bottles, serve for the transportation of the wine, oil, and honey, of the province; and, being afterwards tanned, are made into shoes for the people. Five shepherds are counted sufficient for a flock of 1000, and, when the vintage is over, they bring their flocks into the vineyards, to feed on the vine leaves. The people of Attica still excel in the art of dyeing wool and cotton; they dye blue with indigo, yellow with Avignon berries, and red with the

chrysoxylon or wood of the rhus-cotinus, which, growing on the mountains in the neighbourhood of Marathon and Pendeli, is gathered by the Albanians, who sell it to the dyers. The country yields great quantities of good madder, and a little cochineal is gathered on mount Cacha, but not used in dyeing. The wine, anciently much esteemed, is very bitter, weak, and saturated with resin; the honey of mount Hymettus, once so celebrated, Clarke assures us, has now the effect of a medicine, so that it is dangerous to take much of it. The poor Caloyers, who inhabit this barren mountain, are obliged to deliver the honey which they gather to the bishop of Athens, to whom the revenues of their convent belong. Wood is in general very scarce in Attica, and in some places they have no other fuel than brambles; there are very few mulberry trees, and the quantity of silk produced is very small; it is, however, fine and entirely white. Every thing seems to have degenerated on this classical soil, not through the fault of nature, but of man. The oil, of which they make 20,000 large measures a-year, furnishes occupation during the winter to a great number of workmen; many of whom themselves possess a house with a little vineyard, some olive plants, and a few hives of bees, on which they subsist, while taking care of the olive plantations of the oikokouroi, or richer proprietors. The latter also let out little farms, with a cottage and some arable land, to the poor, furnishing them with grain for seed and cattle, and receiving at the harvest two-thirds of the produce, after a tenth has been reserved for the voivode or Turkish governor. In the plain of Athens a great quantity of barley is cultivated; it is sown in October or November: in the month of May they drive horses and asses into the fields, tying them to posts, that they may eat the barley; and removing the posts when they have sufficiently fed upon and manured the land around them. A plough of the simplest construction is then used in preparing the ground for the sowing of cotton, which immediately commences. Instead of a harrow, they employ a process, which is also evidently derived from the early times of Greece; a laborer standing upright on a plank laid upon the ground, which is drawn by oxen over the furrows in order to close them. The cotton harvest commences in the month of September, and when it is finished the barley sowing commences; so that the earth never rests, but, after a long series of ages, still yields its fruits without relaxation or abatement. When they thresh their corn, they bring it out into a court, the floor of which is either paved or made of closely beaten or smooth earth; in the neighbourhood of Athens the ground is sufficiently hard without beating; in the midst of this area they fix a post, to which they fasten with a cord one or more horses, making them turn round in a circle; the cord winding round the post, is continually shortening and bringing the horses to the centre; they then make them turn the contrary way, till the cord is completely unrolled; the workmen in the mean time are constantly throwing in the corn under the animals' feet. When the grain is winnowed, it is laid up in

heaps, and before the year 1821 the Turkish aga used to come and put his seal upon them, and it was unlawful to remove the least portion, until the title had been taken. Besides this title there was a tax upon vineyards, another upon wine, another on exports, and lastly a karatch or capitation tax: when the harvest is finished in Attica the laborers go with their mares into Boeotia, where the season is later on account of the mountains and lakes.

In Attica the native Greeks have by degrees given place to the Albanians, or intermingled with the foreigners who had possession of the country in the middle ages, such as the Arragoneses, the French, the Venetians, and the Genoese; it would therefore be very difficult to find any trace of the ancient Athenians or Eleusinians. The language and manners of the nation, however, still predominate, and have resisted even the barbarous oppression of the Turks.

The Piræus, formerly the celebrated port of Athens, exhibits few and very imperfect remains of the fine monuments of art with which it was once adorned: it now consists only of a convent, a custom-house, a few warehouses, and four anchoring places. The commerce of Attica, now furnishes only some fruits, oils, and cotton, for exportation. A plain and a few hills separate it from Athens, the citadel of which first strikes the eye of the traveller on his approach: on the road there are some fragments of tombs; and traces of the wall, which joined the city to the port, are still visible. In the neighbourhood of the port extends a bank of rocks scarcely elevated above the soil, and on putting aside the bushes there is to be seen a line of pits cut in the rocks, and covered with flat stones; this was the ancient necropolis or burying-place; these graves are filled with fine mould, at the bottom of which lie the remains of the Athenians or Piræans of ancient times. Burnt bones of black sheep sacrificed to the dead are also found, as well as pateræ and other things connected with the profession of the deceased: one plate of bronze bears the name of a judge, in another tomb there is a mask of baked earth, in another the figure of a philosopher sitting, and in others painted vases, &c.

Athens is irregularly intersected and surrounded by a rampart rudely elevated, and its present gates do not answer to the situations of the ancient ones; that of the Lions is the most imposing in its appearance. What remains of the ancient monuments is rather to be sought for without the city, the country parts being less subject to change, and in the city the ruins of antiquity serving mostly for the construction of new buildings. Formerly Athens extended all round the Acropolis, which is now isolated and on the outside of the city, which now does not occupy, perhaps, more than a fourth part of its former site. The bazaar or market place occupies a large space of ground, formerly perhaps the Cerameicus of the ancients; and a mosque, thought to be founded on the ruins of the Parthenon, stands in the midst of the square; another is supposed to be erected on the foundations of the temple of the Uranian Venus; and in front

of the Turkish cadi's palace, near the same place, the prison of Athens once stood. In the same neighbourhood are to be found some remains of the portico of the stoics, and the dervises or Turkish monks not long since occupied the tower of the winds, which stands at the end of one of the streets: it is of an octagonal form, and built of marble, and received its name from the circumstance of Andronicus Cyrrhestes, its builder, having represented on the eight sides the figures of the principal winds; a brazen triton, turning on a pivot, indicated on the top of the building the prevailing wind; every front also had a sundial upon it. Demosthenes's Lantern, an ancient edifice, also of white marble, has become by a strange vicissitude the abode of the capuchins; not far from this is another ancient monument, called the Lantern of Diogenes, well known by the imitations of it constructed in some western countries, especially in the park of St. Cloud. The modern edifices and establishments are small and mean in appearance, and, if we except the residences of the foreign consuls, are easily overtopped by the palm trees and olives, and by the minarets of the mosques; the hospital exhibits nothing but poverty, and, if the visits of travellers in this age had not induced some naturalised foreigners to keep something like inns, the curious visitor would not have been able to find a lodging in the city of Pericles.

It would be worth while to take a journey to Athens, if it were only to see the Acropolis. This is the most ancient part of the city, and was at once a fort and a sanctuary, whence they held dominion over the bodies and souls of the inhabitants. A sacred olive, a salt spring, and an old idol, believed to be that of Minerva, gave rise in the time of Pericles to the construction of this fine monument of antiquity. Cecrops and Erechtheus had their tombs in it. After the burning of the old temple of Minerva and the sacred olive by the Persians, in the seventy-fifth olympiad, Pericles built the magnificent Propylæum and the majestic temple of Parthenon, the ruins of which are still the models for artists; and this is not wonderful, since Phidias adorned it with his inimitable sculpture. Only the walls, however, the columns, and the caryatides, remain. This fine edifice, it appears, was not quite perfect in symmetry, which may have arisen from the necessity of occupying the site of the old temple, which was accounted sacred. The interior received scarcely any light from without, but was illuminated by a vast golden chandelier, the masterpiece of Callimachus, which was supplied with oil only once a year, the wick being made of asbestos, and consequently indestructible; this mysterious light shed its flickering beams over the old idol of Minerva, which had its face turned towards the east; and a figure of Mercury, surrounded with myrtle branches, and the sacred serpent, the guardian of the temple, came in for a share of the public veneration. Some traces of the Cella are still discovered in three saloons of different sizes; the largest, towards the east, dedicated to Erechtheus, was adorned on the outside with a portico, supported by six

columns of the Ionic order. The smallest formed a little temple, borne by six caryatides, and erected on the site of the sacred olive tree and salt spring, and the other was the temple of Minerva. An ancient inscription proves that the Parthenon was not built till the fourth year of the ninety-second olympiad. The columns, on which the fronts of this edifice rest, are seen from afar; they are of the finest proportion, and executed with that perfection which the Greeks bestowed on their great monuments. The six caryatides represent Athenian girls assisting at the festivals of Minerva; above the tunic they have a kind of mantle, and a third part of their garment is thrown over their backs; part of their hair falls in ringlets over their shoulders and breasts. One of them has disappeared, and another, being carried off by lord Elgin, has been replaced by a pillar of rude masonry. The finest remains of the Parthenon were those admirable bas-reliefs which adorned the pediment and metopes, and which also lord Elgin brought into this country, where they are exhibited in the British Museum. When Spon and Wheeler visited Athens, the Parthenon was used as a Greek church, and was still in such good preservation, that its primitive order could be tolerably well ascertained. A portico, elevated upon steps and supported by pillars without bases, completed the tour of the edifice; a sculptured pediment decorated the two fronts; under the portico was a frieze, also sculptured; in fine, the metopes or catouches of the front presented to view those beautiful sculptures which are now in England, with the remains of the frieze. The figures of the front and of the frieze have been conjectured by some to represent the contest between Minerva and Neptune; and by others Minerva, newly born, at the council of the Gods; but they are so mutilated that it is not easy to decide: they are nineteen in number. On the northern angle is represented the god of a river, supposed to be the Cephissus, situated on the north of the city; near him are a king and a woman, apparently about to embrace one another; then follows a figure, probably representing Irene, the goddess of peace, on whom Plutus is leaning, and leading on Proserpine, who is standing with Ceres in a chariot, the horses of which are imitatively sculptured; they seem to be teaching Minerva and Erechthus to guide the chariot. Jupiter is supposed to be standing near Minerva, with other figures representing the other divinities. On the southern extremity of the pediment is another river god, supposed to be the Illyssus, to the south of Athens. Some of these figures are naked and others clothed, and in the former the more art has been employed, the less it appears; we could almost suppose they were alive, the figure of Illyssus seems as if it moved and were rising up. The frieze on the peristyle probably represents the processions at the Panathænean festivals; at the east, under the portico, are twelve figures, representing the principal divinities, towards whom the procession appears to be moving; this is followed by sacrifices, heroes, persons carrying baskets of fruits, choirs of citizens, chariots and troops of cavaliers, while on

the metopes on the outside of the peristyle are seen, in demi-relievo, figures of men breaking horses, and contending with centaurs. The other monuments of the Acropolis are less important, and the ruins less grand than those of the temple of Minerva. It is founded on a limestone rock, and was once the key of Athens; it was one of the last places quitted by the Turks in 1822, and for the first time since its ancient days belongs to the Greeks, and protects, instead of menacing, the inhabitants of the city. At the foot of it is a grotto, supposed to be that of Pan and Apollo, and a circular excavation in the rock indicates the site of the theatre of Bacchus; a naked and smooth platform of rock points out the famous Pnyx, where the turbulent populace of Athens assembled, to hear their orators discuss the public interests of their country, and sometimes to banish those who had rendered it the greatest services. A small excavation was the site, perhaps, of the tribune from which they harangued; not far from this are some anciently hollowed caves, supposed to be the prisons of the formidable Areopagus, but its situation is very doubtful. To the west of the city there are some fine pillars of marble, which once supported the temple of Theseus, built on the same plan as the Parthenon, and as late as the seventeenth century there remained some of the frieze of the portico, representing in basso-relievo the battles of the Centaurs and the Lapithæ. It stood on an elevated situation, and was made into a little church by the modern Greeks; as the Turks have formed a little mosque under the ancient portico of Adrian, where it still exists, and where not long since was to be seen a solitary dervise perched between the majestic columns. On another hill, anciently that of the museum, stands the little monument raised to the consul Antiochus Philopappus. The bed of the Illyssus, at the foot of this hill, is dry during the greater part of the year; its waters used to be conveyed to Athens by a subterranean canal; in this bed rises the fountain of Callirhoë. The academy and other celebrated places have so completely disappeared, that it is very difficult to assign their situations.

Some European travellers have not given a favorable representation of the Greek population at Athens; it has been long a proverb, 'May heaven preserve us from the Jews of Salonia, the Turks of Negropont, and the Greeks of Athens!' Mixed with the Turks and the Schypetars, this aboriginal race must have lost all feeling of their national dignity, and the more so as they settled down into misery and ignorance. It is hoped that the exertions of foreigners, and the events of the present struggle, will have a tendency to spread information and raise the spirit of the people, and thus lead the Greeks to rally round the names of their ancestors.

The climate of Athens is generally fine, and the air pure, but the excessive heats sometimes produce epidemic fevers; at the end of the last century the plague carried off more than one-third of the population. Ophthalmies are common, but these are rather the effects of their intercourse with Egypt, than of any local circumstances. In spite of the exactions of the Turks,

the oil trade of Athens is very considerable; it has also some manufactories of soap and morocco leather. In the families they fabricate very fine tissues, of cotton and silk, with broad stripes which are much worn by the rich instead of body linen.

The archbishopric of this city is one of the most ancient sees in Christendom, Dionysius the Areopagite having once filled it, and they still pretend to show his dwelling. Under the Turks the archbishop used to hold every Monday a kind of council with the Christian magistrates of the city, to receive complaints and adjust differences; the heads of families also were accustomed to choose every year four archons to watch over the public welfare, and these magistrates sat every day to hear causes, and to prevent them from being carried before the *cadi*. It is true, that Turkish despotism very much paralysed the influence of this institution, yet the Athenian archons did all in their power to conceal any fault from the knowledge of the *voivode*, and if he should get information of it, they endeavoured to obtain permission to inflict punishment themselves, to moderate the fines, and, if possible, hinder the matter from becoming public. There were also attorneys to defend the national, before the Turkish authorities, and each district of the city had its *epitropos*, a magistrate chosen annually by the citizens, for the assessment of taxes, contributions, and exactions.

From mount Anchesmus, and mount Hymettus, situated at a short distance from the city, a most delightful prospect is afforded of the country of Attica. The way to Hymettus lies across the Ilyssus, and over a plain covered with myrtles; among the rocks at the foot of the mountain is situated the poor convent of Siriani. The miserable calovers boast of being possessed of a miraculous fountain, an infallible preventive of barrenness and all manner of diseases, at which, as they say, the Holy Spirit came to drink, on the day of Pentecost, in the form of a dove. The silver mines of Laurium, below Hymettus, were exhausted by the ancients, and, to a considerable distance west of Thorica, are perceived empty shafts and masses of scoria. Though the mines were worked in the centre of the range of hills, the smelting seems to have taken place on the coast, probably for the sake of procuring fuel the more easily, which would soon fail in the populous districts of the interior of Attica. The quarries of marble are equally discernible, which the Athenians worked on mount Pentelicus; a monastery situated on this mountain still bears the name of *Pendeli*. This is one of the best situated, and most richly endowed monasteries in Greece; seated on the declivity of the mountain, below the marble quarries, and surrounded by thickets of poplars, laurels, myrtles, pines, olives, and *mastich* trees, it possesses olive-yards and apiaries of considerable extent; it produces honey nearly equal to that of Hymettus, of which it used to send a quantity annually to Constantinople; it paid no taxes and enjoyed great privileges.

Below Pentelicus lies the famous plain of Marathon, shut in between two ridges of hills and watered by a little river from mount Parnassus, which runs through it. This plain opens

on the sea, where it presents a good anchorage for ships; and it was here that the Persians landed their vast army destined for the invasion of Greece. Part of it is now a marsh in the midst of which is a hillock, similar to those frequently found in the Troas, containing probably the bones of the heroes who died on this spot in defence of their country; on opening it nothing was found but a few remains of urns. In a marsh on the coast are still perceived the foundations of ancient marble monuments, probably some of those raised to testify the gratitude of the republic. The village of Marathon contains about 200 inhabitants, whose cottages are surrounded with gardens full of apricot trees, vines, and olives. The only remnant of antiquity about it is an ancient basin which receives the waters of a neighbouring fountain. The desert mountains near it are sometimes infested by jackals, wolves, and foxes. A little farther, on the strait of Euripus, are the remains of the temple of Themis, formerly in the ancient port of Rhamnus. This little temple was built of blocks of stone, rudely sculptured after the cyclopean manner. In the interior a mutilated statue of the goddess has been found, which is very ancient, dating its mutilation probably from the time of the Persian invasion. Near this temple are the ruins of that of Nemesis, which has this singularity, that the mouldings of the cornice are painted red, and this painting has preserved from decomposition every place it has touched. This temple was of Pentelican marble, and its statue of Parian, a master-piece of Phidias, may perhaps lie buried under the ruins of the building, which seem to have been overthrown by some violent convulsion of nature. The ancient walls of Rhamnus are still visible, especially on the land side, where they are covered by the thick foliage of the *mastichs*. There is to be observed here the bottom of a marble chair, which might be either a votive offering, or the seat of honor for the magistrates of the city. On the same coast was situated the ancient port of Thorica, which served to protect the working of the silver mines; the remains of a portico of fourteen columns of the Doric order still exist, but the city has disappeared. The modern port of Rafti has probably drawn off what remained of its population. On Cape Sunium, now Colonna, where Plato ravished his disciples with his mild eloquence, and which is now uncultivated and desert, are still found some of the pillars of the fine temple of Minerva, which are of extraordinary length. Here the peasants on digging the earth, frequently find pieces of the silver-bearing lead.

From Athens a sacred road led to Eleusis, whose mysterious worship attracted the Greeks; some traces of this place are yet to be discerned, as well as some ruins of the monuments which bordered it. On the remains of the temple of Apollo, the last columns of which have been carried away by lord Elgin, is situated the convent of Daphne or the Laurels, with a church, surmounted by a dome that contains some fragments of antiquity. From thence we pass the ruins of the temple of Venus, and near to them the little lakes called *Reti*,

which separated Attica from Eleusis; then the site of the paved court of the temple of Ceres, said to be the first place where grain was threshed to deposit it in granaries, a mark of the civilisation of the inhabitants, which owed its commencement to Eleusis. The temple of Eleusis has been so completely destroyed that for a long time it was impossible to recognise its plan; a society of English travellers have, however, discovered the propylæum which served for an entrance to it, and which appeared to be like those of Athens. In the court, which succeeded to these, they thought they found some traces of the chariots, in which the priests used to cause those that were initiated into the mysteries to be rolled along; to this succeeded a second vestibule, at the extremity of which was the front of the temple, supported by twelve columns. The level of the interior appears lower than that of the portico, which makes it probable that there was another flooring, below which they put in motion the machine with which they used to astonish and bewilder the initiated. The bust of the colossal statue of Ceres was still lying on the ground at the end of the last century, and the people of the village, though Christians, attached superstitious ideas to it, pretending that it procured them good harvests: it is now deposited in the university of Cambridge. Antique remains are dispersed through the village of Lefchimo, which occupies the site of Eleusis; it is inhabited by about forty families of Albanians, who live by agriculture, to which the fertility of the plain invites them. The ancient city was built partly on the coast, where there was a port, and partly on the declivity of the hill; and there are some remains of an aqueduct, which supplied it with spring water, and in the neighbourhood some fragments of tombs.

Two ancient ways, one passing by Marathon and the other leading directly to Thebes, conduct the traveller from the capital of Attica into Bœotia, crossing the Athenian Cephissus, that rolls its waters through a country covered with verdure, flowers, and fruit trees. Near this river is the ancient Colonna, celebrated by the misfortunes of *Œdipus* and the verses of *Sophocles*, of which *Mr. Smart Hughes* gives the following glowing account:—"All the expressions used by *Sophocles* to describe the beauties of this enchanting place are still applicable to it: the saffron, the narcissus, and a thousand other flowers mingle their perfumes to embalm the atmosphere; the young shoots of those ancient olives on which *Jupiter* fixed his watchful eye still extend their great branches, and form an arch impenetrable by the rays of the sun. At the commencement of the fine season the thickets resound with the song of the nightingale; and in autumn the vines, trained round the cottages and country houses, are loaded with purple grapes: the peaches, and especially the figs, are here of an exquisite flavor. At the time when I traversed on foot this delightful country, the golden yellow of the quinces, which loaded the branches, formed an agreeable contrast with the deep red of the pomegranates just bursting their shells: across the groves on the one side were seen the *Acropolis* of Athens with its temple of *Minerva*, mounts *Hy-*

mettus, *Anchesmus*, and *Pentelicus*; and on the other the undulations of the *Corydæan*, *Ægæan* and *Parnassian* chains. This terrestrial paradise owes its beauty and fertility to the *Cephissus*, which laves it with its inexhaustible waters, fanned by the softest breezes: but the traveller should take heed; these balmy breezes breathe death, and a night passed within the precincts of the ancient academy may be his last."

Passing from Eleusis through the defile of *Cithæron* we see near a torrent the walls and towers of an ancient fort, probably that of *Æneus*; a little farther to the north the walls, nine feet thick, and some remains of the towers of the ancient city of *Eleutheria*, called now *Gifto Castro*, a fort of the Egyptians or Bohemians. Here a great tower of an irregularly polygonal form, on the most elevated spot, commanded the defile. The convent of *Meletius* also resembles a fort; it has an iron door, and the walls are thick and pierced with loop-holes, that serve to give light to the cells of the monks, of whom there are about ten, who in case of attack become soldiers, and defend themselves against robbers. The church within the enclosure is ornamented with pillars of red marble from the ruins of *Eleutheria*, where once stood a temple dedicated to *Bacchus*. Situated in the gulf of Athens are two islands, famous in ancient days; one is *Salamis*, the kingdom of *Ajax*, celebrated for the greatest struggles between the Greeks and Persians: it is now called *Colouri*. The whole population is included in two villages inhabited by 500 *Schyptetars* or Albanians, who cultivate the vine and the olive, and make turpentine. In the fine season they employ themselves in taking, on the coast, the octopodes, with pikes attached to poles thirty-six feet long; they also use the euphorbium soaked and ground, which they put under the stones in the water, to stupify the fishes. The convent of *Phanomeri*, fortified like a castle of the middle ages, is situated opposite the coast of *Megara*, supporting by its olive-yards about fifty monks, who reside in it. The church is adorned with columns of marble and granite. In the seventeenth century the inhabitants of *Colouri* left their cabins at the appearance of a strange vessel, and fled to caverns to shelter themselves from pirates; there are 100 of these caverns, in one of which, probably, *Euripides* composed his tragedies. *Psyttalia*, now a mere rock between *Salamis* and the coast of Attica, is the ancient *Ægina*, once one of the richest and most famous places in Greece, where the first Greek money was coined, and its fine China ware and bronze works were esteemed throughout the country: it was celebrated for its trade, and for a magnificent temple of *Jupiter* of which there are some striking remains. The principal front had figures on it, which were discovered in the trenches, and, after being repaired by *Thorwaldsen* at Rome, were deposited in the museum of antiquities at Munich. They represent, as some suppose, warriors of different nations on each side of a figure of *Minerva*; on the one side are *Patrocles* lying on the ground, *Ajax* protecting him, *Teucer* the archer, and *Ajax* the son of *Gileus*, both on their knees, with a wounded soldier; and on the other *Hippothous*, who is attempting to draw the fallen

Greek towards the Trojans, Hector fighting, Paris and Æneas both on their knees, and a wounded Trojan. There is a stiffness, however, in the draperies; the same countenance and insignificant expression is observable in all the heroes; and the figure of Minerva, covered from head to feet, resembles an idol cut in wood. The hair of all the warriors is arranged in pointed meshes, resembling perukes; the figures are painted blue and red, and it would seem that their armour was metal. In the same trenches also was found an enormous ivory eye, probably belonging to the colossal statue of Jupiter. The Venetians had a fortress here, which overlooked a town of about 800 houses. In the seventeenth century the partridges were so numerous that the magistrates used to oblige the inhabitants to go in the spring to look for their nests and destroy their eggs. At present this island exports only almonds; but its population, consisting mostly of Albanians, has increased to about 2000.

Bœotia, though little visited by travellers, and containing now no considerable city, still presents most charming scenery and a multitude of once celebrated places: it is a country abounding as formerly in grain; and, should Athens recover its numerous population, would be able again to supply it. Mount Cythæron separates it from Attica; Helicon and Parnassus lift their lofty summits over its western boundaries; and several other chains covered with pines, mastichs, wild olives, and evergreen oaks, traverse the interior, bordered by plains of rice, cotton, dourah, and wheat, and also some fine pasture ground. The largest of these plains, enclosed between ridges of hills and feeding flocks of fine black sheep, are watered by rivulets that flow from the heights around them. The Asopus runs directly to the sea: but the Cephissus falls into the lake Copais, already described. Steep rocks, covered with wood, border the gulph of Potosmathi, where stands the village of Martino, in the neighbourhood of which are the ruins of an ancient city, perhaps that of Larymna, among which there is no public edifice or any monument of sculpture; the port, however, is yet to be observed. On the other side of the Copais we find some remains of the city of Orchomenes, called in the time of Homer the Athens of Bœotia: it stands just above the village of Sciripou, which is inhabited by about 400 peasants. Here are to be seen the foundations of the walls of the ancient acropolis, well built, though without cement; and the paths, cut in the rock, which led to the city are still visible. The most curious part of the ruins is what Pausanias calls the Treasury of Minyas, of an age, according to Greek authors, before that of Hercules, which they fix 1350 years before the Christian era. It consists of two walls, on each of which is laid a large block of marble, and the entrance was probably closed by one side of the rock. Some curious inscriptions are found at Orchomenes; on the pillars of the temple of the Graces is to be seen a long list of musicians, actors, and declaimers; another inscription contains a contract, by which the right of pasture was preserved to the inhabitants of the neighbourhood. A small convent established

here contains several fragments of ancient monuments, with inscriptions; and what renders this spot remarkable is, that at Orchomenes Sylla gained a battle which paved the way to his dictatorship. Not far distant, the village of Caprana indicates the site of the ancient Chæronea, where are seen on a height some ruins, probably those of the Acropolis, and seats cut in the rock, which mark the situation of an ancient theatre. This city was situated at the foot of Helicon, now replaced by Cranizza, in which is an old square tower whose massive construction may be assigned to very early times.

Helicon does not present the pleasing or sublime aspect we might expect from a mount consecrated by the poets; it has, however, charming valleys, covered with corn fields and orchards, over which poplars and plane trees rise on all sides. The muses' wood has become solitary; Hippocrene exists no longer; it is perhaps dried up; the Permessus rolls its waters to the Copais without inspiring any Pindar, or any modern Æsiod; and the celebrated Thebes, the centre of the confederated cities of this province, is now no more than a small town within the limits of the ancient Cadmeion or citadel; its poor remains scarcely afford any idea of its former state. It is the see of an archbishop; but it no longer possesses the silk manufactories and dye-houses established there by the Jews in the middle ages; nor that of pipes, which existed in the seventeenth century, the materials of which were brought from a quarry of earth peculiar to this country. The town of Lebadea, now called Livadia, is the chief place in Bœotia; it is situated at the entrance of a ravine, at the bottom of which flows the river Ilereyna. It is the residence of a vovode and an archbishop, the centre of a considerable trade, and presents a more prosperous appearance than the other cities of the country: a castle built on a rock, but now dismantled, protects it. At the foot of the rock they show a cavity, which they say was the cave of Trophonius; but it is not deep, and probably was the subterranean chamber where the image of the god was deposited; it is in fact only twelve feet square; in the upper part is discoverable a colored border, similar to what is found in other ancient Greek monuments. A grotto on the other side of the mountain, now converted into a Greek chapel, is more likely to have been the famous cave, where they terrified with spectacles and illusions those who came to consult the oracle. The springs of Lethe and Mnemosyne still flow in the same country, and mingle their waters with those of the Ilereyna.

The defile of Cythæron is defended by an old fort; to the north of it stretches the plain watered by the Asopus, where the Greeks obtained the famous victory of Platea. The foundations of this city are yet visible; at the foot of Cythæron, consisting of thick walls, flanked with towers; on the probable site of the Acropolis are some broken columns and unformed masses of masonry, and, below its walls, a few sarcophagi cut in the rock, but now broken. A poor village, inhabited by 150 peasants, occupies the situation of this once famous city; it bears the name of Cocla. Near the defile stands also the village of Calivia.

In the plain, between Leuctra and Plataea, are two hillocks, under which probably were buried the Greeks who perished in the sad contest between the Thebans and Spartans. A hamlet of the name of Lefka, consisting only of five houses, is all that remains of Leuctra; but another called Eremo-Castro, on the heights to the north, contains some ancient inscriptions. On the eastern coast of Boeotia we find Orope occupying its ancient site; its name is upon three or four marbles preserved at Scamino, supposed to be the ancient Tanagra. Farther on, at the outlet of the strait of Euripus, an area strewn with ruins appears to have been the situation of Anthedon; near it we discern the remains of the two moles, which in the form of a crescent enclosed the harbour, now abandoned; we perceive also some vestiges of the city and port of Aulis, where the fleet of the Greeks under the command of Agamemnon anchored; and of the city of Delium, where the foundations of a theatre are still visible.

The island of Eubœa, now Negropont, extends opposite to Boeotia as far as the coast of Attica, and approaches so near the Boeotian territory, that Chalcis, its principal city, almost touches the continent. The strait of Euripus is scarcely more than a canal; the ancients threw a bridge over it, probably in the same place as that which now passes from Boeotia into Eubœa; it consists of two arches, below which are some mills, and several towers defend its extremities. This island is crossed through its whole length by mountains, whose tops are entirely bare, and their height diminishes as they approach the coasts. The valleys between them are covered with a soil, in which, under a very soft climate, corn, vines, and olives, flourish in great abundance. The pasturage of Eubœa has been renowned in antiquity, as well as its baths, and its two springs, one of which, it was pretended, whitened the wool of the sheep that drank of it, while the other dyed it black. The ancients reported strange things of this strait and did not even agree among themselves; some stating the flux and reflux at seven times, and others, as Seneca, at fourteen times in twenty-four hours. A modern observer, father Babin, observed only the common ebbing and flowing of other seas, except on certain days, particularly during the first and last quarters of the moon, when the sea flowed irregularly; during the eleven days of the month, in which the water fluctuates, it changes its motion more than ten times a day, the wheels of the mills on it turning as often in contrary directions. Having stopped an hour and a half at one of these mills, he saw the course of the current change three times. During the rest of the month the sea rises twice a day to the height of one foot.

The modern name, Negropont, was given to this island by the Venetians, who held it for a long time, and built and fortified the city of Negropont on the site of the ancient Chalcis, where the diet of the confederated cities of the island sat, and where the celebrated copper manufactories flourished. This city is built with narrow and dark streets, and surrounded with ramparts; the suburbs are inhabited by Greeks and Jews, while the Turks occupy the part with-

in the fortifications. Few ancient cities have left ruins in such good preservation as Eretria; its limits are marked by well-constructed walls, the citadel, the plans of the houses, and that of the theatre, the proscenium of which is almost the only part standing. The interior of the island is but little known. On approaching it from the isle of Andros, the first objects that strike the eye are the steep and pointed rocks of Cape d'Oro, formerly Caphareus; the islets and shoals round this cape are still as dangerous as when the Grecian fleet was wrecked at the entrance of Aulis, on its return from Troy. Violent tempests continually prevail round this promontory, and what aggravates the misfortune, in case of shipwreck, is, that the villages of mount Ocha in the neighbourhood are inhabited by ferocious Albanians, who, not content with dragging away the wrecks of the vessels, often murder the crews. These Schypetars, at first Christians, have become Mahomedans, although they have no religion except a few superstitious opinions; their wives still practise the Christian worship. Their ordinary occupation is the care of their flocks; they are called Acrianides or Barmades. The ancient Carystos, out of which the Italians made a modern city, under the name of Castel-Rosso, still contains 1600 Turkish families and 1400 Greeks. The inhabitants choose their voivode, always from the Turks, because these are most numerous; they also garrison the citadel. Beyond Carystos are seen on the declivity of mount Ocha, now St. Elie, the quarries, from which the ancients extracted the beautiful columns of cipolian marble, of which some now adorn the edifices of Rome. Entire pillars are still found here, which, after being cut, have been abandoned in consequence of some alteration in the state of Greece. Near the summit of the mountain the marble gives place to gneiss. Walnut trees are seen growing in it, and at this height an English traveller discovered the remains of a temple of singular construction, that seems to have been unknown to Pausanias. It was built of great pieces of freestone, on which were laid large flat stones with the entrance narrowed towards the top, like those of the Egyptian temples. The north of the island is less known than the south, being inhabited by a barbarous race, on whom the Turks themselves have not been able to impose their yoke.

Thessaly is separated by natural limits from the rest of Greece; the sea washes its eastern coast, Olympus closes it in on the north, the chain of Pindus towards the west, mount Eta on the south, and it is still further enclosed by mounts Pelion and Ossa; all of them poetic boundaries. Different ramifications of these mountains run out towards the interior, covered with pastures and separating the charming valleys through which winds the Peneus, descending from mount Pindus and receiving a number of tributary streams, some of which fall in cascades; after passing the delightful valley of Tempe, this river finds its outlet at the gulf of Therma. The sun darts its rays on this enclosed basin, and the heat would be intolerable were it not for the refreshing breezes from the mountain chains, which give birth to numerous springs of cooling

water, and shady forests. 'In picturesque views and enchanting landscapes,' says Dodwell, 'it surpasses Italy, and indeed every country in the world; lively and clear colors heighten the effect of the soft undulations of the distant mountains; no vapor interposes, as in Italy, between the landscape and the eye of the spectator; and the limits of the hills, which bound the horizon, are fine and distinct, without that sharpness which offends the painter.' The plains are covered with fine corn fields, plantations of olives, mulberry and walnut trees, surrounded with vines, fruit trees, cotton, tobacco, or odoriferous flowers; while cypresses and majestic plane trees decorate the scene. The declivities of the mountains furnish excellent wood for building, feed a multitude of game, and afford pasture to the Walachian flocks, which regularly descend every autumn, after the fall of snow on the Pindus, to enjoy during the winter the refreshing grass and mild climate of the interior. The Walach shepherds go about the middle of November, with their families and flocks, to fold in the great valley of the Peneus, and wait the return of the fine season. These nomades, habituated to live in the open air, and clothed in plaids, made of goats' hair, fix their tents, of the same material, under the green oaks, and as much as possible near the rivulets and woods. There is nothing poetic in their manner of living; they are half savages, with a fierce and martial air: wandering over mountains infested with wolves, and exposed to the depredations of Albanian robbers, they arm themselves to defend their flocks, and we need only to see them muffled up in their capes, and almost immovably fixed to one spot, casting ferocious looks over their sheep, goats, cattle, and horses, while their wives are groaning under the fatiguing labors to which they are doomed, to perceive at once that it is not among them we must expect to find the beau-ideal of rural life. When the rivers of Lower Thessaly overflow their banks, they raise their black tents, to go and seek pasture elsewhere. Sometimes they have the misfortune to lose a great part of their flocks by famine or different disorders. They sell their butter and cheese and wool, pay the capitation tax to the Turks, and, when the snow begins to disappear on mount Pindus, leave the plains, to gain their old abode on the heights. Although of a rough character, approaching to barbarism, this pastoral race has some estimable qualities: they are commended for frankness, which appears to advantage in contrast with the general dissimulation of the Greeks. If we seek in Thessaly for the descendants of the centaurs, who passed for supernatural beings by subduing the horse, and those unconquerable tribes who amused themselves by fighting with bulls, we shall still find men who justify this illustrious origin, by the efforts they are making to vindicate the liberty of their ancestors. The names of Boukavalas and Blackavas are celebrated in Thessaly; and if it should be objected, that our admiration of their acts of patriotism must be diminished by the recollection, that they are but bandit-chiefs, issuing from a mountain tribe who have well merited the name of Clephta-Choria, or the village of robbers, it may be asked in reply,

Were not many boasted heroes of antiquity of the very same description?

On the southern side the entrance of Thessaly is most imposing; the defile of Thermopylae, which crosses the chain of mount Eta; is the only grand route leading to it from Phocis: there are two mountain tracts which are not practicable, especially for armies. The passage of Thermopylae has always been important for the defence of Greece, and it has been secured by walls and ramparts against the Gauls, the Romans, the Huns, and the Turks. In the age of patriotism, a chosen band of citizens has formed its chief defence against an invading army. On the right hand of the road is a hill on which a guard-house has been built in modern times, where, it is said, that Leonidas and his brave Spartans were interred. Every place on this sacred spot is interesting; but unfortunately the marshes, which have been formed on the coast, have buried it, it is feared, many precious remains of antiquity under their rushes. The defile, however, still remains, and the warm springs which gave it its name; while of the six rivers described by the ancients only three are to be found: the Boagrius, the Asopus, and the Sperchius. Over the last, through the narrowest part of the defile, is the way to the springs, the principal of which, of a sulphureous quality, but very clear, issues, bubbling out of the foot of a rock, and its passage covers the reeds with a calcareous crust. Near their source these waters form rivulets which flow into the sea. The ancients had baths here, and an altar in the neighbourhood to Hercules. Here are to be seen the remains of the fortifications which formerly defended the pass; and, near the source of the Asopus, the situation of the ancient Heraclea is still visible. The precipitous rocks of the Eta, crowned with planes, oaks, pines, and other trees and shrubs, and furrowed by the torrents which descend from it, render this scene very picturesque.

Issuing from the defile, and passing through fields of rice, tobacco, and cotton, we reach in a few hours the town of Zeitoun, the ancient Samia, which is still overlooked by some ruins of the Acropolis. The exhalations from the marshes and rice grounds render the climate of this place unwholesome, which is evident from the pallid complexion of the inhabitants: they are about 3000 in number, mostly Greeks. Yet Zeitoun occupies a high situation, commanding a beautiful prospect; on the one hand of the sea and the island of Eubœa, and on the other of the passage of Thermopylae, to the foot of the Eta. Zeitoun has a bishopric; its port is at the village of Stilidi, perhaps on the site of the ancient Phaleria; it has also another port, the village of Agia-Marina. There are two ways from this town to the capital of Thessaly; one by Pharsalia, the other by the coast of the Egean Sea. The village of Eschinos, on the borders of the sea, is near the site of an ancient city, the ruins and acropolis of which are still visible. On a neighbouring height are seen some enormous olives that cover, with their thick foliage, the remains of foundations composed of massy stones, of a temple and of a church, which had replaced it;

time having here put an end to the worship both of Pagans and Christians. Passing from thence we enter a charming country, watered by numerous streams, and planted with mulberry, orange, and fig-trees. This was Phthiotis, the kingdom of Achilles. It is not quite certain where Larissa-Cremaste, the capital of this state, was situated; perhaps its ruins may be found at the foot of a hill between Gradityla and Machala.

On turning the gulf of Pagasæ, Pelion rises to view, covered with groves and gardens: this picturesque amphitheatre extends across the country of Magnesia, terminated by mount Tisea, at the end of a large peninsula. Vines, olives, mulberry, and every kind of fruit trees, adorn the foot of Pelion, fine planes and chestnut trees cover its declivities, and the villages appear embosomed in forests; orange, citron, and fig trees fill the gardens of the peasants, who live by the manufacture of silk and oil, by their flocks of sheep and goats, by the game, and the fish on their coasts. The fruits are neither so good, nor so abundant, on the east as on the west of the mountain, arising probably from the greater humidity of the soil, occasioned by the numerous springs which run down it. The Greek peasants in Magnesia manufacture cotton yarn, and make bonnets, hoods, and other garments. The town of Makrinitza, at the commencement of the peninsula, is built of stone, and inhabited by about 1000 Greeks, most of them laborious artizans, who, if they could have communicated their energy to all their countrymen, would long since have rescued Greece from the yoke of the Turks. In the neighbourhood stands the well-built village of Volos, or Golos, inhabited by Turks and Greeks, who are very different in their manners; the houses are neat and lofty; the streets are adorned with poplars, walnut-trees, cypresses, and planes, on which are a multitude of birds, making the air resound with their melodious strains; and, in fine, those charming pavilions, where the Mussulmans give themselves up to the dolce farniente. The Greeks, though they have no pavilions, are not less fond of pleasure, but they are the pleasures of the table. At the distance of a league from Volos is a dismantled fort occupied by the Turks; and there are many pretty villages scattered over the country, in delightful situations, among which are Drakia, Portaria, Saint Laurent, Saint Georges, and Lechonia. Some ruins are discoverable not far from this place, by some said to be those of Demetrias, and by others those of Iolkos; there are still to be seen a cistern, the old foundations, and the acropolis. Here stands the village of Goritza, where, on festivals, the mass is still celebrated in the open air, after the eastern manner, near a spring which was probably held sacred by the ancient Thessalians.

Trickery, at the extremity of Magnesia, is inhabited only by sailors. On the eastern coast is the flourishing village of Zagora, with about 500 houses, so shaded with chestnut and walnut trees as to resemble a great wood. The wolves here so easily elude pursuit, that in winter they come and howl in the midst of the village.

Many of the Zagorians emigrate, to go and work in other places, and return to enjoy the fruits of their industry. The principal islands, near the coast of Magnesia, are Skiathos and Scopelos; the first is fertile, but badly cultivated, abounding in vines, fig-trees, and wild olives; it produces also a multitude of goats, whose flesh is highly esteemed, and a great quantity of fish. Skiathos had two cities in ancient times, besides villages; now there is only one village and a hamlet, and the miserable cabins form a striking contrast with the richness of the scenery around, in which various trees and aromatic plants, border the rocks of white marble, which are seen in the uncultivated plains. In the church, a stone, bearing an ancient inscription, serves for the base of the communion table; the papas make their parishioners believe, that it has something mysterious about it, so that learned travellers have had great difficulty in obtaining a copy of the inscription. Scopelos is equally fruitful, but still less peopled; it furnishes excellent wines, oranges, citrons, olives, and figs, and some silk. Here the bishop of the two islands resides; there are also some monasteries, a dozen churches, and no Turks: it is independent.

In the way from Magnesia to the capital we find Velestin near the site of the ancient Phæræ; Pagasæ was its port, on the gulf of that name. In the suburbs is still seen the fountain of Hyperia; it forms a little lake of limpid water, bordered with cypresses, poplars, planes, and olives, the verdure of which forms an agreeable contrast with the handsome houses, and the white minarets of the mosques around it. However celebrated it was in the verses of Homer, and other poets, it no longer preserves any of the ruins of its ancient monuments. Near Lake Bæbeis, surrounded with its waving hills, are the picturesque ruins of an edifice, which appears to have been a temple; but the cities of Bæbe and Læceria have disappeared. Arnyro is now one of the principal cities in the country; it is inhabited by Turks: a few ruins prove that it was inhabited in very early times; but more considerable remains are found at Aias, where there are stones ten feet thick, which are probably of high antiquity. A broad and convenient road leads to Larissa, still the capital of Thessaly. There are few places which have preserved their pre-eminence during so long a series of ages; we must not, however, expect to find any remains of antiquity at Larissa: nothing is to be seen but dirty streets; masses of houses irregularly built, but sometimes well grouped and mixed with cypresses and gardens, watered by fountains; bazaars abounding with victuals, but with very little valuable merchandise; some mosques, surpassing in grandeur those of the other cities of Greece; and a fine modern bridge crossing the Peneus, in the direction of the valley of Tempe. There is, however, one remnant of ancient manners to be observed at Larissa; it is the use of those old cars mounted on round solid pieces of wood instead of wheels, which in the heroic times were used in the Troad. There are scarcely any Greeks in the town; they have but one church, but it is the archiepiscopal church, on which depend ten bishops, compris-

ing, with the archbishop of Larissa, the exarchate of Lower Thessaly, and of all Greece. The Turks have made this place the capital of a province containing 100 villages, mostly scattered over the ancient plains of Pelasgia; the city, according to Dr. Holland, has 4000 houses, and 20,000 inhabitants, among whom he was surprised to find many negroes.

On descending from Larissa, along the course of the Peneus, we cross some delightful plains, once animated with a numerous population, and still embellished by nature, and arrive at the foot of the mountain chains, through which the river winds its course to the Thermaic Gulf. These plains are sometimes excessively hot, and the inhabitants are much troubled with intermitting fevers. Travellers should visit the vale of Tempe in the spring, if they wish to see it without danger in all its freshness and beauty of vegetation. Here Olympus and Ossa, which seem to bound the course of the river on the north, present a curtain of verdure along the horizon; the forests of Olympus are crowned with summits covered with snow, that justify the epithet of snowy given to this mountain by Hesiod; while the less elevated Ossa has less wood, and is not so much watered by springs. A little village, called Baba, stands below the confluence of the Peneus and the Titaresus, in a circular plain near the entrance of the valley. Domes, minarets, and houses, are grouped together in a most picturesque manner, with vast plane trees, cypresses, and pyramidal pines. Some think that this village stands on the site of the ancient Platea; in going to it you coast along a pretty large lake, or more properly a marsh, called Nézéro, anciently Nessian. On entering the valley of Tempe, you become sensible that the Greek and Latin poets have a little exaggerated its beauties; there are many superior scenes in Europe and other parts of the world. This defile, however, through which the streams of Thessaly flow into the sea, and which is enclosed by Ossa and Olympus, unites natural beauties of a kind rather striking than agreeable;—a river, the waters of which, always agitated, are shaded by planes, on the branches of which the wild vine hangs its leafy festoons; rocks, more or less elevated and steep, raising themselves above the banks of the Peneus, in some places at the distance of not more than 200 or 300 feet; whilst an ancient paved road, sometimes cut in the rock, sometimes raised in terraces, and sometimes shut in by the narrow valley, passes along the river, often at a considerable height: such is Tempe. In the middle of the valley there is a cold spring at the foot of a rock, where travellers generally halt, and near it a dismantled tower. A Latin inscription on a rock states, that Cassius Longinus fortified this passage, but since the Persian invasion the Greeks have abandoned this part of their territory. In the spring of the year some boats navigate the Peneus, with hives, in order to collect the honey on the coasts, and on the sides of the mountains, while others drive their cars also, laden with hives, into the meadows of Pharsalia for the same purpose, which they afterwards leave, to follow the spring in the higher regions of the mountains.

On issuing from the valley of Tempe, we perceive the mouth of the Peneus and the boundaries of Macedonia. Here is a flourishing city of Magnesia, called Ampelachie; the inhabitants of which distinguish themselves by the spinning and dyeing of cotton; and it is thought that the waters of the country contribute to the brilliancy of the colors, which they know how to apply to this sort of thread: those of them who have travelled in the west for the purposes of trade wear the European costume. There is a Greek school here, founded by the bishop of Salonica, Platonemos Dionysius. The whole population amounts to between 5000 and 6000 souls. The nearest sea-port for the exportation of cotton is Karitza, about six miles distant. Another industrious place, of the same country, is the little town of Rapsiani, which has a Greek school by the same founder, and also exports the same articles. Returning to the south of Larissa, we arrived at the ancient Pharsalia through some narrow passages of the mountains. Not far from it was situated, on the Eripeus, the city of Melitea, which is reduced to a very small population, as are many others, which once peopled Thessaly. Ascending towards the source of the Peneus, we pass by Triccala, anciently called Tricea, in the middle of the last century the most considerable city of the province; but the cruelty of the Turks, and the pestilential exhalations from the rivers in the neighbourhood, have destroyed its splendor: it occupies, however, a charming situation in a valley of the Peneus; its Greek churches, its mosques, its old citadel, and houses, intermingled with groves of trees, form with the verdant scenery around a most delightful picture. The market is held under the shade of vines, but the houses are surrounded with filth: it contains about 7000 inhabitants.

On the side of Mount Pindus, near the village of Kastraki, there are some ruins which are supposed to be those of the ancient Gomphi; and in this mountainous region are to be found the Meteores of Stagous, little monasteries, built on the edges and platforms of precipitous rocks, standing like pyramids in a wild desert. Here, free from the attacks of robbers, and more useless to society than their brethren in the plains, live a number of monks; who will, however, afford the rites of hospitality to any traveller who shall have the courage to suffer himself to be drawn up by a rope and pulley. It is indeed no joke to find one's self suspended at the height of 150 feet, by a simple cord, between heaven and earth, at the discretion of these solitary beings, by whom every stranger might justly be suspected. There is nothing particular in these monasteries beside their elevated situation; the monks seem to have as little occasion to think as the birds who nest in their rocks; they have scarcely any books, and trouble themselves little with the history of their aerial dwellings. Under the reign of Ali Pasha, they were compelled to become the gaolers of his state prisoners. Formerly there were twenty of these monasteries, now there are only seven, the most considerable of which are those of Meteoron and Varlaam. They consist of hermitages, chapels, and altars, built on the platforms and in the holes and crevices

of the rocks, and the hermits who inhabit these inaccessible places have renounced all earthly wealth; they, however, possess considerable revenues, and pay a rent to their landlord as well as a tribute to the patriarch. At the bottom of these five rocks Stagous occupies a territory fertile in cotton, mulberries, and corn: the inhabitants manufacture the silk and send it to the depôts at Larissa. The town has a bishop, who is a suffragan of the archbishop of the capital. The river Cæchia, flowing through the country and uniting with the Peneus, seems to be the Ion of the ancients.

Leaving Ætolia, and proceeding along the southern coast of the Corinthian Gulf, we arrive at the bay of Salone, formerly Crissa, which experiences a regular tide, of which there is little appearance in the whole of the gulf besides. The fine plains of Phocis, watered by the Cephissus, are at first concealed by mountains and rocks; the country, however, extends between the bay and the mountains; and the scenes where the festivals of Delphos were celebrated open to the view. At the entrance of the bay, where Æanthus once stood, is now situated the town of Galaxidi, inhabited by a race of men, almost barbarians, devoted to a sea-faring life, despising every thing that has the appearance of convenience and comfort, living on vegetables and fish, and in miserably built houses: their town is situated on a naked and barren rock. It is thought, that the fear of the cupidity of the Turks has induced these habits of wretchedness, though they possess about fifty buildings. Passing the port Janiki, and the mouth of the Hyleus, which flows from the plain of Malandrino, we come to the road of Salone, and the mouth of the ancient Plistus, now called Crissa, as well as the town situated on its banks; the ancient town, together with Cirrha, its port, exists no longer. Crissa contains about 1200 or 1500 inhabitants, and is the see of a bishop. Salone, occupying the site of Amphissus, is more considerable: it has about 6000 inhabitants, of whom more than 2000 are Turks. There are in this place some remains of the sepulchres of the ancient Amphissians.

Ascending the Plistus, and crossing the plain of Crissa, we soon reach Delphos; here the ancient hippodrome has disappeared, as well as all that once rendered this place so famous in Greece, and made it, as it were, the seat of government for the priesthood. The port of Crissa formerly experienced the sanguinary vengeance of these priests, for having molested the pilgrims in their way to the shrine: the town was razed, and the inhabitants exterminated. The curse of Apollo is, however, now forgotten, and the plain is overshadowed with olives and mulberry-trees. On approaching Delphos are seen some ancient cryptæ cut in the rock; under the arches we perceive sarcophagi, attached to the sides of these caves, with their coverings removed and for the most part broken: over every two sarcophagi an arch is formed, as is customary in Egypt, in Persia, and even in Italy. Some of the foundations of the walls of Delphos are still visible, and even the remains of an entrance composed of small stones cemented

together; large blocks of stone are dispersed here and there in the neighbourhood, probably intended for the repair of the works. The ancient city stood in a little circular and deep valley, surrounded by the rocks of Parnassus, with its triple peak, and those of mount Cirphis, and almost entirely separated from the rest of Phocis. The place is so small, that it is difficult to conceive how a city of any considerable size could be built there: very few fragments of marble have been discovered; and yet we cannot suppose that much of it is buried in the ground, since there is a very shallow bed of soil to cover the rock in this narrow valley. Some broken pieces of earthenware are also found covered with a fine black and red varnish. The splendid temple, elevated by its situation over the other edifices, enriched by the offerings of nations and kings, embellished with the masterpieces of sculpture, and constructed with the greatest magnificence; that temple, so protected by public veneration, where different nations deposited their treasures, where the blood of victims incessantly flowed, and where the oracle of the Pythoness frequently decided the fate of empires; all has disappeared, with the exception of a small part, which has escaped the attention of most travellers, and which Mr. Smart Hughes alone seems to have penetrated. It is a kind of cell, or cave, dark and dirty, where it is difficult to breathe; on the north wall, formed of large pieces of cut stone, a great many inscriptions are seen; it was with the greatest trouble that the English traveller deciphered the best preserved of these inscriptions, containing the act of cession made to the temple; thus leaving no doubt of the ancient destination of this monument.

The Castalian fountain is almost the only thing which remains unchanged at Delphos; it rises, as formerly, at the foot of the peaks of Parnassus; the water, clear and pleasant to drink, falls from a rock, covered with an overhanging yew-tree, into a basin shaded by a fig-tree, and descending by a ravine of the valley to join the Plistus. Spon, after drinking of the fountain, was so inspired that he composed two Greek quatrains on the spot; and Chandler experienced something of the same sensation; but it appears that the charm no longer operates on poets by profession. 'At Castri,' (the present name of Delphos) says lord Byron, 'we drank of the water of a dozen rivulets, some of which were none of the clearest, before we could decide, to our satisfaction, which was the true Castalia; and this even had a detestable taste, proceeding, I suppose, from the fallen snow.' Near the spring some traces have been discovered of the bath of the Pythoness; the descent is by a few steps. The Delphian girls, still very handsome, are seen at the present day drawing water from this fountain, which is now only applied to the most common uses. Castri has not more than 100 houses, and those, for the most part, miserable cabins with only one room each; the best have only a first floor for the residence of the family, while the ground-floor is divided, as is customary throughout Greece, into a stable and a cellar. Poor, and peaceably disposed, the Castriots seldom stray from their

valley, and are rarely visited by foreigners; the Turks, even, forget them. They are Arnauts by their origin; they mostly speak Greek and Albanian; and, notwithstanding their poverty, know how to read and write. Silk and oil are their principal productions; but they cultivate some grain also upon the ancient terraces, constructed for a very different purpose.

Upon a declivity of mount Parnassus is a little convent, the monks of which, subsisting by the culture of their fields and by alms, have always some bread and cheese, olives and wine, and a chamber without furniture, to offer to travellers. In their convent are seen some fragments of antiquity, such as metopes, altars, and inscriptions. Not far distant lie some great blocks of stone, which probably have been cut from Parnassus at a very early period; some think that they are the same as those which, according to Herodotus and Diodorus, crushed the army of Xerxes. Parnassus, extending as far as Bœotia, is now called Lyakoura; this barbarous name, however, is not quite modern: anciently one of the mountains of this chain was called Lycœrea, and one of the most ancient places in the country Lycœria. At a village in the mountains, bearing the same name, it is said, there are some antiquities; in winter the snow forces the inhabitants to leave it, and betake themselves to the neighbouring villages. Parnassus is a third rate mountain: the snow rests on it only a part of the year; and it is thought that none but subalpine plants grow on it; yet a most extensive prospect is enjoyed from its summits, on the one side beyond Eubœa, and on the other across the gulf of Corinth, as far as the mountains of Peloponnesus. The whole of Phocis lies under the feet of the spectator, with the poor villages that occupy the places of the little flourishing republics of the Phœaciens. There is only the plain watered by the Cephissus, now Mauronero, between Parnassus and the mountains of Thessaly. Upon a platform of Parnassus is a grotto of 300 feet long by 200 broad, which receives only a feeble light through a narrow and low entrance; stalactites hang from the roof in the form of draperies and chandeliers; the stalagmites, that rise from the ground, assume the most singular forms; and the water, dropping from the top of the grotto, renders the floor very slippery. At the end of this cave there is a passage, which perhaps leads to another. An ancient inscription on the rocks shows that the place was dedicated to the nymphs and the god Pan.

Proceeding along the gulf of Aspra Spitia, to the east of that of Salone, we arrive at Dystome. The country round it is planted with the Kermes oak, which must have been very ancient; as, according to Greek authors, the town of Ambrissus was formerly engaged in the cultivation of this article. This town must have nearly occupied the site on which Dystome now stands. From Aspra Spitia, formerly the gulf of Anticyra, hellebore is no longer exported, but a pretty brisk trade is carried on in the productions of Livadia. Near a barren coast is situated the monastery of St. Luke Styrites, built in the Gothic style; the church, which attracts many pilgrims, is

partly paved with great flags of ancient green stone. Spon found, in the monastery, 150 monks, and in their cellar vessels twenty feet long. In the library there are only a few manuscripts spoiled by the dust. Near St. Luke stood the port of Balis, where they used to fish for purple shells. On this port also is the little port of Kokosi, and two little islands; Didascalos, receiving its name from an ancient school, now in ruins and the abode of wild pigeons, swallows, and immense bats; and Ambelia, full of rocks, where falcons nest in great numbers. Elatea, the ancient capital of Phocis, is in ruins: and the tomb of Laius, and the temples formerly scattered over it, are now no more. It is still, however, possible to assign the situations of the fortified cities of the Phœaciens. Elatea was probably situated at the entrance of the defile, leading from the plain of the Cephissus to Thermopylae, where now the hamlet of Turco-Chorio stands. Ascending the Cephissus, from this place, we find the remains of an ancient fort, perhaps Drymœa. Other ruins, at the entrance of a road leading to Delphos, seem to mark the situation of the ancient Charadra; and the village of Agourea is probably on the site of ancient Lilaæ. There are also remains of the foundations of walls and towers in the modern villages of Ladon and Velizza, the latter the Tithorea of the Greeks. Near the village of St. Blaise must be sought the site of Panopeus; the circuit of the city is marked, and the ruins of the citadel are on a steep rock. There is the appearance of an acropolis near the village of Thavlia, the ancient Daulis probably, pleasantly situated on the Parnassus. On this mountain, and at the foot of the chain, there were eight ancient places, not less fortified by art than by their situation, being founded on precipices and heights very difficult of access; walls, flanked with round or square towers, follow the inequalities on the surface of the rocks, on the declivities and at the foot of which are some towns: forts only, without towns, protected the most important defiles of the country.

The half savage district of Ætolia presents itself on passing the mountains of Pindus, which leads from the frontiers of Epirus and Macedonia to Thermopylae, and forms the barrier of the north of Thessaly. The Achelous and the Evenus, descending from the same chain, bound it on its two sides as far as the sea, into which they empty themselves. Upper Ætolia has always been the resort of robbers, and left uncultivated; but lower Ætolia, with Ætolia the maritime district, was more civilised, and contained some flourishing cities, the names and monuments of which have disappeared, and we can now scarcely recognise a single trace of antiquity. Aspropotamos and Fidari are the modern names of the country, and the chain of the Pindus, separating it from Thessaly, is called Agrapha. Foreign people and foreign manners have been imported into this country; and the true descendants of the ancient Greeks are to be found among the poor goatherds, who forsake the soft climate of the plains to take refuge from oppressions among rocks and forests on the Agrapha, buried in snow during a great part of the year. These shepherds have some vivacity, energy, and, above all, the love of liberty, and

are worthy of that improvement which we may hope is awaiting them. The climate of their mountains is not so rough as that of Switzerland; fine forests, wholesome springs, valleys delightful in summer, flocks which furnish them with every necessary of life, and liberty are their inheritance. They have a bishop residing at Gardiki, and there are some anchorites dispersed over the deserts of the mountains. The canton of Carpenitzé, near that of Agrapha, is inhabited by Walaeks and Mahomedan Albanians; other Walaeks, formerly living peaceably in Apodotia, of which Cosina was the capital, forsook their establishments, harassed by the despotism of Ali Pasha, preferring a life of freedom on Mount Aninas.

Cavari, a dreary province of Upper Ætolia, appears to be composed of rocks separated by precipices, with a few cabins here and there, completely isolated by the snow during several months of the year; so that the inhabitants are, during that time, obliged to live on provisions which they have collected in the fine season, and which are generally very miserable. Chestnuts serve them for bread, and to these they add some salted meat, &c. The chief place is Amourani; the district contains sixty-three villages, a bishop, and about 12,000 inhabitants, nearly one-fifth of the whole population of Upper Ætolia. These miserable creatures are reduced to the most abject state. They are seen in crowds in the lower regions even as far as Constantinople, and the Ionian Isles, displaying to the Greeks and Turks the wounds and disgusting diseases which they have partly provoked or brought upon themselves in order to excite compassion. They say that these beggars have medicaments to give themselves the gutta-serena, and to bring out livid wounds. Expert in every art of begging, they gain considerable sums, and, though taxed by the Turks on the way, carry home sufficient to live upon till they are able to take new excursions, and even lay up something against old age. Their wives, in the mean time, are burdened with all the labors of the family and the field. These people are supposed to be derived from a tribe of those Bohemians which still infest Albania, and it appears sufficiently probable from their swarthy complexions, their thick and matted hair, their intemperate habits, and wandering manner of life. All the advantage they have over the Ghiftis, or Bohemians, they owe to the influence of Christianity, which they profess, and which preserves them from still greater barbarism. Amourani is surrounded with the rocks of Mount Corox, and contains about 1000 people; the way to it is very dangerous, leading along frightful precipices, and over mountains that beasts of burden cannot climb.

In proceeding along Southern Ætolia, towards the sea, we cross the district of Vlochos, bounded on the west by the Achelous, and abounding in corn, maize, olive-oil, cotton and currants. Thermus and other cities used to embellish this charming country; now there are only a few villages, the principal of which is Vrachori, inhabited by Mussulmans, Christians, and Jews; the latter carry on a trade in silk, and the former manufacture morocco leather. A lake at some

distance, eighteen miles long, occupies the bottom of a basin crowned with woody hills; it is the ancient Trichonium, now Souli; it is divided by a marsh, and its waters flow by two branches into the Achelous; a great causeway, resting on 366 arches, encircles a part of it, a work taking its date from ancient times, when the lake presented to view an active and prosperous population; now there are only the huts of a few butchers and fishermen. There are to be seen in this country the ramparts and gate of Arsinoë; Angelo-Castron now stands on its site, built under the later Greek emperors; there is nothing remarkable here, but an ancient monastery bearing the name of Pontocrator, or the ruler of all things. Through a defile of the Aracynthus, infested by banditti, we enter the maritime district of Zigos; the valley of the Tombs reminds one by its name of the crimes often committed here, and it is necessary to have a good escort, in order to pass this place without fear; but the precipices with which it is bordered warn travellers of another sort of danger. On the sea shore and at the mouth of the Achelous we find a more hospitable country, and softer manners; the chief employments of the people lie in the fisheries and olive-plantations. The little islands of the Echimades almost join the shore; but Anatolio, the ancient Permili, remains separated by a channel; 300 Turkish and Christian families inhabit it; the climate is unwholesome and diseases frequent.

The Ætolian coast presents scarcely any place of note, except Missolonghi, or Messologion, situated on a channel abounding in excellent fish. The inhabitants carry on a little coasting trade, salt fish; make salt and boutargue; and export acorn cups for dyeing and tanning. The oak of Ætolia suits better for this purpose than that of Peloponnesus. There are about 800 houses in the town, a few small Greek churches, and a mosque; the merchants have some warehouses and about thirty small vessels. The Greek women here are very fond of gowns of a very striking color, as red, blue and yellow, and wear over them a shawl of a color equally lively. The marshes extend some miles along the coast, so that the vessels cannot approach very near the shore: on the one hand, the sight is offended by these stagnant spots, which are the resort of a multitude of aquatic birds; and on the other it is astonished by the vigor of the vegetation around, especially in the gardens. Cotton, tobacco, sesamum, and maize are equally thriving. The coasts of Carthaga furnish excellent wine; and near this town there appear some ruins, probably those of ancient Acragas. Hippochon, at the mouth of the Avenus, seems to occupy the site of Chalcis. The most considerable ruins, in the neighbourhood of Missolonghi, are those which the Greeks call the Castle of St. Irene; on an oblong hill there are some walls flanked with square towers, and at the western end the remains of the acropolis still more ancient; rubbish, intermixed with tiles and earthenware, fill the interior of this ancient city; and on the south side is a theatre, some of the seats of which are still visible. Near the theatre is perceived a square space cut in the rock, below the level

of the soil, which seems to have been a granary : near the middle of the town there are some walls of a beautiful construction, but as there is no marble, no sculpture nor any inscriptions, the name of this place is quite unknown.

On the west of the Evenus or Fidari extends another district, answering to the ancient *Ætolia Epictetes*, called in the Levant the Venetian. It has sixteen miserable villages, and about 1357 Greek and Mahomedan families, and offers nothing remarkable, except the castle of Lepanto, formerly Naupacte, commanding with that of Patras in the Morea, the entrance of the great gulf of Corinth ; it occupies the extremity of the cape once called *Antirrhium*. *Taphius* is the highest mountain of this depopulated district. In a grotto, not far from Naupacte, the young Greek girls consult the lot about the choice of a husband, as once they addressed their prayers to *Venus*. The country on the gulf of Crissa, to the east, inhabited formerly by the *Locrians*, now forms the province of *Malandrino*, inhabited by about 6000 people, and infested by robbers, who find a refuge in retreats inaccessible to those who pursue them. The village of *Malandrion*, in a valley watered by the *Hyleus*, and *Galaxidi* with its port, are the principal places ; the poverty of the latter port sufficiently proves the stagnation of trade on this coast.

The aspect of the country and the manners of the inhabitants of *Acarnania* have undergone little change since the days of antiquity. It contains, as formerly, only fortified towns, or groups of houses ; the little islands and bays are favorable to piracy, as they once were, and the interior still serves for a retreat to bands of robbers, whose ferocity has not diminished since the earliest historical times of Greece : the district of *Hermeros*, opposite to *Ithaca*, is a favorite retreat for them. The forests, chiefly consisting of oaks and chestnuts, abound in wild boars and deer ; meadows and desert valleys, lakes, rivers and mountains, shaded with pines and cypresses ; and the absence of all traces of the plough, and of the haunts of civilised society, remind us of the immense savannahs and heights of *South America*. A few poor villages widely scattered form the residence of the modern *Acarnanians* ; while some solitary chapels, or monasteries show the religion which they profess. Not one flourishing city has assumed the situation of those of the ancient people, the ruins of which have for the most part disappeared ; *Metropolis*, the ancient capital, and *Stratos* lying in the east of the country, cannot be discovered with certainty ; but the ford of the *Achelous* is still practicable, except in winter. In the environs of *Lepenou*, supposed to occupy the site of *Stratos*, is seen the monastery of *Licobiti*, the most considerable in *Acarnania*, containing about twenty monks, and the village of *Machala*, consisting of seventy houses ; not more than ten families form the population of *Medenico*, on the declivity of mount *Vips*. Here the ruins of ancient *Medeon* are visible in several large blocks of stone, near which is the defile of *Porta*, by which it communicates with the sea ; in this pass is situated the little monastery of *Saint George*. The ancient port of *Limnea* is in the same state of

ruin ; it is now called *Loutraki*, and has a custom-house and some warehouses, but attracts scarcely any vessels. There is little more activity in the small port of *Candili*, at a short distance from which are some ruins, probably of the city of *Alyseus*. So great has been the decline of this district, that of 224,000, which constituted the former population, there are said to be not more than 8000 remaining, including *Agrais* and *du Valtos*, and its depopulation is continuing. The little trade that is carried on by the inhabitants, is transacted at *Dragomestre*, but a part of this town, near the sea has fallen into decay ; the remainder is inhabited by about 100 Greek families and some Mahomedans ; the only antiquity to be met with is found in the remains of a fort. It is surrounded by deserts, the great forest of *Menine*, and the monastery of *Veder-nico*.

On the west, towards the gulf of *Previsa*, are the ruins of a place very celebrated in Grecian history, or rather in that of *Rome*—the city of *Actium*. Here the monuments, both of the victors and the vanquished, have sunk into decay, and we can scarcely recognise the foundations of the temple, the theatre, and the site of the *naumachiz*. The city of *Nicopolis*, built by *Augustus* opposite to *Actium*, no longer exists, though the principal monuments, and even the houses, are standing, having survived the existence of the Roman people. At some distance from *Actium* is the lake of *Bulgaria*, surrounded by thick forests, and the monastery of *Pleya*, almost as wild as the country. Warm and moist vapors rise from the marshes near the sea, and noxious animals, such as serpents, vipers, and troublesome insects abound. The most considerable place in the west of *Acarnania* is *Vonitza*, a town inhabited by 100 Greek families, and the capital of a canton containing 2550 people ; it stands in a valley watered by the *Kiphalo-Vrysi*, and is commanded by a mountain fortified by the *Venetians*. Dye-stuffs, rice, and maize, are exported from this place to *Sainte Maure*. There is a convent near, bearing the fine name of *Paradisi*, whither pilgrims resort to be cured by the *Virgin of the fevers* with which they are afflicted.

The gulf of *Ambracia*, now *Previsa*, strait at the entrance, and incumbered with pieces of rock, will not admit large vessels ; it washes the canton of *Vonitza*, and the whole of *Acarnania*. A number of creeks and bays indent the shores of this gulf, inhabited by pelicans, cormorants, swans, and other aquatic birds ; crabs and shell-fish of different kinds, as well as dolphins, mullets, eels, and a variety of other fish, employ the hands, that under the despotism of the *Turks* do not find security in agriculture. A north-west wind, called *Imbat*, blows on this gulf from eleven o'clock till sun-set, and during this time the fleets carry their shell-fish and other marine productions to the coast of *Acarnania* ; at the close of the day the sea is calm, and the fishermen apply themselves to their fishing during the night. The island of *Sainte Maure* or *Leucadia*, once a part of the continent, and separated in fact only by a narrow strait, is now reckoned among the *Ionian Isles*, under the protection of *England*. The neighbouring islets are favorable

for pirates, and the channel itself was much infested previous to the arrival of the English; Leucadia, however, has a fortress which commands part of it, but that can be bombarded from the coast of Acarnania. There are still to be seen the remains of a bridge built over the strait by the Turks. For about twelve leagues round Leucadia presents good pasturage, and fields fertile in corn and fruits, such as oranges, citrons, figs, and almonds; yet the harvests do not furnish much more than half the quantity consumed by about 18,000 people, contained in the capital and about eight or ten villages, the remains of thirty, which once existed. For further particulars of this island, as well as of Ithaca, Cephalonia, &c., see IONIAN ISLES.

Beyond the gulf of Arta, and at the foot of the mountains of Albania, two little republics have not long since displayed the heroic valor of their ancestors, or rather that austere courage and inflexibility of the ancient Spartans, which sometimes bordered on ferocity. Parga and Souli have acquired some celebrity in the records of their country. Ancient Epirus, or Lower Albania, is a mountainous but fertile country, supporting a population of Greek origin, but as warlike and energetic as the other Greeks were mild and peaceable. The situation of their villages is such as to induce them to form themselves into independent tribes, and to carry on a warfare against their neighbours, or any troops that might be disposed to subjugate them. They cultivate the soil no farther than is necessary to afford them a supply of miserable food, but they like to possess large flocks; and, while the life of a shepherd is in other places peaceful, here it is intimately connected with the profession of arms. Privations do not affright them; they delight in danger; if their enemy injures them, they live in the hope of taking signal vengeance; their fiery passions know no moderation, and, if despair seizes them, they are the first to sacrifice every thing that is dear to them. When they lose their liberty, and their native soil, nothing any longer attaches them to life; they are totally unmannered, become incapable of any generous resolution, and brutalise in servitude. We refer here to the Epirots, who practise the Greek worship, and speak the Greek language; the Armaouts, or indigenous Albanians, unite the greater barbarism with the fanaticism of the Mussulmans. From some remains of antiquity it would appear, that the Parginots very early established themselves in this country; but it has been in modern times, that they occupied and fortified the steep rock on which they lately established themselves, perhaps to shelter themselves from the inroads of other Albanians. Their citadel was on the rugged summit of a precipice, beaten by the waves, and commanding a little territory of unequal level, but well watered and covered with corn, groves of cedars and cypress, and plantations of olive and orange trees. Parga, notwithstanding the weakness of its population, amounting only to 5000 souls, made its independence to be respected by the Venetians, though it could not hinder them from putting a garrison into its port, which had become important for the protection of the coast of Epirus.

It remained for the ferocious Ali to complete its ruin, and the expatriation of its people, as we shall see in the slight sketch of modern Grecian history, which we intend to present to our readers. Souli, which has sustained a more bloody and obstinate struggle against the same oppressor, is composed of several villages situated among the rocks, and surrounded with fields, pasturage, and plantations. A river, which appears to be the Acheron of the ancients, and which falls into the sea near Parga, waters this mountainous territory, a little nearer to the sea than Janina, the capital of Epirus. Its population is greater than that of Parga; it was not able, however, to protect it from the forces of Ali Pacha, who attacked it with 12,000 men; but of this barbarous and unwarrantable outrage we shall hereafter speak.

III. The Peloponnesus has received the modern name of the Morea, according to some, from its plantations of mulberry trees; and to others from the epithet of Oraia, the Beautiful, which was given to it by the ancients. Here, as in Great Greece, a few ruins are the only remains of flourishing kingdoms and republics; and it is surprising even to find these, after the many natural and political revolutions which this peninsula has experienced. Of the 2,000,000 inhabitants once living here in splendor, not more than 300,000 now remain, scattered chiefly in mean villages, and barely subsisting by the produce of their land, their flocks, and other resources which nature has provided for them. Almost the whole of the peninsula is surrounded by mountains of a small elevation, barren on their summits, but fertile at their bases. Mount Pholoe, in Arcadia, and the Taigetis in the country of the Spartiots, are distinguished in those chains which stretch to the southern extremities. The Alpheus, the Eurotas, and the Pamisus, which issue from the mountains of the interior, flow through the valleys, the fertility of which has been justly celebrated by the ancients.

The corn harvest here is abundant. The wheat is gathered in the month of June, and yields ten or twelve per cent. A clayey soil, requiring little culture, constitutes the fields destined for the growth of corn; but the defects in their instruments of husbandry necessarily diminish the harvests. The barley of the peninsula is gathered in May, but is not equal to the wheat, which, notwithstanding the bad cultivation, is exported in great quantities; and the Ionian laborers, who come to assist in the harvest of the peninsula, are paid in this commodity, which is scarce in their islands. The bread of the Morea is however bad, on account of their negligence in the grinding and baking.

The soil of the peninsula is not less favorable to the cultivation of vegetables. Instead of those large forests of lemons, oranges, and citrons, which formerly stretched as far as the eye could reach in the environs of the principal towns, we now see only small orchards of them; and the lemons are small, and rather acid: the peaches, pomegranates, and almonds, also partake of this flavor, as well as other stone fruits, which they have no idea of improving by grafting. The figs have a more agreeable taste, especially in the

neighbourhood of Calamata, owing to the progress of caprification, which is practised almost throughout the archipelago. There are two kinds of fig-trees, the wild and the domestic, both of which bear fruit; but that of the latter falls before it is ripe, if precautions be not taken to prevent it. When the wild figs are ripe, which is in the months of June and July, they are gathered and fastened by strings to the domestic fig-trees; soon afterwards small gnats proceed from the wild figs, and introduce themselves, by what is called the eye of the fruit, into the still green figs of the domestic tree. This is called caprification, which process gives to the fruit great sweetness. The insect which conduces to the maturity of the fruit transforms itself into a worm; to prevent its hatching, the figs are placed in an oven, or kept in jars hermetically closed. The olive-tree seems to belong peculiarly to the Morea, it shoots and multiplies every where, though in a wild state; and there are still the remains of woods and forests of these trees. Under the government of the Venetians, the Morea furnished an immense quantity of oil, the best of which is now chiefly produced in Corinth, Napoli di Romania, and the district of Maina. Although in other parts the olives are not cultivated with equal care, the harvest is always abundant.

It is different with regard to the silk: mulberry trees do not fail, or rather would not fail were they to establish plantations; but there is a great mortality amongst the silkworms, which the Greeks attribute to sorcerers, instead of their own want of precaution: in the Morea 100 pounds of balls only yield from seven to eight pounds of silk. Neither is the Morea in its present state a wine country: vines are abundant; but with the exception of that of Misitra, and St. George in Corinthia, the wine is common, and in order to preserve it they mix it with resin, or even with turpentine, which renders it bitter. The Corinthian grape, which is the sort particularly cultivated by the husbandmen of the Morea, appears to have been transplanted from the isle of Naxos, and to thrive best in a dry and flinty soil which prevails in the peninsula. The vintage for these grapes is at the end of July and during the whole of the month of August: a very good wine is extracted from them, but, as they yield but little, they are principally dried for exportation. It is chiefly along the gulf of Corinth, and in the Ionian isles bordering on the Morea, that vineyards of this kind are found: they have succeeded to the plantations of tobacco, with which the Morea was formerly filled, and the quantity of Corinthian raisins which is generally exported in time of peace is valued at 6,000,000 or 8,000,000 of pounds. The cotton of the peninsula may vie in fineness and whiteness with that of Salonica and Smyrna: flax grows spontaneously in all parts of the Morea, but hemp fails there.

Argos, Messenia, and Arcadia, are capable of feeding great numbers of cattle, and the pastoral productions would enrich the inhabitants, had not the race of domestic animals greatly degenerated: the wool of the sheep also, which is naturally long and silky, would, if treated with

suitable care, equal that of the Merino breed: Navarin and Napoli di Romania exported great quantities of it not long since. The butter, though excellent when fresh, will not keep, from a defect in the preparation. They export a quantity of raw hides, and acorns.

Plains covered with rosemary, thyme, wild thyme, mint, wild fennel, and other aromatic plants, furnish the bees with materials for excellent honey and wax; which, however, the people neglect to purify, and sell it in its coarse state. Many other vegetables would grow here in abundance, were the inhabitants to bestow more attention on them: it seems even certain, that the sugar-cane would succeed very well in some parts of the Morea.

Planes, carob-trees, cypresses, mastich-trees, kermes-oaks, pines and firs, together with laurels, roses, and myrtles, grow near the towns and in the deserts of the Morea: the large pines furnish excellent wood for building; those of Elis might be employed in the construction of men of war. The resinous wood of the Morea produces much tar, pitch, and turpentine, and slips of it, lighted, supply the place of lamps to the cottagers. They extract a kind of aromatic oil from the berries of the laurel, which is efficacious in the cure of rheumatism and sprains. Another kind of oil is obtained from the pistachio: and the Moreans have more than once in time of famine mixed the ground root of the *arum maculatum* with their bread. With the *rhus cotinus*, which the Greeks call *chrysoxylon* or golden wood, the Moreans dye an orange color: the fruit serves to season their dishes. The *agnus castus*, which grows on the borders of rivulets, furnishes them with osiers. It may be supposed from the state of agriculture, that farming is at a very low ebb in the Morea; notwithstanding which they very well understand the conducting of water even to the distance of some leagues, though there is still much improvement required in that as well as in other branches of husbandry. The manufacturing interest is not more flourishing: necessity has taught the Moreans to manufacture many articles, such as cotton, leather, felt, and even in some places they fabricate silks, gauzes, stuffs, &c.; but for other merchandise they are dependent on foreign nations. It is to be remarked however that the Moreans, though but indifferent manufacturers, are excellent merchants: they have abolished all the foreign houses in their ports and engrossed the whole of the commerce. 'There is no nation,' says Sero-fani 'which can be compared with the Greeks for avarice, parsimony, cunning, and activity.'

It is a remarkable circumstance, that the isthmus of Corinth, which anciently served as a link between the Peloponnesus and Great Greece, and contained an opulent city, should have become in 1822, after so many ages of nothingness, a rallying point for the free Greeks and the seat of their government until the city of Minerva shall be in a condition to receive it. In the foundations of the ramparts and bastions, which surround the acropolis, may be perceived ancient layers of stone of Pelasgian or Cyclopean workmanship. The fountain of Pyrenus issues from the foot of the mountain, on which the

citadel stands; and, farther on, is the fountain of Lerna; which rushes from the rock, and swelling in a rivulet, after having watered Corinth, empties itself into the gulf of that name. Fragments of the fluted columns of the ancient temple of Minerva are remaining; and other vestiges may still be seen on the declivity of the mountain.

At a short distance from the town there are seven fluted columns standing, which still support a part of their ancient architraves, and which the inhabitants of the country suppose are the remains of the temple of the Sun. Judging by the descriptions of Strabo and Pausanias we may also recognise the foundations of the theatre and gymnasium; but of the famous temple of the Melanean Venus no traces are to be found, and from the present melancholy aspect of Corinth no one would suppose it to have deserved the name of the 'city of pleasures.' Its ancient port of Lechaëum, on the gulf, still contains some small buildings and a custom-house; but this tract of land is become an unwholesome marsh, impregnated with saltpetre. Cenchrea, now Hachries, another port of Corinth at the mouth of the Helicon, is almost a desert. Mosques and a few Greek churches, among which the cathedral is distinguished, have succeeded the ancient temples: and since 1821, probably, the minarets no longer announce the supremacy of the Mussulman worship in this bulwark of Greece. The archbishopric of Corinth boasts of being more ancient than even that of Rome. Besides the churches, a caravan-serai and a post house were the only public establishments here in 1821. With regard to military affairs, Corinth is important for the defence of the Peloponnesus against the attacks of land armies; though, from its being situated between two gulfs, an army may easily approach and quickly disembark, especially on the side near the isle of Ægina. Corinth has never been celebrated for the fertility of its soil; scarcely any trees are to be seen, except small pines, and cypresses; only a few of the gardens are adorned with citron and orange trees; and, after the harvest, the chalky lands, burnt up by the sun, present the very picture of sterility.

The villages of the isthmus are now comprised under the general name of Dervena Choria, and have a population amounting to 10,430 inhabitants: Corinth itself contains about 360 houses. Two roads diverge from the town, one, turning towards the east, leads to Megara; the other westward to Sicyone.

On the road to Megara we pass through Examili, a village divided into high and low, and inhabited by Greeks and Albanians: in this place is found an astonishing quantity of ancient coins, which the women wear as ornaments; and near the village are the remains of a temple and a theatre, fragments of marble and granite, and pieces of antique pottery. From the number of pines found here, it has been conjectured that in this place the Isthmian games were celebrated.

The passage of Mount Æneus was not, until lately, free from danger, and various recollections contributed to sadden the traveller. The torrent

of the Massacre, which is to be passed, issues from a ravine shaded with rose laurels, pines, maples, and other trees; it was here that in 1779 a troop of Albanians were murdered. The ascent of Caki-scala leads to the summit of the torrent, which commands a fine view of the neighbouring country and sea.

Towards Megara the coast is guarded by the Scironian rocks. The fertile country around is inhabited by Albanians, who, taking advantage of the partial liberty granted them by the Turks, have secured to themselves a lucrative trade in oil of turpentine, butter, wax, and honey. Megara, which was built on three hills, has lost its monuments, owing partly to the decomposition of the stones composing them: the more ancient foundations, which are still to be seen on one of the hills, being of the primitive rock of Mount Gerania, have been more lasting, and appear to be of cyclopean construction. Megara is only a borough, inhabited by about 1400 Greeks and Albanians, having an episcopal see. The houses are pretty well built, and on the declivity there is a road from this place to Thebes, through the defiles of the Ceralian mountains.

Returning to Corinth, we find a road, which leads along the gulf in a westerly direction to Sicyone, which district is bounded by the rivers Nemeus and Sysais, the most fertile part of the present Corinthia: the Schypetars, who inhabit it, cultivate olives, vines, and cotton, and feed cattle, goats, and poultry; their wives spin the cotton, and show much order and neatness in their houses.

The ancient Sicyon is reduced to a borough: its ruins are found near the mouth of the Asopus, where it is easy to recognise the Greek and Roman acropolises; but the temples, and the wood of the Eumenides, have disappeared. The present village is called Vasilika; it is situated in a deep ravine, through which runs a spring called by the Greeks the Dropping Fountain, because it is supplied by drops falling from the roof of a cave. Sicyone, peopled by the Dorians, early distinguished itself by its love of peace, and the culture of the fine arts: dancing, music, tragedy, and the art of moulding in brass, were carried to great perfection in this Dorian colony; even the women possessed cultivated minds: but the assertions of the ancients are the only proofs of the former prosperity of Sicyone. The very small province of Phliasia, remarkable for its wines, is inhabited by Greeks, who are, perhaps, descended from the ancient Dorians, without any mixture of other nations. On a hill near the Asopus are the ruins of a town, which may have been Phlius.

Argos, the kingdom of Agamemnon, has shared the fate of the other states of Greece; and, in later times, a pacha with two tails governed this formerly independent province. Many historical recollections are awakened here, by every town, river, and mountain: ruins abound in this province, partaking rather of the indestructible solidity of the Egyptian monuments, than of the light and graceful character of the Grecian architecture. Some of these ruins probably equal in antiquity the pyramids on the banks of the Nile, and belong to the style called Cyclo-

pean, indicating the gigantic stature and strength of the people who raised them. Instead, however, of cyclops and descendants of the ancients, there are now scarcely any inhabitants in Argos but Schypetars.

Passing through that mountainous district, which is bathed on one side by the gulf of Argos, and on the other by the sea of Saronica, we arrive at Nauplie. At the bottom of the gulf of Argos, now the gulf of Napoli di Romania, we find a town, which under the Venetian government was the capital of the Morea; the port is still the depot of the productions of the Grecian continent and islands. To this place Samos sends its sponge, Laconia its silks, Mitylene its excellent oils, and other parts of Greece their wines, acorns, and vermillion: ancient medals of various sorts are also found here. It does not appear that any modern traveller has explored the catacombs, or the subterraneous labyrinth, which, according to Strabo, lie between Nauplie and the city of Argos. The acropolis of Nauplie, still bearing the name of the hero Palamedes, is yet visible; but the most remarkable remains of antiquity here are the ruins of Tyrinthia, at the distance of half a league from the town. The walls of Tyrinthia are mentioned in the *Iliad* as existing long before the Trojan war; nor have thirty centuries been able to destroy them; travellers who have examined these masses of stones laid one upon another without cement, think that they may still remain as many more. Amongst other peculiarities, the use of the ogive is observed here, which proves that this kind of arch is of great antiquity, although it was seldom much employed till the middle ages.

In going from Tyrinthia to the ancient Argos, the Inachus must be crossed: the bed of this river during a part of the year is dry, but at other times almost the whole plain of Argos is inundated. The ruins of the acropolis are in the same cyclopean style as those of Tyrinthia, at least in the foundations; for the rest is modern, and composed partly of a collection of more ancient ruins. Many classic writers mention the cyclopean walls of Argos, which, from their great solidity, the inhabitants of Mycenæ were not able to demolish. Few remains of the buildings of this city are to be found, except the plan of the theatre, south-east of the acropolis: it is cut in a rock, and had apparently two wings, which is not the case with other Grecian theatres. A chapel, situated near this theatre, appears to have taken the place of the Hieron of Venus, in which the inhabitants erected a statue to Tele-silla, a woman distinguished equally for her poetic genius, and her valor, displayed against the Lacedæmonians, in their attack upon Argos. On a rock, to the north-east of the ancient citadel, is a monastery, probably built upon the ruins of the temple of Apollo Diradiotes; and we are assured, that this rock encloses a cavern, which was formerly used for oracles, of which Argos had several. Modern travellers have discovered near the acropolis, on the site of the sanctuary of an ancient temple, a subterraneous passage, which led to the altar, and in which the impostor, who made the oracle speak, probably

hid himself: every word pronounced there is reverberated by the rocks in an astonishing manner. How many have been dupes to this cheat, and how many hopes and fears has it excited, while the priests of Argos have laughed at the credulity of the people! Within the walls of a large church, at the southern extremity of the town, are the fragments of some columns of the Ionic order; and one of the mosques of Argos is said to be built with the remains of the grotto of Esculapius in Epidaurus.

The province of Argos is inhabited by Schypetars to the number of 8000 or 10,000, who employ themselves mostly in agriculture, in the fine plains watered by the Inachus; their houses are very neat, and their women, if not equal to the ancient Argians in beauty, may at least pass for their descendants.

Two leagues further north are the ruins of another celebrated city, Mycenæ, which five centuries before the Christian era, was reduced to its present state of dilapidation by the Argians, who were jealous of the glory its inhabitants had acquired in an engagement with the Spartans at Thermopylæ. An acropolis, surrounded by cyclopean walls, rises amidst the unformed ruins. The entrance to the ancient citadel is still plainly seen; and is composed of enormous blocks of stone, upon which are others lying one against another, and forming a kind of rude arch, finished with a stone, on which are cut two lions or panthers standing against a pillar; similar to the animal figures used in modern heraldry. Sculpture of this kind and of this antiquity is surely one of the most curious objects among the ruins of Greece: it is nine feet in height, and more than eleven in width at its base: the gate over which it is placed is mentioned by Sophocles and Pausanias.

On the outside of the acropolis is a tumulus, something resembling the hypogæa of Egypt; some old steps lead to the entrance gate of this massy structure. On the top of this entrance, which widens as it advances, is an enormous lintel, composed of a single bræchia stone, twenty-seven feet in length, seventeen in width and about four and a half in thickness, being perhaps one of the largest ever employed in an edifice. In the interior of the building is a room terminating in a point like that in the second pyramid of Egypt, from which we pass into a smaller apartment, where we find over the entrance a kind of ogive like that over the citadel. This monument has been called the treasury of Atreæ, from a supposition that the ancient Grecian kings were accustomed to deposit their treasures in such buildings: some learned persons, however, believe it to have been a tomb; and there are others who think that it was a place for mystical worship.

The tombs of Agisthus and Clytemnestra have not yet been found. M. de Chateaubriand imagined he had discovered them; but what he took for Grecian tombs are those of a Mussulman and his servant, who were murdered there thirty years ago.

A little further to the north, through the woody defile of Treta, we arrive at the ancient city of Nemea, of which the hamlet of Colone, so

named from some columns of a temple of Jupiter, is all that remains, and a few solitary trees in the neighbourhood indicate the site of the forest which formerly covered the country: here the celebrated games were solemnised, and the inhabitants still assemble annually on the 15th of August, to celebrate the festival of the Virgin, near a ruined church under a very old wild pear-tree.

Following the course of the Nemean river, through the plain of Coutzomati, we enter the canton of St. George, which belongs to Couthia, and is justly celebrated for its vineyards. The lion subdued by Hercules is supposed to have had its den near Nemea. In the way from Argos to Epidaurus we pass near a hill on which are the ruins of Lessa, on the borders of the territory of Argos; and all along the road are to be seen tombs of great antiquity, composed of rough stone; there is one in the shape of a pyramid, like the Egyptian tombs.

Cotton, corn, mulberry, and pomegranate trees and myrtles, cover the beautiful plains and valleys. On the way, and near the sea, are fine woods of olive trees. Epidaurus, the chief city of this province, which now belongs to Corinth, was situated in sight of the isle of Ægina, and has been succeeded by the maritime town of Epiada. The temple of Esculapius was situated in a place now called Ligoris, and adorned with myrtles, Indian fig-trees, and other shrubs. The temple of the god of health is no longer standing, but the plan is still visible. The ancient Trezenia and Hermionides form the extremity of a peninsula, and are badly peopled, uncultivated, and unhealthy. Methone still exists under the name of Methana, but it is merely a village like most of the other cities of ancient Greece. At Hermione, now called Thermis, the girls no longer, as in the golden days of Greece, consecrate their hair to Venus at the time of their marriage; and the sacred wood is no longer preserved in honor of the Graces. Quantities of the shells used in the manufacture of purple, which formerly rendered this town famous, are still to be seen; but Hermione is now only known in commerce by the fine sponge found on its coasts. The ancient Calauria, now known by the name of Poros, is inhabited by Albanians.

The Cymeria of the ancients, now Saint Pierre, a province which reaches to the mountains of Laconia and Arcadia, is on the other side of the gulf of Argos. The inhabitants feed a number of sheep on their mountains, part of the wool is exported, and the remainder is manufactured into felt and carpets; they likewise make annually 5000 quintals of cheese, and 3000 barrels of olive oil; also some silk and vermillion. Before the insurrection of 1821 they were accustomed to repair to Constantinople, in order to sell butter, and, after enriching themselves at the expense of Christians and Mussulmans, they returned to their mountains, and laid out their money in ammunition from the neighbouring islands of Hydra and Spezzia. In the summer the inhabitants of the coast visit these mountains in order to escape the damp and unhealthy vapors prevalent near the sea at the equinoxes.

The town of Saint Pierre seems to have suc-

ceeded the ancient Thyraea; and the towns of Prasto and Saint Reontas, which form the see of an archbishop, point out the site of the maritime town of Prasica: since the last century a new town, called Neoprasto has been built at a short distance from the two preceding ones. The temple of Diana appears also to have given place to the chapel of Notre Dame de Carga, where the mountaineers perform their devotions with the same zeal as their ancestors. The Tzaconic dialect, a kind of gibberish, in which some remains of the ancient Doric have been discovered, is spoken here. A few centuries since, the language of the Tzaconians, that is of the district comprising the towns of Prasto, Kastanitzas, and Satina, was not understood by the other Greeks; but commerce, by increasing the communication among the different states, is gradually abolishing this particular language, and, as it has perhaps never been written, no traces of it will probably be left.

Achaia, the northern extremity of the Peloponnesus, is as poor and unfruitful as in ancient times, although it possesses one of the principal cities of the peninsula, that of Patras, a maritime city built at the foot of Mount Panachaikos. This place has always preserved the importance which it owes to its situation, being with Lepanto the key of the Corinthian Gulf; the walls, of which ruins are still to be seen, formerly reached to the sea, but the present town, falling far short of the ancient in beauty, is situated at the distance of a mile from the coast. In the modern fortress, itself become a ruin, are the remains of the acropolis, where, in a niche, is a mutilated statue apparently of Diana; this goddess being venerated at Patras, on account of the chase in the forests of Panachaikos, now infested with lynxes and other wild animals. Bacchus shared with Diana the homage of the Patracians, and justly, for the vines here are still magnificent, the foliage very thick, and the grapes of a considerable size. These vines cover a valley crossed by a Roman aqueduct on two rows of arches, which furnishes water to a fountain supplying the citadel. There is another fountain, or rather covered pit, near the ancient port, and the ruins of the church of Saint André, erected, as is supposed, on the site of the temple of Ceres. This fountain was applied to in the time of Pausanias by invalids: the present inhabitants, more cautious than their ancestors, draw water here on Saint Andrew's day as a preventive of evil. Saint Andrew is the patron of the Patreans, and these have made vain efforts to obtain permission from the Turks, for the rebuilding of his church, which was demolished by the Albanians in 1770. On the day of his festival, the Greeks crowd to the ruins, worship the sarcophagus, which contained his bones, and devoutly drink the water of the pit consecrated to him; small wax tapers are lighted each night upon his tomb.

Near the temple of Ceres was formerly a sacred wood, used as a promenade for the inhabitants: it is succeeded by the vines of Calumogdarti, where have been found some relics. The ruins of two piers, and the bases of two towers, are all that remain of the port which was an

ciently decorated with temples and statues: its waters are stagnant, and produce fevers. A badly screened bay receives the ships, which load principally with Corinthian raisins, for which production there are magazines near the custom-house, also store-houses for fish and salt provisions. The bazaar of St. George appears to be on the site of the ancient market; and according to M. Pongueville, who caused this land to be cleared, the garden of the French consul still contains the Mosaic which served as a pavement to the temple of Bacchus Esmynetus. This gentleman thinks that researches in the bazaar would bring to light other antiquities.

The present Patras will transmit scarcely any monuments to posterity: streets badly paved, dirty, narrow, and in some places shaded by roofs of ivy; houses built on ground dried by the sun, small churches, and mosques, are all that compose a city which passes for one of the first ports of the Levant, and which contains 16,000 inhabitants, three parts of whom are Greeks. This town possesses natural advantages which, under a free government, might render it one of the first cities in Greece and the Levant: under that of the Turks the safety of the inhabitants was threatened at the gates. So common were assaults in the road which passes through the woods of mount Panachaikos into Arcadia, that it was abandoned and stigmatised by the name of 'the road of murders;' it is more safe to go to Arcadia by sea. Besides vines, the neighbourhood of Patras is planted with mulberry and fig-trees, myrtles and mastic: hyssop, stocks, and other flowers, enamel the shore. Notwithstanding the beauty of the situation, we rarely find in Patras that hardy and robust race which formerly peopled Achaia: those born in Patras are generally afflicted with rickets, perhaps owing to the want of cleanliness and proper diet. More negroes are found here than in other Grecian cities; they generally succeed in obtaining their liberty, and establishing themselves, and then become exceedingly arrogant.

In ancient times Patras was the chief place of only a small district, which was increased by the Romans: at present it extends from the Larissus to Meganitas, and comprises ninety-five villages with a population of 10,700 souls. To the south-east of Patras, after crossing the river Melas at Camenitza, are found the ruins of the ancient city of Phares, on which the Christians have built a chapel to St. John. The small village of Cato-Achaia, which contains all the population of this district, abounds in mulberry, almond, and fig trees: rivers, fields of maize, wheat, and cotton, form, together with a forest of oaks, the resources of the modern Phareans. The greatest number of relics in this district are to be seen near the village of Chalanthistra, which some centuries ago had an archbishopric and several churches; and which probably stood on the site of the ancient Tritea: thus this city has fallen twice. In the mountains of Craca stands the richly endowed monastery of St. Michael the archangel, which maintains about eighty monks, and up to the present time is one of the largest convents in Greece.

The ancient Ægeum, built on a promontory,

has lost its splendor, and the small town of Tostitza, which has replaced it, has experienced too many calamities to admit of its attaining to prosperity: there are some remains of this town and a fountain formerly dedicated to the goddess of health. The inhabitants of this district are exposed to earthquakes, a variable climate, and a violent wind, which blows from Marrichiotis; and, what is still worse, they are the vassals of some Turkish families, to whom this province was given on the conquest of Achaia. They console themselves, however, by the abundant fishery of their gulf, by the fertility of their soil, and by that resignation which makes us endure an evil that we know cannot be remedied. At the ancient Bura, near Tostitza, Hercules delivered oracles in a grotto, which is still seen: it is opposite Delphos, which may be seen on the other side of the gulf of Lepanto. The Greek priests have never been able to impart to the oracle of Bura the reputation which was attached to that of Apollo: they pretend that the monks of Negaspelon have deprived them of their titles. The ancient Pellenia, whose barren soil is covered with pines which exhale an aromatic odor, is now inhabited by Albanians: they make in their woods pitch and oil of turpentine.

With the name of Arcadia we naturally associate the idea of the golden age, and the Arcadian shepherds. Their country, which occupies the middle of the peninsula, is an elevated plain overlooked by mountains, from which rivers flow in all directions and water the provinces inclining toward the sea: the principal of these are the Alpheus, the Erimanthus, the Eurotas, and the Inachus. Fountains of water gushing from all parts of the plain impart to the air a delightful freshness; the forests which clothe the sides of the mountains, and which must formerly have been larger and thicker; charming pastures; a soil abundantly fruitful; mountains sheltering the inhabitants from invasion; a poverty, which, though not amounting to indigence, served to discourage the greedy conqueror; liberty, without which all other enjoyments are unstable; and a simple and frugal life undisturbed by violent passions; in these advantages consisted the happiness of the ancient Arcadians: they enjoyed that felicity which poor, weak, and free nations seem alone destined to enjoy. But in proportion as the population around Arcadia increased, the inhabitants felt the influence of foreign manners: their simple worship was loaded with the pomps of superstition; the priests subdued the spirit of the people; ambition and jealousy excited civil feuds; proud of their own liberty they filled their country with slaves; the shepherds forsook their mountains and shed their blood in the contests of the neighbouring states, indifferent as to which side they took in those quarrels which ended by desolating the once happy Achaia. Under the Turks they preserved a kind of liberty, at least in their mountains, but it was not that of their ancestors. It is a singular circumstance that many of the Arcadian rivers, after having inundated the country and formed lakes, hollow for themselves subterraneous passages, disappear for a considerable distance, and are then found in other parts: when the canals

by which the rivers disappear are obstructed, the neighbouring villages are threatened with deluges similar to those which ruined the towns of the ancient Arcadia.

Butter, cheese, and wool, are the chief articles of exportation: agriculture might have added other riches, had it been encouraged and protected under the reign of the Turks. Sufficient domestic tranquillity, however, remains in the mountains to preserve the primitive beauty of the Arcadians: a tall figure, expressive features, a regular profile, and flaxen hair, even now distinguish the fair sex.

More than 300 villages contain the population of the four cantons of this province, which are named after their chief towns. Tripolitza, which before 1821 was the residence of the pacha, and in some manner the capital of the peninsula, appears to have been built with the ruins of the cities of Tegea and Mantinea, which were situated in the neighbourhood and were formerly rivals in power. The city of Tripolitza is situated in a fertile, and well-cultivated valley, to the east of mount Menalus, now Roïno. It is surrounded by walls and crowned with a citadel, where, since 1821, the Greek flag waves over a free people. The pacha, enclosed in his seraglio, paid little attention to embellishing his residence; and Tripolitza, except in the principal street, which crosses the whole town, presents no other appearance than that of most Turkish cities. A market, shaded by large plantains, occupies the centre of the town; and four mosques, ornamented with ancient columns and bas-reliefs, serve for the worship of Mahomet: a caravansera, shut in the evening like a prison, with iron gates and chains, is provided for the reception of travellers. The plain of Arcadia, exposed to the heat of the sun in summer, and covered with snow in winter, with bad water and few trees, presents the most melancholy spectacle in this beautiful country; but its soil, if properly cultivated, is capable of furnishing pasture for cattle and of producing grain, wool, vermilion, and cheese, sufficient for exportation. About seventy-five villages belong to this canton, which has its archbishop residing in the chief town. A few remains, in a place now called Palao-Episcopi, point out the site of Tegea, within a league of Tripolitza: some stumps of columns, and fragments of capitals, in which are seen the three different orders of architecture, lie on the ground.

Mantineia has been still less spared by time than Tegea. A marsh covers the spot where Epaminondas vanquished the Lacedemonians, and terminated his glorious career; and no traces remain of the monument erected to his memory; but the remembrance of the hero still inspires his descendants in their struggles with their oppressors, and the territory of Mantineia and Tegea has been freed by their valor. In the mountainous canton of Leontaris, or Londari, there are not twenty villages: the inhabitants lead a pastoral life; their lands producing grain and cheese barely sufficient for their own consumption. The borough of Londaris, probably on the site of one of the three ancient cities, bearing the name of Leuctra, occupies the centre of a tolerably fertile and healthy valley.

Perhaps the finest monument of Arcadia is the ruined temple of the Epicurean Apollo, on mount Cotyla, near the ancient Phigalia, now Paolizza; it was erected after the famous plague, to Apollo the saviour, under the direction of Jotunus, the Parthenian architect. With the exception of two only, the thirty columns of the Dorian order, which adorned the portico of the building, were still standing in 1812, and some fragments of bas relief, found amongst the rubbish, are now in the British Museum. But the most valuable remains found here are twenty-three marble tablets, with figures in bas relief, representing the two combats of the Centaurs and Lapithæ, and the Amazons and Greeks.

Caritene is the chief town of a well-peopled district, containing 230 villages, and watered by the river Alpheus and its tributary streams. In this country, under a more liberal government, tobacco, grain, vegetables, fruits, silks, and vines, might be cultivated so as to produce an extensive commerce. Neglected as agriculture is, it yet exports wool and cheese.

All the north of Arcadia is comprised in the canton of Calavista, interesting for its picturesque views and its remains of antiquity. Besides the productions common to the before mentioned districts, it has an abundance of Corinthian grapes, and gum adraganth. In the mountains there are some considerable monasteries. Calavista, the chief town, is of little importance: it is situated in an elevated valley, watered by the Cerynitus, the inundations of which render the ground marshy, and the air unhealthy; while the neighbourhood of the mountains experiences violent winds and severe cold. The town, in latter times containing 2500 Greeks and 300 Turks, dates its foundation only from the middle ages, though there is on a mountain near the city an ancient ruined fortress: this post has long ceased to protect the country, and a range of mountains, some leagues from Calavista, bears the dreadful name of the defile of the massacre, on account of the numerous murders committed there. The icy summit of mount Olenos overlooks this wild country.

The monastery of Mega Spelion, situated three or four leagues to the north of Calavista, is one of the largest in Greece; in the road to it is the village of Kerpeni, which, enjoying a finer climate than that of Calavista, draws away its inhabitants. On an isolated rock, at some distance from this village, are some ruins, called in the country Old Calavista: they are probably those of the ancient Cynetha, whose inhabitants had the reputation of being thieves and highwaymen; a character which has been bequeathed to the neighbouring village of Suthera. The monastery of Mega Spelion is half buried in a high rock, and shows on the outside scarcely any thing but its front; the entrance, which runs through a dark arch, is shut by an iron portcullis, having on the two sides a great number of loop holes. The monks are defended almost entirely by nature from the attacks of their enemies. The Arnautes, not being able to get possession of the monastery, once climbed the rock which rises perpendicularly behind the cavern, and rolled down masses of stone; these, however,

fell over the cavern and did no harm to those within. The monks allow no one to enter of whom they have any suspicion: when Mr. Dodwell visited the monastery they were ranged on each side of the entrance; and he afterwards learned that they concealed poniards under their ample robes. There are in Bœotia monasteries to which the only way of admission is by a basket, drawn up with a pulley. By such precautions as these weak men lead peaceful lives in the midst of barbarous countries. This convent is supposed to be very rich, and has large farms and vineyards of Corinthian grapes; the monks, however, exercise hospitality to those who come here to worship a rough image of the Virgin, preserved in their chapel, and which they pretend is the work of St. Luke. The small chapel is ornamented with Mosaic work, gilding, images of saints, and lamps of silver and ex-voto; it receives but a feeble light from without, and the kitchen receives none, being a subterraneous cave. The library of the convent has been twice burned, and now contains only homilies and legends. Their cellar contains perhaps the largest tuns that monks ever possessed, excepting indeed the German monks, and these are filled with excellent wine, the produce of their own vineyards. The lay brethren direct the domestic affairs. Notwithstanding their good wine, the monks feel the dampness of the cave, and are afflicted with rheumatism. Their usual walk is to the burying-ground, situated on an eminence, surrounding a chapel and shaded with cypress.

The convent of Taxiarchi is near the last mentioned, and in the neighbourhood is the cascade of the Styx, not far from the village of Vounari. It is a rivulet formed by two springs, which, rising at a short distance from each other, unite and fall into an abyss, where they disappear with the waters of another river, which issues from a grotto. But not far from here, in the plain, is a clear rivulet, which is most probably fed by the subterraneous reservoir that has engulfed the two springs.

Some ruins, found in a plain watered by the Erymanthus, are supposed to be the remains of the ancient Psophis; and on a neighbouring height are the ruins of an acropolis, which might belong to the city of Phegea, whence the inhabitants went to build Psophis in the plain. No traces remain of the canal which they dug to prevent inundations, but there are still some of the ancient Raos, and of another town near the village of Scoupi.

Elis, the theatre of the Olympic games, next engages our attention, but the revolution of time has spared but few traces of the ancient splendor of its towns. Elis forms a maritime province of twenty leagues in extent, watered by the rivers Peneus, Alpheus, and Meda, and divided by mount Pholoë and other mountains from Arcadia. The Alpheus has lost even its poetical name, and is now called the Roupbia; Olympia and Elis are uninhabited, and the modern towns of Gastouni, Pyrgos, and Lala, contain all the civilisation of the province. The Schypetars, laborious agriculturists, have established themselves on the ruins of the magnificent

cities of antiquity, for which they care no more than the Turks. The cape Fornese, which is the most prominent part of Elis on the west, received its modern name from a castle now dilapidated. The city of Cyllena is now only a village, under the name of Andravida: some ruins round this place show that there has been a town, and the style of the churches proves that it existed in the middle ages. The Penea of Elis now falls into the sea, near cape Fornese, under the name of the Gastouni River. The town of Gastouni might have remained as a monument of what the Turks could have effected every where if they would; but already since the revolution it presents the melancholy aspect of a declining city: at the time of M. Pongueville's visit, it contained from 1200 to 1500 inhabitants, with a ghastly complexion, living in houses built solely of mud.

Following the course of the Peneus we meet with the ruins of Elis, which the shepherds call the Palæopole, or ancient city; the site of the citadel may be recognised, and other remains would, by investigation, most probably be found. The ruins of this city cover the space of half a league; those of Pylos are less considerable. Near the cape anciently called Pheia is a monastery bearing the name of the neighbouring village, Ranagia Scopthidia: the villagers are scarcely more industrious than the monks. In the town of Pyrgos, near the Alpheus, is found the greatest proportion of prosperity and industry: this town, regarded as the finest in the Morea, is the chief place of a small canton, inhabited by 1700 Greek families, who, having been less molested by the Turks than those of other parts of the Peloponnesus, are very successful in their agricultural affairs. Their town, seated on an eminence, is the see of a bishop; on the hill are some ancient sepulchral monuments. A few leagues from Pyrgos is the modern village of Miraka, in the neighbourhood of which a few ruins point out the site of Olympia, without showing its magnificence. From the nature of the antiquities which are frequently found, it seems probable that the demolition of Olympia was effected, not so much by the hands of barbarians, or by the slow operation of time, as by one of those earthquakes so frequent in the west of the Peloponnesus. Mr. Dodwell thought he had been fortunate enough to discover the ruins of the temple of Jupiter. He found the stumps of some columns of the Doric order and fluted, which, judging from their diameter, must have surpassed in height those of the Parthenon and the temple of Olympus at Athens. The famous hippodrome, or area for chariot racing, is still to be seen; but the present inhabitants instead of rejoicing, are employed in wresting their country from the hands of barbarous oppressors. The stade, or foot race-ground, is near the hippodrome, and is being gradually wasted by the waters of the Alpheus. The new monuments, built in this city by the emperor Adrian, have not better resisted the attacks of time than those of older date. Near this place are some other ruins, probably those of the ancient Pisa; the windings of a branch of the Alpheus whose waves are yellowish like those of the Tiber; mountains crowned with the fine verdure

of pines and oaks; meadows watered with clear rivulets, and shaded with myrtles and other odoriferous shrubs, or adorned with wild roses and other field flowers; compose a landscape worthy of surrounding a fine city.

The river Erymanthus descends from heights covered with snow, and, rolling its limpid waters through a fine valley, joins the Alpheus, with which it enters the sea. Unfortunately, clouds of musquitos drive the traveller from the enchanting borders of the two rivers issuing from Arcadia. In the village of Agolinitza the inhabitants, in hot weather, sleep in the open air, under little tents well closed, in order to be cool, without being incommoded by the musquitos.

The aspect of the village of Lala offers a sad contrast to the delightful country around it: it is an abode of Schypetar robbers, who are continually at war with the peaceable inhabitants, and amongst themselves: they have not, however, neglected to cultivate the land. Lala is one of the most salubrious spots in the Peloponnesus, which appears from the healthy, robust, and proud air of the Laliots. These rustics would let no Christian stranger approach their village: perhaps the fall of the Turkish power in the peninsula has a little abated their brutal arrogance. Their aga resides in a mean dwelling, and is always guarded by men completely armed. The Laliots never quit their arms, of which they bear a great number. Like most barbarous oriental nations they roast sheep entire, and tear them to pieces with their hands in order to eat them.

The ancient Triphylia in the south of Elis, and on the gulf of Cyperissa, now contains no remarkable place; nothing remains of the city of Pylos, unless the ruined acropolis, which is seen near the village of Petrye, may have belonged to it. The country of Lepreum is barren and produces only pines; and Agio Sederio, where there is a bad caravansera, is the only considerable village in this canton.

Messenia was situated to the west of Lacedæmon, on a vast gulf, now called the gulf of Coron. At the bottom of this gulf the Pamisus disembogues, after a short course, during which it waters one of the finest valleys in the Peloponnesus: oranges, olives, and pomegranates, grow in abundance: the sugar-cane and banana also succeed with a little cultivation. Many large plains are covered with a fine harvest, fertile pastures feed a number of cattle, and fishing supplies what more is wanting to the inhabitants. Nothing is wanting to the fine country watered by the Pamisus, but free inhabitants, in order to restore the image of happiness which it must have presented before the invasions of the Spartans. Notwithstanding so many ages of oppression it is still one of the best peopled countries of Greece: it has 350 villages, and more towns and sea-ports than the other provinces of the Peloponnesus. The waters of the Pamisus, formerly noted for their salubrious qualities, now exhale unwholesome effluvia; but the warm and fertile land through which they flow is well cultivated, and the plantations on their banks show the value of the soil. Passing by Nisi Calamata and Androussa, and going direct to

Mount Ithome, which M. de Chateaubriand poetically compares to an azure vase placed in the fields of Messenia, we arrive at an ancient enclosure of a citadel, which encircles the mountain like a crown: this enclosure is shut with stones five feet in length placed across: the foundations of the tower which flanked the citadel are still remaining, and likewise a door made of only three stones. In the enclosure is a fountain, as in the acropolis of Corinth. The town which this citadel protected was Messenia, of which there are few remains, and the small village of Marromati gathers its harvest on the site of this ancient capital. Mount Ithome is difficult of ascent, from its great ruggedness; the rocks are covered with mastichs and bushes, and even to the summit the purple flax, the red cressis, and the catananche lutea flourish. At the foot of Ithome are some ruins called the Destroyed Village: it is supposed that the city of Andania occupied this site. Echalia was situated in the neighbourhood.

The beautiful valley of Stenyclaros is still fertile in grain: it contains about thirty villages, the principal of which is Court Chaoux; they are all dependent on the grand seignor. The chief place is Androussa, on the right bank of the Pamisus: man languishes here, but the vegetation is most rich and the verdure almost constant. Grain, wine, tobacco, figs, olives, &c., abound; and the fine pasturage feeds numerous flocks, the wool of which is exported together with silks, cheeses, and goat-skins. The city is surrounded by olive plantations and tombs shaded by cypresses: it is the see of a bishop, and before 1821 was governed by a Turkish voivode. The canton of Calamata, on the other side of the Pamisus, is equally delightful, abounding in orchards and gardens filled with fruits of all sorts, and meadows and fields in excellent cultivation, where a vast quantity of honey is deposited. The town of Calamata, on the ancient Nedon, near the mouth of the Pamisus, consists of 300 houses, interspersed with gardens, resembling the dwellings of the Maniots; they are like towers, having strong walls pierced with loop-holes, on account of the pirates that formerly infested the neighbourhood. On a hill behind the town we perceive the ruins of a Venetian fortress. Lately the inhabitants were accustomed to choose their own magistrates, and collect their tribute, which they sent to the voivode, who commanded a little garrison of Janissaries. It is at once the principal commercial and manufacturing place in the country; great indolence, however, characterises the inhabitants, and it is the Maniots who labor for them. They weave stuffs something like programs, barracans, and handkerchiefs, which they sell in the archipelago. Their silk yields commonly for the manufacturing labor 120 per cent. upon the first cost. Silks, oil, tobacco, honey, and goat-skins are the chief exports of Calamata; they were formerly conveyed in French ships, but now Greek vessels are mostly used. Some antiquities near it, as well as its name, make it probable, that it stands on the site of the ancient Calame, which name a neighbouring village still bears. It has a bishopric and about ten villages dependent on it. In this neighbourhood also must

have stood the city of Pharos and the wood of Chærius. A narrow defile leads from Calamata to Misitra, about eight leagues from the Pamisus; in descending along the western side of the river towards Cape Gallo, formerly Acritas, there are some remains of ancient baths, built of brick covered with stucco, and a country house of the bey of Coron, defended by towers and encircled by a moat with a draw-bridge.

Coron is a port so situated on the gulf as to have all its houses on the sea shore; so that it is seen rising by steps on the declivity of a mountain crowned by the citadel, the ancient acropolis. This is closed by a gate in the form of an ogive, which appears to have been built in the times of the latter empire: the Venetians added some ornaments to it. One of the first houses seen is that belonging to the French consul, the terrace of which advances up to the sea. The 800 Turks who lately lived here, and the little security that vessels found in the port, banished almost all the maritime commerce. Coron is the chief place of more than seventy small villages and hamlets, dispersed amongst woods of olive trees, and the well-watered regions around; containing, however, hardly 4000 souls, it has been so reduced by the vexation of the Ottomans. To withdraw themselves from their despotism, many families have retired to the caves of the mountains, where their flocks and themselves find an asylum, that is seldom molested. Some of these tribes are complete masters of the passes over the mountains.

Near Cape Gallo is the little Island of Venetico, formerly Thigamussa; here is a sepulchral grotto, with some sarcophagi; it is now inhabited. A little to the right we perceive the islands of Cabrera, Verte, and Sapience, included by the ancients under the name of the Ænneses: the latter, having a good anchorage, is situated opposite to the continental port of Madon, from which it is separated by a strait. This port, on the site of the ancient Methone, was inhabited before 1821 only by Turks, who had banished the Greeks, and devoted themselves to commerce. They also cultivated the olive, which forms the true riches of Messenia; woods of these trees, which in some places would be taken for trees of great height, overshadow all the coasts of this province. A fort built on a tongue of land, or rather on a small island, united by a bridge commands the passage between Madon and the island of Sapience. The Turks made this place a market for negroes. Fifty little villages are dependent on this place, which is not more than two leagues distant from another Messenian port, called Navarin. This place has all the appearance of an oriental town; orange trees shade and refresh the courts of the houses, palm trees elevate themselves among the habitations, groves of these trees, as also of olives and planes, and vines suspended on the large trees adorn the plain; and, to complete the resemblance, the scarcity of water and great heats dry up the verdure at the commencement of spring, and give the soil the appearance of the scorched lands of Africa or Persia. The character of the people is also oriental; by their phlegm, their indolence, their carelessness at the

arrival of a stranger, they might be taken for Turks. There is a fountain in the town, probably of antique construction and very solid; and another furnished with a reservoir springs up at the entrance of the town, which besides these has no other water than what is brought by means of an ancient aqueduct extending to a considerable distance, but of which only 100 arches are entire. From these circumstances, and the description of Thucydides, it would seem that this was the site of the ancient Pylos. The town does not contain above 600 Turks, and a Greek suburb of 130 souls; the whole canton, comprising thirty-six villages, cannot number more than 1600 individuals. The bad character of the Turks has discouraged Europeans from building in this district, or engaging in the commerce of tobacco, olive oil, and vermilion. Proceeding across olive plantations by an ancient way, adorned at intervals with fountains, we reach an ancient bridge crossing the Cyparissa, and afterwards pass a cistern where the women are to be seen drawing water in red jugs, of an elegant form and painted after the Etruscan manner. Philathrea, near this cistern, is a little town or village, irregularly built in the midst of a country abounding in fruit trees. The traveller is struck with the singular construction of a church, and the dress of the women is rather remarkable. Red and yellow are the predominating colors, by which it appears probable, that the women have derived their attachment to these two colors from old time, since they recall to our recollection the flammeum of the ancients. They have chemises with large ruffles of these colors intermixed, great veils bordered with red and yellow fringes, and girdles of the same tints.

Following the coast we arrive at the canton of Arcadia, the most southern part of Messenia, and the nearest to Elis; we may say, also, the most populous. It contains more than 100 villages, and the richest productions; its revenue amounts to more than 5,500,000 piastres a year. It produces a great quantity of grain, fruits, dye-stuffs, tobacco, flax, and silk; and exports besides these wood for building, cattle and poultry, goat-skins, wool, cheeses, and its vintage is valued at more than 100,000 small barrels. Its population amounts to about 15,000 souls. In the mountains there is a race of people regarded as truly indigenous, the natives of Soulina; these have never known the Turkish yoke. Arcadia, a town built on the site of the ancient Cyparissa, was, on the contrary, altogether occupied by the Turks. An acropolis overlooks the town, the position of which on the road from Messenia to Elis is of some importance. Thick forests as that of Coela, and defiles, affording a retreat for bands of robbers, have to the present time rendered travelling very dangerous in this district.

Crossing the barren summits of Tâgetus, and the course of the river Eurotas, running at the foot of the chain now called Basili-Potamos, the Royal River, we arrive at Laconia, the country of the ancient Spartans. It is almost environed by mountains; but its coasts are very favorable for commerce and communication with other countries. The Eurotas, after traversing the

interior of the country from north to south, empties itself into the gulf of Kolochina, along which the continent extends on both sides, terminating at the capes Matapan and Malée. The mountains follow the same direction, and branch out towards the same extremities; so that, with the exception of the north, the sea either washes every side of Laconia, or is at a short distance from it. The present inhabitants know better how to appreciate the advantages of their coast, than the ancient Lacedemonians did: on the east they have first the commercial port of Monembasia, the principal place of a mountainous district, in which the inhabitants chiefly subsist by agriculture and their flocks. The name is a corruption of embasia, that is, in the plain; the Italians called it Napoli di Malvisia, of which the French made Malvoisie, and the English, Malmsey. It stands upon an island, and has an archbishop, on whom six suffragan dioceses are dependent; he does not assume, as was customary in the times of the latter empire, the title of panagiosini, or all holiness. On the bay there are some ruins, consisting of walls in blocks of granite, of cyclopean construction, and consequently very ancient, some fragments of vaults, excavations, &c. A citadel probably occupied this place; it is thought, it was that of Epidaurus-Limera, and that the neighbourhood was what the ancients called Minoa. The native inhabitants call these ruins Palæo-Embasia, that is the old Embasia. Other ruins are scattered near the shore, and in the caverns and ancient quarries, by which the rocks are excavated; some families of shepherds have fixed their residence among them, to shelter themselves from pirates and robbers. Some of these subterraneous abodes are very difficult of access; others have their entrance half open, and a little door leads to the interior, whither the flocks retire with the shepherds during the night, and in times of danger. Sometimes enormous dogs are the guardians of these troglodytes, whom you may see in the morning in their cotton coats, bound by a leathern girdle, as shepherds are represented on ancient monuments, conducting their flocks over the mountains. Those who live in the lofty regions, where the air is inclement, muffle themselves up, as the Walack shepherds of Mount Pindus do. Some of the shepherds on the coast often change their abode, establishing themselves in the first cavern they meet with, and having often no other water than what drips through the rock. The canton of Monembasia is said to contain fifty-four boroughs and villages; it extends to the south as far as Cape Malée, but there is no remarkable place in it; hills covered with evergreen oaks, and wild olives, follow the direction of the coast.

Adjoining the above district is that of Mistra, the ancient Sparta. It is the valley of Eurotas, bordered by two chains of mountains and capable of the finest cultivation, while the mountains afford food for numerous flocks. Silk is here an article of considerable export, especially to France. The olives on the banks of the Eurotas yield 20,000 barrels of oil in a year; grain is produced equal to the consumption of the country, as well as a great quantity of honey

and wax, vermilion and gall-nuts. It consists of more than 100 villages, with an archbishop and five suffragans. Mistra, or Maestra, is at present a town of about 7000 souls. The houses, built of wood, are of one story, and the streets are not paved. There is a church, an hospital, and even a synagogue. Some think it stands on the site of ancient Sparta, but others that this is to be found at Palæo-Chori, or old town, where there is nothing to be seen but a cottage surrounded by trees, with a few ruins. The archbishop bears, it is true, the title of archbishop of Lacedæmon, and this town has still its ephori, but it is very doubtful indeed if Sparta was situated here. It is most astonishing, that a republic which filled the world with its renown should have left no trace by which the precise seat of its government can be ascertained. The want of great cities almost gives to Laconia that rustic appearance which it had in the earliest times. A miserable village, Slavochori, is said to occupy the situation of the city of Amyclea, the temple of which was counted one of the most beautiful in the Peloponnesus. Some basso relievos, that are found suspended in the little church of the village, appear to have come from the ancient temple; they represent articles of a woman's toilet, such as jewels, paint boxes, combs, slippers, &c., supposed to be votive tablets presented by the women. The little district of Bardouria, on the left of the Eurotas, is inhabited by Ezerite Albanians from Macedonia, who have founded there a little republic or anarchy, as some other Schypetars have done in the district of Lala. It is the see of a bishop, and the inhabitants subsist by the cultivation of olive plantations, when they are not at war, or making predatory excursions. From this place as far as Cape Malée we may suppose ourselves in the ancient republic of Lacedæmon. Not long since, travellers ran the risk of being plundered if they ventured thither, and scarcely ever did a foreign vessel show itself on the inhospitable coast east of the gulf of Kolochina.

Disembarking on the western coast we enter the province of Måina or the Magne, the country of those celebrated Måiniotes who form a distinct nation in the midst of Greece, and, what is more, a mighty and formidable people. It consists of an assemblage of petty chiefs, who have their vassals, live intrenched in their strong forts, contend with the power that would oppress them, and make little wars among themselves, when they have no enemies without to fear; they are more-over barbarous, brave, daring, and even hospitable, when a stranger furnished with recommendations places himself in their hands, or purchases their protection and assistance. These chiefs or captains live in isolated towers in the midst of their lands, built in a very massive style, having only one low and narrow door, and no windows on the ground floor, which is in fact only a cellar; the only openings in the lower parts being loop-holes made for the defence of the building; the family live in the upper story as in an observatory, with only small windows furnished with iron bars. Sometimes, within the precincts of the walls, a court extends round this little fort. We abridge the description given of

one of these fastnesses by Mr. Morritt, who travelled through the country under the protection of the captains. 'The house of this captain,' says Mr. Morritt, 'consisted of two stone towers, very much like those on the borders of England and Scotland, with a range of offices and lodgings for the servants, stables and coach houses built on the sides of a court by a door in an arcade flanked with bastions. An armed man came to meet us, and spoke to our guide, who had conducted us from Myla. He went in again and told the chief, who ran to the door to receive us, accompanied by a numerous suit, all surprised at the appearance of the English strangers. We were received with great kindness, and led to a commodious room in the principal apartment of the tower, inhabited by the chief himself, the other being the residence of his niece, who bore the title of capitaneess. Zanetachi Koutouplari was a man of a respectable figure, about fifty-six years old; he had a wife and four daughters, two of them under age, occupying the floor below ours. The old chief had dined early, but, according to the rites of hospitality peculiar to this country, he sat down near us to partake our repast; his wife and daughters waiting on us with much etiquette for some time notwithstanding our remonstrances, and afterwards retiring, leaving an old servant to attend us. In the evening feather beds and mattresses were brought and spread on the floor; then sheets and pillows bordered and made of broad bands of muslin and silk of various colors, all the manufacture of the females. As the Greeks always lie in their under clothes, this sort of bed is not found inconvenient. The next day being Easter Sunday, we had an opportunity of witnessing and partaking in the general rejoicings that took place not only in the castle but in the villages round. In every house, at this season, a lamb is killed, and every one gives himself up to joy. We dined with our host and his family at half past eleven in the morning, and afterwards had a solemn audience with his niece Helen in her own apartments. She was, in fact, mistress of the castle and of the surrounding district, which she received in inheritance from her father. She was a young widow, still handsome, and with much grace and dignity in her manners; she was assisted only by her sister, and some females richly dressed. When we entered she was sitting alone; after inviting us to sit down, she made her sister take a seat near her, and ordered her suit to serve up coffee and refreshments. The women were all very beautiful, and this is commonly the case with the females of many of the Mainiote villages: their beauty is of a most delicate kind, that we should not expect from their manner of living: united with the fine physiognomy of the Italians and Sicilians, the Mainiotes join a smooth skin, a fine complexion, and clear chestnut colored hair, which would seem peculiar to colder climates. The men also are well proportioned, of a middle stature, and of a rather slender constitution, but muscular. The Capitaneess wore a robe of blue cachemere, brodered with gold, fastened by a girdle, and a corset of crimson velvet brodered in the same manner; over this vesture she had a Polonese robe of deep

green velvet, with large open sleeves, and loaded with a rich embroidery. Her head-dress consisted of a green velvet cap, covered with gold, and arranged in the form of a crown, to which was attached a white veil worked with gold, which passed over her bosom, then under her arms, and fell down her back. Her uncle was dressed in pantaloons of a bright blue color, a tight vest with open sleeves, brodered with white and gold, a red and gold girdle containing his pistols and poniard, garters of blue cloth brodered with gold, plates of silver protecting the joints of the thighs, and lastly a dolman of black velvet with sleeves bound with fur. When he went out, he threw over his shoulders a rich mantle of cloth blue outside and red within, with gold borders in the front and along the sleeves. His turban was green and gold, and his gray hair hung below this head dress.—The costume of the inferior classes resembles this, only the quality is different and they have no ornaments.

The Mainiotes are trained to arms from their childhood, especially shooting in which the women sometimes take part; the warlike spirit of the men communicates itself to the other sex, so that women have more than once been seen fighting with the same bravery, and displaying the same daring, and even the same cruelty, as their husbands and their brothers. They enjoy more liberty and kinder treatment than the Greek women of other provinces; they are not shut up as in other places, and this may be one reason of their fidelity, which the fear of the terrible vengeance with which the Mainiotes punish adultery may also tend to preserve. In default of male issue, the daughters inherit the patrimony and the seignories or captainships; in the villages they are devoted to rustic labor, and bear fatigue, without seeming to feel it. The Mainiotes profess the Greek religion, but make it consist merely in acts of devotion and superstition; they have a multitude of little churches, to which they do not fail to repair, after having committed acts of robbery and violence. The chapels in the mountains are all dedicated to St. Elias; and the rocks on the coast have many excavations, inhabited by hermits. They believe in charms and amulets, and adore a multitude of saints, but all this does not soften their natural barbarity. When attacked on land they take refuge in the mountains, with every pass of which they are acquainted, and from thence harass and destroy their enemy in detail. In the bays and creeks they have a great number of long boats, capable of containing from twelve to twenty men, with which they venture out into the open sea, when they have any hope of a booty. In these bays they watch for their prey like the wild beast in his den, and woe to the imprudent traveller who in unquiet times ventures into these countries without a sufficient protection. The bravery of independent mountaineers is generally mixed with frankness and honesty; but among the Mainiotes this does not seem to exist. According to M. Pongueville's description they are treacherous, cowardly, ferocious, greedy, and fanatical. We would hope, however, that this character does not apply to all the Mainiotes without distinction. It is true that for many ages the pirates of Magne

have been the scourge of Greece, and that the Algerine corsairs have not been worse : they carried away Turks to sell them to Christians, and Christians to sell them to Turks. Families who inhabit the neighbourhood of the Magne, or the Magne itself, find it very difficult to keep beautiful children : no one was sure even of his neighbour. La Guilletière relates the history of two Mainiote pirates who had often committed depredations together, but at last disputed as to the division of some booty. Animated with resentment Theodore carried away the wife of his old neighbour and associate Anapliottis, and took her to the vessel of a Maltese corsair, stationed in the road between Maina and Vitulo, in order to sell her. The Maltese, after having looked at the woman, refused to give him the price he asked, telling him that he had bought two hours before for half the sum a much more beautiful woman, and in order that the Mainiote might judge for himself he sent for her. What were the surprise and rage of Theodore when he saw his own wife, whom his neighbour Anapliottis had already sold : he was less anxious to recover his own wife than to sell his enemy's, and therefore yielded his prey at the price which the Maltese chose to give him. In the mean time Anapliottis, hearing that his wife had been taken to the corsair, came in an armed shallop : Theodore instead of cutting his throat joined with him in forcing the Maltese to restore their wives : the two rascals were then reconciled and continued their occupation together.

The Magne contains about ten captainships, not including the mountains of Cape Matapan, inhabited by a people hitherto unconquered, the Cacovouniotes. They are brigands by choice and by necessity ; in the bays, near which their cabins and hamlets are built, they watch till some shipwrecked vessel is driven by the tempests on their shores. Wo to the men that are cast on these barbarous coasts ! they are pillaged, and even massacred, without mercy, by these ferocious mountaineers, who rejoice in their misfortunes. They are, however, very strict in observing their fasts ; and believe, that they would be much more culpable in eating meat on a fast day, than in putting to death an unfortunate traveller ! At Marathonisi, a port on the gulf of Kolakyna, resides the bach-bagon of the Mainiotes ; this is the chief place in the Magne ; it is only a small town, divided into narrow streets, and built at the foot of a mountain near the sea. The market-place, which is in front of the church, is the only paved place ; the houses are built partly of wood and partly of brick, of one story in height. The captain resides on a height near the town ; and a few arms and straw mats form his whole furniture. There are some gardens, and the sides of the mountains are shaded with pines and chestnut trees ; but the Mainiotes are better soldiers than husbandmen : with the exception of fish, which their coasts supply in abundance, they draw all their provisions from the islands. The port of Marathonisi is large, but not one of the safest. Near the coast there are some antiquities of Roman construction, which the Greeks call *Paleopolis*. The ancient Gythium must have stood somewhere to the north of the

present city. A rivulet of salt-water issues from the rocks, which perhaps might have been the ancient fountain of Æsculapius. The ruins of some baths are still visible, and some fragments of marble have been sometimes dug out of the earth. Coutouphari, the residence of another captain, is a village built among mountains covered with oaks ; Platza and Scardamoula have also their captains ; that of Platza has his tower near the rocks of Pephnos, on which a town of that name formerly stood ; the thick walls of this tower, and the barrels of gunpowder ranged on the platform, put his residence into a respectable state of defence. In these captainships, the people are so little accustomed to see strangers, that they run from afar, when a European, under the protection of their chiefs, passes through their villages. Scardamoula, the capital of Androvistas, is only a little village, with three or four towers, inhabited by chiefs. On a rock near, which has been rent by an earthquake, are some vestiges of the ancient acropolis of the city of Cardamila, and the remains of some sepulchres cut in the rock below. At the village of Armyros, to which vessels retire during the winter, there is a plentiful spring, which turns several mills, and which, they say, swells as often as the wind is in the north, and subsides when it is in the opposite quarter ; they suppose that it has a communication with some cavern on the coast, where the waters are agitated by the wind. Vitulo, the ancient Ætilus, is built on the sea shore, on some rocks, bordering a deep and narrow bay, called Chiniova. It contains about 3000 or 4000 inhabitants, who are pirates ; they have a bishop, and a few papas. Below the modern houses are found some of the foundations of that ancient city mentioned by Homer, and of which Pausanias describes the monuments ; among others the temple of Serapis. Leuctra is only a mean village ; and at Cape Gros there are some ruins which indicate the situation of the ancient Cœnapolis.

The manners of the Mainiotes are very similar in all these districts ; they have the same warlike character, and manifest the same hospitality towards those who put themselves under their protection. We will add a few words on the customs practised by them at marriages and funerals. A Mainiote never sees a young woman in private before his marriage ; these people do not understand jesting upon matters of this kind. A chief told an English traveller, that a German musician, who had been in the country, took a fancy one day to make a declaration of love to one of their females, when she drew out a pistol and shot him dead on the spot. A young man, who was betrothed to a damsel, but too impatient to wait for the wedding day, to speak to her whom he loved, took the opportunity of her going out of her house, to attempt to converse a moment with her. The young woman was near a rock, and, conceiving herself dishonored by this attempted conversation before marriage, she preferred flying from her lover, and casting herself headlong from the precipice ; and the young man threw himself after her. The marriage is celebrated with discharges of musquetry, and great festivals ; dried fruits are thrown out of the

window to the passengers; and, after eight days, the married couple return to the church, and the young husband receives his wife's dowry. The bridegroom's dress consists of a garment, made of a brilliant colored stuff, with brodered seams, red drawers, with a tuft of silk, and very wide pantaloons. The women, like the men, wear no stockings; they cover themselves with a fringed veil, a silk cap, a robe without sleeves, and a scarlet tunic with very wide sleeves. On the death of a Mainiote, the corpse is exposed in the house with the face uncovered, the women utter lamentable cries, and accompany it, as well as the men, to its last home. As no fire is lighted in the house of the deceased, the relations and friends bring their food ready prepared, and eat it with the afflicted family; but, strict to their rules of subordination, the men never suffer the women to approach the table, till they are satisfied. Except in families of the first rank, the women hold a very low station among them, and are burdened with the most laborious avocations, both in the house and in the field. They have often, however, fought, as if they had been equals with the men, and not their slaves. Their common costume consists of a cotton petticoat, with a broad red or white border, an under waistcoat, and a little red cap, with a handkerchief rolled round it. The rich females adorn themselves with rings of gold and silver.

IV. The third and last grand division of Greece is the ARCHIPELAGO, consisting of a number of islands, included between the thirty-fifth and forty-first degree of north latitude, and the twentieth and twenty-sixth degree of east longitude; lying scattered over the sea between the two Greek peninsulas on the one side, and the coast of Natolia or Asia Minor on the other. On this part our present limits will not permit us to say much; nor is it very necessary since some of these islands have been already described under their respective articles, and others will occupy a place in the succeeding pages of this work. We can only, therefore, specify the principal islands, remarking their situation and their most striking peculiarities, referring our readers for a more detailed account to the articles above mentioned. There are about sixty of these islands, some of them very mountainous and rocky, others almost flat and covered with a good soil; some well peopled and rich through industry or the gifts of nature, others sterile and almost deserted. Fruitfulness, however, is the general characteristic of the Archipelago; and it appears like a vast garden intersected by canals, or a labyrinth of verdant islands scattered over an immense lake of a light bluish color. Some of them have been overwhelmed by volcanic fires; but vegetation, far from being annihilated, only makes its way with greater vigor through cinders and pumice stones. The heat, which would otherwise be insupportable, is tempered by delightful breezes, and the inhabitants of the Archipelago scarcely know what winter means; not one mountain penetrates so far into the higher regions as to become the depository of perpetual snow; a constant spring prevails, uninterrupted either by the excessive heats of summer, or by floods and hurricanes. Olive and

mulberry trees, vines, grain, fruits, and cotton, abound in every island, and little labor and care are necessary to obtain a harvest more than equal to the consumption. The sea also furnishes abundance of fish, and offers to the inhabitants of these islands most important advantages in regard to navigation. By crossing the Mediterranean they can reach the continents of Europe, Asia, and Africa, and would become factors to all the commercial states of these three parts of the world, if they did but unite with their natural vivacity of mind, and habitual seafaring life, a genius for extensive speculations; or if liberty had completed their civilisation and enabled them to enter into a community of views and enterprises with the maritime nations of Europe. Formerly every island had its king; the Greeks of the Peloponnesus and of Great Greece subdued the greater part of these islands; but, since the fall of the Greek empire, the Archipelago has always enjoyed some degree of liberty: the Venetians, the Genoese, and other European powers have made some conquests in it; and the Turks have taken possession of all the islands: but it would cost them too much to attend to the government of each individual island, and, despot as they are, they have been obliged to leave to some of them a kind of liberty and independence, which has eminently favored the development of the natural genius of the Greeks. There exists in the Archipelago so great a variety of temperature, of appearances, of soil, of manners, and of customs, that it would be very difficult to give a general view of them, and every island seems to need a particular description.

Nearest to the Peloponnesus is Hydra, presenting the pleasing spectacle of a vigorous population, creating riches for itself from a narrow and barren territory, and having a considerable degree of naval power and enterprise. It has several little islands surrounding it, among which is Spezzia, having, next to Hydra, the most powerful navy in the Archipelago. At the entrance of the Archipelago, south of the gulf of Colochina, is Cerigo, formerly Cythera, the famous island of Venus, having a rocky soil, and exposed to the rays of a burning sun. There are here some ancient remains, but in so dilapidated a state, that it is difficult to ascertain for what purpose they were designed. The little island of Cerigotto, about fifteen miles distant from Cerigo, to the south-east, is useful to it on account of the pastures it affords for its flocks; it has but one house, that of the keeper, whose family forms the whole population. Milo, anciently Melos, situated at a greater distance to the north-east, with its surrounding little islands, especially Antimilo, Policandro, or Pholyandros, and Sicanos or Sikino, bears the marks of volcanic fires, consisting of rocks of black lava, and a light and porous soil of the quality of pumice stone. It was formerly celebrated for its medicinal baths, which are now situated between the town of Milo and its port. Proceeding again to the south-east, we find Thera or Santorin, the Callisto, or fair island of the ancients; it has now, however, lost its character, and is become one of the least beautiful in the Archipelago. It is, as it were, on a volcanic

foundation, and is very subject to terrible convulsions; yet it is the best peopled island in the Archipelago. These convulsions and eruptions have at different times given birth to several new islands in the neighbourhood, as *Iliria* or *Kammeni*, *Micri Kammeni*, &c. At some distance to the north of *Milo* is *Thermia*, anciently *Cytlamos*, celebrated in antiquity for its fine pasturage. The splendor of its two cities is still attested by the fragments of white marble that are yet to be seen. It has two convents and sixteen churches. To the south of *Thermia* lie *Serpho* or *Seriphos*, and *Syphnos* or *Syphanto*, where *Perseus* is fabled to have turned the men into stones. The former has a dry soil, but it conceals mines of iron and loadstone, which have never been worked to this moment; the soil of the latter is more fertile, and it is rich in mines of gold, silver, iron, lead, and loadstone, as well as in a few quarries of marble. *Cimolis* or *Argentiere* is a barren and volcanic island, producing only a little barley, wine, oil, and cotton; provisions are very scarce. The most useful production is a kind of talc, proceeding from the decomposition of the red porphyry, used in scouring wool, and exported to every part of the Levant. *Paros* and *Antiparos* lie between *Siphanto* and *Naxos*; they are rich in quarries of beautiful statuary marble. The latter is rendered remarkable for its fine grotto. To the north-east of *Paros* is the little island of *Icaria*, now *Nicaria*, the poorest island in the Archipelago, though formerly very flourishing, and having a fine temple of *Diana*. *Naxie*, anciently *Naxos*, once the seat of the worship of *Bacchus*, is the queen of the *Cyclades*; it is celebrated for the production of enormous grapes, as large as damascenes. It abounds also in grain, fruits, olives, aromatic plants, and has game in great plenty: it is in every respect a beautiful country.

To the north of *Paros* is situated the island of *Delos*, famous in ancient times for the feasts of *Apollo*, frequented by all the Greeks. It has now become a wild desert, producing hardly any trees but mastichs, which grow among the ruins of ancient monuments. A narrow strait lies between *Delos* and *Rhenea*, which is much more fertile and of greater extent; but the inhabitants of *Mycone* use it only as a place of pasturage for their flocks. *Syra*, another of the *Cyclades*, is on the west of *Delos*; it answers pretty nearly to the description given of it by *Homer*, though its fertility does not equal what it enjoyed in those times. The inhabitants live in the same simple manner as formerly, and are still blessed with that longevity which *Homer* ascribes to them. There are but few ruins of the ancient city of *Syros*, and those but of little importance. To the north-west is situated the little island of *Gyaros*, now called *Joura*, whence, according to *Pliny*, the rats drove out the inhabitants, and which was a place of exile under the Roman emperors. To the east of *Naxie* lies the island of *Amorgo*, where formerly knowledge and industry flourished, and which furnished the Greek women with fine and brilliantly colored tissues for their dress, but all that once embellished it is destroyed, and its manufactures have left no traces behind

them. Nothing but the advantages of nature remain. Northward of *Thermia* is situated the little island of *Ceas*, now called *Zea*; it still enjoys a fine climate, and has excellent pasturage, but its monuments are fallen into ruins. Another of the *Cyclades* is *Tine*, or the ancient *Tenos*, lying north-east of *Syra*; it presents at first sight only barren rocks to the view of the traveller, but on the sides of the hills and in the plains the finest cultivation prevails, the soil being rendered very rich by the streams of two rivers which water it; but unfortunately this fertility is dearly purchased by the prevalence of diseases among the inhabitants, arising from the marshes around them. Opposite to *Tine*, to the south-east, is the island of *Mycone*, which is rocky and unfruitful, and very much in want of water; so that the inhabitants, not finding resources in the soil, devote themselves to seafaring pursuits. Not far from *Eubcea*, or *Negropont*, is situated the well watered and fertile island of *Andros*, containing about thirty villages, and carrying on a considerable export trade to the continent of Greece. Very far to the north, in the fortieth degree of latitude, we meet with the island of *Lemnos*, of which *Vulcan* was, in ancient times, the tutelary god: it still bears on its surface the marks of volcanic eruptions, though the site of the volcano, in which *Vulcan* was fabled to have worked, is now matter of dispute among the learned. At some leagues distance to the west are three capes, forming the extremities of so many peninsulas, and being part of *Macedonia*; the most easterly of these is the famous *Mount Athos*, or the *Holy Mountain*, called by the Greeks *Hagionoros*; the principal seat of Greek monachism. It is altogether peopled by monks and hermits, who devote themselves to mortifications and abstinence of the most severe description. This country is visited by devotees from all parts of Greece. The summit of *Mount Athos* is discerned from a great distance, though it is by no means one of the highest mountains in Greece, being only 4278 feet above the level of the sea. A great variety of plants grow on its surface and fill the interstices of the rocks, and little gardens full of olives, vines, and different sorts of fruit-trees, adorn the neighbourhood of the hermitages. *Sainte Laure* is the principal of these monasteries, containing, it is said, with its dependent convents or hermitages, not less than 600 monks. Proceeding again eastward we fall in with *Samotraki*, anciently *Samothrace*, a colony of the *Thracians*. It is a very fertile spot, abounding in fine forests and charming valleys, supplying grain more than sufficient for the consumption of the islanders, and pasturage for their goats, from the milk of which they make excellent cheeses. To the south of *Samotraki* is situated the island of *Imbra*, on which the sea has made great inroads; wheat is its principal production, and the chief article of exportation. Still farther to the south lies the famous island of *Metelin*, anciently *Lesbos*, where the *Turks* have more power than in any other place in the Archipelago, and consequently the ancient monuments, which are numerous, are crumbling to dust, the inhabitants disappear, and vegetation itself seems to fail. *Scio*, anciently *Chios*, lies still farther to

the south; it was, before the year 1822, well cultivated and fruitful, and its population industrious, lively, and contented, had, by their intercourse with other nations, gained an easiness of manners that rivalled the most polished nations; at that period it was devastated by the Turks, and the unfortunate inhabitants either cruelly slaughtered or dispersed. Its women are remarkable for their beauty, their natural gaiety, and the liberty which they enjoy, and which, according to the report of travellers, does not diminish from the virtue of their character. The monks were almost as powerful as the Turks, being lords over not fewer than thirty-two villages, nearly half the population of the island. To the west of Cape Nicolo is situated the little rocky island of Psyra, now Ipsara; the greater proportion of the population consists of mariners. Still smaller, and to the west, is the rocky and elevated island of Anti-Ipsara, serving as a shelter for the port of Ipsara. To the north-west of these is the island of Skiro, or Scyros, forming the extremity of the Cyclades, and containing only 300 Greek families, with scarcely a decent house within its limits. Its port, called Saint Georges, is dependent on the monastery of Saint Laure, on Mount Athos. Near the Ionian coast lies the island of Samos, once one of the richest and most brilliant in Greece, now covered with marshes, with only a few ruins to mark the situation of its ancient temples and palaces. The chain of mountains, which crosses it, is composed almost entirely of marble, and its natural resources are still so extensive, and so various, that the inhabitants would find abundant and profitable employment, if there existed among them any spirit of industry and enterprise. To the south-west of Samos is situated the little island of Patmos, the coasts of which are surrounded by rocks of black porphyry. On an elevated mountain is shown a grotto, where the banished apostle John is said to have written the Apocalypse; at the top is a monastery with about fifty monks.

A number of little islands are scattered about on the sea to the east of Patmos, bearing the names of Nacri, Lipso, Agathonisi, Fermaco, &c., and on the southern side are those of Capra, Caprone, Calane, and Lero. The charming island of Cos lies to the south-east, the native country of Hippocrates and Apelles. There is a number of ruins lying on the site of the ancient city of Cos, and the vast plane tree is still standing, which is said to have formerly covered forty shops with its shade. The island is yet subject to the Turks. Still farther to the south-east is the larger island of Rhodes, which has lost the importance it has at different periods assumed, but the inhabitants still retain their love for the sea. Two-thirds of its population are Turks, and there are about 1000 Jews. Its ancient cities have almost entirely disappeared, and but few remains of its ancient monuments are to be seen. Every thing in Rhodes used formerly to be gigantic, and its celebrated colossus, even without believing the fable of its legs reaching from one pier to the other of the harbour, must have been an astonishing monument, and well worthy of being

accounted one of the seven wonders of the world. In the neighbourhood are several small islands; particularly that of Castel Rosso, famous for its good port; and Symes celebrated for its sponge fishery. At an equal distance from Syria and Caramania is the large island of Cyprus, now called Cypre or Chypre, which after having been successively governed by the Phenicians, the Greeks, the Romans, and Venetians, fell into the hands of the Turks in 1572. The land is dry, and the climate unwholesome; the plague, the despotism of the Turks, the barbarity of pirates, every thing conspires to the ruin of the Cypriots, and, without some remarkable change occurs, they will soon be extirpated. The wine of Cyprus is still very fine, and the island produces excellent wheat, its bread is indeed the best in the east. South of the Archipelago lies the extensive island of Candia, anciently Crete, being nearly 200 miles long. Of all its formerly splendid cities only a few ruins are visible, its picturesque landscapes are now deserts, and the dominion of a foreign nation has extinguished the genius of the people, who are now so diminished in numbers as to be scarcely able to cultivate one-fourth part of the soil. Leprosy is here so common, that most of the inhabitants are infected with it, and many are obliged to separate themselves from the society of their friends. We shall mention but one more island, that of Tenedos, near the coast of the Troad, from which it received its celebrity, and, as long as Troy flourished, it shared its prosperity. It is now remarkable for its vineyards, and its situation is important as overlooking the entrance of the Dardanelles. It has but few trees, and little verdure. The Troad, a large country on the continent of Asia Minor, was in early times much connected with Greece. It is opposite to Tenedos, and contains many vestiges of its ancient splendor; but we must refer our readers for a full account of it to its appropriate article.

History.—Since the year A. C. 146, when Greece became a Roman province, under the name of Achaia, the history of this country has been more or less mixed and identified with that of its successive conquerors. Though the splendor of Constantinople, during the time of its prosperity, might have reflected some lustre upon Greece, yet it gained scarcely any thing under the miserable emperors, who filled the throne, of which they were not worthy, for a long time previous to its fall, and who were most of them hurled from it by the hand of violence. The Latins, the enemies of the Greek emperors, seized on the Morea, and laid it waste; the Sicilians and the Normans afterwards made themselves masters of part of the same peninsula; a marquis of Montserrat succeeded to the government of its ancient republics, and an obscure gentleman of French origin, Guy de la Roche, became duke of Athens, while the Messenians and Arcadians were condemned to become the serfs of a lord, who was not even acquainted with their language. The crusades, which commenced in the eleventh century, for a length of time affected Greece, particularly in some of its islands, on which several of the

leaders in those mad enterprises settled ; but it was not at all probable, that the semi-barbarous customs of the feudal system, which they brought with them, would confer any real benefit upon the people, or re-kindle the torch of science, which was nearly extinguished. The same remarks will hold good with regard to the knights templars, and the knights of St. John, who about the same time exercised an influence over some parts of this country ; the blind devotees themselves of a senseless and degrading superstition, they were not likely to improve the manners, or advance the real prosperity of those whom they governed ; and these falsely called Christian heroes of the middle ages only prepared the way for the more desolating and despotic sway of the Turks.

Under the barbarous yoke of the Mussulman power, Greece has continued with very short intermissions, until in modern times it has begun to assert its claims to independence, and to commence that struggle for liberty which, whatever may be its termination, entitles it to the sympathy of every real friend of man. Towards the end of the seventeenth century the Venetians invaded the country, took Athens, and extended their power over a great part of the continent and some of the islands ; but, republicans as they were, they treated in the most despotic manner the serfs of the Morea : still, as they wished to realise some advantage from their conquest, they encouraged the people to cultivate agriculture. It is to them that they owe the numerous plantations of olives, the remains of which are still found in the woods : some historians assure us, they contrived to manage this country so well, that they realised a revenue of 300,000 crowns ; they rebuilt several ancient fortresses, and were very anxious to keep a conquest which they judged necessary to secure their dominion in the Archipelago. But Venice experienced changes in her turn ; she lost one possession after another, and at last, at the beginning of the eighteenth century, the Morea was wrested from her after the loss of Candia.

Again the Turks became masters of the peninsula, made the inhabitants feel the weight of their iron sceptre, and imposed the karatch, or capitation tax, as a price at which they consented to spare the lives of the vanquished. The interference of Christian powers, however, especially of Russia in the year 1770, only tended to increase the miseries and aggravate the bondage of the unhappy Greeks. Peter the Great had, there is no doubt, laid the foundation of a plan for assisting them, and driving their oppressors out of Europe ; and the empress Catherine, following up the views of her great predecessor, sent a fleet of twenty sail of the line, towards the close of the year 1769, which took possession of several islands, attacked the Turkish fleet, and finally succeeded in destroying it. The call to the Greeks on this occasion to arm themselves, and shake off the yoke, was instantly obeyed, and an insurrection took place throughout the Morea, and in many of the islands of the Archipelago. The Russian fleet, however, was re-called, and the poor Greeks abandoned to their fate. The Albanians ravaged the country in conjunction with

the Turks, who carried off a great multitude of the inhabitants into slavery. It is confidently stated by Eton, in his Survey, that a deliberate proposal was made in the divan, to exterminate all the Christians in the Morea, innocent or guilty, of whatever sex or age, and that this blood-thirsty design was only stopped by the observation, that in case of a general massacre the Ottoman Porte would lose the benefit of the karatch or capitation tax, which they paid. The Albanians conducted themselves with so much cruelty, that at length the Turks were obliged to reduce them to a state of peace by force of arms. The brave Lambro, a native of Thebes, who had the courage to keep the sea against the power of the Turkish fleet, was proscribed, and compelled to wander from one country to another, as a miserable exile. Notwithstanding the diminution of the population, and the increased distress which prevailed in the Morea, the karatch was estimated in 1780 at 56,670 notes from three to eleven piastres each for the whole peninsula, with the exception of the Magne ; and this large sum did not exempt them from the payment of the tenths, the customs, the taxes on wine, as well as the dues attached to the ancient feudal lands. ‘ The rise of Ali Pacha,’ says Mr. Blaquiere, ‘ not long after the peace of Kaimardgi, rendered the situation of the Greeks more hopeless than ever ; the enterprising and ferocious spirit of this chief had enabled him to extinguish the last remains of Christian freedom in Epirus, and his vicinity to the Morea gave him the power at all times of pouring in any number of those barbarous hordes, to whom it had recently been given up : and, in order to render such an operation still more easy, all the approaches and passes were occupied by Albanians devoted to his interests.’

Notwithstanding the persecutions which followed the fruitless struggle of the Greeks, in 1770, the spirit of the people was not yet broken, nor their anxiety to shake off the insupportable yoke, under which they groaned, at all diminished. For a while, however, they applied themselves to trade, and to the acquisition of useful knowledge, judging this the best mode of ultimately securing the object of their wishes. The French revolution, which took place in 1789, was very favorable to their interests in this respect, by bringing them into relation with the more civilised western nations, and opening a wider field for their commercial speculations. No people ever manifested so much enthusiasm in the pursuit of knowledge as the Greeks have done for thirty years past, and a wonderful change has been the consequence. ‘ It is worthy of record,’ adds Mr. Blaquiere, ‘ that not more than half a century has elapsed since there was but one possessor of a map among the Fanariot Greeks, who from their residence in the capital, and admission to the highest political employments, might have been considered much more enlightened than the rest of their countrymen. Yet, before the recent explosion, there was scarcely an individual in this class, who had not experienced the benefit of a liberal education, while many were distinguished for their varied and extensive erudition ; even the young ladies

of the Fanar joined the study of Homer and Thucydides to that of modern languages and music. There have been numerous examples, both at Constantinople and in other places, of youths denying themselves the necessities of life, that they might be able to attend the schools.

In general the Turks did not oppose any impediments to this ardor, or to the progress of knowledge that was making such rapid advances; though individual instances of arbitrary conduct were sometimes too frequent. It is said, for instance, that the Turkish commandant of Dara, a village in the Morea, happening to pass the school, while pupils were taking their lessons, had the didascalos or master dragged out and bastinadoed, and it was then dangerous to complain. The most flourishing Greek academy, was that at Scio, attended by several hundreds of students, and furnished with books, chemical apparatus, and astronomical instruments. The colleges of Joannina, Athens, Bucharest, Aivali, and Cydonia, were also eminent; but they have been destroyed in the political struggle.

Close to the eastern shore of the Peloponnesus lie the islands or rather barren rocks of Hydra and Spezzia, and near Scio is situated that of Ipsara. Furnished by nature with commodious havens, these islands afforded a refuge to some Albanian families, who were driven out of their own country by tyranny and want, and who, settling on them, built villages, and applied themselves to fishing. By degrees a coasting trade was opened to them, and their commerce extended, till they were at length able to purchase the right of governing themselves, paying a tribute, and annually furnishing the Porte with a number of sailors. Thus, at liberty to purchase the dictates of their own active minds, they became some of the most hardy and skilful seamen of Europe, the number and size of their vessels increased, and they were soon the carriers of the productions of Russia and Asia to different ports in the Mediterranean. As they were much exposed on these voyages, especially to the attacks of the Barbary pirates, it was necessary to have their vessels armed, and the transition was easy to the formation of a fleet for warlike purposes. Their wealth increased, and these islanders soon had little to wish for; but they felt the political debasement of their countrymen, and in the recent struggle they have more than once boldly attacked and put to flight the Turkish squadrons.

At the time of the expedition of the French into Egypt, the Greeks, strongly excited by the events of the war, which was thus approaching them, waited for them as liberators, with the firm resolution of going to meet them and conquering their liberty; but again their hopes were disappointed, and the succours they expected from France were removed to a distance. The brave Rhigas, at once a poet and a warrior, and the author of the famous national air in imitation of the Marseillois, which is to this day the war song of the Greek troops, perished at Belgrade by the hands of the oppressors of his country; but his blood, and that of other less celebrated chiefs, have only served to inflame the nation instead of discouraging it. Having

waited in vain, in the midst of the great events, which in several respects have changed the whole face of Europe in this century, the Greeks, taking counsel only of their despair, and indignant at living always as Helots on the ruins of Sparta and of Athens, when nations but of yesterday were recovering their rights and recognising their social relations, rose against their despotic and cruel masters, perhaps with greater boldness than prudence.

The first decided movement in these later times took place in the year 1800, when the Servians, provoked by the cruelty of their oppressors the Turks, made a general insurrection, which was headed by their famous chief Czerni George, who had served as a sergent in the Austrian service, and afterwards became a bandit chief. He was possessed of much energy of character and bravery; but he was extremely despotic, and is said to have murdered his father, and caused one of his brothers to be hanged. Under him the Servians obtained several victories. He blockaded Belgrade; and, one of the gates being surrendered to him, he made his entry into the city and slaughtered all the Turks that were found in it. At this time the affairs of the Porte were in great disorder; it had but just terminated its war with France, and the efforts, by which it had been endeavouring to reduce Passavend Oglou, pacha of Widden, had failed and ended in disgrace. At home the Janissaries were ever dissatisfied, and Roumelia was in a state of disturbance. The divan, however, exerted themselves to quell the Servians, and they were aided by the Bosnians, in consequence of which many sanguinary combats took place. Relying, however, on the promises of the Russians, and receiving pecuniary succors from Ipsilanti, the hospodar of Walachia, the insurgents continued the contest, taking refuge in the heights when their enemies were too powerful for them, and, when these were obliged to retire into winter-quarters, issuing from their fastnesses and marking their progress through the surrounding country, by spreading devastation in every direction. In the mean time Russia openly declared against the Porte in 1807, and carried on the war until the year 1812, when the treaty of Bucharest was negotiated; and though some efforts were made to obtain a concession in favor of their Servian allies, yet one difficulty after another being stated by the Porte, a peace was at length concluded, as before, upon such terms as left the insurgents to their fate. The Turks in the summer of 1813 sent Chourshid Pacha with nearly 100,000 men, who over-ran the country, meeting with scarcely any resistance, and signalled his triumphs by treacherously executing many, and among the rest a number of persons who had returned to their homes, under a false promise of an amnesty. It was not long, however, before the Servians took up arms again, and obtained some advantages over their enemies, and the Porte, at length wearied out, sent a Greek bishop to conduct the negotiation. By the treaty then made, it was agreed, that Milosh, brother-in-law to Czerni George, a native, should be their prince, that the sum of £100,000 should be paid yearly to the Turks, whose garmi-

sons in the fortresses of the Danube were to be limited, and that the prince should maintain a few national forces, for the regulation of the internal policy; stipulations decidedly evincing the real weakness of the Porte.

The period that intervened between 1815 and 1820 was apparently tranquil: the Ottoman affairs seemed prosperous; the sultan, Mahmoud, by his vigorous measures, maintained peace with his neighbours, quelled the spirit of the mutinous Janissaries, suppressed several revolts in the eastern part of the empire, drove the Wechabites from Mecca, and gave more weight to the imperial firmans, than they had heretofore possessed. But, under this appearance of tranquillity, all those projects were forming which have produced the recent convulsions. The Greeks soon became more open in their plots against their oppressors, and entertained some considerable hopes from the probable arrangements of the congress at Vienna: but that congress closed without effecting any result favorable to the liberties of Greece. This, however, did not damp the ardor of its friends, nor induce them to abandon the plans they had projected. About this time was formed the celebrated association of the Heteria, the true object of which was the emancipation of Greece, though this design was concealed under the show of distributing books and extending the benefits of education. Almost all the Greeks in Europe, and men of great note, repaired to St. Petersburg where its headquarters were fixed, under pretence of commerce and other business, but really to obtain by means of court Capodistrias, their countryman, some immediate or early support from Russia; and, though he told them that at present nothing could be attempted openly in their behalf, he displayed much interest in their affairs, and generally dismissed them with a present from the emperor. In the mean time Czerni George, who was then residing at Kiow, and count Galati, a native of Corfu, who was a relation of the Russian secretary, having no hope of immediate aid from abroad, in the year 1817 resolved upon a plan to begin the revolution, relying on their own resources for success. The former was suddenly to make his appearance in Servia, and thus creating a diversion of the Turks to that quarter, to afford Galati, Colotroni, and other patriots an opportunity of making an effort in the south. He set out in disguise on this errand, and had reached his destination in safety, when he was treacherously assassinated by his relative and former friend Milosh, and his head sent to Constantinople. This event stopped, for the present, the progress of their scheme, and Galati retired to Bucharest, where he died soon afterwards, and the completion of his mission devolved upon other agents.

The degree of independence enjoyed by Servia, was a source of disquietude to the sultan and the divan, and they seemed determined, if possible, to violate it. The fortified posts on the Danube were repaired, and well stocked with provisions and ammunition; their garrisons, notwithstanding the treaty of 1815, were increased, and fresh troops called in from all sides, professing to relieve their comrades; but none return-

ed. An attempt was also made to put Milosh out of the way, but he was too wary to be taken in the snare; he sent deputies to Constantinople, and was taking measures for defending himself, when the attention of the Turks was called off from him by the insurrection, which broke out in the south.

It appears that the Heterists had not intended to commence their operations before 1825, leaving sufficient time for the arrangements they had to make; but the rupture between Ali Pacha and the Porte, and the civil war that ensued, rendered it expedient to proceed to the execution of their design much earlier. The Albanian tyrant had, until this period, kept the Greeks in awe; but, the moment an attack upon himself seemed inevitable, he called upon them to arm in his defence; the Porte did the same, and some of his best troops forsook him on this occasion; he found opponents also in the peasants of Mount Pindus; and the Souliotes, his old enemies, were brought to the continent to act against him. The Porte, however, did not fulfil its promises to those who lent it their assistance, and the Greeks, in the disappointments they experienced, forgot the despotic acts of their former tyrant. Ali learned all these circumstances with great pleasure, and availed himself of them. By means of his money and his intrigue he soon brought over the chiefs who had deserted him, and even gained the Souliotes to his party by surrendering to them their strong holds, with all the treasures and ammunition contained in them; so that Souliotes, mountaineers, and Klephtai were all soon engaged in harassing the Turks, and cutting off their communications. These again drew off the flower of their armed force from Livadia and the Peloponnesus, and left the field open in those quarters for the efforts of the friends of freedom. A subscription immediately commenced, and a commander-in-chief was appointed; the choice of the Heterists fell on Alexander Ipsilanti, the son of a former governor of Walachia, who retired and died at Kiow; he had been in the Russian service, and was at that time aid-de-camp to the emperor. Prince Cantacuzene, another Russian general, of Greek extraction, also volunteered, though of higher rank, to serve under the generalissimo; and Michael Suggo, hospodar of Moldavia, engaged to join them on their reaching Yassy. A conspiracy was organised in the capital, and it was thought that on the news of the revolt the Servians would unite with the Greeks.

Some of the chiefs of the Arnauts or Albanians had been treated with, that they might furnish a body of forces to act under Ipsilanti; but while the latter was making his arrangements, and about to give the signal, another individual appeared, influenced by private and interested motives, to raise the standard in Walachia. This was an adventurer named Theodore Vladimiresco, who had dislivered with the Boyards or nobles of his country, on account of some claims he pretended to have for money spent in the state service: but the divan would not judge the affair, till the new prince had arrived. He therefore entered the field against them, at the head of 300 well-armed men. The divan re-

solved to call upon the pacha of the Danube for assistance; but the entrance of these troops was opposed by the Russian consul; and the Boyards upon this formed a body of Arnaut horse, Servians, Walachians and others, under the conduct of the aga, Nicolas Vacarisco. He had scarcely, however, proceeded a day's journey, when it was intimated to him by the troops, that he need not go farther, as it would be both useless and dangerous. Meetings of the divan were held daily, and more urgent representations made of the necessity of calling in the Turks, as Vladimiresco was rapidly approaching. In this situation of affairs, some news from the north gave the finishing stroke to the weak government of the divan. Vladimiresco was not connected with the Heterists; his only object was to enforce his private claims, and immediately on his arrival he put forth a declaration, which soon brought Ipsilanti to Yassy at the head of 200 men. Surprised at this sudden appearance, the Moldavians were about to resist, but their minds were quieted by prince Suzzo, who publicly testified his participation of Ipsilanti's measures, and withdrew his allegiance from the Porte. On the 7th of March 1821 prince Alexander addressed a spirited proclamation to his countrymen, calling upon them to shake off the Turkish yoke, to follow the standard of the cross, and in conjunction with him to attempt the liberation of Greece. The Heterists wore a uniform entirely black, in token of mourning for their country, and a phoenix rising from its ashes was described on their banners, as a symbol of that regeneration they hoped to achieve.

Tidings of these things soon reached Bucharest, and excited great consternation; the hopes of the divan appeared to rest on Brancovano, the Boyard, who possessed most influence in the country; but in the midst of this anxiety he departed one morning early with his family and effects for Transylvania. The Russian and Austrian consuls also left the town, and to increase the confusion and distress, Vladimiresco's troops fell upon the fugitives, and plundered and ill-treated them without distinction; the women even, some of them of high rank and beauty, were insulted. That chief himself took possession of the city, and gave a loose to his disorderly forces to commit various excesses; he seemed, indeed, bent on making war on his own account, and nothing but the influence of Douka, his lieutenant, who had entered into Ipsilanti's views, made him agree to the proposal of acting in conjunction against the common enemy. This was not the only mortification that the prince experienced; he had expected the co-operation of Russia, and the reception he had met with in Moldavia in a great measure was to be attributed to the expectations of this succour; and while the Russian ambassador was daily insulted in the capital, the emperor published a manifesto, treating the Greek leader as a rebel and incendiary. This turned the whole tide of public opinion, and reduced the patriots to a state of mingled despair and rage. Prince Suzzo ceased to have any influence in Moldavia, and was obliged to leave the province: the plot laid in the capital was discovered and frustrated; the Servians made

no effort, but a Greek emissary, who was sent among them, was discovered and hung by the Turks. The state of his own army too was most discouraging to Ipsilanti; he wished to bring it into a state of discipline, and to arm it in the European manner; but the envy and intrigues of his lieutenants defeated his intentions, and the soldiers were completely unmanageable. There was only one corps on which he could place any reliance, a body of Greeks, who had been brought up in Europe, consisting mostly of students and merchants' clerks, on whom, on account of their patriotism, he conferred the title of the Sacred Band, and who justly merited the distinction. In the beginning of April the Turks took the field, and, after a few skirmishes, captured Galatz, the Greek garrison of which place, after making a brave but ineffectual resistance, were partly cut to pieces, and partly obliged to seek refuge in flight. The Turks carrying fire and sword wherever they came, and sparing neither age nor sex, entered Bucharest on the 10th, without meeting with any resistance. Women and children were indiscriminately butchered in this neighbourhood. In one monastery alone 300 women and children were put to death; and the Turkish soldiers are said by M. Blacquiere to have hung numbers of the latter by the feet on trees, along the public roads.

Vladimiresco, whose motives were altogether selfish, and who was envious of Ipsilanti's having the chief command, was tampered with by the Turks, and promised the dignity of hospodar, if he would give up his associates; he therefore refused to assist the prince, who wished to risk a battle in defence of Bucharest. The city was consequently abandoned, and a retreat to Tergousto commenced: here, having arrested the traitor, the prince had him tried, and on his being condemned he was immediately executed, and his troops united to those who served under Ipsilanti. This, however, did not put a stop to the disaffection and treason that prevailed among the officers. On the 17th of June a battle took place between Ipsilanti's forces and a Turkish division that had advanced against him; for a long time the contest was obstinately maintained, but treachery was at work; the infamous Karavia fled with his Arnaut cavalry, and in his way threw the corps of Nicolas Ipsilanti, the prince's brother, into such disorder, that not all his efforts could rally his men. The troops were upon this seized with a panic, and, notwithstanding all that Alexander could do, re-crossed the Oltau, and abandoned the sacred band to the enemy. These, imbued with the spirit of their ancestors at Thermopylae, preferred a glorious death to flight or dishonor, and thus nearly 400 Greek youths perished amidst slaughtered heaps of their enemies, who fell around them. The hopeless Ipsilanti now proceeded to Trieste to join his brother in the Morea; but the Austrian cabinet arrested him, and shut him up in the castle of Mongatz in Hungary. After this the provinces submitted; but two chiefs, of whom the brave Giorgaki was one, betook themselves to a convent on the Pruth, where they made a desperate resistance. One of them died on his way to Constantinople, the other was beheaded. The

neric Anastasius, with his small body of 500 men, continued to keep his position near the river for three days, until half his soldiers were cut off; he then, with his brave companions, plunged into the river, and was received by the Russians on the other side. Not fewer than 4000 Turks perished on this occasion.

The news of the revolt in Moldavia produced in Constantinople the usual measures. All who were in any degree related to, or connected with, the revolvers were immediately massacred; and it has been confidently said, that the divan resolved on the complete destruction of the Greek people; orders were sent to the provinces to disarm all of them, and the consequence was, that massacres took place at Salonica, Adrianople, Smyrna, Aivali, Rhodes, Cyprus, Candia, and in every place where any plunder was to be obtained.

Before this revolt the secret of the Heterists had been confided to a few ecclesiastics, some of the primates, or municipal magistrates, and a select number of the kleptai in the Morea. A set of emissaries had arisen, called apostles by their employers, who went every where, spreading reports, that the sultan had determined to transport all the Greeks into Asia; that prince Alexander, aided by Russia, was marching with a large force to Constantinople, &c., the people greedily receiving their information, and engaging at once in the enterprise. The inhabitants of Sedena, a large village in the north of Arcadia, first took the field. The Turks, however, had taken the alarm and proceeded to Tripolitza to invite the Greek bishops and primates to a conference, detaining in confinement those who were so incautious as to venture into their power. A few were thus ensnared; but the attempt to make the people deliver up their arms was less successful; the governor of Patras, meeting with a decided refusal from the Christian inhabitants of that place, fired upon the town from the castle, and easily took possession of it; but the next day Germanos, the archbishop, made a descent from the mountains with nearly 4000 peasants, and obliged him to take refuge again in the citadel. A rising immediately took place through every part of the peninsula, while the standard of independence was unfurled by the people of Hydra, Spezzia, and Ipsara, who with their numerous vessels began to cruise against the Turkish traders with the utmost celerity. Many richly laden vessels were taken by them at first; but, when the news of the revolt was spread, no merchantman would venture out into the Mediterranean. Samos and other islands declared themselves free, and Lesbos, Rhodes, and Scio were kept in awe only by the Ottoman garrisons. In Cyprus the introduction of 10,000 Syrians prevented the rising of the people, and 10,000 Christians perished here without any attempt to revolt.

The Turks, astonished and affrighted, now betook themselves to their fortified places. The agas of Calavrita and Calanata were compelled to surrender; in Elis, the Mussulmans at Gastouni and Lala had sharp contests with the Greeks; those in the latter place gave them much trouble, and nothing but the appearance

of count Metaxa, with a few pieces of cannon, could overcome them, and one of the best contested battles of the whole war took place on this spot. The Laliots were forced to retire from their town, which they set on fire, with the loss of 300 men. Skirmishes occurred continually, and, both by the one party and the other, a number of towns and villages were burned, and of those that remain the greater part have been much injured four or five different times. The citadel of Patras at this time had nearly been taken by the Greeks, but was relieved by Yusuff, pacha of Negropont, who afterwards also raised the siege of Lala.

About this time appeared, to aid the cause of the Christians, that hardy mountain race the Mainiotes. The whole peninsula by the middle of May, with the exception of a few fortresses, was in the hands of the Greeks, and a new government was established consisting of archons and bishops. In the mean time the seraskier Chourshid Pacha, who was blockading Ali Pacha in the citadel of Joannina, and cutting off his communication with the Souliotes, dismissed what forces he could spare into Greece: 2000 Albanian cavalry, with his kiyah or lieutenant at their head, landed at Patras, raised the blockade of the acropolis, burnt Argos, and proceeded to Tripolitza, where he took the command, and began to make plundering excursions. In one of these excursions, Nicetas, or Nikitas, the bravest and most magnanimous of the Greek commanders, with only fifty soldiers, fell in with nearly 3000 Turks, and three pieces of cannon; he kept up such a spirited fire, that he repulsed the enemy with great loss. Ali Bey, the second in command, was killed by a musquet ball.

On the 6th of June the Greeks, commanded by Colocotroni, assisted by Anagnostoras and the bey of Maïna, were attacked by the kiyah. The infidels were so confident of victory, that they celebrated it beforehand by Albanian dances; but on the rocky and uneven ground on which they had to act, they were soon thrown into confusion, and the vigorous attack of the Mainiotes in flank, completed the rout; 200 of them, at least, were slain. After this the Turks did not take the field again, and the Greeks had only to watch the fortresses. Taking up their head quarters before Tripolitza, they laid siege to Modon, Coron, and Malvasia; Navarin was invested by 2000 Peloponnesians and a band of Ionians; and a body of Achaïans, with allies from Cephalonia and Zante, blockaded Patras. The Argolidan militia blocked up Napoli di Romania, and the Corinthians and Sicyonians besieged the Acrocorinthos. The vessels of Hydra and Spezzia cruised along the coast to prevent communication, and Bibolina, the heroine of Spezzia, took charge of blocking up Napoli, with seven armed ships, her own property, and fitted out at her expense.

The insurrection in the northern provinces continued to gain ground. In Acamania and Elis there were very few Turkish troops, and in Phocis, Attica, and Bœotia, the peasants assembled, but nothing very worthy of notice occurred. Omer Vrioni, a celebrated Albanian chief, marched to Athens with 700 horse; here a few Turks were

shut up, in great straits for provisions, and the Hydriots had landed a body of men with some ship-guns at the Piræus. Hearing, however, of Omer's approach, the Hydriots sailed away, and the Athenians took refuge in the mountains. In Macedonia the Greeks had, in the first instance, been rather successful, and had advanced as far as Salonica; but they pursued no settled plan. Being routed in a few skirmishes, they were seized with a panic, and fled to the treble peninsula of Cassandra, Torone, and Athos. The Greek inhabitants, too, of Mount Pelion, were excited to take up arms, but they were soon overpowered by the Turks.

At sea the Greeks were greatly superior, keeping the Turkish ports and islands of the Ægean in complete blockade. Two Turkish ships of the line, however, and some vessels of smaller size, left the Hellespont about the end of May, and proceeded to Lesbos. The Greek fleet met with one of them of seventy-four guns, which ran into the gulf of Adramiti; when the Greeks sent in two fire-ships, chained together, while the Mussulmans stood still on the deck, thinking they meant to board them, and mistaking some figures they had dressed up for men. In a few minutes the Turkish vessel was in flames; and though the captain cut his cables, and let her drive to the shore, the crew took to the sea to save themselves, but were opposed in their attempts to land; so that hardly one out of 300 escaped. The other part of the squadron now made for the Dardanelles with all possible haste.

Early in June Demetrius Ipsilanti reached the island of Hydra. He bore a commission from his brother, appointing him commander-in-chief of all the Greek forces, and was accompanied by Cantacuzene and others. He was received with every demonstration of joy. Proceeding to the Morea, he assumed, at Tripolitza, the command of the army. As soon, however, as the disastrous termination of the campaign in the north was divulged, the ardor of his troops cooled, and the ephors, or primates, were deaf to all his propositions. Candiotti soon left the Morea, suspected of having appropriated part of the subscription money he had received. Afendouli also, another partizan of Russia, went to Crete, and obtained the command of the independent forces; but he was soon considered as an impostor, and very nearly lost his life. Ipsilanti's wish was to organise a general and central government for all Greece; and to put the army into a state of discipline. In these plans he met with much opposition; the captains and ephors uniting to oppose him. The events, too, that attended the surrender of the two strong fortresses of Malvasia and Navarin in the month of August gave him still greater disgust. The garrisons of both these places were reduced to a state of starvation, being obliged to eat their slippers; and, in the case of the former, to feed on human flesh, eating their prisoners, and even their own children. The one surrendered to Cantacuzene, and the other to Tpaldo, the Cephalonian, on the faith of being transported in Greek vessels to the coast of Nafolia; while, however, these treaties were pending, the news arrived of the murder of the patriarch, and of the Greek clergy, at Adrianople.

and excited the troops to a pitch of fury; a considerable number of the garrisons were therefore sacrificed, and it was with great difficulty, that the generals interposed to save any of them. Ipsilanti, indignant at these disorders, published a proclamation, severely reprehending them; and resigning the command, retired to Leondari, until the alarmed primates and captains sent a deputation to his retreat, and prevailed on him to return.

All eyes were fixed on Tripolitza, which was now in a state of close blockade, and its fall daily expected. The usual population was about 15,000 souls; it is also computed, that the garrison, with all the Albanians of the Kiayah, amounted to 8000 men; there could not, therefore, have been fewer than 20,000 persons within the walls; yet they allowed themselves to be blockaded by 5000 undisciplined and ill-armed Greeks without artillery or cavalry. While the Turkish horse were in a state for service, the Greeks did not attempt any thing in the plain; but their forage soon failed, and the only food they could get was vine leaves. Provisions were become very scarce; and the Greeks had cut the pipes, and thus intercepted the supply of water. Ipsilanti, however, was impatient and felt anxious to begin a regular siege; but he had neither proper ordnance nor engineers. Some cannon and mortars had indeed been brought from Malvasia and Navarin, and were entrusted to the care of an Italian adventurer, but in the first essay he burst a mortar, and was dismissed. Things were in this state, when prince Mavracordato arrived, bringing with him some French and Italian officers. About the same time arrived Mr. Gordon of Cairness, who, sympathising with the condition of the Greeks, loaded a vessel with cannon, arms, and ammunition, and raised a few followers on whom he could rely. Ipsilanti now resumed his design of disciplining his troops; and Mr. Gordon, who had been an officer in the late wars, assisted in forming companies. In the beginning of October the Turks began to make propositions for a capitulation, and the treaty was proceeding, on the 5th, when an accidental circumstance rendered it of no avail, and hastened the catastrophe. Some Greek soldiers, having approached one of the gates, began to converse, and, as usual, to barter fruit with the sentinels. The Turks imprudently assisted them in mounting the wall, but no sooner had they gained the top than they threw down the infidels, opened the gate, and displayed the standard of the cross above it: immediately the Christians rushed from all quarters to the assault, and the disorder became general. The Turks immediately opened a brisk fire of cannon and small-shot; but the gates were carried; the walls scaled; and a desperate struggle was kept up in the streets and houses. Before the end of the day the contest was over, and the citadel, which held out till the next evening, surrendered at discretion. About 6000 Turks, it is said, perished, some thousands were made prisoners, and numbers fled to the mountains.

While these transactions were occurring at Tripolitza, four pachas proceeded in the month of August from the frontiers of Thessaly and

Macedonia to Zeitouni, with the design of forcing the straits of Thermopylæ, and in conjunction with the Ottoman troops, at Thebes and Athens, relieving the besieged fortresses in the Morea. Odysseus was stationed on a height above the defiles at a place called Fontana. They sent a body of 300 horse to reconnoitre his position, but this detachment was cut to pieces. The next day they attacked him with their whole force; at first the Greeks gave way, but a brave chief, named Gouraz, made a stand, and rallied the fugitives. They returned to the charge, and the infidels were routed with the loss of 1200 men. One of the pachas was slain, and vast quantities of baggage and ammunition taken. This was on the 31st of August, and was a victory of immense importance to the cause. About the same time the bishop of Carystus raised an insurrection in Eubœa, and endeavoured to intercept the communication between Athens and that island.

The grand Ottoman fleet left the Dardanelles on the 14th of August; it consisted of thirty sail; four of them of the line, and one three-decked vessel. After an unsuccessful attempt on Samos, the commander, Kara Ali, the capitana b-y, steered his course northward, the Greeks with 109 vessels pursuing him, but only attempting to separate his fleet, attacking it with fire ships. The Turks, however, took care to avoid these machines, and kept in a close body, always sailing. After this Kara Ali proceeded to Peloponnesus, exciting a general consternation. From Modon the capitana proceeded to Patras, where 3000 Achæians and Ionians blockaded the place on the land side, and several light vessels cut off the supplies by sea. The latter, on the appearance of the fleet, fled, and either took shelter at Galaxidi, or ran aground in the shallows of Messolonghi, where they were burned by the Turkish boats. Having arrived in the roads, Kara Ali discharged his artillery upon the camp of the Greeks, and the garrison made a sally at the same time; one post resisted, but the remainder of the besiegers fled to the mountains, leaving the few guns they had in the power of the Turks. This event led Ipsilanti to abandon Tripolitza, for the purpose of renewing the blockade and obviating the consequences of this defeat. On the 30th of September, at day break, having learned that the forces of the sultan had landed at Vostizza, he marched to meet them, and, approaching the coast, took his station on an eminence. On the 1st of October, at noon, the fleet steered to the north-east, and in the evening arrived off Galixidi, a commercial town on the bay of Cyrrha, near the entrance, and immediately summoned it to surrender. The Galaxidiotes answered the summons by firing on the boat that brought it. Immediately the attack commenced, and the place was battered for two hours, till night came on, and at day-break for two hours more, when a cloud of flame and black smoke announced but too plainly the issue. The inhabitants had fled to Salona in the mountains, after destroying their batteries and vessels. The wind changing to the east, the Turkish fleet now proceeded towards Patras.

Demetrius advanced, summoning the garrison of the aeropolis at Corinth on his way, and warning them by the fate of Tripolitza; having stopped a day or two at Argos, and visited Napoli, he reached Tripolitza on the 15th. The appearance of the town was most wretched; the Mainiotes had carried every thing off, and the prince was assailed on all sides by complaints about the unequal distribution of the booty.

An assembly was now called to meet at Argos for the purpose of organising a government, and the prince repaired thither to attend it; while deputies in the mean time arrived from different parts to demand succours from the administration of the peninsula, and to report what was doing in their districts. In Macedonia the monks of Mount Athos, provoked by the violent proceedings of the Turks, were driven into revolt. The pacha of Salonica had summoned them to receive a Turkish garrison, and, without waiting for a reply, seized a number of servants who cultivated their lands, and had them publicly executed. The monks, upon this, imprisoned the Turkish governor, and opened a communication with the forces at Potidea and Torone. The Turks sent expeditions twice against Cassandra, and were as often repulsed; in the latter attack the Christians sallied out and took nine pieces of heavy artillery. Being distressed for provisions they applied to the Peloponnesians for assistance; but, the new pacha of Salonica coming up with an overpowering force, Cassandra was taken by storm on the 12th of November, and its garrison put to the sword. Mount Athos capitulated soon after.

About the middle of October a deputation from Mount Olympus arrived at Tripolitza, bringing information that 7000 Macedonians were ready to rise there, and requesting cannon, gun-powder, and officers. Two mortars were sent to them, but they were no sooner landed, than the Turks seized them; the insurrection, however, took place, and has ever since continued. In the Peloponnesus nothing vigorous was effected except at Patras and Napoli. After the capitana bey had supplied the fortress on the coast, and added to his own fleet the squadron that had acted against Ali Pacha, he prepared to return to the Dardanelles. On this the siege of Patras was renewed; towards the end of the month it was carried by assault, and the garrison again retired into the citadel; but, on the 15th of November, Yussuff Pacha, who had retired into the castle of the Morea, came up with 400 horse and foot, unperceived by the Greeks, entered the gates, and commenced an attack. The garrison of the citadel sallied out at the same time, and the Christians were routed. Mavrocordato and Caradja with difficulty reached a boat, which conveyed them to Messolonghi; their cannon, baggage, and 1500 muskets were taken.

Ipsilanti wished at this time to hasten the siege of Napoli, and colonel Voutier, a French officer, had been making preparations, but they were greatly deficient in means for attacking so strong a place. A report was spread, that it was on the point of capitulating, and not less than

12,000 peasants were attracted to share its spoils. Scaling ladders were provided, and on the 15th of December at night, arrangements having been made, the attack was commenced, but the assailants were completely driven back. After this failure, prince Demetrius went to Argos, and held frequent meetings of deputies, until Mavrocordato arrived, when Ipsilanti's visitors immediately diminished, and a rivalry was evident between these leaders. Ipsilanti, therefore, despairing of carrying his plans into effect, directed his attention to the war, and soon after went to Corinth with Kiamel Bey, by whose influence it was hoped the surrender of that place would be hastened; while, in order to carry on the siege of Napoli without interruption, it was determined that the congress should be removed to Epidaurus.

The assemblage of a congress has been regarded as a new and important era in the Greek Revolution; the anxiety of the nation for the organising of a government was evident from the eagerness with which the people elected the deputies. By the middle of December not less than sixty had arrived, including ecclesiastics, land-owners, merchants, and civilians, most of whom had been liberally educated. They first named a commission to draw up a political code; the rest were occupied in examining the general state of the nation, and laying plans for the next campaign. On the 27th of January, 1822, the independence of the country was proclaimed, and its code published amidst the joyful acclamations of the deputies, the army, and the people. The government was for the present, styled 'provisional,' while the promulgation of the constitution was accompanied with an address, exhibiting the reasons for shaking off the Turkish yoke. Five members of the congress were nominated as an executive, and prince Mavrocordato was appointed president. Ministers were appointed for the different departments of war, finance, public instruction, the interior, and police; and a commission named of three individuals to superintend the naval affairs.

In the mean time the siege of Corinth was vigorously pushed; but so impregnable was this fortress, that every effort was made to induce the garrison, consisting of not more than 600 men, to surrender. For this purpose Kiamel Bey, who had fled from Corinth, leaving his family there, was brought from Tripolitza, in the hope that he might use his influence with the garrison. He, however, proved treacherous, and thwarted the design. A new turn was then given to the operations before Corinth by the arrival of Panowria, a popular chief of Salona, who persuaded the Albanian portion of the garrison to capitulate. On their leaving the place, the Turks declared themselves willing to surrender, and it was stipulated that they should lay down their arms, and be transported by the Greeks to the coast of Asia Minor; but, before the last of these conditions could be fulfilled, the peasants, who had suffered much from the oppressions of Kiamel Bey, burst into the place and wreaked their vengeance on many of them. The new government signalled their liberality by a decree for the abolition of slavery, as well as the sale of any Turkish prisoners, who

might fall into their hands, prohibiting it under the severest penalties; they also passed another edict for a compensation for military services, and a provision for the widows and orphans of those who should fall in battle; and a third regulating the internal administration of the provinces. The organisation of the army was also commenced; a corps called the first regiment of the line was formed and officered from the volunteers of different nations, and, as there were more of them than were requisite for this service, a second was formed of the remainder, which took the name of Philhellenes. Patras was blockaded again by 3000 men, and a smaller body under the French colonel Voutier was sent to Athens, to reduce the acropolis; the forces before Napoli were augmented, and Modon and Coron closely invested by the armed peasantry around.

An event, the most terrific and atrocious that history has ever recorded, marked the commencement of the second campaign: the destruction of Scio, and its miserable inhabitants. The Sciois had taken no part in the movement of 1821. In the beginning of May, in that year, a small squadron of Ipsariots appearing off the coast furnished the aga with a pretext for his oppressions, and he began by seizing forty of the elders and bishops; who were immured as hostages for the good conduct of the people.

'On the 23d of April,' says Mr. Blaquiere, 'a fleet of fifty sail, including five of the line, anchored in the bay, and immediately began to bombard the town, while several thousand troops were landed under the guns of the citadel, which also opened a heavy fire on the Greeks. It was in vain for the islanders to make any resistance: deserted by the Samians, most of whom embarked and sailed away when the Turkish fleet hove in sight, they were easily overpowered, and obliged to fly. From this moment, until the last direful act, Scio, lately so great an object of admiration to strangers, presented one continued scene of horror and dismay. Having massacred every soul, whether men, women, or children, whom they found in the town, the Turks first plundered and then set fire to it, and watched the flames until not a house was left, except those of the foreign consuls. Three days had, however, been suffered to pass, before the infidels ventured to penetrate into the interior of the island, and even then their excesses were confined to the low grounds. While some were occupied in plundering the villas of rich merchants, and others setting fire to the villages, the air was rent with the mingled groans of men, women, and children, who were falling under the swords and daggers of the infidels. The only exception made during the massacre was in favor of young women and boys, who were preserved to be afterwards sold as slaves. Many of the former, whose husbands had been butchered, were running to and fro frantic, with torn garments and dishevelled hair, pressing their trembling infants to their breasts, and seeking death as a relief from the still greater calamities that awaited them.

'Above 40,000 of both sexes had already either fallen victims to the sword, or been selected for sale in the bazaars, when it occurred to the pacha, that no time should be lost in persuad-

ing those who had fled to the more inaccessible parts of the island to lay down their arms and submit. It being impossible to effect this by force, they had recourse to a favorite expedient with Mussulmans; that of proclaiming an amnesty. In order that no doubt should be entertained of their sincerity, the foreign consuls, more particularly those of England, France, and Austria, were called upon to guarantee the promises of the Turks: they accordingly went forth, and invited the unfortunate peasantry to give up their arms and return. Notwithstanding their long experience of Turkish perfidy, the solemn pledge given by the consuls at length prevailed, and many thousands, who might have successfully resisted until succours arrived, were sacrificed: for no sooner did they descend from the heights, and give up their arms, than the infidels, totally unmindful of the proffered pardon, put them to death without mercy. The number of persons of every age and sex who became the victims of this perfidious act was estimated at 7000.

‘After having devoted ten days to the work of slaughter, it was natural to suppose that the monsters who directed this frightful tragedy would have been in some degree satiated by the blood of so many innocent victims; but it was when the excesses had begun to diminish, on the part of the soldiery, that fresh scenes of horror were exhibited on board the fleet, and in the citadel. In addition to the women and children embarked for the purpose of being conveyed to the markets of Constantinople and Smyrna, several hundreds of the natives were also seized, and, among these, all the gardeners of the island, who were supposed to know where the treasures of their employers had been concealed. There were no less than 500 of the persons thus collected hung on board the different ships; when these executions commenced, they served as a signal to the commandant of the citadel, who immediately followed the example, by suspending the whole of the hostages, to the number of seventy-six, on gibbets erected for the occasion. With respect to the numbers who were either killed or consigned to slavery, during the three weeks that followed the arrival of the capitan pacha, there is no exaggeration in placing the former at 25,000 souls. It has been ascertained that above 30,000 women and children were condemned to slavery, while the fate of those who escaped was scarcely less calamitous. Though many contrived to get off in open boats, or such other vessels as they could procure, thousands, who were unable to do so, wandered about the mountains, or concealed themselves in caves, without food or clothing for many days after the massacre had begun to subside on the plains. Among those who had availed themselves of the pretended amnesty, many families took refuge in the houses of the consuls, who were indeed bound by every tie of honor, and humanity, to afford them protection. It has, however, been asserted, upon authority which cannot well be doubted, that the wretched beings thus saved from Mussulman vengeance, were obliged to pay large ransoms before they could leave the island. Nay more, numbers of those who escaped the

massacre, affirm, that it was extremely difficult to obtain even temporary protection under the Christian flags, without first gratifying the avaricious demands of those who conceived this appalling event a legitimate object of mercantile speculation.’

At the commencement of the campaign Colocotroni with 300 men was despatched to Patras, where a part of the Turkish fleet had landed a great body of men in the latter end of February. On his approach the Turks went to meet him with almost all their force. Colocotroni, not considering himself strong enough for them, retreated to the mountains; but suddenly stopped, addressed his men, and wheeling about advanced towards the enemy. Upon this the Turks, struck with a panic, thinking he had received notice of a reinforcement, turned their backs and were pursued by the Greeks up to the walls of the town; 500 of them were slain in less than two hours, and Colocotroni blockaded the place. The Ottoman fleet was pursued by the Greeks under Miauli and Tombasi, and the admiral’s frigate nearly fell into the hands of the Greeks. Mareo Bozzaris and Rango gained many advantages in Epirus, and took Arta, the key of Albania; but, owing to the treachery of Tairabos, it was abandoned. Odysseus and his companions endeavoured to check the enemy in Livadia and Negropont; but the disaster of the Greeks at Cassandra so much strengthened them, that they advanced again and threw some reinforcements into Athens.

The fall of Ali Pacha had now so much increased the resources of Choursid, that he concerted measures, which would have been the destruction of the Greek cause, had they been skilfully executed. Mavrocordato, in order to frustrate them, laid a plan to undertake an expedition into Epirus, draw off the Turks from the Morea, relieve the Souliotes, and carry the war into the heart of Albania. He communicated his plan to the executive, and it was determined to place 5000 men at the disposal of the president, who was to lead the expedition in person. The only forces, however, which could be mustered, were the corps of the Philhellenes, and the first regiment of the line, neither of them complete, with 700 men commanded by general Nonnan and Kiriakouli, to relieve the Souliotes. He arrived at Patras on the 12th of June; but Colocotroni here opposed many difficulties to any of his troops being detached, and he was obliged to leave without the expected assistance. Accordingly he sailed to Messolonghi with only a few hundred men. A large force of the enemy was in the mean time collected at Larissa and Zetomi; Colocotroni suddenly left the blockade of Patras and proceeded with all his army to Tripolitza, leaving an opportunity for the Turkish garrison either to enter the Morea, or cross the Lepanto. Consternation prevailed in the Peloponnesus; Corinth was abandoned and re-occupied by the enemy, not without the suspicion of treachery.

The situation of Ipsilanti was at this time very critical, he had no money or provisions, and hardly 1300 men to oppose to 30,000; he therefore, in order to stop the enemy’s progress, threw

himself into the citadel of Argos, while Colocotroni took up the strong position of Lerno on the west of the gulf. The first body of the Turks, consisting of 7000 cavalry and 4000 foot, halted near Argos, and part of it proceeded to Napoli; soon after Marchout Pacha arrived with 10,000 more. The Pacha, however, entered Napoli, and continued several days inactive; when, threatened with the extremities of famine and drought, he gave orders for the return to Corinth, and his army set out in the greatest disorder. Colocotroni attacked and destroyed 5000 of them in a few hours; the advanced guard was attacked in the defiles by the Maimotes under Nikitas, and 1200 perished in the first onset. These successes happened between the 4th and 7th of August. On the 18th the Pacha attempted to draw the Greeks into an ambuscade, but they got into his rear and he was defeated with great loss; the next day, determining to regain the position they had lost, the Turks again attacked under Hadji Ali, who was slain in the engagement, and nearly 2000 of his men were lost, as well as a large quantity of baggage and several hundred horses. The Greeks, however, had no means of following up their successes.

Ipsilanti advanced to Napoli to assist in its reduction, while the troops left under the command of Coliopulo, not being supplied with rations or pay, became so weary of the service that the greater part withdrew, leaving Colocotroni's eldest son, with 200 or 300 men to continue the blockade of Corinth. Soon after this Colocotroni, at the passes near the isthmus, stopped the Turks who wished to bring succours to Napoli; and they being driven to the greatest extremity of famine, and the Palamida or citadel having been surprised, the garrison had no alternative left them but to surrender. The Greeks took possession of this important place on the 11th of January. The Turkish commanders, on the surrender of Napoli, determined to proceed to Patras, which the Greeks had lately neglected blockading. Setting out in the middle of January, they had reached Akrata near Vostitza, when a detachment from Messolonghi stopped one of the passes, and shortly after another body blocked up the other; so that the Turks were reduced to the greatest straits, feeding upon horses, the herbs on the rocks, their saddles, and at last one another. For nearly three weeks longer the place held out, when Odysseus arriving, and on one of the boys being acquainted with him, a negotiation was commenced, by which the garrison obtained permission to embark, and the boys were sent prisoners to Napoli. The number of the enemy that perished on this occasion without firing a shot amounted, it is said, to 2000. Thus ended the second campaign in the Morea, costing the Turks not fewer than 25,000 men in the Peloponnesus alone.

The operations in Epirus, though on a smaller scale, were little less interesting. Mavrocordato put his forces in motion, and first making a feint, as if he wished to reach Salona, returned on the village of Therasova and entered Messolonghi on the 17th of October, where greater difficulties than ever awaited him. Here he was besieged by the Turks, until the 4th

of November, when the blockading squadron was chased away by six vessels bearing the Greek flag; and on the 14th Mavromichalis arrived with the long expected succours; a sortie was then made. But it was of little avail, and the garrison was so much weakened, that Omer Vrioni determined to attack the place. Accordingly on the morning of Christmas-day, at five o'clock, 800 men approached the walls with scaling ladders unperceived, and had even fixed some, but they were instantly cut down; the conflict that followed was desperate and sanguinary, and the Turks were obliged to retire with the loss of 1200 men and nine pieces of colors. The rising now became general through the country, and the retreat of the enemy was intercepted in all quarters; so that of the whole force brought into the country, only three months before, not half escaped. Mavrocordato arrived in the Peloponnesus in the early part of April 1823, after an absence of ten months.

The national congress met at Astros, a small town in Argos, on the 10th of April, 1823, in a garden under the shade of orange trees; nearly 300 deputies were occupied in the debates, which began at sun-rise. The following oath was taken at the first meeting by each member:— 'I swear, in the name of God and my country, to act with a pure and unshaken patriotism, to promote a sincere union, and abjure every thought of personal interest in all the discussions which shall take place in this second national congress.' Having settled a number of important points, its labors ended on the 30th. The third meeting of the congress was deferred for two years; and the executive and legislative body was transferred to Tripolitza, where measures were immediately taken for opening the third campaign.

The enemy was not idle as the summer advanced; a fleet of seventeen frigates, and sixty smaller vessels, was sent with stores to supply the remaining fortresses in Negropont, Candia, and the Morea; and, after accomplishing this object, the capitan pacha arrived at Patras about the middle of June. Yusuff pacha led on a large body to Thermopylae, and Mustapha conducted another to the pass of Neopatra, near Zeitouni, the former especially laying waste the whole country, and committing all manner of excesses. Odysseus in the mean time arrived from Athens, and Nikitas from Tripolitza, and a sort of guerrilla warfare was commenced, which so harassed the Turks under Yusuff that they retreated in the greatest disorder. Mustapha was attacked, and forced to take refuge in Negropont at Carystos, where he was closely blockaded. Marco Botzaris, who commanded the Greeks at Crionero, fell on the Turks, and either killed or captured two-thirds of their number. The same brave leader undertook a forced march against Mustapha, who had 14,000 men, while he had only 2000. On assigning each man's part at midnight on the 19th, his last words were, 'If you lose sight of me during the combat, seek me in the pacha's tent.' On his arrival at the centre, he sounded his bugle, as agreed upon, and the enemy, panic-struck, fled in all directions. In the midst of the attack, which was

now general, he was twice wounded, and at last carried off from the field expiring; the struggle, however, was maintained till day-light, when the Greeks were victorious on all points, and the loss of the enemy was not less than 3000. One of the first acts of the capitan pacha, on his arrival with his fleet, had been to declare Messolonghi, and every other Greek port in a state of blockade. The entrance of a few Greek gun-boats, however, was sufficient to set the capitan pacha at defiance; having remained inactive for above three months, and lost nearly a third of his crews by epidemics, he at length made the best of his way to the Archipelago.

At the commencement of the year 1824 proclamation was issued by the president and senate of the United States of the Ionian Islands, declaring their neutrality, and their firm resolution not to take any part in the contest; also prohibiting any foreigner, who should do so, from residing in the Islands. Among the Greeks dissensions still prevailed, every faction following its own plans, and seeking to advance its own influence. Mavrocordato, Colocotroni, and Ipsilanti, headed different factions, among the members of which there was neither unanimity of counsel, nor uniformity in action.

The Turkish fleet sailed on the 23d of April. The Greek senate summoned Colocotroni to surrender himself, and to deliver up Napoli and Tripolitza, but he refused; the troops that were investing Patras quarrelled about the division of some of their booty, and were withdrawn; in the mean time the Turks sailed from Lepanto with fourteen ships, and blockaded Messolonghi. In order to encourage the Greeks a loan of £800,000 was contracted for in London. About this period Ipsarta was threatened by the Turkish fleet, which was now at Mitylene. The island of Caso was attacked on the 8th of June by an Egyptian squadron, and after an obstinate resistance was taken on the 9th; 400 died with arms in their hands, the rest took refuge in the mountains, leaving behind most of the women and children, who fell a prey to the Turks. On the 3d of July the capitan pacha again attacked Ipsara, having previously gained over the Schypetars, who garrisoned the principal forts. The first victims that fell by the swords of the invaders were the treacherous Schypetars.

The triumph of the Turks, however, was but short; the Ipsariots sent most of their wives and children to Syra. One of the forts was garrisoned by sixty men, and surrounded by mines. A Greek named Maroaki, finding himself unable to keep the place hoisted a flag, with the words, 'liberty or death,' and blew up the fort destroying 1200 Turks. The Ipsariots then returned upon the Turks, and took seventy gun-boats.

In Thessaly several Mussulman corps were attacked in the month of June, and defeated by the Greeks.

The long delay in paying the loan in London at this time threatened Greece with a total want of funds; the government, however, found means to fit out two fleets; the first drove away the Egyptian squadron, recaptured Casa, and destroyed the Turkish troops in the island; the other, by the brilliant success it obtained, repaired the fortunes of Ipsara.

While the Egyptian fleet was cruising between Moeri and Rhodes, the capitan pacha was preparing for a descent on Samos, where there was a small Greek squadron under the command of Georgius Tactouri. He made two attacks without success; and on the 16th of August approached with all his force; but the Turks were thrown into disorder by the Hydriots and Speziots, and the troops collected on the opposite hills of Asia Minor witnessed the entire discomfiture of their fleet.

The Greek cause now continued to prosper. Daily successes were obtained in the west, over the remains of Dervishi Pacha's army. Athens was in a good state of defence, the garrison continually making sallies against the Turks, who were besieging them; and though new levies were made by the Turks, the commanders complained, that the recruits were continually leaving the service.

Partial actions took place on the 5th and 9th of September, between the Turkish and Greek fleets, and on the 10th an action ensued between the Greeks and the united fleets of Turkey and Egypt, when the former burned a frigate, a corvette, and two brigs, and took sixteen transports. After this another action took place at Patmos, in which the Greeks burned two frigates and four brigs, and took prisoner Ismael Gibraltar, the Tripolitan commander, and the brother-in-law of the pacha of Egypt. The Turks offered 200,000 piastres for his ransom, but Miaoulis demanded eight frigates, and whatever Gibraltar had under his command. The combined fleets were pursued to the Dardanelles.

On the 18th of April, this year, lord Byron died at Messolonghi, of an inflammatory fever, after having zealously devoted himself to the cause of the Greeks from the time he first landed in August, 1823, up to the period of his death. We have not referred to these exertions in the preceding narrative, having given a very full account of them under the article BYRON, which see. But one of the great topics of his lordship's anxiety, the divisions among the Greek leaders, has continued to this day deeply to injure their cause.

Instead of spending the winter, now drawing on, in preparations for the approaching campaign, they seemed almost wholly taken up with their internal dissensions. The people of the Morea broke out into an open insurrection, at the head of which were Colocotroni and his sons, Niketas, and others. They attempted the capture of Napoli; after some bloodshed, however, by the end of the year, the rebellion was quelled.

The porte, on the other hand, was very active in its preparations, and the troops of Mahomet Ali, pacha of Egypt, were directed to land in great force upon the Morea: and it now became evident, that the neighbourhood of Navarino was destined to be the seat of war; the Greek troops were drawn off from Patras, to march southward; while Conduriottis, the commander-in-chief, and prince Mavrocordato, were preparing to set off with fresh troops, Ibrahim received reinforcements from Candia, which made his force 15,000 strong, and a battery was immediately erected against Neo-Castro, or Navarino. Conduriottis had assembled about 6000

men at Cremidi, about the middle of April; but on the 19th Ibrahim attacked and routed all the troops which he had been able to collect.

On the 1st of May the Egyptian fleet, from sixty-five to seventy sail, left the port of Suda, where it had been watched by a Greek squadron under Miaoulis. Miaoulis sailed to Navarino, and sent in seven vessels, of which Isammados was to take the command. On the 8th Miaoulis's squadron, amounting to twenty-two vessels, was near Yante; the Egyptian fleet, forty-six in number being off Sphacteria, and Tsammados's eight vessels inside the harbour. In about an hour from 2000 to 3000 troops effected a debarkation from the Egyptian fleet, on the island. The garrison of Old Navarino capitulated on the 10th, and the garrison of Navarino, on the 23d, marched out, leaving water for four days and bread for ten.

After the surrender of Sphacteria, a great part of the Egyptian fleet was followed by Miaoulis into the harbour of Modon, and more than half of it destroyed by fire-ships.

A body of Greeks was now defeated by part of Ibrahim's army at Mount Aghiaon, which overlooks the town of Arcadia, anciently Cyparressus, and he himself took possession of Calamata. He then proceeded into the interior, and, having met with a loss in the mountains from the division under Colocotroni (restored to command by the Greek government), he took up his position on the 20th at Tripolitza, which was half in ruins, and soon after made his appearance before Napoli di Romania. Having made several attacks without success, and failing in his design of surprising the town, he retreated. The Turks also about this time made a descent from Epirus and Thessaly, upon the shores of the Corinthian Gulf, and seized Salona, while Redschid Pacha appeared before Messolonghi.

In the end of May the Turkish admiral left the Dardanelles, and on the 1st of June was encountered by the Hydriote Sakhturi, who, by means of his fireships, destroyed three men of war and some transports. Soon after the capitan pacha entered Suda, and joined the Egyptian fleet from Navarino, at the expense of three fire-ships. The Greek fleet was dispersed by a tempest, and, having no fire-ships, they retired to Hydra, while the Turkish admiral landed a reinforcement of 5000 men at Navarino, and went to Messolonghi with seven frigates and many smaller vessels. The siege was now vigorously pressed; the Lagune was penetrated on the 21st of July, and Anatolico, an island to the north, surrendered to the Turks. The supply of water was now cut off, batteries had been erected near the main works of the place, the ramparts had been injured, and part of the ditches filled up; at length a general attack was ordered on the

1st of August, and the town assailed on four places at once. The Turks were every where repulsed. On the 3d the Greek fleet, consisting of twenty-five brigs, attacked and destroyed two small ships of war and all the boats in the Lagune, relieved Messolonghi, and obliged the enemy's fleet to retire. On the 20th the fleet of the Greeks, about thirty sail, commanded by Miaoulis, engaged the Turks between Zante, Cephalonia, and Chiarenza, and an action ensued, which lasted with little intermission for two days and nights, when, the wind, blowing hard from the eastward, the Greeks were obliged to retire. On the 29th another naval action took place, and skirmishes on the two next days, when at length, on the 2d of December, the Greeks forced the enemy to take shelter in the Gulf. On the 10th of August preceding, the Greeks had attempted, but without success, to burn the Turkish fleet in the port of Alexandria.

During the year 1826 the affairs of the Greeks began to wear a much more discouraging aspect. After a lengthened blockade, in which every effort was made by the Greeks to defend it, and every privation endured, the important fortress of Messolonghi was, towards the autumn of this year, taken by assault and sacked by the Turks.

One of the most remarkable and disastrous events of this year (1827) has been the capture of Athens, the news of which arrived while we were writing this article. It was taken in the month of May by the Turks under Kiutaki, not long after the arrival of the gallant lord Cochrane in its neighbourhood, with a considerable naval force. The loss of the Greeks on this occasion amounted to 700 men killed on the field of battle, and 240 taken prisoners, including eighteen Philhellenians of different countries. Kiutaki, supposing that lord Cochrane and general Church were among the Europeans, had the prisoners brought before him, and, after examining them carefully, caused the eighteen Europeans to be poniarded before his eyes. He afterwards ordered the 222 Greeks to be massacred; and, if he manifested any degree of clemency at the taking of the city, it was forced on him by the presence of the English and French ships of war.

Ibrahim has resumed his excursions, but he is suffering from want of provisions, and no supplies can reach him while the Greek fleet is cruising off the coast.

In the public papers appears this day (July 13th), a most important treaty between Great Britain, France, and Russia, destined, we trust to close the sufferings of the Greeks. It binds the high contracting powers to put an end to the war, and virtually to establish the independence of Greece, with the exception of a tribute and a nominal suzerainship being given to Turkey.

GREEDY, *adj.* } Sax. *grædig*; Gothic
GREEDINESS, *n. s.* } *grædig*; Belgic *gretig*.
GREEDILY, *adv.* } Ravenous; voracious, either in appetite or desire; eager: it is a word which simply expresses a strong and vehement desire of possession.

As a lion that is *greedy* of his prey. *Ps.* xvii. 12.

Be not unsatiable in any dainty thing, nor too *greedy* upon meats. *Eccles.* xxxvii. 29

Who so yoke a wethers skinne,
And wrapped a *greedy* woulfe therinne,
For he should go with lambes white,
Wenest thou not he wold him bite.

Chaucer. Romaunt of the Rose.

Soche *gredinesse* him assaileth,
That whan he moste bath, moste he faileth. *Id.*

Thither with all *greediness* of affection are they gone, and there they intend to sup. *Shakspeare.*

If thou wert the wolf, thy *greediness* would afflict thee. *Shakspeare. Timon.*

Greedy to know, as is the mind of man,

Their cause of death, swift to the fire she ran.

Fairfax.

He made the *greedy* ravens to be Elias's caterers, and bring him food. *King Charles.*

He swallowed it as *greedily*

As parched earth drinks rain. *Deuham.*

I with the same *greediness* did seek,

As water when I thirst, to swallow Greek. *Id.*

Greedy she engorged without restraint. *Milton.*

Stern looked the fiend, as frustrate of his will,

Not half sufficed, and *greedy* yet to kill. *Dryden.*

While the reaper fills his *greedy* hands,

And binds the golden sheaves in brittle bands.

Id.

Even deadly plants, and herbs of poisonous juice,

Wild hunger seeks : and, to prolong our breath,

We *greedily* devour our certain death. *Id.*

How fearful would he be of all *greedy* and unjust ways of raising their fortune ! *Law.*

GREEK CHURCH is that part of the church which is established in Greece, Russia, and various parts of Turkey. It is so called, in contradistinction from the Latin or Romish church; also the Eastern church, in distinction from the Western. The Romanists call the Greek church the Greek schism; because the Greeks do not allow the authority of the pope, but depend wholly, as to matters of religion, on their own patriarchs. They have treated them as schismatics ever since the revolt, as they call it, of the patriarch Photius.

The Greek church may be considered under two main divisions, i. e. that which maintains religious communion with the patriarch of Constantinople, and that which is established under its own synod, bishops, and rulers, in Russia.

The Georgians and Mingrelians also adopt the doctrines and ceremonies of the Greek church; but are independent of all jurisdiction of the Constantinopolitan prelate.

That part of the Greek church connected with the patriarch of Constantinople, is divided, as in the early ages of Christianity, into four large districts or provinces; Constantinople, Alexandria, Antioch, and Jerusalem; over every one of which a bishop presides, who has also the title of patriarch, and whom the inferior bishops and monastic orders unanimously respect as their common father. This prelate has the privilege of nominating other patriarchs, though that dignity still continues elective, and of approving the election that is made; nor is any thing of moment undertaken or transacted in the church without his express permission, or his special order. Indeed, in the present decayed state of the Greek churches, whose revenues are small, and whose former opulence is almost annihilated, their spiritual rulers enjoy little more than the splendid title of patriarchs.

The spiritual jurisdiction and dominion of the patriarch of Constantinople are very extensive, comprehending a considerable part of Greece, the Grecian Isles, Walachia, Moldavia, and several of the European and Asiatic provinces that are subject to the Turks. The patriarch of Alexandria resides generally at Cairo, and exercises his spiritual authority in Egypt,

Nubia, Lybia, and a part of Arabia. Damascus is the principal residence of the patriarch of Antioch, whose jurisdiction extends to Mesopotamia, Syria, Cilicia, and other provinces. In Syria there are three bishops who claim the title and dignity of patriarch of Antioch. The first is the bishop of the Melchites, a name given to the Christians in Syria who follow the doctrine, institutions, and worship of the Greek church; the second is the spiritual guide of the Syrian Monophysites; and the third is the chief of the Maronites, who hold communion with the church of Rome.

The patriarch of Jerusalem comprehends, within the bounds of his pontificate, Palestine, Arabia, the country beyond Jordan, Cana in Galilee, and mount Zion.

The episcopal dominions of these three patriarchs are indeed extremely poor and inconsiderable; for the Monophysites have long since assumed the patriarchal seats of Alexandria and Antioch, and have deprived the Greek churches of the greatest part of their members in all those places where they gained an ascendant. And as Jerusalem is the resort of Christians of every sect, who have their respective bishops and rulers, the jurisdiction of the Grecian patriarch is consequently confined there within narrow limits.

The right of electing the patriarch of Constantinople is vested in the twelve bishops who reside nearest that famous capital; but the right of confirming his election, and of enabling the new chosen patriarch to exercise his spiritual functions, belongs only to the Turkish emperor. But this institution is subject to the grossest perversion and abuse by the corruption and avarice of the reigning ministers. The power of this patriarch among a people spirited by oppression, and sunk into the grossest superstition by extreme ignorance, must be, and actually is, very considerable and extensive. Besides, his own prerogatives are numerous; for he not only convenes councils by his own authority; but by the special permission of the emperor, he administers justice and takes cognizance of civil causes among the members of his communion. His influence is maintained on the one hand by the authority of the Porte, and on the other by his right of excommunicating the disobedient members of the Greek church. The revenue of this patriarch is drawn particularly from the churches that are subject to his jurisdiction; and its produce varies according to circumstances.

The Greek church acknowledges as the rule of its faith, the Holy Scriptures, and the decrees of the first seven general councils; but no private person has a right to explain, for himself or others, either the declarations of Scripture, or the decisions of these councils; the patriarch and his brethren being the only persons who are authorised to consult these oracles, and to declare their meaning. The Nicene and the Athanasian creeds are allowed by them, and they hold the doctrine of the Trinity, but with this qualification, that the Holy Ghost proceeds from the Father only, and not from the Father and the Son. The invocation of saints is

alike received in the Greek and Roman communion. The Greek church admits the use of pictures to instruct the ignorant, and to assist the devotion of others by those sensible representations. In the Greek church there are seven mysteries, or sacraments, as they are called in the Latin church, viz. baptism, the chrism, or baptismal unction, the eucharist, confession, ordination, marriage, and the holy oil or extreme unction. As to baptism, they practise the true immersion. Chrism is called the unction with ointment, and extreme unction is called the consecration with holy oil. The chrism is a mystery peculiar to the Greek communion, and holds the place of confirmation in the Roman. It immediately follows the immersion at baptism, when the priest anoints the person baptised on the principal parts of the body with an ointment, consecrated with many curious circumstances for that purpose by a bishop; this ceremony is always used at the reception of a proselyte from any other church. Children immediately after baptism may receive the communion. Predestination is a dogma of the Greek church, and a very prevailing opinion among the people of Russia. The Greek church admits prayers and services for the dead as an ancient and pious custom, and even prayers for the remission of their sins; but it disallows the doctrine of purgatory, and determines nothing dogmatically concerning the state and condition of departed souls. It also pays a regard to the relics of saints and martyrs of which too superstitious a use is made. Supererogation, indulgencies, and dispensations are utterly disallowed in this church; nor does it affect, like the Latin, the character of infallibility.

The most modern summary of its doctrines and practices is that published by Platon, late metropolitan of Moscow; and which Mr. Pinkerton some years ago translated. We shall avail ourselves of his labors; and particularly of his description of that most important part of this church, the Greek church of Russia.

On the introduction of Christianity into Russia, the first dignitaries of the church were the metropolitans, who were chosen by the grand princes and the bishops, and ordained by the patriarch of Constantinople. Hence the patriarchs, not unfrequently, without consulting either the Russian princes or clergy, sent them metropolitans and bishops of their own choosing, though the grand princes generally opposed such an infringement on their prerogative, and often sent them back again to Constantinople; and even some of the grand princes, in place of applying to the patriarch, commanded the Russian bishops to ordain their own metropolitans. But, in general, the person chosen to be metropolitan of all Russia, went to Constantinople for ordination; and this usage continued till the taking of that city in 1453 by the Turks, when a final stop was put to the free communication which had so long subsisted between the patriarchs and the Russian church. On this account, Tzar Theodore Ioanovitch, in 1588, appointed his own patriarch in the Russian church; in which appointment the four patriarchs of the east having acquiesced, Jeremias, the patriarch of Constan-

tinople, came into Russia, and ordained Job, the metropolitan of Moscow, patriarch of all Russia, conferring upon him equal authority and powers with the eastern patriarchs. This office lasted till the beginning of the eighteenth century, when the disturbances which had taken place in the preceding reigns between the princes and the patriarchs, induced Peter the Great to abolish this office, in order the better to carry into effect his plans of reformation, both in church and state.

When Peter the Great ascended the throne, the power of the patriarch was almost equal to that of the tzar, after whom he took the first seat, and had a chief voice in all the affairs of the empire, both civil and religious. Without his blessing, neither war was undertaken, nor peace concluded. From these peculiar privileges, and the influence he possessed over the clergy and people, an influence which was oftentimes augmented by his own extensive domains and family connexions, it not infrequently happened that the patriarch opposed his voice to that of the tzar and nobles, in national affairs of importance, for no other reason but because he had not been previously consulted. On this account, Peter, on the death of the last patriarch, Adrian, in 1700, abolished the patriarchal office, and appointed an exarch, or vicegerent of the Holy See, with limited powers, who could do nothing without the consent of the other bishops, and was obliged to refer all affairs of moment to the decision of the tzar himself.

The person appointed to the exarchy was Stephen, metropolitan of Rezan, under whose presidency the schools of the clergy were much improved, the priests and monks more strictly looked after, and arrangements made for that further reformation in the government of the church which soon followed.

In 1721 Peter abolished the exarchy also, and, in place of it, instituted the Holy Legislative Synod, and furnished it with instructions, for the government of spiritual affairs, under his own particular cognizance. This spiritual council was at first to consist of twelve members, chosen from amongst the Archirès, Archimandrites, and Protoirès; but the number is now indefinite, and the choice and appointment of its members depend entirely on the will of the sovereign.

At the head of the Holy Legislative Synod there is always a *layman*, denominated the Ober Procurator, who is considered as sitting there on the part of the crown, and has a negative on all its resolutions till laid before the emperor.

The Russian clergy are divided into regular and secular. The former are all monks, and the latter are the parochial clergy. The superior clergy are divided into metropolitans, archbishops, and bishops, who are indiscriminately styled Archirès; but the title of metropolitan or bishop is merely personal, and not properly attached to the see; and, though there is some difference among the superior clergy in denomination, rank, and dress, yet it scarcely ever happens that one archirè is subordinate to another.

Before the time of Peter the Great the bishops were absolute in their own dioceses; and

though, at consecration, they took a general oath to walk in the spirit of their office, according to the Holy Scriptures and councils of the fathers, yet Peter found it necessary, in 1716, to make their duties and obligations more clear and specific, as the moral conduct of many of them was highly unworthy their sacred office, and others were remiss in the performance of their spiritual duties.

Promotion to the rank of bishop depends entirely on the will of the sovereign. When a vacancy takes place in a diocese, the holy legislative synod presents to his imperial majesty two or three candidates from among the eldest of the archimandrites, or chiefs of monasteries, out of whom he selects one, and orders him to be ordained an archirè; though he is not restricted in his choice to any of the candidates brought forward by the holy synod. Thus, the metropolitans, archbishops, and bishops, compose the highest class of the Russian clergy; of whom the greater part in the present day are men of learning, and many of them possessed of distinguished abilities, whose theological writings, especially of late years, have done honor to their profession and country; but, unfortunately for their literary reputation, they write in a language which is unknown to the other nations of Europe.

After the archirès, the next in order of dignity are those who in Russia are called *tschornoe duhovenstvo*, or the black clergy, to which class belong the archimandrites, or chiefs of monasteries, from amongst whom the bishops are always chosen; the hegumins, chiefs of small convents, of which they have the direction; *icromonachs*, and *ierodiacons*, who perform divine service in the monasteries; and last of all the monks.

All the black clergy, and also the archirès, according to the regulations of the Greek church, are obliged to lead rigid and reclude lives; are forbidden animal food; and are not permitted to marry, after entering into this order. They compose the regular clergy, and consider themselves as superior to the secular priests, in respect both of rank and learning; for the whole powers and dignities of the Russian church are exclusively vested in them.

The secular priests are called *beloe duhovenstvo*, or the white clergy, and consist of *protoirès*, or, as they were formerly called, *protopopes*, priests, and deacons, together with the readers and sacristans. According to the statement published by the Holy Synod in 1805, the number of *protoirès*, priests, and deacons, in actual employ was 44,487; and of readers and sacristans, 54,239; in all 98,726.

The *protoirès*, priests, and deacons, must all have been educated in the spiritual schools, and must be married before they can be ordained to these offices; but are restricted from marrying widows. The death of their wives, however, does not now prevent them, as formerly, from officiating as priests, though they are not allowed to marry a second time. But they are at liberty to enter into the order of the black clergy, by becoming monks; and thus the way is open before them to the first dignities of the Russian church. Those, again, who desire to marry a second time, must first resign their office in the

priesthood, and are for ever excluded from that order.

The duties of a secular priest in Russia are peculiarly laborious. The service of the church which must regularly be performed three times a day, and which, from its excessive length, is evidently of monastic origin, and only adapted for such as are entirely withdrawn from the world, together with the numerous and complicated ceremonies attending the administration of baptism, marriage, burial of the dead, visiting of the sick, &c., occupy the greater part of his time, and leave him but little leisure for study. To this cause, in part, must probably be attributed that want of zeal and activity in advancing the true interests of religion and morality, which, in general, forms such a conspicuous feature in the character of the Russian clergy. Perhaps their being, as it were, a distinct tribe, tends also greatly to produce this general characteristic; for, since the time of Peter the Great, who, in order to reform the irregularities which then existed among the clergy, ordered them all to be registered, and obliged them to send their sons to the spiritual schools, to receive a suitable education for the ministry, none have been admitted to the offices of secular priests, but the sons of the clergy. Hence, many thousands of these men have entered into the priestly order, not from choice, but from necessity. It is but justice, however, to add, that many of the secular priests are learned and worthy characters, who diligently perform the duties of their office, and spend their days in promoting the spiritual interests of the flocks committed to their charge. Nor is it unworthy of remark, that the Russians of all ranks are in general void of that persecuting rancor against other religious persuasions, which is so characteristic of Roman Catholics; and, though they adhere strictly to the doctrines and ceremonies of their own church, yet not only the laity, but even the clergy, are far from thinking that there is no salvation without her pale. In most of the churches now, both in towns and villages, a sermon is preached every Sunday, and on the chief holidays. Some of these discourses, which are delivered in different parts of the empire, for sound reasoning and clear views of the leading doctrines of the gospel, might have done honor to a British clergyman. In some of the churches, may also be heard a homily read by the priest from a printed book, a practice which is not unfrequent in the country, particularly in large congregations, where the duties of a priest leave him but little time for study.

Among the peculiar privileges of the clergy, may be mentioned their complete exemption from all civil taxes. They are also exempted from corporal punishment, even in the case of committing capital crimes: and, according to an ukaz of 1801, they are permitted to hold lands. The greater part of their support is derived from the free-will offerings of their parishioners, and their revenues are comparatively small. With the view of adding to their respectability, and exciting them to diligence in their sacred calling, the emperor Paul began to bestow upon the superior clergy the orders of knighthood: and, in 1797, he appointed golden crosses to be made

for the secular priests, to be worn suspended from their necks, together with mitres like those of the archimandrites, and other marks of distinction in dress. These he bestowed on such of them as distinguished themselves in their holy calling.

This emperor, also, in order that the country clergy might have more time to attend to their spiritual duties, commanded that their fields should be cultivated by the peasants belonging to their respective parishes; a regulation, however, which has since been laid aside.

The whole Russian empire is divided into thirty-six dioceses or eparchies, which, in extent, are nearly the same with the divisions of the empire into provinces, or governments. In these there are 483 cathedrals, and 26,598 churches, which are, in general, magnificent buildings. Formerly many of them were of wood, but now they are mostly built of brick; and comparatively few of the wooden churches remain. A foreigner, in particular, is forcibly struck with the elegance of these fine edifices, raising their gilded spires amidst the humble izbas, or huts of the peasantry. Some of the churches are large square buildings, but the most of them are built in the form of a cross. In general, they have five domes, with crosses, which, in monasteries and cathedrals, and even in some parish churches, are gilded, and have a splendid appearance. Adjoining to the church, or near to it, there is always a steeple or belfry, commonly of great height, provided with large bells; and, like the churches, overloaded with decorations.

The church is divided into three parts; first, the *sanctum sanctorum*, called the altar, and into which females are not permitted to enter. In the middle of the altar stands the holy table, upon which a golden or silver cross, and a richly ornamented copy of the Gospels, are always laid. This part of the church is the east end, so that the congregation always worship with their faces towards the rising sun.

The altar is separated from the nave or body of the church, by a screen, upon which pictures of our Saviour, the Virgin, the Apostles, and Saints, are always painted. This screen is called the *ikonostas*, in the middle of which are the royal doors, which are opened at different times in the course of the service. Upon a platform before the *ikonostas*, raised several steps, the readers and singers stand behind a low rail, to separate them from the congregation; and, in the middle, before the royal doors most of the service is performed.

The second division is the nave or body of the church, which properly may be styled the inner court, where the congregation stand; for there are no seats in the Russian churches, neither do the congregation make any use of books. In some of the new churches in Petersburg and Moscow there are pulpits erected to elevate the speaker; but they are unknown in the churches in other parts of the empire, in which the preacher, while delivering his discourse, usually stands before the royal doors, behind a moveable desk.

The third division is called the *trapeza*, which

is the west end of the church, and may properly be denominated the outer court. This part is usually as large as the inner court, where the congregation assembles; but, on holidays, both these divisions are generally filled with the worshippers.

The inner walls and domes of the churches are covered with scriptural paintings, which in general represent the most interesting scenes of our Saviour's history. The *ikonostas* is always richly gilded and ornamented, and the pictures of the saints adorned with gold and silver, pearls, and precious stones.

The service of the church is contained in upwards of twenty volumes folio, all in the Slavonian language, which, though the ancient language of the country, is not well understood by the greater part of the modern Russians. Twelve of these volumes, one for every month, contain the particular services and hymns for the festivals of the saints, who are so numerous in the Greek kalendar, that there are more of them than there are days in the year. These twelve volumes are called the *Minæon*. The *Octoechos* compose two volumes, and are divided into eight voices or tones, each of which contains hymns for the days of one week, that are mixed in the service according to the subjects to which the days of the week are appropriated. Thus, Sunday to the resurrection; Monday to the angels; Tuesday to John the Baptist; Wednesday to the Virgin; Thursday to the apostles; Friday to the passion of Christ; and Saturday to the saints and martyrs. To these two there is a supplementary volume, containing hymns, to supply the deficiency in the *Minæon*. The *Psalter* and the *Hours* take up another volume. The *Book of Psalms* is divided into twenty parts, one of which is read at a service; so that the whole is read through in the course of a week. The *Book of Prayer* contains the ordinary daily prayers and *ectinias* for the priest and deacon, in the vespers, matins, and communion service. The *Fast Triods* are two volumes, which contain particular services for the great fast before Easter, and for the days of Pentecost, when the hymns in the *Octoechos* are discontinued. The four Gospels compose another volume, a portion of which is read at every service. The *Book of Offices* contains the rites of baptism, marriage, burial service, &c. And, lastly, the *Book of Regulation*, which contains directions how to use the rest.

The lives of the saints are contained in several folio volumes, which are not now read in churches, but are sometimes read in monasteries, at the matins or morning service.

The Russians make no use of a complete copy of the Bible in their churches; they have only extracts from the Old Testament and the Epistles, interspersed throughout the *Minæon* and *Octoechos*; and even many of the clergy in the country do not possess an entire copy of the Scriptures. Both in monasteries and parish churches the service is performed three times a day. It begins in the evening of the preceding day, as among the Jews; the vespers at sunset; the matins between four and five in the morning; and the liturgy or communion service between

nine and ten. The greater part of the service consists of psalms and hymns, which, according to the regulation, ought to be sung, but are now mostly read. The length of the service, also, has given rise to the unintelligible manner in which most of it is now performed; for the priests and readers, in order to get the more quickly through it, have fallen into the practice of repeating and reading the hymns and prayers so quickly, and in such a tone of voice, as renders the greater part of them impossible to be understood by the congregation. The Gospel, however, is always read slowly, and in a distinct and audible voice; so that it is much more intelligible, from being thus read, than many other parts of the service.

Our limits forbid us to extract several able passages from Platon's 'Orthodox Doctrine,' which we had marked with that view. We can only take the following:—

Of the death of Christ, he says, 'The death of Christ is the true sacrifice. A sacrifice, because Christ offered up himself upon the altar of the cross, as an innocent lamb, slain by the justice of God, and consumed by the fire of love, with which he burned for the salvation of mankind; and his being thus consumed was a spectacle no less wonderful in itself, than acceptable to God, the Father.

'Christ was also the true sacrifice; for all the other sacrifices were nothing, but a kind of types or images of this; and it alone was capable of satisfying divine justice, meriting for us God's mercy, cleansing us from our sins, and of restoring us to our original state of blessedness. The word of God bears testimony to this; 'But Christ being come an high priest of good things to come, by a greater and more perfect tabernacle, not made with hands, that is to say, not of this building; neither by the blood of goats and calves, but by his own blood, he entered in once into the holy place, having obtained eternal redemption for us. For if the blood of bulls and of goats, and the ashes of an heifer, sprinkling the unclean, sanctifieth to the purifying of the flesh; how much more shall the blood of Christ, who, through the eternal Spirit, offered himself without spot to God, purge your conscience from dead works, to serve the living God!' Heb. ix. 11, 12, 13, 14.

'This sacrifice put an end to the sacrifices of Aaron or of the Old Testament, and Christ became the only and eternal priest. The only priest, because another sacrifice is impossible; the eternal priest, for, according to the words of the apostle, 'He continueth ever, hath an unchangeable priesthood; wherefore he is able also to save them to the uttermost that come unto God by him, seeing he ever liveth to make intercession for them.' Heb. vii. 24, 25.

'This great high priest is called of God a priest not after the order of Aaron, but after the order of Melchisedec. Heb. v. 10. Now in this there is a great mystery; in which every one must be astonished to behold revealed three of God's excellencies, mercy, justice, and infinite wisdom. Mercy so great, that the only begotten Son of God, of the same essence with the Father, was delivered up unto death for us the enemies of

God. Can there be a greater display of mercy! Justice so holy and inviolable, that, without a complete satisfaction, it could not clear us of guilt. Infinite wisdom, that devised such a wonderful plan, not only to satisfy justice, but to pour upon us the whole fountain of goodness. O the depth of the riches both of the wisdom and knowledge of God! This most exalted mystery is to the Jews a stumbling block, and to the Greeks foolishness; but to us, who are thereby saved, it is the power of God and the wisdom of God: and we, with Paul, will declare, 'God forbid that we should glory, save in the cross of our Lord Jesus Christ;' Gal. vi. 14.

'Of faith in Christ.—'Verily, Christ died for all,' 2 Cor. v. 15. And there is no one so great a sinner whom his grace alone is not able to save. But, in order that this grace may become effectual in us, faith is requisite, that is, we must heartily receive Jesus Christ as our Saviour, and without doubting rest assured, that only through him we can be made partakers of the mercy of God. Without the infinite merits of Christ all our attempts are in vain, and man can never be saved. This is clearly taught every where in the word of God, John iii. 15; 'For God so loved the world that he gave his only begotten Son, that whosoever believeth in him should not perish, but have everlasting life;' and verse 18, 'He that believeth on him is not condemned, but he that believeth not is condemned already.' When we consider faith as essential to salvation, it is to be understood, that we mean faith unfeigned, sincere, and living, that is, 'faith which worketh by love,' Gal. v. 6.

'Of the true church.—From the beginning of the world to the present time, and to the very end of time, the church has been, and will be, always one and the same. One, because there is for ever one faith, one foundation of faith, and one head of the church, Christ; one way of salvation, and one hope for all. Thus it is written to the Ephesians, 'One body and one spirit, even as ye are called in one hope of your calling; one Lord, one faith.' Chap. iv. 4. Hence this church only cuts off all those who either do not receive the word of God, or mix their own improper opinions with it; therefore, the society of such people is not a church, but an assembly holding heterodox opinions, which is governed by the spirit of division, and not by the Spirit of God. Even at the present time, to the offence of Christians, we behold three chief sects or parties in Christianity: Papists, Lutherans, and Calvinists. They are mutually in opposition to one another. Popery, exclusive of its being filled with the most pernicious superstitions, and the edicts of Popes, in contradiction to the word of God, blindly holds the tenet in regard to the proceeding of the Holy Ghost above mentioned, and explains it in opposition to the clear testimony of Holy Scripture. It has also taken away from the common people the cup in the communion, and the reading of the Holy Scriptures. It has further devised some sort of a purgatory fire, has appropriated to itself a power unknown in the gospel, and undertakes to convert gainsayers by fire and sword.

'The Lutherans and Calvinists dissented not

long ago from popery under Luther and Calvin, whom passion, more than any thing else, excited to this novelty. They, in avoiding popish superstitions and superfluities, threw away, together with them, the holy apostolical traditions of the first churches. Notwithstanding they held the same opinion with the Romanists in regard to the proceeding of the Holy Ghost. But exclusive of this, they teach, what is contrary to scripture, respecting the mystery of the communion and the other mysteries. The Lutherans, moreover, attach to the body of Christ omnipresence, which is an attribute peculiar to God alone, and the Calvinists draw upon men's actions an inevitable kind of predestination. But our Greco-Russian church proves its genuineness by incontestable evidences; for, from the very time of the apostles to the present day, it has preserved inviolate the faith preached by them, and the ancient traditions of the first churches. Greece was converted to the faith by the apostle Paul himself, and the truth which she received from him she preserved inviolate throughout all the succeeding ages; and, if there happened to be sometimes heretical and pernicious doctrines taught, yet they were always condemned in the general and particular councils.

With this faith, thus preserved in all its purity, it pleased God at last to enlighten Russia. And as in Greece, so in Russia, there never has taken place any change in the faith: such, for instance, as took place among the Papists in the time of Luther; yet, amongst those who hold to our church, there may exist a certain kind of superstition and abuse; but our church does not justify such improprieties; she rather mourns over them, reproves and corrects them. And the erroneous opinions of a few, founded on ignorance of the truth, can never, in justice, be imputed to the whole church. Hence, it is evident, that our orthodox church is not only the true church, but that it is one and the same from the very foundation of the world. From the very foundation of the world, I say; because it agrees with the Greek church, and the Greek church never departed from the primitive apostolical church. Again, the apostolical church was not different in the essence of faith from the Old Testament church; and the Old Testament church was founded upon the saving truth, which, with steadfast faith, was held both before and after the flood by the holy patriarchs, even from the very foundation of the world. Hence the evangelical orthodox faith of our church refers for its foundation to the very beginning of the world, and shall remain, as the Holy Ghost hath assured us, to the end of time.

There are many passages in this treatise which would do honor to any protestant writer, and which prove this branch of the Greek Church to be possessed of much 'sound doctrine.'

The GREEK LANGUAGE, as preserved in the writings of the celebrated authors of antiquity, Homer, Hesiod, Demosthenes, Aristotle, Plato, Xenophon, &c., has a great variety of terms and expressions, suitable to the genius and occasions of a polite and learned people, who had a taste for arts and sciences. In it, proper names are significant, which is the reason that the modern

languages borrow so many terms from it; and that when any new invention, instrument, or machine, is discovered, recourse is generally had to the Greek for a name. See LANGUAGE.

GREEK ORDERS, in architecture, are the Doric, Ionic, and Corinthian; in contradistinction from the two Latin orders, the Tuscan and Composite. See ARCHITECTURE.

GREEN, *adj. n. s. & v. a.*
 GREEN'-BROOM, *n. s.*
 GREEN'-CLOTH, *n. s.*
 GREEN'-EYED, *adj.*
 GREEN'-FINCH, *n. s.*
 GREEN'-GAGE, *n. s.*
 GREEN'-HOUSE, *n. s.*
 GREEN'-ISH, *adj.*
 GREEN'-LY, *adv.*
 GREEN'-NESS, *n. s.*
 GREEN'-SICKNESS, *n. s.*
 GREEN'-SWORD, *n. s.*
 GREEN'-SWORD, *n. s.*
 GREEN'-WEED, *n. s.*
 GREEN'-WOOD, *n. s.*

Saxon *græne*; Germ. *grün*; Dut. *groen*. Having a color formed commonly by compounding blue and yellow; of the color of the leaves of trees or herbs. Figuratively, pale; sickly: from whence we call the maid's disease the green-sickness, or chlorosis. Like it is Sappho's *χλωροτέρα ποτα*. Flourishing; fresh; undecayed; not dry; half-roasted; unripe, according to the subjects to which it is applied as an epithet; a green color; a grassy plain; shrub; a quantity of foliage. Green-finch, a kind of bird. Green-gage, a species of plum. Green-house, a house in which tender plants are sheltered from inclement weather. Green-sward, the turf on which grass grows. Green-wood, a term applied to the woods as they appear in spring or summer. Green-cloth, a board or court of justice held in the counting-house of the king's household, for the taking cognizance of all matters of government and justice within the king's court-royal; and for correcting all the servants that shall offend.

I sawe the laurer Daphne closed under rinde;
 With the *greene* laurer; and the wholesome pine;
 The Mirre also, that wepeth ever of kinde;
 The Cedres hie, as upright as a line;
 The filbert, eke, that lowe doeth encline
 Fire lowes *greene* unto the yerth adoun, adoun,
 Unto hire knight, called Demophoon.

Chaucer. *Complaint of the Blache Knight.*

With goodly *greenish* locks, all loose, untied,
 As each had been a bride.

Spenser.

If a spark of error have thus far prevailed falling
 even where the wood was *green*, and farthest off from
 any inclination unto furious attempts; must not the
 peril thereof be greater in men, whose minds are of
 themselves as dry fæwel, apt beforehand unto tumults?

Hooker's *Dedication.*

Was the hope drunk
 Wherein you drest yourself? Hath it slept since?
 And wakes it now to look so *green* and pale
 At what it did so freely? *Shakspeare. Macbeth.*
 There's never any of these demure boys come to
 any proof: they fall into a kind of male *green* sick-
 ness.

Id. *Henry IV.*

You'll find a difference
 Between the promise of his *greener* days,
 And these he masters now. *Id. Henry V.*

My sallad days,
 When I was *green* in judgment, cold in blood!

Shakspeare.

Kate, I cannot look *greenly*, nor gasp out my elo-
 quence; nor have I cunning in protestation. *Id.*

The door is open, Sir, there lies your way,
You may be jogging while your boots are green.
Shakspeare.

Griefs are green;
And all thy friends, which thou must make thy
friends,
Have but their stings and teeth newly taken out.
Id.

In a vault,
Where bloody Tybalt, yet but green in earth,
Lies festering in his blood.
Id. Romeo and Juliet.

This is the prettiest low-born lass that ever
Ran on the *greensward*. *Id. Winter's Tale.*
Doubtful thoughts, and rash-embred despair,
And shuddering fear, and *greeneyed* jealousy.
Shakspeare.

Her mother hath intended
That, quaint in green, she shall be loose enobed.
Id.

For this down trodden equity, we tread
In warlike march these *greens* before your town. *Id.*
Of fragility the cause is an impotency to be ex-
tended, and therefore stone is more fragil than metal,
and so dry wood is more fragil than green. *Bacon.*

For the *greencloth* law, take it in the largest sense,
I have no opinion of it. *Id. Advice to Villiers.*

The general colour of plants is green, which is a
colour that no flower is of: there is a *greenish* prim-
rose, but it is pale and scarce a green. *Bacon.*

A man that studieth revenge keepeth his own
wounds green, which otherwise would heal and do
well. *Id. Essays.*

Among wild herbs under the *greencloth* shade.
Fairfax.

Being an olive tree
Which late he felled; and being *greene*, must be
Made lighter for his manage. *Chapman.*
In a meadow, though the meer grass and *greenness*
delights, yet the variety of flowers doth heighen and
beautify. *Ben Jonson.*

My reason, which discourses on what it finds in my
phantasy, can consider *greenness* by itself, or mellow-
ness, or sweetness, or coldness, singly and alone by
itself. *Digby on Bodies.*

O'er the smooth enamelled green,
Where no print of step hath been,
Follow me as I sing. *Milton.*
Whose primitive tradition reaches
As far as Adam's first green breeches. *Butler.*

About it grew such sort of trees, as either excellency
of fruit, stateliness of growth, continual *greenness*, or
poetical fancies have made at any time famous.
Sidney.

This prince, while yet the errors in his nature were
excused by the *greenness* of his youth, which took all
the fault upon itself, loved a private man's wife. *Id.*

If you but consider a piece of green wood burning
in a chimney, you will readily discern, in the dis-
banded parts of it, the four elements. *Boyle.*

With *greens* and flowers recruit their empty hives,
And seek fresh forage to sustain their lives. *Dryden.*

Every brow with cheerful green is crowned;
The feasts are doubled, and the bowls go round.
Id.

The fragrant *greens* I seek, my brows to bind. *Id.*

It happened on a Summer's holiday,
That to the *greenwood* shade he took his way;
For Cymon shunned the church. *Id.*
I might dilate on the temper of the people, the
power, arts, and interest of the contrary party, but
those are invidious topicks, too green in our remem-
brance. *Id.*

O charming youth, in the first opening page;
So many graces in so green an age. *Id.*

But with your presence cheered, they cease to
mourn,

And walks were fresher green at your return. *Id.*

After break their fast
On *greensward* ground, a cool and grateful taste. *Id.*

If I have any where said a green old age, I have
Virgil's authority; sed cruda deo viridisque senectus.
Id.

The young Emilia, fairer to be seen
Than the fair lily on the flowery green. *Id.*
The green do often heat the ripe, and the ripe,
so heated, give fire to the green.

Mortimer's Husbandry.
If you would fat green geese, shut them up when
they are about a month old. *Id.*

The chaffinch, *greenfinch*, dormouse, and other
small birds, are injurious to some fruits. *Mortimer.*

If the season prove exceeding piercing, which you
may know by the freezing of a moistened cloth set in
your *greenhouse*, kindle some charcoal. *Evelyn.*

Stubble geese at Michaelmas are seen
Upon the spit, next May produces green. *King.*

Take the picture of a man in the *greenness* and vi-
vacity of his youth, and in the latter date and de-
clension of his drooping years, and you will scarce
know it to belong to the same person. *South.*

Sometimes our road led us into several hollow
apartments among the rocks and mountains, that look
like so many natural *greenhouses*, as being always
shaded with a great variety of trees and shrubs that
never lose their verdure. *Addison.*

A kitchen-garden is a more pleasant sight than the
finest orangery or artificial *greenhouse*. *Spectator.*

Till the *green-sickness* and love's force betrayed
To death's remorseless arms the unhappy maid.

Garth.
Cinnabar, illuminated by this beam, appears of the
same red colour as in day-light; and if at the lens
you intercept the *green* making and blue making rays,
its redness will become more full and lively.

Newton's Opticks.
Of this order the *green* of all vegetables seems to
be, partly by reason of the intenseness of their co-
lours, and partly because, when they wither, some of
them turn to a *greenish* yellow. *Newton.*

Sour cruciations, and a craving appetite, especially
of terrestrial and absorbent substances, are the case
of girls in the *greensickness*. *Arbuthnot.*

Groves for ever green. *Pope.*

In shallow soils all is gravel within a few inches;
and sometimes in low ground a thin *greensward*, and
sloughy underneath; which last turns all into bog.

Swift.
Under this head we may rank those words which
signify different ideas, by a sort of an unaccountable
far-fetched analogy, or distant resemblance, that fancy
has introduced between one thing and another; as
when we say the meat is green, when it is half
roasted. *Watts's Logic.*

Let us but consider the two colours of yellow and
blue; if they are mingled together in any considerable
proportion, they make a green. *Id.*

Great Spring before
Greened all the year; and fruits and blossoms
blushed

In social sweetness on the self-same bough.
Thomson.

But see the fading many-coloured woods
Shade deep'ning o'er shade, the country round
In brown; crowded umbrage dusk and dun,
Of every hue, from wan declining green
To sooty dark. *Id. Seasons.—Autumn.*

Thus is Nature's vesture wrought
To instruct our wandering thought;

Thus she dresses *green* and gay
To disperse our cares away.

Dyer.

From silent mountains, straight, with startling
sound,

Torrents are hurled; *green* hills emerge; and lo,
The trees with foliage, cliffs with flowers are crowned.

Beattie's Minstrel.

GREEN (John), an English prelate, born in 1706, at Beverly, in Yorkshire, was admitted a sizar of St. John's College, Cambridge, of which he became a fellow. In 1744 he was appointed chaplain to the duke of Somerset, who gave him the living of Borough-green, near Newmarket. In 1748 he was elected regius professor of divinity; and two years after master of Benedict College, Cambridge. He became, in 1756, dean of Lincoln, and afterwards bishop of that see. In 1771 he obtained the deanery of St. Paul's. He died in 1779. He was one of the writers of the *Athenian Letters*; besides which he published a tract on *Enthusiasm*, and some sermons, &c.

GREEN (Matthew), a poet, of whom little is known, except that he was brought up among the dissenters of London, and had a situation in the custom-house. He died in 1737. His poem, entitled *The Spleen*, is an ingenious piece, and was printed, with others of this author, in Dodsley's collection.

GREEN (William), an English divine, fellow of Clare Hall, Cambridge, and rector of Hardingham, in Norfolk, died in 1794. His works are—1. *The Song of Deborah*, reduced to metre; with a Translation and Commentary, 4to. 2. *A Translation of the Prayer of Habakkuk*, the Prayer of Moses, and the 139th psalm, with a Commentary, 4to. 3. *A new translation of the Psalms*, with notes, 8vo. 4. *A new Translation of Isaiah*, from the seventh to the fifty-third chapter, with notes, 4to. 5. *Poetical parts of the Old Testament*, translated from the Hebrew, with notes, 4to.

GREEN, a county of Kentucky, in the United States. Greensburgh is the chief town. Population in 1815, 6735.

GREEN, a county of the United States, in the state of Ohio. It has Clinton county on the south, Fayette and Madison counties on the east, and Champaign and Montgomery counties on the west, and is about twenty-four miles square. The valleys are wide, rich, and productive; the more elevated grounds are generally of a second quality. It is watered by the Little Miami, Mud River, Caesar's and Massie's Creeks, and several other inconsiderable streams. Zenia is the chief town. Population in 1815, 8000.

GREEN, a river of Kentucky, United States, which has its source in Lincoln county, and, pursuing a western course, enters the Ohio 200 miles below Louisville, and fifty miles above the mouth of Cumberland River. It is 200 yards wide at its mouth, and is navigable for boats nearly 200 miles. In summer it may be foated at 150 miles above its confluence with the Ohio; but in winter it is frequently swelled, by sudden and violent floods.

GREEN BAY, a bay on the west side of Lake Michigan, about ninety miles in length, but varying in breadth from fifteen miles to thirty. The

channel by which it communicates with Lake Michigan is of sufficient depth for a vessel of sixty tons, and of proportionate width. Long. 87° 58' W., lat. 45° N.

GREEN BRIAR COUNTY, a large and fertile county in Virginia, surrounded by Bath, Randolph, Harrison, Kanlaway, Botetourt, and Montgomery counties. The chief town is Lewisburg. Population in 1816, 5914.

GREEN-CLOTH, BOARD OF, is composed of the lord steward and officers under him, who sit daily. This court has power to maintain the peace of the verge, or jurisdiction of the court-royal; which is every way about 200 yards from the last gate of the palace where his majesty resides. It takes its name from a green cloth spread over the board where they sit. Without a warrant first obtained from this court, none of the king's servants can be arrested for debt.

GREEN-CLOTH, CLERKS OF THE, were two officers of the board of green cloth, who appointed the diet of the king and his household; and kept all records, legers, and papers relating thereto; made up bills, parcels, and debentures for salaries, and provisions and necessaries for the officers of the buttery, pantry, cellar, &c. They also waited upon foreign princes when entertained by his majesty. But this was abolished in 1782.

GREEN EARTH. Color generally celandine-green. Massive, and in globular and amygdaloidal shaped pieces, sometimes hollow, or as incrusting agate balls. Fracture earthy. Opaque. Rather greasy. Adheres slightly to the tongue. Sp. gr. 2.6. Before the blow-pipe it is converted into a black vesicular slag. Its constituents are, silica 53, oxide of iron 28, magnesia 2, potash 10, water 6. It is a frequent mineral in the amygdaloid of Scotland, England, Ireland, Iceland, and the Faroe Islands. It occurs in Saxony, near Verona, the Tyrol, and Hungary. It is the mountain-green of artists in water-colors.

A GREEN-HOUSE, or CONSERVATORY, is a house in a garden, contrived for sheltering and preserving the most curious and tender exotic plants, which in our climate will not bear to be exposed to the open air, especially during the winter season. These are generally large and beautiful structures, equally ornamental and useful. Their length must be proportioned to the number of plants intended to be preserved in them, and cannot therefore be reduced to rule: but their depth should never be greater than their height in the clear; which, in small or middling houses, may be sixteen or eighteen feet, but in large ones from twenty to twenty-four feet; and the length of the windows should reach from about one foot and a half above the pavement, and within the same distance of the ceiling, which will admit of a cornice round the building over the heads of the windows. Their breadth cannot be in proportion to their length; for if in the largest buildings they are more than seven or seven and a half feet broad, they will be extremely inconvenient. The piers between the windows must be as narrow as may be to support the building; for which reason they should either be of stone or of hard burnt bricks. If the piers are made

of stone, they should be thirty inches wide in front, and sloped off behind to about eighteen inches, by which means there will be no corners to take off the rays of the sun. If they are of brick, they will require to be at least three feet in front, but they should be in the same manner sloped off behind. Over the greenhouse may be rooms for drying and preserving seeds, roots, &c., and behind it a place for tools and other purposes; and both those behind, and the rooms above, will be of great use in keeping off the frosts, so that the wall between them need not be of more than two bricks and a half in thickness. The floor of the greenhouse, which should be laid either with Bremen squares, Purbeck stone, or flat tiles, must be raised two feet above the surface of the adjoining ground, or, if the situation be damp, at least three feet; and if the whole is arched with low brick arches under the floor, they will be of great service in preventing damp; and under the floor, about two feet from the front, it will be advisable to make a flue of ten inches wide and two feet deep; this should be carried the whole length of the house, and then returned back along the hinder part, and there be carried up into funnels adjoining to the tool-house, by which the smoke may be carried off. The fire-place may be contrived at one end of the house, and the door at which the fuel is put in, as also the ash-grate, may be contrived to open into the tool-house, and, the fuel being laid in the same place, the whole will be out of sight. Bradley advises, that the front of greenhouses, in the colder parts of England, be built in a sweep or semicircle, so that one part or other of it may receive the sun's rays all day. The use of fires must, however, be very sparing in this place; and not one winter in three or four will require them in any part; only when the weather is very severe, and the frost cannot well be kept out any other way, this expedient may save a whole house of plants. Withinside of the windows, in front of the greenhouse, there should be good strong shutters, made with hinges to fold back close to the piers, that they may not obstruct the rays of the sun. The back part of the house should be either laid over with stucco or plastered with mortar, and whitewashed, in order to prevent the frosty air from penetrating through the walls. When the greenhouse is wainscotted, the walls should be plastered with lime and hair behind the wainscot to keep out the cold; and the wainscot, as well as the ceiling, and every part within the house, should be painted white, to reflect the sun's rays. There must be a number of tressels with forms of wood upon them, to support the pots of plants; the tallest to be placed hindmost, the lowest within four feet of the windows; and the rows of plants should rise gradually, so that the heads of the second row should be entirely above the first; and behind them there should be a space of at least five feet for the convenience of watering the plants, and for a free circulation of the air. The wings may be made capable of a greater warmth also by more flues, and may be made to contain a hot-bed of tanner's bark, for raising many of the tender plants, natives of warm climates. Whilst the front of the greenhouse is exactly south, one

of the wings may be made to face the south-east and the other the south-west. By this disposition the heat of the sun is reflected from one part of the building to the other all day, and the front of the main greenhouse is guarded from the cold winds. These two wings may be so contrived as to maintain plants of different degrees of hardness, which may be easily effected by the situation and extent of the fire-place, and the manner of conducting the flues: the wing facing the south-east is evidently most proper for the warmest stove; this may be divided in the middle by a partition of glass, with glass doors opening from one division to the other. In each of these there should be a fire-place, with flues carried up against the back wall, through which the smoke should be made to pass as many times the length of the house as the height will admit of the number of flues; for the longer the smoke is in passing, the more heat will be given to the house with a less quantity of fuel. The other wing, facing the south-west, should be divided and furnished with flues in the same manner; and thus different degrees of heat may be obtained, according to the seasons and the particular sorts of plants that are to be preserved. If there are no shades behind these wings, the walls should not be less than three bricks thick; and the back part having sloping roofs, which are covered with tiles or slates, should be lined with reeds, &c., under the covering. The sloping glasses of these houses should be made to slide and take off, so that they may be drawn down more or less in warm weather to admit air to the plants; and the upright glasses in front may be so contrived as that every other may open as doors upon hinges, and the alternate glasses may be divided into two. The upper part of each should be so contrived as to be drawn down like sashes, so that either of them may be used to admit air, in a greater or less quantity as there may be occasion. As to the management of the plants, Mortimer recommends opening the mould about them from time to time, and sprinkling a little fresh mould in them, and a little warm dung on that; as also to water them when the leaves begin to wither and curl, and not oftener, which would make them fade and be sickly; and to take off such leaves as wither and grow dry.

GREEN ISLAND, an island on the west coast of North America, in Prince William's Sound, about twenty-four miles in circumference, and is surrounded with islets. Long. $213^{\circ} 7' E.$, lat. $60^{\circ} 18' N.$

GREEN MOUNTAINS, a range of mountains extending N.N.E. to S.S.W. North America, and dividing the waters which flow easterly into Connecticut River, from those which flow westerly into Lake Champlain, Lake George, and Hudson's River. The land generally rises to its height at from twenty to thirty miles distance from the rivers. The growth upon these mountains is hemlock, pine, spruce, and other evergreens; hence they have always a green appearance, and on this account have obtained their name. In some parts snow lies till May, and sometimes till June. The chain extends through Massachusetts and Connecticut, and terminates

in New Haven. Kellington Peak, the highest of these mountains, is about 3454 feet above the level of the ocean.

GREEN RIVER, a river of New Brunswick, which runs into the St. John. Long. $67^{\circ} 58' W.$, lat. $47^{\circ} 20' N.$ —Also a river of Canada, which runs into the St. Lawrence, 115 miles below Quebec.

GREENE (Dr. Maurice), a celebrated musical composer. He was brought up in the choir of St. Paul's, and was afterwards bound apprentice to Brind, the organist of that cathedral. He was early noticed as an elegant organ player and composer for the church, and obtained the place of organist of St. Dunstan in the West, before he was twenty years of age. In 1717, on the death of Daniel Purcell, he was likewise elected organist of St. Andrew's, Holborn; but the next year, his master Brind dying, Greene was appointed his successor by the dean and chapter of St. Paul's; upon which event, he quitted both the places he had previously obtained. In 1726, on the death of Dr. Croft, he was appointed organist and composer to the Chapel Royal; and on the death of Eccles, 1735, master of his majesty's band. In 1730 he obtained the degree of doctor in music at Cambridge, and was appointed public music professor in the same university, in the room of Dr. Tudway. During the last years of his life he began to collect the services and anthems of our old church composers, from the single parts used in the several cathedrals of the kingdom, in order to correct and publish them in score; a plan which he did not live to accomplish; but, bequeathing his papers to Dr. Boyce, it was afterwards executed in a very splendid and ample manner. Dr. Greene died in 1755, and was succeeded, as composer to the Chapel Royal and master of his majesty's band, by his pupil Dr. Boyce.

GREENE, a county of the state of New York, on the west side of the Hudson. It was erected from Albany county in 1801, and is bounded on the north by Schoharie and Albany counties, east by the Hudson, south by Ulster county, and on the west by Delaware county. Its form is irregular, but the area is estimated to be equal to 508 square miles. Population in 1816, 19,566. The chief town is Catskill.

GREENE, a county of the United States, in East Tennessee. Greenville is the chief town. Population 9713.

GREENEVILLE, a town of the state of Tennessee, in Greene county, situated on Nolachucky river, seventy-five miles east of Knoxville.

GREENFIELD, a post town, the capital of Franklin county, Massachusetts, North America, on the west bank of the Connecticut; twenty miles south of Brattleborough; twenty-one north of Northampton; ninety-five W.N.W. of Boston; 406 west. It is situated in a pleasant and fertile tract of country, and contains a court-house, a jail, a printing-office, a cotton manufactory, an oil-mill, and three religious societies, two congregational, and one episcopal. It is situated about one mile and a half from the river; is very pleasant, handsomely built, and flourishing, and has considerable trade. A weekly newspaper is published here.

GREENLAND, an extensive country of the Western hemisphere, having the Polar Seas, or some unknown regions, for its northern boundary; the Icy Sea, and the straight which separates it from Iceland, on the east; and Baffin's Bay on the west: south, and south-east, it is washed by the Atlantic Ocean. It has been conjectured to be insular,—to consist of a cluster of islands, &c., but these are mere surmises: the only known part of the coast is Cape Farewell, and a portion of West Greenland, extending to about 76° of N. lat. The eastern coast has been totally inaccessible in modern times. Hudson saw it in 73° . In 1788 a Danish ship is said to have seen this coast $2^{\circ} 30' E.$ of Cape Farewell; and it is also said to be seen, in clear weather, from the mountains of Iceland, in lat. 65° . The Dutch whalers, it appears, used formerly to visit this coast, between the lat. of 70° and 76° , and gave it the name of Galehamsques, or Hamken's Lund. In lat. 70° they found a deep indentation twenty-five leagues broad, which they concluded to be a strait, communicating with that of Davis, from meeting the same species of whales, some individuals of which they occasionally took with the harpoons of the western Greenlanders in them.

The knowledge of the western coast, however, proves that no strait exists between Cape Farewell and the 72° . Des Pages, who supposed himself to be within a short distance of the coast of Galehamsques, in lat. $74^{\circ} 20'$, estimates its longitude on that parallel at $15^{\circ} 10' W.$, and says, that the Dutch placed it in $18^{\circ} 14'$, on the parallel of 72° . Combining these data with the reports of the missionaries, that the west coast is inhabited to the lat. of 76° , we may rationally conclude that both the east and west coasts extend to this parallel.

Greenland, according to the Chronicles, was discovered in 982. The favorable account given of it by the first visitors caused the Icelanders and Norwegians to send a colony hither in 986. In 1000 these colonists were converted to Christianity; and until 1418 they had a regular succession of bishops from Denmark. The colony was divided into two cantons, named East and West; in the former were the two towns of Garda and Hrattalid, twelve churches, and two convents; and in the latter four churches, and 100 farms in cultivation. The plague, which, at the commencement of the fifteenth century, ravaged all Europe, and depopulated the north in particular, carried off the majority of the inhabitants of Greenland; and in 1418 an unknown fleet arrived, and, attacking the weakened colonists, destroyed every thing by fire and sword. The division of the ancient Scandinavian colony in Greenland into East and West has given rise to a great geographical error. It being conceived that the eastern canton occupied the coast opposite to Iceland, while it is satisfactorily proved by the routes of the voyagers from Norway and Iceland that this canton occupied the most southerly part of the west coast; and, indeed, it is here alone that, for a few weeks in summer, a brilliant verdure justifies the name of Greenland given to this country by the Icelanders. The sites of the two ancient colonies have been discovered by the missionaries, who have found the ruins of

seven churches on the south-west coast, and, after passing a space without any such vestiges, they are again met with a little to the north of Cape Desolation.

From the year 1418 to 1576 Greenland seems to have vanished from observation. In the latter year its south extremity was visited by Frobisher, who named it West Friesland; and, having picked up some black stones which proved to be the marcasite of gold, Elizabeth gave the country the name of *Meta Incognita* (unknown limit), and determined on forming a colony here, for which purpose Frobisher was sent out on his third voyage, but the loss of the ships, with the materials for building, frustrated this plan; and Greenland was again neglected until 1720, when Egede, a Dane, inspired by religious zeal, determined to visit it, and seek for the remains of the ancient colonies. Being followed by other missionaries, with their families, several establishments were formed on the west coast, and many of the Pagan natives converted. In 1765 the Moravian brethren began to form settlements on the same coast.

Greenland forms an assemblage of rocky mountains, whose summits are crowned with eternal snow and ice. The most elevated on the west coast rises in three peaks, called *Deer's Horns*, that are seen forty leagues. The mountains are composed of granite, argillaceous stone, and a colored stone, of which the natives make their lamps, boilers, and other utensils. The signs of metals have been observed, and asbestos is met with in the mountains. A new mineral named *eryolite* has also been found here.

The summer, towards the south, commences at the end of May, and lasts till the beginning of September. This season would be agreeable did not the thick fogs obscure the atmosphere and weaken the power of the sun. At the approach of winter storms are often violent, but during the greatest cold, which is in February and March, it is usually calm. Thunder and rain are uncommon. The *Aurora Borealis* is frequent and very bright. The tides in the bays are said to rise sometimes eighteen feet. In the isle of Onastok, in lat. 60° , is a constant boiling spring.

The soil is clay mixed with sand. To the north the only vegetation is mosses; but to the south are found small juniper, willows, and birches two or three yards high, together with various berry-bearing bushes, wild angelica, sorrel, tansey, rosemary, scurvy-grass, and other antiscorbutic plants, and some grasses. On the south the missionaries have endeavoured to raise wheat, but the plant, after forming a stalk of some height, always dries up and dies: they have, however, succeeded better with cabbages, turnips, and radishes.

The coasts are indented with gulfs, filled with islands, and well stocked with fish, particularly cod, halibut, and herrings. The rocks are the resorts of several species of seals, and of innumerable aquatic birds, amongst which is the eider duck. The rivers are in general small, and as well as the springs freeze in winter, and many of them dry up in summer. They afford salmon and cray fish. The principal fuel is the drift

wood, brought to the shores by the currents. The sea-water deposited in the crevices of the rocks is formed into salt by natural evaporation. The quadrupeds are white bears, white and gray foxes, white hares, wolves, and dogs, used by the natives to draw their sledges, as well as occasionally for food; rein-deer are also tolerably plentiful, but the Greenlanders do not take the pains to domesticate them.

The Greenlanders are evidently the same race as the Esquimaux of the neighbouring continent. Their number is very inconsiderable, being greatly reduced by the small-pox introduced from Copenhagen in 1772. The missionaries calculate under 1000 the fixed Greenlanders in their establishments, and Crantz estimates the wandering tribes at 7000 souls. In 1805 the Europeans were 6000.

Greenland is politically divided into two inspectorships, named North and South, separated by the strait of Romelpoot, in lat. 68° . In the southern inspectorship are seven establishments of the missionaries and three of Moravians, viz. Julian's Harbour, 61° ; Frederick's Harbour, $62^{\circ} 30'$; Fiskenhøst, $63^{\circ} 30'$; Good Haven $64^{\circ} 10'$; Sukertoppen $65^{\circ} 40'$; Kigurtorsok, and Holsteinborg, $67^{\circ} 10'$. The Moravian are New Hernhaut, near Good Haven, Lechtenfels, 63° , and Lichtenau, five leagues north-east of Cape Farewell.

In the northern inspectorship the missionaries' establishments are eleven; one on each of the islands of Prince Royal and Crown Prince, Egedesminde, $68^{\circ} 20'$; Jacob's Haven, $68^{\circ} 40'$; Christian's Haven $68^{\circ} 50'$; Claus Haven, Good Haven $69^{\circ} 10'$, in the isle of Disco; Fortune Bay, eight miles farther north, Rutter's Bank, $70^{\circ} 10'$; Umanak, 71° ; Uppernavik, $72^{\circ} 30'$.

The Greenlanders are a migratory people, and often transfer their abodes, in the winter season, from one place to another. They build their houses generally at the mouths of friths, or on the shores of small islands. The following is a list of places inhabited by them from 1810 to 1813, supplied to the *Edinburgh Philosophical Journal* by Sir Charles Giesecke of Dublin.

1. JULIANAS-HAAB district.—In the south of Greenland, that is in 60° , or the most southern district of Julianus-haab, round Cape Farewell are inhabited:—

1. Alluk (that is the soles), two small islands presenting the shape of the soles of the foot.

2. Kippingajak, an island to the south of Alluk.

3. Pysursoak, a small bay to the north of Staatenhuck.

4. Nettingiak, on the continent, eastward from Cape Farewell.

5. Nennortelik (that is Bear-land), an island eastward from Cape Farewell.

6. Tessermit, a large frith to the north of Cape Farewell, formerly inhabited by the old Norwegians. At the mouth of this frith there are several Greenland houses, sixty-four miles south from the colony of Julianus-haab, in 60° .

7. Kognamint, to the south of Julianus-haab, on the continent.

8. Innersutalik, an island forty miles southward from Julianus-haab.

9. Agluitsock, on the continent, thirty miles southward from the colony.

10. Sardlok, an island sixteen miles southward from the colony.

11. Omenalik, twelve miles to the south of the colony.

12. Upernaviarsuk, sixteen miles towards the east of the colony.

13. Itublik, twenty miles towards the east of the colony. At the colony of Julianas-haab, only natives are employed in the service of the trade, who live in Greenland houses. Between 61° and 62° are inhabited.

14. Ikertongoak, an island eight miles towards the west, at the mouth of the frith called Kakortok.

15. Narksak, in the vicinity of the continental ice, twenty miles northward from the colony.

16. Krimatuluitsanik, an island forty miles northward from Julianas-haab.

17. Okaitsermint and Kikerteitsiak, forty-four miles from the colony. Here ends the district called Julianas-haab. It is inhabited by 1762 natives, viz. 754 males and 1008 females.

11. (18.) FREDERICKS-HAAB district extends from the Nunarsoi Island to the Ice-blink, about $20'$ to the north of Fredericks-haab. Of the southern part of the district are inhabited:—

19. Torngarsuk, an island thirty-two miles to the south of the colony.

20. Kangarsuk, a cape of the continent of Greenland.

21. Narksalik, twenty-eight miles southward from the colony: and,

22. Sioramint, eight miles to the north of the colony. The population of this district comprehends 552 natives, viz. 234 males and 318 females.

III. FISKE-NÆR District extends from $62^{\circ} 52'$ to $63^{\circ} 30'$.

23. The inhabitants of the district Fiskernær have their houses at the settlement of the Moravian Brethren, called Lichtenfeld. Their number is 280, viz. 112 males and 168 females.

IV. GODT-HAAB. The district of the colony Godt-haab begins at $63^{\circ} 30'$, and reaches to $64^{\circ} 52'$. The following places are inhabited:—

24. Kariak, eight miles southward from the colony.

25. New-Sterrn-Ilut, a Moravian settlement, situated between the friths of Ameraglik and Baals River.

26. Godt-haab, the Danish colony in Baals River, and

27. Sarlok, to the north-east of Baals River. —The population of this district amounts to 489 natives, viz. 186 belonging to the Danish mission and 303 belonging to the Moravian mission. The former consists of eighty-one males and 105 females, the latter of 123 males and 180 females.

V. SUKKER-TOP. The district of Sukker-top (sugar loaf) begins at $64^{\circ} 52'$ and ends at $66^{\circ} 17'$. In this district the following places are inhabited by natives. Towards the south of the colony:—

28. Nappasok, an island situated forty miles southward from the colony.

29. The colony Sukker-top itself, called Manetsok by the natives; and

30. Akpaniut, sixteen miles northward from

the colony. The population of this district is 304; viz. 143 males and 161 females.

VI. HOLSTEINBURG District is the last in South Greenland.

31. The district of Holsteinsburg begins at $66^{\circ} 16'$ and ends with $67^{\circ} 45'$. The natives, being employed in the whale fishery, have all their winter-houses round the colony. The number of the inhabitants of this district is 196, viz. eighty-seven males and 109 females. Thus the whole population of South Greenland, the limits of which are fixed to the Strom Frith in 68° , comprehends a number of 3583 souls.

North Greenland commences in lat. $67^{\circ} 43'$, and comprehends the following districts:

1. Egedes-minde district, extending from . . . $67^{\circ} 43'$ to 68°
2. Christianshaab district. . . 68° $68^{\circ} 10'$
3. Jacobshavn district . . . 69° $69^{\circ} 40'$
4. Rittenbenks district . . . $69^{\circ} 40'$ 71°
5. Omenaks district . . . 71° $72^{\circ} 8'$
6. Upernaviks district . . . $72^{\circ} 8'$ $76^{\circ} 30'$

The population of North Greenland is not entirely ascertained, but it does not exceed the number of 3000 souls. The country from 67° to 69° is uninhabited. The first district of North Greenland is that of the colony Egedes-minde. The natives belonging to this and the other districts situated round Disko-Bay, or Fish-Bay, have their houses at the colonies, for the sake of the whale-fishery. The Greenlanders of Omenak district are the only natives of the whole coast who live during winter in the interior of that extensive frith, having their supply in catching the seals, by means of nets which are set under the ice.

The most northern district is that of Upernavik; it begins at 72° , and reaches to the remotest north; but it is only inhabited to the 73° . Southwards from Upernavik is situated Kangersoetsiak, an island inhabited by natives. At Upernavik four or five Greenland families have their abode. At Tessiursak, an island in $74^{\circ} 15'$, eighty miles northward from Upernavik, one family terminates the population of this forlorn country.

GREENOCK, a town in the lower ward of Renfrewshire, and the principal sea-port of Scotland, is situated in long. $0^{\circ} 18' 58''$ W., lat. $55^{\circ} 57' 2''$ N. Seated on the south bank of the Frith of Clyde; it has in front a noble bay, anciently called the bay of St. Lawrence, the river expanding here to the breadth of more than five miles. The advance of Greenock to its present commercial importance, from an obscure fishing village, has been steadily progressive, yet rapid. In 1757, at which period the population was under 4000, it was erected into a burgh of barony by Sir John Schaw, who at the same time conferred upon the feuars and burgesses the power of electing their own magistrates, a privilege rarely possessed in Scotland.

Though a modern town, Greenock is irregularly built, and the streets in the lower part of it very narrow. The principal line, however, which extends about a mile from east to west, is tolerably spacious and well-built, and at the west end of the town the streets are judiciously laid out, and the houses handsome. Near the

eastern extremity is a square, containing a spacious parish church, with a spire 146 feet in height. In the same square is an elegant reading room, and still further eastward are placed the Exchange Buildings, containing another public reading room, assembly rooms, &c.; and on the opposite side of the street is the Tontine, an extensive hotel for the accommodation of travellers.

In 1826 James Watt, Esq., of Soho, son of the celebrated improver of the steam-engine, to whom Greenock had the distinguished honor of giving birth, bestowed a sum of £2000, to be expended in the erection of a suitable hall for a public library, the site of which was judiciously laid in the vicinity of the public buildings just mentioned; and in this edifice is to be placed a full-length marble statue of the late Mr. Watt, from the chisel of Chantry. In 1817-18 an extensive edifice was erected by government, at an expense of £33,000, for the accommodation of the customs and excise departments: it is finely placed, close upon the river, and being a handsome structure, with a spacious front, and elegant portico, of the Grecian Doric order, is a very attractive object in approaching the harbour.

The chief foreign trade of Greenock is carried on with the West Indies, North and South America, the East Indies, and the Mediterranean. The principal imports are sugar, rum, coffee, cotton, timber, ashes, grain, &c. An extensive coasting trade is also carried on; much of the agricultural produce of Ireland is brought hither, and the herring fishery, originally its only trade, is still an important branch; the number of barrels cured in the ten years preceding the 5th of April, 1826, according to the official reports, giving an average of 18,608 barrels annually.

In the year 1825 the duties of customs collected at this port amounted to £414,447 2s. 7d., and, notwithstanding the commercial depression of the following year, the sum of £395,774 2s. 5d. was collected in that which terminated on the 5th of January, 1827. From the 5th of January, 1826, till the period just mentioned, 54,037 tons of British shipping cleared inwards at this port, and 2380 Foreign ditto; 58,519 tons British, outwards, and 2260 foreign ditto; 39,299 tons of shipping cleared inwards, and 71,931 outwards, in the coasting trade. The registered shipping of the port, at this date, amounted to 26,534 tons. The harbours, which have been enlarged from time to time, are spacious and commodious, and capable of admitting vessels of great burden. There are two graving-docks, one of them very extensive, constructed at an expense of £30,000; and, upon the whole works for the accommodation of shipping, upwards of £120,000 have been expended. The revenues of the town and harbours exceed £10,000 annually. The business of ship-carpentry is extensively carried on here, there being four building-yards, which employ a great number of men, and annually launch some of the finest vessels of which the mercantile marine can boast. Since 1812, when on the Clyde the first successful experiment was made of applying steam to the purposes of navigation, the building of steam-boats has given no inconsiderable employment to the

ship-carpenters. It was from this port that the first vessels which navigated the open sea between Holyhead and Dublin were fitted out, and subsequently those which run between the Clyde and Mersey; and, at a more recent date, the largest and most splendidly equipped steam-vessel in the world, the *United Kingdom*, was built and finished here, at an expense little short of £40,000.

In 1827, beside those steam-packets, many of them of large dimensions and power, which conveyed goods and passengers, or the latter exclusively, to and from this port and Liverpool, Dublin, Belfast, Derry, and the Western and Northern Highlands, a number plied within the range of Greenock and Glasgow only, making an aggregate number of about sixty vessels of this description alone. By this means an incalculable number of persons are annually conveyed in every direction; and places previous to the introduction of steam-vessels deemed remote, and comparatively inaccessible, are now brought into communication by a voyage of a few hours, with ease, safety, and certainty.

In local manufactures Greenock has not held so prominent a rank as in commerce; still it contains many works on a respectable scale of magnitude. Its sugar refineries, five in number, in all of which the process is carried on by steam, are extensively employed; it possesses two large works for the manufacture of steam-engines, and other machinery; a flint-glass work, the products of which are much esteemed; a bottle-work, breweries, distilleries, a pottery, rope-works, chain cable, and duck manufactories. Hat-making is also pretty extensively carried on; and, to the enterprise of two gentlemen in this place, the British public are indebted for the manufacture of straw-plat, in imitation of that imported from and known by the name of Leghorn, which they in a short period brought to so much perfection as to rival in every respect the foreign commodity. But in 1825, a period in which so many absurd projects, amongst some of unquestionable utility, found ready patrons, a scheme was first set in motion, of a novel description certainly, but calculated at no distant day to render Greenock as conspicuous in a manufacturing as a commercial point of view. It was shortly this: to take the advantage of the natural facilities which were presented by a chain of hills that extend several miles to the westward of Greenock, and by means of these to lead a considerable stream, known by the name of the Shaw's Water, along a high level to the immediate vicinity of the town, from the heights behind, which it might descend in successive falls, for the purpose of working machinery employed in the various manufactures, by a less expensive agent than steam. A joint stock company was accordingly formed, and incorporated by act of parliament with a capital of £30,000, and the execution of the plan confided in Mr. Robert Thom, of the Rothesay cotton works, who may be said to be the inventor of artificial water-power, having successfully carried into practice the same plan, though on a smaller scale, at Rothesay.

The necessary works were commenced, by

embanking the lower extremity of the valley through which the Shaw's Water flowed, to the height of fifty-six feet, by which a reservoir covering 315 acres of ground, and capable of containing 250,000,000 cubical feet of water, was formed. Less reservoirs were also made, increasing the quantity to 300,000,000, and the whole was computed to be adequate to the entire consumption, for four months, of a stream whose power should be equal to that of 100 horses; for other four months of the year the current natural supply was calculated to meet the demand; and the floods of the winter months were estimated not merely to do so, but likewise to replenish the exhausted reservoirs. In the execution, this leading part of the plan proved eminently successful, the supply of water being most abundant. From the reservoir the aqueduct was formed by cutting an embankment along the chain of hills already noticed: including the numerous curvatures, it measures nearly seven miles in length, and where it first branches off into two distinct streams, each possessing a moving power of fifty horses, with a thirty feet fall, it holds an elevation of 512½ feet above the level of the Clyde. Thus a power is supplied, which, by successively acting on machinery placed at given distances, yields an equivalent to the power of 8234 horses, working eight hours per diem; and as the value of a horse's power, where steam is employed, is estimated at £30 per annum, these works in their present state give an equivalent power of the value of £117,930 yearly; yet the entire undertaking did not cost more than £20,000, and at an inconsiderable expense this prodigious power is capable of being doubled in amount. Many ingenious yet simple contrivances are resorted to for regulating the supply of water, which cannot be here pointed out: they are all self-acting, and contrived to work with admirable precision. This novel undertaking was completed early in the summer of 1827. But for the convulsion of 1826 in the mercantile world, the means thus afforded of obtaining a moving power, which is let by the Shaw's Water Company at about one-eighth the expense of that derived from steam, would have induced many manufactories to be set down here; and there cannot be a doubt that in a few years this will be the case. Grain-mills have already been erected on one of the sites, and several manufactories new to the district, but for which it is peculiarly eligible by the possession of this economical power, and the proximity of an extensive shipping port, will be successively established. Nor can there be any question, that, where similar local facilities can be found, the plans of Mr. Thom will be speedily embraced, as their importance and successful operation become known, to the exclusion of the far more expensive agency of steam. The population of Greenock, by the census taken in 1811, was then 19,042; in 1821, 22,594; and in 1827 has probably increased to 25,000. The town is divided into three parishes; and besides three established churches, and two chapels of ease, possesses dissenting chapels of various denominations; an episcopal, and a Roman Catholic chapel. There are several excellent

charitable institutions in the town. There are two local banking companies, both of which issue notes, but no branch establishments in town. A newspaper is published in it twice a week. Fairs are held twice a year, in July and November. It is distant from Glasgow about twenty-three miles west.

GREENVILLE, a post town of North Carolina, the capital of Pitt country; twenty-three miles from Washington, fifty-three south-west of Edenton, 444 of Philadelphia. Long. 2° 19' W. of that city, lat. 35° 35' N.

GREENWICH, a market town of Kent, pleasantly situated on the banks of the Thames five miles east of London. It had formerly a royal palace, built by Humphry duke of Gloucester, enlarged by Henry VII. and completed by Henry VIII. The latter often chose this town for his place of residence; as did also the queens Mary and Elizabeth, who were both born in it. Duke Humphry began a tower on the top of the steep hill in the park which was finished by Henry VII. but afterwards demolished, and a royal observatory erected in its place by Charles II. furnished with mathematical instruments for astronomical observations, and a deep dry well for observing the stars in the day-time. The palace having fallen into decay, king Charles II. pulled it down and began another, of which he lived to see the first wing magnificently finished. But king William III. in 1694, granted it, with nine acres of ground, to be converted into a royal hospital for old and disabled seamen, the widows and children of those who lost their lives in the service, and for the encouragement of navigation. The wing, which cost king Charles £35,000, is now the first wing of the hospital towards London. The front to the Thames consists of two ranges of stone buildings, with the ranger's house in the centre of the area, but detached from any part of the hospital. These buildings correspond with each other, and have their tops crowned with strong balustrades. The buildings which face the area correspond with them, though in a finer and more elegant style; and have domes at their ends, which are 120 feet high, supported on coupled columns. Under one of these is the hall, which is finely painted by Sir James Thornhill, and contains many royal portraits; and under the other the chapel. A fire broke out in the hospital on the 2d of January 1779, and totally consumed the dome at the south-east quarter of the building, with the chapel, which was the most elegant in the world, the great dining-hall, and eight wards, containing the lodgings of nearly 600 pensioners. The dome was rebuilt about 1785. On the sides of the gate which opens to these buildings from the park, are placed a large terrestrial and celestial globe, in which the stars are gilt; and in the centre of the area is a statue of George II. About 3000 old disabled seamen are maintained in this hospital. Besides private benefactions, to the amount of nearly £60,000 the British parliament, in 1732, settled upon it the earl of Derwentwater's estate, to the value of £6000 per annum. As well as the seamen and widows above mentioned, about 100 boys, the sons of seamen, are bred up for the service of the royal navy; but there are no out-pensioners as

at Chelsea. The park is well stocked with deer, and affords as much variety, in proportion to its size, as any in the kingdom; but the views from the observatory and the one-tree hill are beautiful beyond imagination, particularly the former. The projection of these hills is so bold, that one does not look down upon a gradually falling slope or flat enclosures, but at once upon the tops of branching trees, which grow in knots and clumps out of deep hollows and dells. The cattle which feed on the lawns, which appear in breaks among them, seem moving in a region of fairy-land. This is the foreground of the landscape: a little farther, the eye falls on that noble structure, the hospital, in the midst of an amphitheatre of wood, then the two reaches of the river make that beautiful serpentine which forms the Isle of Dogs, and present the floating treasures of the Thames. To the left appears a fine tract of country leading to the capital, which there finishes the prospect. The parish church of Greenwich, rebuilt by the commissioners for erecting the fifty new churches, is a very handsome structure, dedicated to St. Alphage, archbishop of Canterbury, who is said to have been slain by the Danes in 1012, on the spot where the church now stands. There is a college at the end of the town, fronting the Thames, for the maintenance of twenty decayed old housekeepers, twelve out of Greenwich, and eight alternately chosen from Snottisham and Castle-Rising in Norfolk. This is called the duke of Norfolk's college, though it was founded and endowed in 1613 by Henry earl of Northampton, the duke of Norfolk's brother, and by him committed to the care of the Mercers' Company. To this college belongs a chapel, in which the earl's body is laid; which, as well as his monument, was removed hither several years ago from the chapel of Dover Castle. The pensioners, besides meat, drink, and lodgings, are allowed 18*d.* a week, with a gown every year, linen once in two years, and hats once in four. In 1560 Mr. Lambard, author of the *Perambulation of Kent*, also built an hospital, called Queen Elizabeth's College, said to be the first erected by an English Protestant. There are likewise two charity schools in this parish. The Thames is here very broad, and the channel deep; and at very high tides the water is salt. This is the chief harbour for the king's yachts. A market on Wednesday and Saturday was instituted in 1737; the direction of which is in the governors of the royal hospital, to which the profits arising from it were to be appropriated. The English astronomers reckon their longitude from Greenwich.

GREENWICH, a post town of Fairfield county, on Long Island Sound, in the south-west corner of the state; fourteen miles W. S. W. of New-Haven, forty-five W. S. W. of New-Haven, west 259.

GREENWICH, a post town of Washington county, New York, eight miles west of Salem, thirty-seven north of Albany, 391 west. It contains two houses of public worship, one for congregationalists, and one for baptists; an academy, a distillery, and extensive cotton and woollen manufactories.

GREET, *v. a. & v. n.* } Sax. *gretan*; Belg. *greeten*; Lat. *grator*.
GREETER, *n. s.* }
GREETING, *n. s.* } To address in any manner, but especially with kindness, compliments, or congratulations; to meet.

When Alla saw his wif, faire he hire *grette*;
And wept, that it wos routhe for to see;

For at the firste look he on hire sette,
He knew wel veraily that it wos she.

Chaucer. The Mon of Lawes Tale.

His lady, seeing all that channell from far,
Approacht in haste to greet his victorie. *Spenser.*

My noble partner
You greet with present grace, and great prediction;
To me you speak not. *Shakspeare. Macbeth.*

The king's a-bed,
And sent great largess to your officers;
This diamond he greets your wife withal,
By the name of most kind hostess. *Id.*

Now Thomas Mowbray, do I turn to thee,
And mark my greeting well; for what I speak,
My body shall make good. *Id. Richard II.*

I from him
Give you all greetings, that a king, as friend,
Can send his brother. *Id. Winter's Tale.*

My lord, the mayor of London comes to greet
you.

—God bless your grace with health and happy
days. *Shakspeare.*

Your haste
Is now urged on you.
We will greet the time. *Id. King Lear.*

There greet in silence, as the dead are wont,
And sleep in peace. *Shakspeare.*

I think if men, which in these places live,
Durst look in themselves, and themselves retrieve,
They would like strangers greet themselves. *Donne.*

Now the herald lark
Left his ground net, high towering to desery
The morn's approach, and greet her with his song.
Milton.

Once had the early matrons run
To greet her of a lovely son. *Id.*
The sea's our own, and now all nations greet,
With bending sails, each vessel of our fleet. *Waller.*

Thus pale they meet, their eyes with fury burn:
None greets; for none the greeting will return;
But in dumb surliness, each armed with care,
His foe protest, as brother of the war. *Dryden.*

I would gladly go,
To greet my Pallas with such news below. *Id.*
Such was that face on which I dwelt with joy,
Ere Greece assembled stemm'd the tides to Troy.
But parting then for that detested shore,
Our eyes, unhappy! never greeted more. *Pope.*

With annual joy the redd'ning shoots to greet,
Or see the stretching bran hes long to meet. *Id.*

Thus as the stream and ocean greet,
With waves that madden as they meet—
Thus join the bands from mutual wrong,
And fate and fury drive along. *Byron.*

GREEZE, *n. s.* Otherwise written greece.
See GREECE, or GRIEZE, or GRICE; from deerees. A flight of steps; a step.

GRE'GAL, *adj.* } Lat. *grar*. Belonging
GREGARIOUS, *adj.* } To a flock; going in flock or herds like sheep or partridges.

No birds of prey are *gregarious*.

Ray on the Creation.
GREGORIAN CALENDAR, that which shows the new and full moon, with the time of Easter and the moveable feasts depending thereon, by means of epochs disposed through the several

months of the Gregorian year. See CHRONOLOGY and KALENDAR.

GREGORIAN STYLE, or new style, the style now used, which succeeded the Julian Style, in Britain in 1752.

GREGORIAN YEAR. See CHRONOLOGY.

GREGORIO (St.), an island in the province of Quarnaro, three miles long, and half a mile broad. The natives deal chiefly in sheep, of which there are 2500 on the island.

GREGORY, the name of fifteen popes of Rome. See ITALY. Of these we shall here only mention three of the most eminent, viz.

GREGORY I. surnamed the Great, pope of Rome, was born at Rome, of a patrician family, A. D. 544. He discovered such abilities in the exercise of the senatorial employments, that the emperor Justin the younger appointed him prefect of Rome. Pope Pelagius II. sent him nuncio to Constantinople, to demand succours against the Lombards. When he thought of enjoying a solitary life he was elected pope by the clergy, the senate, and the people of Rome, A. D. 590. Besides his learning and diligence in instructing the church, both by writing and preaching, he by his talents procured the acknowledgment of several princes of his temporal as well as spiritual right over their kingdoms. He undertook the conversion of the English, and sent over some monks of his order, under the direction of Augustin their abbot. With respect to the chastity of churchmen, he was very rigid; and he likewise exerted himself against such as were found guilty of calumny. He, however, flattered and favored the emperor Phocas, while his hands were yet reeking with the blood of Mauritius, and of his three children, who had been butchered in his sight. He is accused of destroying the noble monuments of ancient Roman magnificence, that those who visited the city might not attend more to the triumphal arches than to religion; and he burnt a multitude of the works of the ancients, among which were several manuscripts of Livy, lest the attention to heathen literature should supersede the monkish and ecclesiastical studies of the age. He died in 605. His Dialogues, principally an account of Roman Catholic miracles, and three of his Letters to Phocas, are extant.

GREGORY XIII. was a native of Bologna, and succeeded Pius V. in 1572. He was the most deeply versed in the canon and civil law of any in his time. He ornamented Rome with many fine buildings and several fountains. He corrected Gratian's Decretals, and wrote learned notes on them. But his chief merit lies in his alteration of the Kalendar, which was effected under his orders by Lewis Lilio, a Roman physician. See CHRONOLOGY. A short time before he died he received ambassadors from Japan, acknowledging the authority of the holy see. He died in 1585, aged eighty-three.

GREGORY XV. was also a native of Bologna, and descended of an ancient family. His name was Alexander Ludovisio. He was elected pope in 1621, and was author of several works, particularly one entitled *Epistola ad Regem Persarum*, Shah Abbas; published cum notis Hegalsoni, in 1627, 8vo.

GREGORY (Theodore), surnamed Thaumaturgus on account of his miracles, was the scholar of Origen; and was elected bishop of Neocæsarea, his birth-place, about A. D. 240, during his absence. He assisted at the council of Antioch in 255, against Paulus Samosatenus; and died in 270. He had the satisfaction of leaving only seventeen idolaters in his diocese, where there were but seventeen Christians when he was ordained. Of his works there are still extant, A Gratiatory Oration to Origen: a Canonical Epistle; and some other pieces.

GREGORY, bishop of Nyssa, one of the fathers of the church, and author of the Nicene creed, was born in Cappadocia, about A. D. 331. He was chosen bishop of Nyssa in 372, and banished by the emperor Valens for adhering to the council of Nice. He was afterwards, however, employed by the bishops in several important affairs, and died in 396. He wrote, Commentaries on the Scriptures; Sermons on the Mysteries; Moral Discourses; Dogmatical Treatises; Panegyrics on the Saints; Letters on Church Discipline; and other works. His style is very allegorical.

GREGORY (George Florentius), bishop of Tours, one of the most illustrious bishops and writers of the sixth century, was descended from a noble family in Auvergne. He was educated by his uncle Gallus, bishop of Clermont; and distinguished himself so much by his learning, that in 573 he was chosen bishop of Tours. He afterwards went to Rome to visit the tombs of the apostles, where he contracted a friendship with Gregory the Great, and died in 595. He was extremely credulous with regard to miracles. He wrote, 1. The History of France; 2. The Lives of the Saints; and other works. The best edition is that published by F. Rumart, in 1699.

GREGORY, surnamed Nazianzen, from Nazianzum, a town of Cappadocia, of which his father was bishop, was born, A. D. 324, at Azianzum, a village near it, and was one of the most illustrious ornaments of the Greek church in the fourth century. He was made bishop of Constantinople in 379; but finding his election contested by Timotheus, archbishop of Alexandria, he voluntarily resigned his dignity about 382, in the general council of Constantinople. His works are extant, in 2 vols., printed at Paris in 1609. His style is said to be equal to that of the most celebrated orators of ancient Greece.

GREGORY (David), F.R.S., Savilian professor of astronomy at Oxford. He was born at Aberdeen in 1661, and received the earlier parts of his education in that city. He completed his studies at Edinburgh; and, in the twenty-third year of his age, was elected professor of mathematics in the university of that city; and published, in the same year, *Exercitatio Geometrica de Dimensione Figurarum, sive Specimen Methodi Generalis Dimetiendi Quasvis Figuras*, Edinburgh; 1684, 4to. He saw very early the excellence of the Newtonian philosophy; and had the merit of being the first who introduced it into the schools by his public lectures at Edinburgh. 'He had,' says Mr. Whiston, 'already caused several of his scholars to keep acts, as we call them, upon

several branches of the Newtonian philosophy; whilst we at Cambridge, poor wretches, were ignominiously studying the fictitious hypothesis of the Cartesians.' In 1691, on the report of Dr. Bernard's intention of resigning the Savilian professorship of astronomy at Oxford, David Gregory went to London; and being patronised by Sir Isaac Newton, and warmly befriended by Mr. Flamsteed, he obtained the vacant professorship, for which Dr. Halley was a competitor. This rivalry, however, instead of animosity, laid the foundation of friendship between these eminent men; and Halley soon after became the colleague of Gregory, by obtaining the professorship of geometry in the same university. Soon after his arrival in London, Mr. Gregory had been elected F.R.S.; and, previously to his election into the Savilian professorship, had the degree of M.D. conferred on him by the university of Oxford. In 1693 he published in the Philosophical Transactions a resolution of the Florentine problem de Testudine Veliformi quadrabili; and he continued to communicate to the public, from time to time, many ingenious mathematical papers by the same channel. In 1695 he printed at Oxford *Catoptricae et Dioptricae Sphaericae Elementa*; a work which contains the substance of some of his public lectures at Edinburgh. This valuable treatise was republished first with additions by Dr. William Brown, with the recommendation of Mr. Jones and Dr. Desaguliers; and afterwards by the latter, with an appendix containing an account of the Gregorian and Newtonian telescopes, together with Mr. Hadley's tables for the construction of both these instruments. In 1702 our author published at Oxford, *Astronomiae Physicae et Geometricae Elementa*; a work which is accounted his master-piece. It is founded on the Newtonian doctrines, and was esteemed by Sir Isaac Newton himself as a most excellent explanation and defence of his philosophy. In 1703 he published a folio edition of Euclid in Greek and Latin. Dr. Gregory engaged, soon after, with his colleague Halley, in the publication of Apollonius's Conics, but he had not proceeded far in this undertaking before he died, in the forty-ninth year of his age, at Maidenhead in Berkshire. To the genius and abilities of David Gregory, the most celebrated mathematicians of the age, Sir Isaac Newton, Dr. Halley, and Dr. Keill, have given ample testimonies. Besides those works published in his lifetime, he left in MS. *A Short Treatise of the Nature and Arithmetic of Logarithms*, which is printed at the end of Dr. Keill's translation of Commandine's Euclid; and a *Treatise of Practical Geometry*, which was afterwards translated, and published in 1745, by Mr. Maclaurin.

GREGORY (James), F.R.S., one of the most eminent mathematicians of the seventeenth century, was born at Aberdeen in 1638. He received his education in the languages at Aberdeen, and went through the usual course of academical studies in the Marischal College. At the age of twenty-four he published his treatise, entitled *Optica Promota, seu abditiorum reflexorum et refractorum mysteria geometricae enucleata*; cui subnectitur appendix subtilissi-

morum *Astronomiae Problemata Resolutionem Exhibens*; London, 1663; in which work he first published an account of an invention of his own, and one of the most valuable of modern discoveries, viz. the reflecting telescope. This discovery attracted the attention of the mathematicians, who were soon convinced of its great importance to the sciences of optics and astronomy. The manner of placing the two specula upon the same axis appearing to Sir Isaac Newton to be attended with the disadvantage of losing the central rays of the larger speculum, he proposed an improvement on the instrument, by giving an oblique position to the smaller speculum, and placing the eye-glass in the side of the tube. But the Newtonian construction of that instrument has been long abandoned for the original or Gregorian, which is now universally employed where the instrument is of a moderate size; though Herschel preferred the Newtonian form for the construction of those immense telescopes, which he so successfully employed in observing the heavens. The university of Padua being then in high reputation for mathematical studies, James Gregory went thither soon after the publication of his first work; and fixing his residence there for some years, he published in 1667 *Vera Circuli et Hyperbolae quadratura*: in which he propounded another discovery of his own, the invention of an infinitely converging series for the areas of the circle and hyperbole. To this treatise, when republished in 1668, he added a new work, entitled *Geometriae pars universalis, inserviens quantitatibus curvarum transmutationi et mensurae*; in which he is allowed to have shown, for the first time, a method for the transmutation of curves. These works attracted the notice and the correspondence of the greatest mathematicians of the age, among whom were Newton, Huygens, and Wallis; and their author, being soon after chosen F.R.S. of London, contributed to enrich the Philosophical Transactions by many valuable papers. Through this channel he commenced a controversy with Huygens, occasioned by his treatise on the quadratures of the circle and hyperbole, to which that able mathematician had started some objections. In 1668 Mr. Gregory published at London his *Exercitationes Geometricae*, which contributed still to extend his reputation. About this time he was elected professor of mathematics in the university of St. Andrews; an office which he held for six years. In 1674 he was called to fill the mathematical chair in the university of Edinburgh. This place he had held for little more than a year, when, in October, 1675, being employed in showing the satellites of Jupiter through a telescope to some of his pupils, he was suddenly seized with total blindness, and died a few days after, at the early age of thirty-seven. He was a man of an acute and penetrating genius.

GREGORY (John), M.D., professor of medicine in the university of Edinburgh, was born at Aberdeen, in 1724. Losing his father, in the seventh year of his age, the care of his education devolved on his grandfather, Principal Chalmers, and on his elder brother, Dr. James Gregory, who, upon the resignation of his father a

short time before his death, had been appointed to succeed him in the professorship of medicine in King's College. The rudiments of his classical education he received at the grammar school of Aberdeen; and, under the eye of his grandfather, he completed, in King's College, his studies in the Latin and Greek languages, and in the sciences of ethics, mathematics, and natural philosophy. His master in philosophy and in mathematics was Mr. Thomas Gordon, professor of philosophy in King's College. In 1742 Mr. Gregory went to Edinburgh, where the school of medicine was then rising to that celebrity which has since so remarkably distinguished it. The Medical Society of Edinburgh, instituted for the free discussion of all questions relative to medicine and philosophy, had begun to meet in 1737. Of this society Mr. Gregory was a member in 1742, at the time when Dr. Mark Akenside, his fellow student and intimate companion, was a member of the same institution. In 1745 our author went to Leyden, and attended the lectures of those celebrated professors Gaubius, Albinus, and Van Royen. While at this place he had the honor of receiving from the King's College of Aberdeen, an unsolicited degree of M.D. and soon after, on his return from Holland, was elected professor of philosophy in that university. In this capacity he read lectures in 1747, 1748, and 1749, on mathematics, and on experimental and moral philosophy. In the end of 1749, however, he resigned his professorship of philosophy, his views being turned chiefly to the practice of physic. Previously, however, to his settling as a physician at Aberdeen, he went for a few months to the continent. Some time after his return to Scotland, Dr. Gregory married, in 1752, Elizabeth, daughter of William lord Forbes, and with her he received a handsome addition to his fortune. Of her character it is enough to say, that her husband, in his work, entitled *A Father's Legacy to his Daughters*, declares, that, 'while he endeavours to point out what they should be, he draws but a very faint and imperfect picture of what their mother was.' The field of medical practice at Aberdeen being at that time in a great measure pre-occupied by his elder brother, Dr. James Gregory, and others, our author went to London in 1754, and in the same year was chosen F.R.S. In this city his professional talents would doubtless have procured him a very extensive practice; but the death of his brother, Dr. James Gregory, in November, 1755, occasioning a vacancy in King's College, Aberdeen, which he was solicited to fill, he returned to his native country in 1756. Here our author remained till the end of 1764, when he changed his place of residence for Edinburgh, where, in 1766, on the resignation of Dr. Rutherford, he succeeded as professor of the practice of physic; and was appointed first physician to his majesty for Scotland, on the death of Dr. Whytt. On his first establishment in the university of Edinburgh, Dr. Gregory gave lectures on the practice of physic, in 1767, 1768, and 1769. Afterwards, by an arrangement with Dr. Cullen, professor of the theory of physic, these two eminent men gave alternate courses of the theory

and the practice. The only lectures which he committed fully to writing, were those introductory discourses which he read at the beginning of his annual course, and which are published under the title of *Lectures on the Duties and Qualifications of a Physician*. These lectures were first published in 1770, and afterwards in an enlarged and more perfect form in 1772; when he also published *Elements of the Practice of Physic*, for the use of Students; a work intended solely for his own pupils, and to be used by himself as a text-book to be commented upon in his course of lectures. Dr. Gregory, soon after the death of his wife, and, as he himself says, 'for the amusement of his solitary hours,' employed himself in the composition of a tract, entitled *A Father's Legacy to his Daughters*; which was published after the author's death by his eldest son. These letters were evidently written under the impression of an early death, which Dr. Gregory had reason to apprehend from a constitution subject to the gout, which had begun to appear at irregular intervals even from his eighteenth year. His mother, from whom he inherited that disease, died suddenly in 1770, while sitting at table. In the beginning of 1773, in conversation with his son, Dr. James Gregory, the latter remarking, that having for the three preceding years had no return of a fit, he might expect a pretty severe attack at that season; he received the observation with some degree of vexation, as he felt himself then in his usual state of health. The prediction, however, was too true; for having gone to bed on the 9th of February, 1773, with no apparent disorder, he was found dead in the morning. His death had been instantaneous, and probably in his sleep; for there was not the smallest discomposure of limb or of feature,—a perfect Euthanasia.

GREGORY (George), an English clergyman and general writer, was descended from a Scottish family, but born in Ireland, where his father was prebendary of Ferns. He was at twelve years old removed to Liverpool, and is said to have spent some years in a counting-house at that port. He, however, studied at Edinburgh, where he applied himself chiefly to mathematics and philosophy, and, having taken orders, obtained a curacy at Liverpool in 1778. In 1782 he became curate of Cripplegate, London, but resigned his office in 1785 on being elected morning preacher: he also officiated at the asylum. At this time he made himself known by the publication of a volume of *Historical Essays*. This was followed in 1789 by a Translation of bishop Lowth's *Lectures on the Sacred Poetry of the Hebrews*; after which appeared the *Life of Chatterton*, reprinted in the *Biographia Britannica*; *Church History*, 2 vols. 8vo.; a new translation of *Telemachus*; and the *Economy of Nature*, 3 vols. 8vo. In 1804, through the interest of lord Sidmouth, he was presented to the living of Westham in Essex, having previously obtained a small prebend in St. Paul's, which he resigned, on being preferred to the rectory of Stapleford in Hertfordshire. In his retirement at Westham he superintended the publication of a *Dictionary of Arts and Sciences*,

2 vols 4to. His last undertaking was, preparing for the press *Letters on Literature and Taste*, published after his death, which took place at Westham, March 12th, 1808, in the fifty-fourth year of his age.

GREGORY (James), M.D. F.R.S., professor of physic in the university of Edinburgh, was born at Aberdeen in 1753. He was the author of various works on scientific subjects, and connected with his profession, and among them *A dissertation De Morbis Celi Mutatione Mendendis*, 8vo. 1774; *Conspectus Medicinæ Theoreticæ*, 1780, 2 vols. 8vo., which went through four editions; *Philosophical and Literary Essays*, 1792, 2 vols. 8vo.; *Memorial presented to the Managers of the Royal Infirmary of Edinburgh*, 4to., 1800; *Cullen's First Lines of the Practice of Physic*, with Notes, 2 vols. 8vo. This latter work went through seven editions. He also published a paper in the *Transactions of the Royal Society of Edinburgh*, on the Theory of the Moods of Verbs. Dr. Gregory died April 2nd, 1821.

GREGORY, CAPE, a high rocky bluff, on the north-west coast of North America, nearly perpendicular. Captain Vancouver places this cape in lat. 43° 23' N., long. 235° 50' E.; captain Cook in lat. 43° 30' N., long. 235° 57' E.

GREIFSWALDE, a fortified town in Prussian Pomerania, on the Riek, and having a harbour at the influx of the river into the Baltic. Here are manufactures of tobacco and salt; also some maritime trade. Population 3800. The town is the seat of a university, founded as far back as 1456, but long fallen into decay: some new buildings were erected in 1750, but the number of students continues very small. The library belonging to it contains a number of MSS. on the history of Pomerania. Fifteen miles south-east of Stralsund.

GREIG (Samuel Carlowitz), an eminent naval officer in the Russian service, born at Inverkeithing in Fifeshire. While in the navy of Great Britain, he distinguished himself at the defeat of Conflans by admiral Hawke, the taking of the Havannah, and several other engagements in that successful war. After the peace of 1763 he entered into the Russian service; and there, at the battle of Chio, contributed principally, by his advice and exertions, to the destruction of the whole Turkish fleet. Sensible of his great professional merit, her imperial majesty promoted him, though a foreigner, to the chief command of the Russian navy, which he raised to a degree of respectability and importance it never before had attained. In reward of his great services, the empress bestowed on him many honorable marks of distinction, and an estate in Livonia, which his family now enjoy. In the last war between the Russians and Turks, which last were joined by the Swedes, he, in the Baltic, defeated the Swedish fleet; and had not a part of his squadron, through cowardice, refused to come into action, he probably had captured or sunk the whole of them. Soon after this he was seized with a fever, and died at Revel, on the 26th of October, 1788.

GREMIAT, *adj.* Lat. *gremium*. Pertaining to the lap.

GRENADA, one of the Caribbee islands, the last of the Windward Caribbees, lies thirty leagues north of New Andalusia, on the continent. According to some, it is twenty-four leagues in compass; according to others only twenty-two. It is twenty-eight miles long, and in some places fifteen broad. The chief port, formerly called Louis, now St. George's, stands on the west side of the island, in the middle of a large bay, with a sandy bottom. It is said that 1000 barks, from 300 to 400 tons, may ride secure from storms; and that 100 ships, of 1000 tons each, may be moored in the harbour. A large round basin, which is parted from it by a bank of sand, would contain a considerable number of ships, if the bank were cut through. The island abounds with game, fish, and very fine timber. A lake on a high mountain, about the middle of the island, supplies it with streams of fresh water. Several bays and harbours lie round the island, some of which might be fortified to great advantage; so that it is very convenient for shipping, not being subject to hurricanes. The soil is capable of producing tobacco, sugar, indigo, peas, and millet. On the west side it is a rich black mould, or a substratum of yellow clay. To the south the land is in general poor, and of a reddish hue, and the same extends over a considerable part of the interior country. On the whole, however, it appears to be fertile in a high degree, and by the variety, as well as excellence of its returns, seems adapted to every tropical production. Indigo, sugar, tobacco, coffee, cocoa, and cotton, thrive well in it. The rivers abound in eels, trout, and various other fish. In the woods are found in great numbers partridges, pigeons, thrushes, parrots, &c. Grenada contains about 80,000 acres of land; but the quantity actually cultivated has never exceeded 50,000. It is divided into six parishes, St. George, St. David, St. Andrew, St. Patrick, St. Mark, and St. John, and its chief dependency, Carriacou, forms a seventh parish. The other towns of Grenada, besides St. Georges, are, probably speaking, inconsiderable villages or hamlets, which are generally situated at the bays and shipping places in the several out-parishes.

In 1638 M. Poincy, a Frenchman, attempted to make a settlement in Grenada; but was driven off by the Caribbees, who resorted to this island in greater numbers than to the neighbouring ones. In 1650 M. Parquet, governor of Martinico, carried over from that island 200 men, furnished with presents to reconcile the savages, and with arms to subdue them in case they should prove intractable. The savages are said to have been frightened into submission by the number of the Frenchmen: but, according to some French writers, the chief not only welcomed the new-comers, but, in consideration of some knives, hatchets, scissars, and other toys, yielded to Parquet the sovereignty of the island, reserving to themselves their own habitations. The abbé Raynal informs us, that these first French colonists, imagining they had purchased the island by these trifles, assumed the sovereignty, and soon acted as tyrants. The Caribs, unable to contend with them by force, took their usual

method of murdering all those whom they found in a defenceless state. This produced a war; and the French settlers, having received a reinforcement of 300 men from Martinico, forced the savages to retire to a mountain; whence, after exhausting all their arrows, they rolled down great logs of wood on their enemies. Here they were joined by other savages from the neighbouring islands, and again attacked the French, but were defeated anew; and were at last driven to such desperation, that forty of them, who had escaped from the slaughter, jumped from a precipice into the sea, where they all perished, rather than fall into the hands of their enemies. From thence the rock was called *le Morne des Sauteurs*, or 'the hill of the leapers,' which name it still retains. The French then destroyed the habitations and all the provisions of the savages; but, fresh supplies of Caribbeans arriving, the war was renewed with great vigor, and great numbers of the French were killed. Upon this they resolved totally to exterminate the natives; and, having accordingly attacked the savages unawares, they inhumanly put to death the women and children, as well as the men; burning all their boats and canoes, to cut off all communication between the few survivors and the neighbouring islands. Notwithstanding all these barbarous precautions, however, the Caribbeans proved the irreconcilable enemies of the French; and their frequent insurrections at last obliged Parquet to sell all his property in the island to the Count de Cerrillac in 1657. The new proprietor, who purchased Parquet's property for 30,000 crowns, sent thither a person of brutal manners to govern the island. He behaved with such insupportable tyranny, that most of the colonists retired to Martinico; and the few who remained condemned him to death after a formal trial. In the whole court of justice that tried this miscreant, there was only one man (called Archangeli) who could write. A farrier was the person who impeached: and he, instead of the signatures, sealed with a horse-shoe; and Archangeli, who performed the office of clerk, wrote round it these words in French, 'Mark of M. de la Brie, counsel for the court.' It was apprehended that the court of France would not ratify a sentence passed with such unusual formalities; and therefore most of the judges of the governor's crimes, and witnesses of his execution, disappeared. Only those remained whose obscurity screened them from the pursuit of the laws. By an estimate, taken in 1700, there were at Grenada no more than 251 white people, fifty-three free savages or mulattoes, and 525 slaves. The useful animals were reduced to sixty-four horses and 569 horned cattle. The whole culture consisted of three plantations of sugar and fifty-two of indigo. The island had been sold in 1664 to the French West India Company for 100,000 livres. This unfavorable state of affairs was changed in 1714, owing to the flourishing condition of Martinico. The richest ships from that island were sent to the Spanish coasts, and in their way touched at Grenada to take in refreshments. The privateering traders, who undertook this navigation, taught

the people of that island the value of their soil, which only required cultivation. Some traders furnished the inhabitants with slaves and utensils to erect sugar plantations. An open account was established between the two colonies. Grenada was clearing its debts gradually by its rich produce, and the balance was on the point of being closed, when the war in 1744 interrupted the communication between the two islands, and stopped the progress of the sugar plantations. This loss was supplied by the culture of coffee, which was pursued during the hostilities with activity and eagerness. The peace of 1748 revived all the labors, and opened all the former sources of wealth. In 1753 the population of Grenada consisted of 1262 white people, 175 free negroes, and 11,991 slaves. The cattle amounted to 2968 horses and mules, 2456 horned cattle, 3278 sheep, 902 goats, and 331 hogs. The cultivation rose to eighty-three sugar plantations, 2,725,600 coffee-trees, 150,300 cocoa-trees, and 800 cotton plants. The provisions consisted of 5,740,450 trenches of cassado, 933,596 banana trees, and 143 squares of potatoes and yams. The colony made a rapid progress, in proportion to the excellence of its soil; but in 1762 the island was taken by the British. At this time one of the mountains at the side of St. George's harbour was strongly fortified, and might have made a good defence, but surrendered without firing a gun; and by the treaty concluded in 1763 the island was ceded to Britain. On this cession, and the management of the colony after that event, the abbé Raynal has the following remarks. 'This long train of evils,' the ambition and mismanagement of his countrymen, 'has thrown Grenada into the hands of the English, who are in possession of this conquest by the treaty of 1763. England has not made a fortunate beginning. In the first enthusiasm raised by an acquisition, of which the highest opinion had been previously formed, every one was eager to purchase estates there. They sold for much more than their real value. This caprice, by expelling old colonists who were injured to the climate, has sent about £1,553,000 out of the mother country. This imprudence has been followed by another. The new proprietors, misled, no doubt, by national pride, have substituted new methods to those of their predecessors. They have attempted to alter the mode of living among their slaves. The negroes, who from their very ignorance are more attached to their customs than other men, have revolted. It hath been found necessary to send out troops, and to shed blood. The whole colony was filled with suspicions. The masters, who had laid themselves under a necessity of using violent methods, were afraid of being burnt or massacred in their own plantations. The labors have declined, or been totally interrupted. Tranquillity has at length been restored. The number of slaves have been increased as far as 40,000, and the produce has been raised to the treble of what it was under the French government. The plantations will still be improved by the neighbourhood of a dozen of islands, called the Grenadilloes, that are dependent on the colony.' In 1779 the

conquest of this island was accomplished by D'Estaing the French admiral. Immediately after his conquest of St. Lucia, being reinforced by a squadron under M. de la Motte, he set sail for Grenada, with a fleet of twenty-six sail of the line, and twelve frigates, having on board 10,000 land forces. Here he arrived on the 2d of July; and landed 3000 troops, chiefly Irish, being part of the brigade composed of natives of Ireland in the service of France. These were conducted by count Dillon, who disposed them in such a manner as to surround the hill that commands George's Town, together with the fort and harbour. To oppose these, lord M'Cartney, the governor, had only about 150 regulars, and 300 or 400 armed inhabitants; but, though all resistance was evidently vain, he determined nevertheless to make an honorable and gallant defence. The preparations he made were such as induced D'Estaing himself to be present at the attack; and, even with his vast superiority of force, the first attack on the entrenchments proved unsuccessful. The second continued two hours; when the garrison were obliged to yield to the immense disparity of numbers who assailed them, after having killed or wounded 300 of their antagonists. Having thus made themselves masters of the intrenchments on the hill, the French turned the cannon of them towards the fort which lay under it; on which the governor demanded a capitulation. The terms, however, were so extraordinary and unprecedented, that both the governor and inhabitants agreed in rejecting them; and determined rather to surrender without any conditions, than upon those which appeared so extravagant. On this occasion D'Estaing is said to have behaved in a very haughty and severe manner; indulging his soldiers also in the most unwarrantable liberties, and in which they would have proceeded much farther, had they not been restrained by the Irish troops in the French service. In the mean time admiral Byron, who had been convoying the homeward bound West India fleet, hastened to St. Vincent, in hopes of recovering it; but being informed, by the way, that a descent had been made at Grenada, he changed his course, hoping that lord M'Cartney would be able to hold out till his arrival. On the 6th of July he came in sight of the French fleet; and, without regarding D'Estaing's superiority of six ships of the line and as many frigates, determined if possible to force him to a close engagement. The French commander, however, was not so confident of his own prowess as to run the risk of an encounter of this kind; and, having already achieved his conquest, had no other view than to preserve it. His designs were facilitated by the good condition of his fleet; which, being more lately come out of port than that of the British, sailed faster, so that he was thus enabled to keep at what distance he pleased. The engagement began about eight in the morning, when admiral Barrington, with his own and two other ships, got up to the van of the enemy, which they attacked with the greatest spirit. As the other ships of his division, however, were not able to get up to his assistance, these three ships were necessarily obliged to

encounter a vast superiority, and of consequence suffered exceedingly. The battle was carried on from beginning to end in the same unequal manner; nor were the British commanders, with their utmost efforts, able to bring the French to a close engagement. Thus captains Collingwood, Edwards, and Cornwallis, stood the fire of the whole French fleet for some time. Captain Fanshaw of the Monmouth, a sixty-four gun ship, threw himself singly in the way of the enemy's van; and admiral Rowley and captain Butchard fought at the same disadvantage; so that, finding it impossible to continue the engagement with any probability of success, a general cessation of firing took place about noon. It recommenced in the same manner about 3 P. M., and lasted, with different interruptions, till evening. During this action some of the British ships had forced their way into St. George's harbour, not imagining that the enemy were already in possession of the island. They were soon undeceived, however, by perceiving the French colors flying ashore, and the guns and batteries firing at them. This discovery put an end to the design which had brought on the engagement; and as it was now high time to think of providing for the safety of the British transports, which were in danger from the number of the enemy's frigates, the engagement was finally discontinued. During this action some of admiral Byron's ships had suffered extremely. The Lion of sixty-four guns, captain Cornwallis, was found incapable of rejoining the fleet, which were plying to windward; and was therefore obliged to bear away alone before the wind. Two other ships lay far astern in a very distressed situation; but no attempt was made to take them, nor did the French admiral show the least inclination to renew the engagement. Grenada was restored to Great Britain by the peace in 1783. George's Town, or St. George's, is the residence of the governor, and the governor, general Matthew, made a present to the citizens of a clock and bells in 1790. The garrison then consisted of artillery, two regiments of Europeans, and one of blacks. As there are several small islands subject to the laws enacted in Grenada, they each elect a person to represent them in the general assembly, which is always held in St. George's. As none of the Grenadines have a harbour fit for large vessels, the produce of them is conveyed in small vessels to St. George's, whence it is exported to the different places of Europe, Africa, America, &c. Although by the peace of 1763, all the French inhabitants who inclined to remain in the island became invested with the privileges of British subjects, and although these privileges were confirmed in 1768, yet the treatment which they experienced from the British settlers, proved so extremely oppressive, that they at last broke out into a formidable insurrection. On the 2d of March, 1795, the old French inhabitants, being joined by the mulattoes under Fedon, seized the towns of Grenville and Gouyave, plundered the former, murdered eleven of the English inhabitants, and took the rest prisoners. On the 5th, 130 troops were sent against the rebels, but were obliged to retreat. The most barbarous massacres now

took place on both sides; and general Lindsey, finding himself unable to quell the insurrection, put an end to his own life. On the 16th of April general Nichols, arriving from Martinico, assumed the command, and various engagements took place, wherein sometimes the insurgents and sometimes the British had the advantage. In this distracted state the island continued till December 1795, when the French landed a body of troops, who joined the rebels, and reduced great part of the island; but on the 10th of July 1796 the French commandant, Jossey, surrendered all the French posts by capitulation to the British under general Abercrombie; and Fedon and his associates escaped into the woods, after having murdered all their prisoners. The British obtained complete possession on the 19th of June; Grenada is 123 miles south-west of Barbadoes, and seventy-one north-west of Tobago. Long. $61^{\circ} 40' W.$, lat. $12^{\circ} 0' N.$

GRENADÉ, *n. s.* } Fr. *grenadier*; Latin
GRENADIER, } *granatum*. A globe or
GRENADO. } ball of iron, or other metal, which, being filled with gun-powder, is set on fire by means of a fusee. Grenadier is a foot soldier, of whom there was one company formerly in every regiment: such men being employed to throw grenades.

Yet to express a Scottish enterprize,
Not all those mouth *grenados* can suffice.

Cleveland.

You may as well try to quench a flaming *grenado*
with a shell of fairwater, as hope to succeed. *Watts.*

Peace allays the shepherd's fear
Of wearing cap of *grenadier*. *Gay's Pastorals.*

GRENADÉ, or GRANADO, is a kind of small bomb or shell, of the same diameter as a four-pound bullet; it weighs about two pounds, being charged with four or five ounces of powder, and is thrown by the hand, whence they are most generally styled hand-grenades. They have a touch-hole in the same manner as a shell, and a fusee of the same composition. The fusee is fired with a match, and the grenades being thrown the powder becomes inflamed, and the shell instantly bursts into splinters, that kill or maim whosoever they may reach. They were invented about 1594. The author of the *Military Dictionary* has the following remark on the use of grenades: 'Grenades have unaccountably sunk into disuse, but we are persuaded there is nothing more proper than to have grenades to throw among the enemy who have jumped into the ditch. During the siege of Cassel, under count de la Lippe, in the campaign of 1762, a young engineer undertook to carry one of the outworks with a much smaller detachment than one which had been repulsed, and succeeded with ease from the use of grenades; which is a proof that they should not be neglected, either in the attack or defence of posts.'

GRENADIER, GRANADIER, a foot soldier armed with firelock, bayonet, and in some services with a hanger; grenadiers carry, besides their arms, a cartridge box that will hold thirty-six rounds. They are clothed differently from the rest of the battalion they belong to, by wearing a high cap, fronted with a plate of brass, on which the king's arms is generally represented,

&c., and a piece of fringed or tufted cloth upon their shoulders, called a wing: in some armies they have more pay than a common soldier. They are always the tallest and stoutest men, consequently the first upon all attacks. Every battalion of foot has generally a company of grenadiers belonging to it, which takes the right of the battalion.

GRENADILLOES, or GRENADINES. See GRANADILLOES. These islands are from three to eight leagues each in circumference, but are said to be all destitute of water, except the island Cariacou, wherein one spring has been discovered by digging, which is kept locked up by the proprietor. The capital of that island is Hilsborough, which has a church. See GRENADA.

GRENAILLE, a name given by the French writers to a preparation of copper, which the Chinese use as a red color in some of their finest China, particularly for that color which is called oil-red, or red in oil.

GRENOBLE, a large, populous, and ancient town of France, in the department of Isere, and ci-devant province of Dauphiny, anciently Accusiorum Colonia. It contains a great number of handsome structures, particularly churches, and ci-devant convents. It is seated on the Isere, over which there are two bridges leading into a single street, of great length, and having the appearance of a suburb. Grenoble, though not a fine town, has several spacious squares. It is surrounded with ramparts, and entered by draw-bridges; its population is about 23,000. Among the public buildings that attract the attention of travellers is the ancient Hotel de Lesdiguières, now the town-house: the court house; and the cathedral, a heavy edifice in the Gothic style. On an eminence, near the middle of the town, stand the ruins of a once strong citadel, called the Bastile. From the summit is enjoyed a delightful view as far as Mont Blanc, a distance of thirty leagues. Outside of the town are two hospitals, one for the military, another, on a larger scale, for the poor in general. The literary and scientific institutions are a small university, a provincial school, an academy of arts and sciences established in 1796, societies of medicine and agriculture, the schools of surgery and midwifery, and the artillery school. To these institutions belong a library of 60,000 volumes, a museum, a botanical garden, a cabinet of natural history, and a small cabinet of antiquities.

The principal manufactures are of gloves, cotton articles, and different kinds of liquors. Its glove manufactures have long been celebrated, and employ nearly one-fourth of the population. It has likewise manufactures of hemp. Its commerce is favored by the Isere, which is navigable to a considerable distance above the town, and is made to convey quantities of timber, hemp, flax, linen, leather, iron, and marble. Grenoble is likewise the staple for the cheese made near Sassenage, a village in the neighbourhood. It was formerly the seat of the governor and parliament of Dauphiny, and is now the residence of the prefect of the departement of one of the higher, and of several smaller courts of justice. It is likewise the head-quarters of a military division, and the see of a bishop. The climate here is

very variable, and affected by the exhalations from the neighbouring marshes. This was the first place of note that opened its gates to Napoleon on his return from Elba; he entered it 8th March 1815. Twenty-seven miles south of Chamberry.

GRENOUILLES, LES, a cluster of rocks in the West Indian Ocean, about thirty-six miles south-east from Point Morand, in the island of Jamaica.

GRESHAM (Sir Thomas), an opulent merchant in London, descended from an ancient family of Norfolk. He was born in 1519. His father was king's agent at Antwerp, and Sir Thomas, being appointed to the same office in 1551, removed to that city with his family. This employment was suspended, on the accession of queen Mary, but was restored to him again. Queen Elizabeth knighted him, and made him her agent in foreign parts. About this time he built a large mansion-house on the west side of Bishopsgate Street, since named Gresham College. He now proposed to build a house or exchange for the merchants to meet in, instead of walking in the open street; and offered, if the citizens would provide a proper piece of ground, to build the exchange at his own expense; which being accepted, he fulfilled his promise after the plan of the exchange at Antwerp. On the 29th of January 1570, when the new edifice was opened, the queen came and dined with the founder; and caused a herald with a trumpet to proclaim it by the name of the Royal Exchange. In pursuance also of a promise to endow a college for the profession of the seven liberal sciences, he made a testamentary disposition of his house in London for that purpose. See **COLLEGE**. He left several other benefactions, and died in 1579. He was a great friend and patron of the celebrated martyrologist, John Fox. He was well acquainted with the ancient and several modern languages; and had a very comprehensive knowledge of foreign and domestic commerce. He transacted queen Elizabeth's mercantile affairs so constantly that he was called the royal merchant; and his house was sometimes appointed for the reception of foreign princes upon their first arrival in London.

GRESHAM COLLEGE. See **COLLEGE**.

GRESSIE, or **GRESSIC**, a town on the north-east coast of Java, and formerly the capital of a kingdom. It has comparatively few European inhabitants, but the native population and the Chinese are numerous. The latter have a temple reared by their own priests. The saltpetre works are very extensive; but the want of good water, and the general unhealthiness of the place, may be considered as the causes of its decline. Long. 112° 50' E., lat. 7° 9' S.

GREVILLE (Fulke), lord Brook, a poet and miscellaneous writer, born in 1554, and descended from the noble families of Beauchamps of Powick and Willoughby de Brook. In company with his cousin Sir Philip Sidney, he began his education at a school in Shrewsbury: thence he went to Oxford, and afterwards to Cambridge. He next visited foreign courts, and, on his return to England, was introduced to queen Elizabeth by his uncle Robert Greville; and by means of

Sir Henry Sidney, lord president of Wales, was nominated to some lucrative employments in that principality. He continued a constant attendant at court, and a favorite with the queen to the end of her reign; during which he obtained the office of treasurer of marine causes, a grant of the manor of Wedgnock, and the honor of knighthood. In her reign he was several times elected M. P. for Warwickshire, and his name often appears in committees. On the accession of king James I. he was installed knight of the Bath; and soon after obtained a grant of the ruinous castle of Warwick, which he repaired at a considerable expense. In 1614 he was made under treasurer, chancellor of the exchequer, one of the privy council, and gentleman of the bed chamber; and in 1620 he was raised to the dignity of baron. He was also privy-counsellor to king Charles I., in the beginning of whose reign he founded a history lecture in Cambridge. Having thus attained the age of seventy-four, through a life of continued prosperity, universally admired as a gentleman and a scholar, he fell by the hands of an assassin, one of his own domestics, who immediately stabbed himself with the same weapon with which he had murdered his master. This fellow's name was Haywood; and the cause is said to have been a severe reprimand, for his presumption in upbraiding his master for not providing for him after his death. He had been witness to lord Brook's will, and knew the contents. Lord Brook was buried with great pomp in St. Mary's church at Warwick, in his own vault, over which he had erected a monument of black and white marble, ordering at his death the following inscription to be engraved upon his tomb: 'Fulke Greville, servant to queen Elizabeth, counsellor to king James, and friend to Sir Philip Sidney. Trophæum Peccati.' He wrote several works in verse and prose, among which are two tragedies, *Alaham* and *Mustapha*. A Treatise of Human Learning, &c., in verse, folio. The life of Sir Philip Sidney. An Inquisition upon Fame and Honor, in eighty-six stanzas. *Cecilia*, a collection of 109 songs. His Remains, consisting of political and philosophical poems.

GREUT, n. s. A kind of fossile body.

A sort of tin ore, with its *greut*; that is, a congeries of crystals, or sparks of spar, of the bigness of baysalt, and of a brown shining colour immersed therein. *Grew's Museum.*

GREW. The preterite of *Grow*, which see.

The pleasing task he fails not to renew;
Soft and more soft at every touch it *grew*.

Dryden.

GREW (Nehemiah), a learned English writer, of the seventeenth century, who had considerable practice as a physician in London, and succeeded Mr. Oldenburgh in the office of secretary to the Royal Society. In this capacity, pursuant to an order of council, he drew up a catalogue of the natural and artificial rarities belonging to the society, under the title of *Museum regalis Societatis*, &c., 1681. He also wrote besides several pieces in the Philosophical Transactions, 1. The Comparative Anatomy of the Stomach and Entrails, folio. 2. The Anatomy of Plants, folio. 3. Tractatus de salis Cathartici natura et usu. 4. Cosmologia

Sacra, or a Discourse of the Universe as it is the Creature and Kingdom of God, folio. He died suddenly in 1721.

GREWIA, in botany, a genus of the polyandria order, and gynandria class of plants: natural order thirty-seventh, columbifera: cal. pentaphyllous; petals five, each with a nectariferous scale at the base; berry quadrilocular. Eleven species: the chief are,

1. *G. Africana*, with oval spear-shaped serrated leaves, a native of Senegal in Africa, whence its seeds were brought by Mr. Adanson. In this country it rises with a shrubby stalk five or six feet high, sending out many lateral branches, with a brown hairy bark, and garnished with spear-shaped serrated leaves; but the plants do not flower in Britain. This species is tender, and must be kept constantly in a warm bark stove. In summer it requires a large share of the free air, and should have water three or four times a week in warm weather; but in winter they must be sparingly watered. The negroes of Senegal highly value a decoction of the bark, and use it as a never-failing remedy against venereal complaints.

2. *G. occidentalis*, with oval crenated leaves. It is a native of the Cape of Good Hope, and grows to the height of ten or twelve feet. The stem and branches greatly resemble those of the small leaved elm, the bark being smooth, and of the same color with that when young. The leaves are also very like those of the elm, and fall off in autumn. The flowers are produced singly along the young branches from the wings of the leaves, and are of a bright purple color. This species, though a native of a warm climate, will bear the open air in this country; only requiring to be sheltered in a green-house during winter. It may be propagated by cuttings, or layers, planted in pots filled with soft loamy earth.

GREY, *adj.* Fr. *gris*. More properly written gray. See GRAY.

This ancient ruffian, Sir, whose life I spared at suit of his grey beard. *Shakspeare. King Lear.*

Our green youth copies what grey sinners act,
When venerable age commends the fact. *Dryden.*

GREY (Lady Jane), a most illustrious and unfortunate lady, descended of the blood royal of England by both parents, was the eldest daughter of Henry Grey, marquis of Dorset, and Frances, the daughter of Charles Brandon, lord Suffolk, by Mary, the dowager of Louis XII. king of France, who was the youngest daughter of Henry VII. king of England. She was born in 1537, at Broadgate, her father's seat, in Leicestershire. She discovered an early propensity to all kinds of literature; and having considerable genius, improved under the tuition of Mr. Aylmer, afterwards bishop of London, she made a surprising progress in the languages, arts, and sciences. She understood various branches of philosophy, and could express herself in Latin and Greek. Sir Thomas Chaloner (*Strype's Memorials*, vol. iii. p. 93) says, that she was well versed in Hebrew, Chaldee, Arabic, French, and Italian. He adds, that 'she played well on instrumental music, with a curious hand, and was excellent at the needle.' In 1553 the dukes of Suffolk and Northumberland, who were now, after the fall of

Somerset, arrived at the height of power, began, on the decline of king Edward's health, to think how to prevent any reverse of fortune upon his death. No other remedy was judged sufficient but a change in the succession of the crown, and transferring it into their own families, by rendering Lady Jane queen. Those excellent and amiable qualities, which had rendered her dear to all who had the happiness to know her, joined to her near affinity to the king, subjected her to become the chief tool of ambition not her own. With this view she was married to lord Guildford Dudley, fourth son of the duke of Northumberland, without discovering to her the real design of the match; which was celebrated with great pomp in the end of May; and was so much to the king's satisfaction that he contributed largely to the expense of it. Edward VI. died in July following; and Lady Jane, with infinite reluctance, overpowered by the solicitations of her ambitious friends, allowed herself to be proclaimed queen of England, on the strength of a deed extorted from that prince by her father-in-law, the duke of Northumberland, which set aside the succession of queen Mary, queen Elizabeth, and Mary queen of Scots. Her regal pageantry continued but a few days. Queen Mary's hereditary right prevailed; and the unfortunate Lady Jane Grey and her husband were committed to the tower, and on the 13th of November arraigned and found guilty of high treason. On the 12th of February following they were both beheaded on Tower-hill. Her magnanimity in this dreadful scene was astonishing. Immediately before her execution, she addressed herself to the weeping multitude with composure and coherency. Feckenham, Mary's chaplain, visited her in the Tower, and tried to convert her to the Catholic faith, but found her by far his superior in argument. Her writings are, 1. Four Latin Epistles; three to Bullenger, and one to her sister lady Catharine. The last was written the night before her execution, in a blank leaf of a Greek Testament: a circumstance which seems to have led Dr. Watkins, in his *Biographical Dictionary*, to say it was written 'in the Greek language.' These letters are printed in a work entitled *Epistolæ Helveticæ Reformatioribus, vel ad eos scriptæ, &c.* Tiguri, 1742, 8vo. 2. Her Conference with Feckenham. Ballard. 3. A letter to Dr. Harding, her father's chaplain. Printed in the *Phoenix*, vol. ii. p. 28. 4. A Prayer for her own use during her confinement. In *Fox's Acts and Monuments*. 5. Four Latin verses: written in prison with a pin. They are as follows:—

Non aliena putes, homini quæ obtingere possunt:
Sors hodierna mihi, cras erit illa tibi.

Jane Dudley.

To mortals' common fate thy mind resign,
My lot to-day to-morrow may be thine!

Deo juvante, nil nocet livor malus:

Et non juvante, nil juvat labor gravis.

Post tenebras spero lucem.

Freely rendered thus:

Harmless all malice if our God be nigh,
Fruitless all pains, if he his help deny;
Patient I pass these gloomy hours away
And wait the morning of eternal day.

6. Her speech on the Scaffold. It began thus : 'My Lords, and you, good Christian people, who come to see me die, I am under a law, and by that law, as a never-erring judge, I am condemned to die; not for any thing I have offended the queen's majesty; for I will wash my hands guiltless thereof, and deliver to my God a soul as pure from such trespass as innocence from injustice; but only for that I consented to the thing I was forced unto, constraint making the law believe I did that which I never understood,' &c. Hollingshed, Sir Richard Baker, Bale, and Fox, tell us that she wrote several other things, but do not mention where they are to be found.

GREY (Richard), D. D., a learned English divine, born in 1693, and educated at Oxford, where he took the degree of M. A. in 1719. He obtained the rectories of Kincote in Leicestershire, and Hinton in Northamptonshire, with other benefices. He published many sermons and religious tracts; besides the following:—*Memoria Technia, or a New Method of Artificial Memory*; of which the first edition was printed in 1730, and a fourth in 1756; *A System of English Ecclesiastical Law*, 8vo. 1741; *The Miserable and Distracted State of Religion in England, upon the Downfall of the Church Established*, 8vo., 1736; *A New and Easy Method of Learning Hebrew without Points*, 1733; *Historia Josephi, et Paradigmata Verborum*, 1739; *Liber Jobi*, 1742; *Answer to Warburton's Remarks*, 1744; *Nova Methodus Hebraicæ discendi*, &c., 1751; and *A Translation of Mr. H. Browne's poem, De Animi Immortalitate*. He was married; and died February 28th, 1771, aged seventy-eight, leaving several daughters.

GREY (Zachary), LL. D., an English divine, born in 1637. He studied and graduated at Cambridge. He was vicar of St. Giles's and St. Peter's in Cambridge, and was author of about thirty different works; particularly, *An Answer to Neale's History of the Puritans*; 3 vols. 8vo. His edition of *Hudibras*, 1744, was satirised by Warburton and Henry Fielding. He died in 1766, aged seventy-nine.

GREYHOUND, *n. s.* Sax. *grughund*. A tall fleet dog that chases in sight.

Greihoundes he hadde as swift as foul of flight.

Chaucer. *Prologue to Canterbury Tales*.

First may a trusty greyhound transform himself into a tyger.

Sidney.

So, on the Downs we see, near Wilton fair,

A hastened hare from greedy greyhounds go. *Id.*

The impatient greyhound, slipt from far,

Bounds o'er the glebe to catch the fearful hare.

Dryden.

GREYHOUND. See *CANIS* and *DOG*. Among a litter of greyhound's puppies, the best are always those which are lightest. These will make the nimblest dogs as they grow up. The qualities of a good greyhound are well expressed in the following lines. According to them he is to have

A Head like a snake

Neck like a drake,

Back like a beam,

Side like a beam,

Tail like a rat,

Foot like a car.

In breeding these dogs, the bitch is principally to be regarded; for it is found by experience, that the best dog and a bad bitch will not get so good puppies, as an indifferent dog with a good bitch. The dog and bitch should be as nearly as possible of the same age; and, for breeding perfect dogs, they should not be more than four years old. An old bitch may be used with a young dog, but the puppies of a young bitch and an old dog will never be good for any thing. The general food for a greyhound is chippings or raspings of bread, with soft bones and gristles; and those chippings ought always to be soaked in beef or mutton broth. The proper exercise is coursing him three times a-week, and rewarding him with blood; which will animate him in the highest degree, and encourage him to prosecute his game. But the hare, also, should always have fair play. She should have the law, as it is called; that is, have leave to run about twelve score yards before the dog is shipped at her, that he may have some difficulty in the course, and not pick up the game too easily. If he kills the hare he must never be suffered to tear her; but she must be taken from him, his mouth cleaned of the wool, and the liver and lights given him by way of encouragement. Then he is to be led home, and his feet washed with butter and beer, and about an hour after he is to be fed. When the dog is to be taken out to course, he should have nothing in the morning but a toast and butter, and then he is to be kennelled till taken out to the field. The kennelling these dogs is of great use, always giving them spirit and nimbleness when they are let loose. The best way of managing a fine greyhound is never to let him stir out of the kennel, except when feeding, walking, or coursing.

GREYWACKE, a mountain formation, consisting of two similar rocks, which alternate with and pass into each other, called greywacke, and greywacke-slate. The first possesses the characters of the formation. It is a rock composed of pieces of quartz, felspar, and slate, cemented by a clay-slate basis. These pieces vary in size from a hen's egg to little grains. When the texture becomes exceedingly fine-grained, the rock constitutes greywacke-slate. Its color is usually ash or smoke-gray, and glimmers from interspersed scales of mica. It contains quartz veins, but no beds of quartz. Petrifications are found in it. These rocks are stratified, forming, when alone, round-backed hills, with deep valleys between them. Immense beds of trap, flinty-slate, and transition limestone, are contained in this formation; as well as numerous metallic ores in beds and large veins.

GREZZANA, or GREZZANO, a town of the Veronese, in Maritime Austria, according to the division of that province between the emperor and the Cisalpine republic, made by the treaty of Campo Formio, in 1797; but by the conquest of the Veronese, by the French and Cisalpines under general Brune in December, 1800, and subsequent annexation of the whole province, it became part of the Cisalpine republic. This town is twelve miles north of Verona, and two of Breonio; and is seated near the Bridge of Beja, a remarkable bridge formed by nature,

which connects two hills together. Its arch is fifty Veronese feet broad, and no fewer than 114 feet high.

GRIAS, in botany, a genus of the monogynia order, and polyandria class of plants: cor. tetrapetalous: CAL. quadrifid; the stigma sessile and cruciform: the fruit is a plum with an eight-furrowed kernel. There is but one species, viz. *G. cauliflora*, the anchovy pear, a native of Jamaica. The leaves are nearly oval, and about three feet long. It has a straight stem, upon the upper part of which come forth the flowers. The fruit is large, and contains a stone with eight furrows. These fruits are eaten by the inhabitants.

GRIBALDUS (Matthew), a learned civilian of Padua, who left Italy in the sixteenth century, in order to make a public profession of the Protestant religion. After having been for some time professor of the civil law at Tubingen, he was obliged to leave it, having imbibed some doubts respecting the doctrine of the Trinity: but he was seized at Berne, where he would have met with very severe treatment, had he not renounced his opinions. He however relapsed again, and would certainly have been put to death, had he not died of the plague in 1664. He wrote *De Methodo ac Ratione Studendi in Jure Civili*; and several other works which are held in general estimation.

GRIENER (Michael Henry), a learned civilian of Germany, born at Leipsic in 1682. After writing some time in the *Journal of Leipsic*, he was made professor of law at Wittemberg: whence he passed to Dresden, and was at last recalled to Leipsic to succeed M. Mencke. He died in 1734. Besides several academical dissertations, he wrote 1. *Principia Processus Judicarii*; 2. *Principia Juris Prudentiæ Naturalis*, a small work much esteemed; 3. *Opuscula Juris Publici et Privati*.

GRICE, *n. s.* Dan. and Swed. *gris*. A step or greeze; a little pig.—Gouldman.

No, not a *grice*;

This a step to love.

Shakspeare. Twelfth Night.

To **GRIDE**, *v. n.* Ital. *gridare*. To cut: to make way by cutting. A word elegant, but not in use.

His poignant spear he thrust with puissant sway,
That through his thigh the mortal steel did *gride*.

Spenser.

So sore

The *griding* sword, with discontinuous wound,
Passed through him. *Milton's Paradise Lost.*

GRIDELIN, *adj.* Fr. *gris de lin*. A color mixed of white and red.

The ladies dressed in rich symars were seen
Of Florence satin, flowered with white and green,
And for a shade betwixt the bloomy *gridelin*.

Dryden.

GRIDIRON, *n. s.* 1st. *grind*, a grate, and iron. A portable grate on which meat is laid to be broiled upon the fire.

He had added two bars to the *gridiron*.

Spectator.

GRIEF, *n. s.*

GRIEV'ANCE, *n. s.*

GRIEVE, *v. a. & v. n.*

GRIEV'INGLY, *adv.*

GRIEV'OUS, *adj.*

GRIEV'OUSLY, *adv.*

GRIEV'OUSNESS, *n. s.*

Fr. *grever*; Italian, *grave*; Flem. *griever*; Welsh *griff*; Lat. *gravis*. Sorrow and regret for something past; pain or disease; injury; a harm; what-

ever lies as a weight upon the heart. The verb signifies to afflict; to injure or make sorrowful: when applied to faults, the word *grievous* is expressive of atrocity; it also sometimes implies discontent; to be in pain; to mourn; to sorrow, as for the death of friends. It has sometimes *at* and sometimes *for* before the cause of grief; perhaps *at* is proper before our misfortunes, and *for* before our faults.

It repented the Lord that he had made man on the earth, and it *grieved* him at his heart. *Gen. vi.*

They fled from the swords, from the drawn sword, and from the bent bow, and from the *grievousness* of war. *Is. xxi. 15.*

For he doth not afflict willingly, nor *grieve* the children of men. *Luke iii. 33.*

Forty years long was I *grieved* with this generation. *Psalms.*

She was to blâmè me to leve;

The whiche now dooth me sore *grieve*.

Chaucer. Romaunt of the Rose.

The aire of the place so attempre was,
That ner was ther *grevaunce* of hot ne cold

There was, eke, every wholesome spice and gras;
Ne no man maie there waxen sike ne old.

Id. The Assemble of Foudes.

And overmore, distraind with sicknesse,
Beside all this he was full *grievouslie*.

Id. Complaint of the Blacke Knight.

Wide was the wound, and a large lukewarm flood,
Red as the rose, thence gushed *grievously*. *Spenser.*

Next him went *Griefe* and Fury, matcht yfere;

Grief all in sable sorrowfully clad,
Downe hanging his dull head with heavy chere,
Yet inly being more then seeming sad.

Id. Faerie Queene.

I see how a number of souls are, for want of right information, oftentimes *grievously* vexed. *Hooker.*

To the flesh, as the apostle himself granteth, all affliction is naturally *grievous*. *Id.*

Crying sins I call those which are so heinous, and in their kind so *grievous*, that they hasten God's judgment, and call down for speedy vengeance upon the sinner. *Perkins.*

When one man kills another, thinking that he killeth a wild beast; if the same man remembereth afterwards what he hath done, and is not *grieved* for the fact, in this case he hath sinned; because his not *grieving* is offensive unto God, though the fact were merely besides his will. *Id.*

Gritus perceiving how *grievously* the matter was taken, with the danger he was in, began to doubt.

Knolles.

He cannot come, my lord: he's *grievous* sick.

Shakspeare.

Be factious for redress of all these *griefs*.

And I will set this foot of mine as far
As who goes farthest. *Id.*

The king hath sent to know

The nature of your *griefs*, and whereupon

You conjure from the breast of civil peace

Such bold hostility? *Id. Henry IV.*

Do not you *grieve* at this. *Id.*

Grievingly, I think,

The peace between the French and us not values
The cost that did conclude it. *Id. Henry VIII.*

I will instruct my sorrows to be proud ;
For grief is proud, and makes his owner stout.
Shakspeare.

It was a *grievous* fault,
And *grievously* hath Cæsar answered it. *Id.*
At thy appearance *Grief* itself is said
To shake his wings and rouse his head.
Cowley.

It *grieves* me when I see what fate
Does on the best of mankind wait. *Id.*
He durst not disobey, but sent *grievous* complaints
to the parliament of the usage he was forced to submit to.
Clarendon.

How didst thou *grieve* then, Adam, to behold
The end of all thy offspring end so sad. *Milton.*
Balm for the *grieved* we draw and paste
We mould as baits for curious tastes. *Marvell.*

What magic could me thus confine
Within another's *grief* to pine ? *Id.*
With equal mind what happens let us bear ;
Nor joy nor *grieve* too much for things beyond our care.
Dryden.

Houses built in plains are apt to be *grievously* annoyed with mire and dirt. *Ray on the Creation.*

Wringing of the hands, knocking of the breast, are but the ceremonies of sorrow, the pomp and ostentation of an effeminate *grief*, which speak not so much the greatness of the misery as the smallness of the mind. *South.*

The mother was so much afflicted at the loss of a fine boy, who was her only son, that she died for *grief* of it. *Addison.*

Grieved at the thought, he vowed his whole endeavour
Should be to close those breaches. *Rowe.*

Love, Hope, and Joy, fair Pleasure's smiling train ;
Hate, Fear, and *Grief*, the family of Pain. *Pope.*

What remedy can be found against *grievances*, but to bring religion into countenance, and encourage those who, from hope of future reward, and dread of future punishment, will be moved to justice and integrity ?
Swift.

To own a great but *grievous* truth, though they quicken and sharpen the invention, they corrupt the temper. *Watts.*

Yet leave me not ; I would allay that *grief*,
Which else might thy young virtue overpower ;
And in thy converse I shall find relief
When the dark shades of melancholy lower.
Beattie.

Ah, how shall I pursue
My theme ! To heart-consuming *grief* resigned,
Here on his recent grave I fix my view,
And pour my bitter tears. Ye flowery lays adieu !
Id.

GRIEF. The influence of this passion on the body is very great. Its effects resemble in several instances those of fear, with, however, some variations, owing perhaps to its being in general of longer duration. Grief diminishes the bodily strength in general, and particularly the force of the heart and circulation ; as appear by the frequent sighs and deep respirations which attend it, which seem to be necessary exertions, in order to promote the passage of the blood through the lungs. It diminishes perspiration, obstructs the menstrual discharge, produces paleness of the skin, and oedematous complaints, and scirrhus of the glandular parts. It aggravates the scurvy, and the malignity of putrid and contagious distempers ; and renders people more apt to receive the infection of them. When it comes on

suddenly, and in a great degree, it causes a palpitation of the heart, and renders the pulse irregular. Blindness, gangrene, and sudden death, have followed the excess of this sensation. Its effects of changing the color of the hair are well known. Opiates, in small doses, are good cordials in this case.

GRIELUM, in botany, a genus of the pentagynia order, belonging to the decandria class of plants : *cal.* quinquefid : there are five petals : the filaments persisting : and five monospermous seed-cases. Species one only ; an Ethiopian shrub.

GRIERSON (Constantia), a native of Ireland, was born of poor parents, and died at the age of twenty-seven, in 1733. She was an excellent Greek and Latin scholar ; and studied history, divinity, philosophy, and mathematics. She proved her skill in Latin by the dedication of the Dublin edition of Tacitus to lord Carteret, and by that of Terence to his son ; to whom she also addressed a Greek epigram. She wrote many elegant English poems, several of which were inserted by Mrs. Barber among her own. When lord Carteret was lord-lieutenant of Ireland, he obtained a patent for Mr. Grierson to be the king's printer ; and, to reward the uncommon merit of his wife, caused her life to be included in it.

GRIESBACH (John James), a celebrated German divine and critic, was born at Buzbach in Hesse Darmstadt, where his father was a Lutheran minister. He studied at the universities of Frankfort, Tubingen, Halle, and Leipsic ; and finally became professor of theology at Halle. In 1774 he published an edition of the Historical Books of the Christian Scriptures, 2 vols 8vo., with a copious collection of various readings. The remaining books of the New Testament were subsequently given to the world in the same manner ; and an improved edition of the whole work, under the patronage of the late duke of Grafton, in 4 vols. 4to. reprinted in 2 vols. 8vo. both in German and English. Griesbach was also the author of *Symbolic Criticæ ad supplementa et corrigendas variorum Novi Testamenti Lectionum*, 1785—1793, 2 vols. 8vo., and many other valuable biblical works. He removed from Halle to Jena, where he became professor of theology, rector of the university, and privy counsellor for ecclesiastical affairs to the duke of Saxe Weimar. He died here in March 1812, aged sixty-seven.

GRIFFIN, n. s. } This should rather be
GRIFFON. } written *grifon*, or *gryphon* ;
gryps, γρύψ ; but it is generally written *griffin*.—
Dr. Johnson. A fabled animal, said to be generated between the lion and eagle, and to have the head and paws of the lion, and the wings of the eagle.

That one did plete on the Pope's side.
A *Griffin* of a grimme stature.

Chaucer. The Ploverman's Tale.

Of all bearing among these winged creatures, the *griffin* is the most ancient. *Peacham on Blazoning.*

Aristeus, a poet of Proconesus, affirmed, that near the one-eyed nations *griffins* defended the mines of gold.
Broune.

GRIFFON, GRYPHUS, was supposed by the ancients to have four legs, wings, and a beak; the upper part representing an eagle, and the lower a lion; and to watch over gold mines, hidden treasures, &c. This imaginary animal was consecrated to the sun; and the ancient painters represented the chariot of the sun as drawn by griffons. M. Spanheim observes the same of those of Jupiter and Nemesis. The griffon is commonly seen on ancient arms; and is borne in coat armour. Guillim blazons it rampant; alleging that any very fierce animal may be blazoned as well as the lion. Sylvester, Morgan, and others, use the terms *segreant* instead of rampant. The griffon is also an ornament of architecture in constant use among the Greeks, and was copied from them, with the other elegancies of architectural enrichments, by the Romans. See **SPHINX**.

The **GRIFFON**, in Scripture, is that species of the eagle called in Latin *ossifraga*, the osprey; and גריפון, of the verb פָּרַס, *paras*, to break. See **FALCO**.

GRIG, *n. s.* Bavarian *kricke*, a little duck. It seems originally to have signified any thing below the natural size; a small eel; also a merry creature: supposed from Greek; Lat. *graculus festivus*.

Hard is her heart as flint or stone,
She laughs to see me pale;
And merry as a *grig* is grown,
And brisk as bottle-ale. *Swift.*

GRILL, *v. n.* } Fr. *grille*; qu. Lat. *crati-*
GRILLAGE, *n. s.* } *cula*. To broil on a grate
GRILLY, *v. a.* } or *gridiron*: and hence figuratively, to harass, tease, or ridicule a man.

While we wrangle here and jar,
We are *grilled* all at Temple-bar. *Hudibras.*

GRIM, *adj.* } Sax. *gnumma*; Goth.
GRIMACE, *n. s.* } *grem*; Swedish *grym*.
GRIME, *n. s. & v. a.* } These words signify a
GRIMLY, *adv.* } countenance of terror;
GRIMNESS, *n. s.* } any thing hideous or
frightful; ugly or ill-looking. Grimace is a distortion of countenance, either from affectation or insolence. Grime is dirt deeply insinuated. Grimness, a countenance of horror.

Some saide he looked *grim*, and wolde fighte,
He bath a sparh of twenty pound of wighte.
Chaucer. The Knightes Tale.

He loketh as it were a *grim* leoun,
And on his toos he rometh up and down;
Him deigned not to set his feet to ground.

Chaucer. The Nonnes Preestes Tale.
The innocent prey in haste he does forsake,
Which quit from death, yet quakes in every limb,
With change of fear to see the lion look so *grim*.
Spenser.

The augurs
Say they know not; they cannot tell; look *grimly*,
And dare not speak their knowledge. *Shakspeare.*
Swart, like my shoe, but her face nothing so clean
kept; for why? She sweats: a man may go over
shoes in the *grime* of it. *Id.*

Grim visaged war hath smoothed his wrinkled
front. *Id.*
Venus was like her mother; for her father is but
grim. *Id.*

My face I'll *grime* with filth.
Blanket my loins, elf all my hair in knots. *Id.*

Their dear causes

Would to the bleeding and the *grim* alarm
Excite the mortified man. *Id. Macbeth.*
Thou hast a *grim* appearance, and thy face
Bears a command in't. *Id. Coriolanus.*
We've landed in ill time: the skies look *grimly*,
And threaten present blusters. *Shakspeare.*

Grim Saturn yet remains,
Bound in those gloomy caves with adamantine chains.
Dryden.

Straight stood up to him
Divine Ulysses; who, with looks exceeding grave
and *grim*,
This better check gave. *Chapman.*

He that dares to die,
May laugh at the *grim* face of law, and scorn
The cruel wrinkle of a tyrant brow.

Denham's Sophy.
What if the breath that kindled those *grim* fires,
Awaked, should blow them into seven-fold rage?
Milton.

Expert to turn the sway
Of battle, open when and where to close
The ridges of *grim* war. *Id. Paradise Lost.*
He had not spared to show his piques,
Against the haranguer's politicks,
With smart remarks of leering faces,
And annotations of *grimaces*! *Hudibras.*

The favourable opinion and good word of men
comes oftentimes at a very easy rate; and hy a few
demure looks and affected whims, set off with some
odd devotional postures and *grimaces*, and such other
little arts of dissimulation, cunning men will do won-
ders. *South's Sermons.*

So Pluto, seized of Proserpine, conveyed
To hell's tremendous gloom th' affrighted maid;
There *grimly* smiled, pleased with the beauteous
prize,
Nor envied Jove his sunshine and his skies.

Addison.
Their swarthy hosts would darken all our plains,
Doubling the native horror of the war,
And making death more *grim*. *Id. Cato*
The French nation is addicted to *grimace*.
Id. Spectator.

Collow is the word by which they denote black
grime of burnt coals or wood. *Woodward on Fossils.*
Vice in a vizard, to avoid *grimace*,
Allows all freedom, but to see the face
Gruncille.

Thus to their hopeless eyes the night was shown
And *grimly* darkled o'er their faces pale,
And the dim desolate deep. *Eyren.*

Achilles' self was not more *grim* and gory
Than thousands of this new and polished nation,
Whose names want nothing but—pronunciation.
Id.

GRIMALDI (FRANCIS), an eminent painter, also called Bolognese, was born at Bologna in 1606, where he became a disciple of Annibal Caracci, and proved an honor to that illustrious master. From the school of Annibal he went to complete his studies at Rome, and improved himself daily, until his superior talents recommended him to Innocent X., who afforded him immediate opportunities of exerting his genius in his palace at Monte Cavallo, and in the Vatican. His merit soon engaged the attention of the public, and increased the number of his friends; among whom were prince Pamphilio, and the principal nobility of Rome. His reputation reached cardinal Mazarine at Paris, who sent for him, settled a large pension on him, and

employed him for three years in embellishing his palace and the Louvre, by the order of Louis XIII. The troubles of the state, and the clamors raised against the cardinal, whose party he warmly espoused, placed him in so much danger, that his friends advised him to retire among the Jesuits. He did so, and painted a decoration for the exposition of the sacrament during the holy days, according to the custom of Rome. This piece was much admired at Paris, and the king commanded him to paint such another for his chapel at the Louvre. Grimaldi after that returned to Rome, and found his patron Innocent X. dead; but his successors Alexander VII. and Clement IX. honored him equally with their friendship, and found him variety of employment. The following instance of his benevolence may serve to characterise Grimaldi. A Sicilian gentleman, who had retired from Messina with his daughter during the troubles of that country, was reduced to the misery of wanting bread. As Grimaldi lived near him, he was soon informed of it; and in the dusk of the evening, knocking at the Sicilian's door, without making himself known, tossed in money, and retired. The thing happening more than once, raised the Sicilian's curiosity to know his benefactor. Discovering him at last, by hiding himself behind the door, he fell down on his knees to thank the hand that had relieved him. Grimaldi remained confused, offered him his house, and continued his friend till his death. He died of a dropsy at Rome in 1680, and left a considerable fortune among six children. The genius of Grimaldi directed him chiefly to landscape. His coloring is strong; his touch light and delicate; his situations are uncommonly pleasing; and the leaves of his trees are admirable. Sometimes, indeed, his coloring appears rather too green; but those landscapes which he painted in the manner of the Caracci, may serve as models for all those who admire the style of that school; and he designed his figures in elegant taste. The pictures of this master are very rare, especially those of his best time; and, when they are to be purchased, they obtain large prices. Of his children, the youngest, named Alexander, proved a good painter, in the same style and taste with his father, though far inferior to him: some of the pictures of Alexander, however, are either artfully or injudiciously ascribed to Francis.

GRIMALKIN, *n. s.* Fr. *gris*, gray, and *mal-kin*, or little *Moll*, says Dr. Johnson; (gray, and Teut. *mal*, of Lat. *macula*, a spot.—Mr. Thomson.) Gray little woman; the name of an old cat.

Grimalkin, to domestick vermin sworn
An everlasting foe, with watchful eye
Lies nightly brooding o'er a chinky gap,
Protending her fell claws, to thoughtless mice
Sure ruin. *Philips.*

GRIMM (Frederick Melchior), baron de, counsellor of state of the Russian empire, was born in 1723 at Ratisbon, of humble parents, who bestowed on him however a superior education. His taste for literature manifested itself in a tragedy, which he wrote in his youth. He went early in life to Paris as governor to the

children of the count de Schomberg, and was appointed reader to the duke of Saxe-Gotha. At this period he became acquainted with Rousseau, Diderot, d'Alembert, d'Holbach, &c. The count de Friesse at last made him his secretary, with lucrative appointments. He published in 1753 a pamphlet entitled *Le petit Prophete de Bechmischbrode*, in defence of the Italian opera. On the death of his patron, de Friesse, he was nominated principal secretary to the duke of Orleans; soon after which we find him employed, in conjunction with Diderot, in transmitting to the duke of Saxe-Gotha an account of the writings, friendships, quarrels, &c., of the authors of the day. In 1776 he became envoy from the duke of Saxe-Gotha to the French court, and was honored with the title of baron, and several orders. On the revolution breaking out, he retired to the court of Gotha. In 1795 the empress of Russia appointed him her plenipotentiary to the states of Lower Saxony; and he was confirmed in that post by her successor Paul, but ill-health obliged him to relinquish it, and return to Gotha, where he died December 19th, 1807. His principal work was published in different portions, under the following titles:—*Correspondance Litteraire, Philosophique, et Critique, adressée à un Souverain d'Allemagne, depuis 1770, jusqu'en 1782, par le Baron de Grimm et par Diderot, Paris, 1812, 5 vols. 8vo.*; *Correspondance Litteraire, &c. en 1775, 1776, 1782,—1790. Troisième et dern. part. 1813, 5 vols. 8vo.*; and *Correspondance Litteraire, &c. depuis 1753 jusqu'en 1760. Prem. part. 6 vols. 8vo.* A selection from this voluminous collection was published in 2 vols. 8vo. in French and English.

GRIMM, or GRIMMA, a town of Upper Saxony, in the circle of Leipsic. It has a castle, three churches, and a college. Its chief trade is in linens, flannels, thread, beer, and wool. It is fifteen miles E. S. E. of Leipsic, and forty-two W. N. W. of Dresden.

GRIMOARD (count de), a French diplomatist and general, was descended from the family of pope Urban V. Louis XVI. entrusted him with a negotiation in Holland; and on his return he formed the plans, offensive and defensive, of the campaign of 1792. The fall of the king interrupted his career, and he retired to private life, in which he wrote *Essai Theorique et Pratique sur les Batailles, 1775, 4to.*; *Traité sur la constitution des Troupes légères, et sur leur emploi à la Guerre, 1782, 8vo.*; *Recherches sur la force de l'armée Française, &c., 1806, 8vo.*; *Tableau Historique de la Guerre de la Revolution de France, 1803, in conjunction with general Servan, of which work only three volumes were published, when Buonaparte suppressed it. He died in 1815.*

GRIMSBY, a sea-port town of Lincolnshire, 168 miles from London, and one of the most ancient corporations in England. It was a mayoralty in the reign of king John; and has returned two members to parliament ever since the reign of Edward I.: the right of election is in the resident free burgesses paying scot and lot. All the sons of freemen born in the town are entitled to their freedom, as well as

every person marrying a freeman's daughter or widow. It had anciently three convents and a castle. It is governed by a mayor, high steward, recorder, twelve aldermen, twelve common-council-men, two bailiffs, two coroners, and a town-clerk. It has several streets of good houses, and a handsome church. Its harbour was formerly choked up, but a fine dock has been constructed, and the harbour deepened and improved, and the road before it is a good station for ships that wait for a wind to get out to sea. Its chief trade is in coals and salt to the Baltic, which are brought by the Humber.

GRIN, *v. n. & n. s.*,

GRIN'NER, *n. s.*

GRIN'NINGLY, *adv.*

Sax. *grænnian*; } Dut. *grinnen*, *grin-*
Den, undoubtedly
of the same origin with *to grind*, as we now say,
to grind the teeth; Fr. *grincer*.—Johnson. To
fix the teeth as in wrath, or anguish, or mirth.

And *grinning* for dispirited rage;

Her nose ysnorted up for tene

Ful hideous was she for to sene.

Chaucer. Romaunt of the Rose.

What valour were it when a cur doth *grin*,

For one to trust his hand between his teeth,

When he might spurn him with his foot away.

Shakspeare.

I like not such *grinning* honour as Sir Walter hath:
give me life, which if I can save, so; if not, honour
comes unlooked for, and there's an end.

Id. Henry IV.

Death, death! oh, amiable, lovely death!

Come *grin* on me, and I will think thou smilest.

Shakspeare.

I asked which way was the wind,

For I thought in some talk we must enter,

'Why, Sir (she answered and *grinned*).

Have you just sent your wits for a venture?'

Sir John Suckling

It was no unpleasant entertainment to me to see
the various methods with which they have attacked
me; some with piteous moans and outcries, others
grinning, and only showing their teeth. *Stillingfleet.*

He laughs at him: in's face too.

—O you mistake him; 'twas an humble *grin*,

The fawning joy of courtiers and of dogs.

Dryden.

A lion's hide he wears;

About his shoulders hangs the shaggy skin;

The teeth of gaping jaws severely *grin*. *Id.*

They neither could defend, nor can pursue;

But *grinned* their teeth, and cast a helpless view. *Id.*

The muscles were so drawn together on each side
of his face, that he shewed twenty teeth at a *grin*.

Addison.

The frightful'st *grinner*.

Bethe winner. *Id. Spectator.*

Madness we fancy, gave an ill-timed birth

To *grinning* laughter, and to frantick mirth.

Prior.

What lords are those saluting with a *grin*?

One is just out, and one is lately in. *Young.*

Fools *grin* on fools, and Stoicklike support,

Without one sigh, the pleasures of a court. *Id.*

Care to our coffin adds a nail no doubt,

And every *grin*, so merry, draws one out.

Dr. Walcot.

GRIN, *n. s.* Sax. *gryn*, *gypene*. A snare;
a trap.

The *grin* shall take him by the heel, and the robber
shall prevail against him. *Job, xviii. 9.*

Like a bride that hasteneth to his *gryn*,

Not knowing the perile.

Chaucer.

GRIND, *v. a. & v. n.* Preter. I ground;
GRIND'ER, *n. s.* } part. pass. ground.

GRINDLESTONE, *n. s.* } Saxon *grindstan* *grē-*
GRINDSTONE, *n. s.* } *grunden*. To reduce

to powder by friction; to sharpen any instrument by rubbing on something hard; and figuratively to harass or oppress. Grinder is one that works in a mill; also the name of the double teeth. A grind-stone is that stone on which knives, &c., are sharpened.

To *grind* our corn and carry it hame again;

I pray you spede us. *Chaucer. The Reeves Tale.*

Whoso first cometh to the mill firste *grint*.

Id. Prologue to the Wife of Bathes Tale.

But in helle, hir sight shall be full of darknesse
and of smoke; and hir eyen full of teres, and hir her-
ing full of waimenting and *grinting* of teeth.

Id. The Persones Tale.

He the raging lioness confounds,

The roaring lion with his javelin wounds

Scatters their whelps, their *grinders* breaks; so they

With the old hunters starve for want of prey.

Sandys.

His heart a solid rock, to fear unknown,

And harder than the *grinder's* nether stone. *Id.*

So up he let him rise; who with grim look,

And countenance stern, upstanding, 'gan to *grind*

His grated teeth for great disdain. *Spenser.*

He that will have a cake out of the wheat, must
needs tarry the *grinding*.

Shakspeare. Troilus and Cressida.

Some merchants and tradesmen, under colour of
selling the colony with necessities, may not *grind*
them so as shall always keep them in poverty.

Bacon's Advice to Villiers.

The teeth are in men of three kinds; sharp as the
foreteeth; broad as the back-teeth, which we call the
molar-teeth, or *grinders*; and pointed teeth or canine,
which are between both. *Bacon.*

Harsh sounds, as of a saw, when it is sharpened,
and *grinding* of one stone against another, make a
shivering or horror in the body, and set the teeth on
edge. *Id. Natural History.*

Such a light and metallad dance

Saw you never yet in France;

And by the lead-men for the nonce,

That turn round like *grindstones*.

Ben Jonson.

Meeting with Time, slack thing, said I,

Thy sithe is dull, whet it, for shame!

No marvel, Sir, he did reply,

If it at length deserve some blame;

But where one man would have me *grind* it,

Twenty to one too sharp do find it. *Herbert.*

Fettered they send thee

Into the common prison, there to *grind*

Among the slaves and asses.

Milton's Agonistes.

One, who at the sight of supper, opened wide
His jaws before, and whetted *grinders* tried.

Dryden.

Both he brought;

He mouthed them, and betwixt his *grinders* caught.

Id.

Not knowing 'twas my labour, I complain

Of sudden shootings, and of *grinding* pain,

My throes come thicker, and my cries increas'd.

Id.

Against a stump his tusk the monster *grinds*,

And in the sharpened edge new vigour finds. *Id.*

The jaw-teeth or *grinders*, in Latin *molares*, are
made flat and broad a-top, and withal somewhat un-

even and rugged, that, by their knobs and little cavities, they may the better retain, *grind*, and commix the aliments.

Ray on the Creation.

Smiths that make hinges brighten them, yet seldom file them; but *grind* them on a *grindstone* till bright.

Mozon.

Now exhort

Thy hinds to exercise the pointed steel
On the hard rock, and give a whealy form

To the expected *grinder*.

Philips.

Shrinking sinews start,

And sneary foam works o'er my *grinding* jaws.

Rowe.

Another way the Spaniards have taken to *grind* the Neapolitans, and yet to take off the odium from themselves.

Addison.

That the stomach in animals *grinds* the substances which it receives, is evident, from the dissection of animals which have swallowed metals, which have been found polished on the side next the stomach.

Arbuthnot on Aliments.

Nature is at a great deal of labour to transmute vegetables into animal substances; therefore herb-eating animals, which do not ruminate, have strong *grinders*, and chew much.

Arbuthnot.

What relation or affinity is there between a minute body and cogitation, any more than the greatest? Is a small drop of rain any wiser than the ocean? Or do we *grind* inanimate corn into living and rational meal?

Bentley's Sermons.

GRINDING is also used for rubbing or wearing off the irregular parts of the surface of a body, and reducing it to the destined figure, whether that be flat, concave, or the like. The grinding and polishing of glass is a considerable art; for which see GLASS-MAKING; and for grinding of optical glasses, see OPTICS.

GRINDING, in cutlery, the operation of sharpening edge-tools. This operation, as usually practised, is attended with no small inconvenience, from the production of heat by friction. The heat produced is so great, that hard tools are often softened and spoiled by the steel becoming ignited during the grinding. To prevent this effect, the grind-stone is partly immersed in a trough of water; but in this case the rotation of the stone must be moderate, and the work, of course, slow, else the water will be thrown off by the centrifugal force. When the water is applied from above by a cock, the quantity is too small to counteract the heat, and preserve the necessary low temperature. It has even been found, that the edge or point of a hard tool ground under water will be softened, if it be not held so as to meet the stream, sparks being often produced even under water. To remedy this inconvenience, Mr. Nicholson made the following experiments:—He procured a Newcastle grind-stone of a fine grit, ten inches in diameter, and a mahogany block, to be used with emery on it; both mounted on an axis, to be applied between the centres of a strong lathe. Both were of the same diameter, and turned truly cylindrical. The face of the mahogany block was grooved obliquely in opposite directions, to afford a lodgment for the emery: the face of the stone was smooth, and a trough with water was placed below it. The wooden cylinder was faced with oil and emery. The tool to be ground was a file, from which it was intended to grind off all the teeth. The velocity of the

rotation produced by the lathe was so great as to turn the apparatus about five revolutions in a second. Yet the stone operated but slowly, and the trough was quickly exhausted; so that the workman was obliged to slacken the velocity on account of the heat. The emery cylinder cut rather faster. But, although the friction was made to operate successively and by frequent changes on the whole surface of the file, it soon became too hot to be held; and, when a cloth was used to defend the workman's hand, the work not only went on awkwardly, but the heat increased to such a degree, that the oil was decomposed, and emitted an empyreumatic smell. The stone was then allowed to dry, and the file tried upon its face. It almost instantly became blue, and very soon after red-hot. Both the cylinders were then covered with tallow, by holding the end of a candle to each while turning round, and emery was sprinkled on the wooden one. The file was then applied to the grind-stone while in rapid motion. At first the friction was hardly observable, but very soon afterwards, the zone of tallow pressed by the file became melted, and the stone cut very rapidly. Yet the file was for a long time hardly heated at all; and, when at last it began to feel warm, its temperature was instantly lowered by removing it to another zone of the cylinder. The same effects were produced on the wooden cylinder. This is easily explained upon the modern theory of heat. When oil was used on the wooden cylinder, the heat produced by the friction was employed in raising the temperature of the file and the oil; but when tallow was used, instead of the oil, the greatest part of the heat was exhausted in melting this substance. From the increased capacity of the tallow when fused, the heat was absorbed and became latent, instead of raising the temperature: and when the melted tallow began to grow hot, together with the file, the temperature was easily reduced by employing the heat on another zone of tallow. Mr. Nicholson used these two cylinders in a considerable quantity of work with great satisfaction. This discovery bids fair to be of great utility.

GRINSTED, EAST, a market town of Wiltshire, near Salisbury, twenty-nine miles from London, seated on a hill near the borders of Surrey. It has a handsome church, which was rebuilt after having been burnt down in 1683. On the 12th of November, 1785, the beautiful tower, having fallen to decay, fell down, and partly lighting on the church, very considerably damaged it. An hospital in the reign of king James I., for thirty-one poor people of this town, was built and endowed with £330 a-year. It is a borough by prescription, governed by a warden, and two gentlemen-assistants; has sent burgesses to parliament ever since the first of Edward II., who are elected by about thirty-five burghage-holders: and had a charter for a monthly market from Henry VII. The returning officer here is the bailiff, who is chosen by a jury of burghage-holders. Its market is on Thursday. At the east end of the town is a large handsome building in the form of a square, called Sackville College, founded by Sackville, duke of Dorset, about the year 1616, for twenty-four

aged persons of both sexes, where each has a comfortable room, and a yearly allowance of £8.

GRIP, *n. s.* A small ditch.—*Ainsworth.*

GRIPPE, *v. a., v. n., & n. s.* } Saxon *gripan* ;

GRIPPER, *n. s.* } Gothic *gripan* ;

GRIPINGLY, *adv.* } Dut. *grippen* ; Scot.

GRIPPLE, *n. s.* } *gripp.* To grasp ;

to hold hard ; to catch ; to press, or squeeze ; a seizure of the hand or paw. Gripes, a name given to the colic or pain in the bowels : hence, figuratively, oppression or affliction. A griper is an extortioner ; a usurer. Gripe is a griping or covetous miser.

If I maie gripe a riche man,

I shall so pulle him, if I can,

That he shall in a few stoundes

Lesse all his markes and his poundes.

Chaucer. Romaunt of the Rose.

A wonderous way it for this lady wrought,

From lion's claws to pluck the griped prey. *Spenser.*

Therefore still on high

He over him did hold his cruel claws,

Threatening with greedy gripe to do him dy. *Id.*

They put a barren sceptre in my gripe,

Thence to be wrenched with an unlineal hand.

Shakspeare.

Should I

Slaver with lips, as common as the stairs

That mount the Capitol ; join gripes with hands

Made hardy with hourly falsehood as with labour. *Id.*

He gave me his hand,

And, with a feeble gripe, says, dear, my lord,

Command my service. *Id. Henry V.*

I take my cause

Out of the gripes of cruel men, and give it

To a most noble judge, the king my master.

Shakspeare.

You took occasion to be quickly woo'd,

To gripe the general sway into your hands. *Id.*

He that speaks doth gripe the hearer's wrist,

Whilst he that hears makes fearful action

With wrinkled brows. *Id. King John.*

Clysters help, lest the medicine stop in the guts,
and work gripingly. *Bacon's Natural History.*

Others pretend zeal, and yet are professed usurers,
grippers, monsters of men, and harpies. *Burton.*

It is mean revenue, by being scattered, in the worst
of times growing upon him, when others that had great
ones, by griping, made them less, and grew stark
beggars. *Fell.*

Adam, at the news

Heart-struck with chilling gripe of sorrow stood,

That all his senses bound ! *Milton's Paradise Lost.*

Canst thou bear cold and hunger ? Can these limbs,
Framed for the tender offices of love,

Endure the bitter gripes of smarting poverty ? *Otway.*

Thus full of counsel to the den she went,

Griped all the way, and longing for a vent.

Dryden.

I fell ; and with my weight the helm constrained
Was drawn along, which yet my gripe retained.

Id. Æneid.

Fired with this thought, at once he strained the
breast ;

'Tis true, the hardened breast resists the gripe,
And the cold lips return a kiss unripe. *Dryden.*

And first the dame came rushing through the wood ;
And next the famished hounds that sought their food,
And griped her flanks, and oft essayed their jaws in
blood. *Id. Fables.*

He seized the shining bough with griping hold,
And rent away with ease the lingering gold.

Dryden.

Many people would, with reason, prefer the griping
of an hungry belly to those dishes which are a feast
to others. *Loche.*

Manna, by the bulk, figure, texture, and motion of
its parts, has a power to produce the sensations of
sickness, and sometimes of acute pains or gripings in
us. *Id.*

In saucy state the griping broker sits,

And laughs at honest and at trudging wits.

Gay.

In the jaundice the choler is wanting ; and the
icterical have a great sourness and gripes, with windi-
ness. *Floger.*

Unlucky Welterd ! thy unfeeling master,

The more thou ticklest, gripes his hand the faster.

Pope.

GRISAMBER, *n. s.* Used by Milton for
ambergrise.

Beast of chase, or fowl of game,

In pastry built, or from the spit, or boiled,

Grisamber steamed. *Milton's Paradise Regained.*

GRISE, *n. s.* See GREECE, as it should be
written. A step, or scale of steps.

Let me speak like ourself ; and lay a sentence,

Which as a grise or step, may help these lovers

Into your favour.

Shakspeare. Othello.

GRISGRIS, a superstition greatly in vogue
among the negroes in the interior parts of Africa.
The grisgris, according to Le Maire, are certain
Arabic characters, mixed with magical figures
drawn by the Marabuts or priests upon paper.
Labat affirms, that they are nothing else than
scraps of the Alcoran in Arabic ; but the words
are probably of the Mandingo language, though
the characters are an attempt to imitate the
Arabic. The poorest negro never goes to war
without his grisgris, as a charm against wounds ;
and, if it proves ineffectual, the priest transfers
the blame on the immorality of his conduct.
These priests invent grisgris against all kinds of
dangers, and in favor of all desires and appe-
tites ; by virtue of which the possessors may
obtain or avoid whatever they like or dislike.
No priests in the world are more honored and
revered by the people than these impostors are
by the negroes ; nor are any people in the world
more impoverished by their priests than these
negroes are, a grisgris being frequently sold at
three slaves and four or five oxen. The grisgris
intended for the head is made in the form of a
cross, reaching from the forehead to the neck
behind, and from ear to ear ; nor are the arms
and shoulders neglected. Sometimes they are
planted in their bonnets in the form of horns ;
at other times they are made like serpents,
lizards, or some other animals, out of a kind
of pasteboard, &c.

GRISKIN, *n. s.* Irish *grisgin*, roast meat.
The vertebre of a hog broiled.

GRISLEA, in botany, a genus of the mono-
gynia order, and octandria class of plants :
natural order seventeenth, calycanthemæ : CAL.
quadridrif ; and there are four petals, one from
each incisure of it. The filaments are very
long, ascending or running upwards : CAPS. glo-
bose, superior, unilocular, and polyspermous.
Species two ; one an East Indian shrub with a
fine red flower ; the other, *G. secunda*, a South
American tree, with leaves like the bay-tree.

GRISLY, *adj.* Sax. *grīflu*. Dreadful; horrible; hideous; frightful; terrible.

Among all this—to romblen gan the heven;
The thunder rored with a *grisly* steven.

Chaucer. Legende of Good Women.

All painted was the wall, in length and brede,
Like to the estres of that *grisly* place
That hight the gret temple of Mars in Trace.

Id. The Knights Tale.

Full black and *grisly* did his face appeare,
Besmeared with smoke that nigh his eye sight blent;
With rugged beard, and hoarie shagged heare
The which he never wont to combe or comely sheare.

Spenser.

His *grisly* locks, long growen and unbound,
Disordered hung about his shoulders round. *Id.*

Where I was wont to seek the honey bee,
The *grisly* toadstool grown there might I see. *Id.*

My *grisly* countenance made others fly;
None durst come near, for fear of sudden death.

Shakspeare. Henry VI.

Back stepped those two fair angels half amazed,
So sudden to behold the *grisly* king;
Yet thus, unmoved with fear, accost him soon.

Milton.

For that damned magician, let him be girt
With all the *grisly* legions that troop
Under the sooty flag of Acheron. *Id.*

The beauteous form of fight

Is changed, and war appears a *grisly* sight.

Dryden.

In vision thou shalt see his *grisly* face,
The king of terrors raging in thy race.

Id. Innocence.

Thus the *grisly* spectre spoke again. *Dryden.*

Close by each other laid, they pressed the ground.
Their manly bosoms pierced with many a *grisly* wound.

Id.

So rushes on his foe the *grisly* bear.

Addison.

Lo! in the vale of years beneath

A *grisly* troop are seen,

The painful family of Death

More hideous than their queen. *Gray.*

GRISONS, *THE*, the largest canton in Switzerland, is bounded by Upper Austria, Venetian Lombardy, and the small cantons of Ticino, Uri, Glarus, and St. Gall. It comprehends sixty principal and lateral valleys, and has, in all, a superficial extent of 2500 square miles. Its population, classed according to their language, has been thus estimated:—

Those who speak German	26,000
———— Italian	10,000
———— Romanish or the ancient Rhetian language	37,000
Total	73,000

It is still divided into three leagues, viz. the Grison or Gray League, the League of the house of God, and the ten Jurisdictions: which united formed one republic. The two first lie toward the south, and the third towards the north. The inhabitants are said to have been named Grisons, from the gray coats they wore in former times. This country, lying among the Alps, is very mountainous, yielding good pasture for the cattle, sheep, and goats, with some rye and barley: in the valleys there is plenty of grain, pulse, fruits, and wine. It abounds also with

hogs and wild fowl; but there is a scarcity of fish and salt, and their horses are mostly purchased of foreigners. The principal rivers are the Rhine, the Inn, and the Adda. It has also several lakes, most of which lie on the tops of the hills. The culture of potatoes was introduced here so lately as 1772, and has been carried to a considerable extent. Some parts are covered with valuable timber. The valley of the Engadin exports large quantities to Tyrol by the Inn; and the northern districts have opened a trade in that article with Holland, through the medium of the Rhine. This country is also rich in minerals: there are no manufactures however except a few cotton works at Coire. Their exports are cattle, wood, and minerals. From Suabia and the Tyrol they import corn; salt from the Tyrol and Bavaria; and from different parts of Switzerland, linen, and English and French cloths.

This country was anciently a part of Rhetia. After the extinction of the Roman empire in the west, it was some time subject to its own dukes, or those of Swabia. Then the bishop of Coire, and other petty princes, dependent on the emperors of Germany, became masters of great part of it: at last, by the extinction of some, purchase, voluntary grants, and force, it got rid of all its lords, and was erected into three distinct republics. This country, as well as the whole of Switzerland, suffered much during the late wars, having been repeatedly and successively overrun by the French and Austrians. In 1797 these republics were acknowledged by France, and in the following year the Grisons with its dependencies was formed into one of the Swiss cantons. The leagues are divided into communes.

GRISSAUNT (William), an eminent English physician, astronomer, and mathematician of the fourteenth century. Being, from the ignorance and superstition of the times, suspected of magic, he retired to France, gave up mathematics, and applied solely to medicine. His son was elected pope, and took the name of Urban V.

GRIST, *n. s.* Sax. *grīst*. A corruption of grindst. Corn; supply; provision: 'Grist to the mill'—is profit or gain.

Get *grist* to the mill to have plenty in store,

Lest miller lack water. *Tusser's Husbandry.*

The computation of degrees, in all matrimonial causes, is wont to be made according to the rules of that law, because it brings *grist* to the mill. *Ayliffe.*

A mighty trade this lusty miller drove;

Much *grist* from Cambridge to his lot did fall,

And all the corn they used at scholar's hall.

Miller of Tromp.

Matter, as wise logicians say,

Cannot without a form subsist;

And form, say I, as well as they,

Must fail, if matter brings no *grist*. *Swift.*

GRISTLE, *n. s.* } Saxon *grīstle*; Teuton.

GRISTLY, *adj.* } *crustel*. A cartilage; a part of the body next in hardness to the bone.

No living creatures, that have shells very hard, as oysters, crabs, lobsters, and especially the tortoise, have beres within them, but only little *gristles*.

Bacon's Natural History.

At last they spit out pieces of their lungs; it may be small *gristly* bits, that are eaten off from the lung-pipes.

She has made the back-bone of several vertebrae, as being more fit to bend, more tough, and less in danger of breaking, than if there were all one intire bone without these *gristly* junctures.

Fins are made of *gristly* spokes, or rays connected by membranes; so that they may be contracted or extended like women's fans.

Lest the asperity or hardness of cartilages should hurt the œsophagus or gullet, which is tender and of a skinny substance, or hinder the swallowing of our meat, therefore the annular *gristles* of the windpipe are not made round, or intire circles; but, where the gullet touches the windpipe, there, to fill up the circle, is only a soft membrane, which may easily give way to the dilatation of the gullet.

They have a louder and stronger note than other birds of the same bigness, which have only a *gristly* windpipe.

Each pipe distinguished by its *gristly* rings,
To cherish life aerial pasture brings.

GRIT, *n. s.* } Saxon *grutta*, *grout*.
GRITS, *n. s.* } The coarse part of meal;
GRITINESS, *n. s.* } oats husked; or coarsely
GRITTY, *adj.* } ground; sand; rough hard

particles
In fuller's-earth he could find no sand by the microscope, nor any *grittiness*.

The sturdy pear-tree here
Will rise luxuriant, and with toughest root
Pierce the obstructing *grit* and restive marl.

Silesian bole, crackling a little betwixt the teeth, yet without the least particle of *grit*, feels as smooth as soap.

I could not discern the unevenness of the surface of the powder, nor the little shadows let fall from the *gritty* particles thereof.

GRIT, ARGILLACEOUS, a genus of argillaceous earths. Its texture is more or less porous, equable, and rough to the touch. It does not give fire with steel, nor effervesce with acids. When fresh broken, and breathed upon, it exhales an earthy smell. Kirwan mentions two kinds; one from Hollington near Utoxeter, of a yellowish or whitish gray, and about the specific gravity of 2288. Another, from Knepersly in Staffordshire, is of the specific gravity of 2568; and so unfusible as to be used for fire stones. According to Fabroni, the *grit-stone* is of greater or less hardness, mostly of a gray, and sometimes of a yellowish color, composed of a siliceous and micaceous sand, but rarely of a sparry kind; with greater or smaller particles closely compacted by an argillaceous cement. It gives some sparks with steel, is indissoluble for the most part in acids, and vitrifiable in a strong fire. It is used for millstones and whetstones; and sometimes for filtering stones and for building.

GRIZZELIN, *adj.* More properly gridelin
See GRIDELIN.

The Burgundy, which is a *grizelin* or pale red, of all others, is surest to ripen in our climate.

GRIZZLE, *n. s.* } Fr. *gris*, *grisaille*. A
GRIZZLED, *adj.* } mixture of white and black;
GRIZZLY, *adj.* } a gray color.

To the boy Cæsar, send this *grizzled* head.

Shakspeare.

His beard was *grizzled*?

It was as I have seen it in his life. *Id. Hamlet.*
O thou dissembling cub! what wilt thou be,
When time hath sowed a *grizzle* on thy face?

Living creatures generally do change their hair with age, turned to be grey and white; as is seen in men, though some earlier, some later; in horses that are dappled and turn white; and in old squirrels, that turn *grizzly*.

His hair just *grizzled*,
As in a green old age.

Those *grizzled* locks, which nature did provide
In plenteous growth their asses' ears to hide.

GROAN, *v. n. & n. s.* } Sax. *gnanan*; Belg.
GROAN'FUL, *adj.* } *gromen*, *kreun*. To
GROAN'ING, *n. s.* } breathe with a hoarse
noise as in pain or agony: any hoarse deep melancholy sound. A groaning is an expression used by the common people to signify an accouchement.

Men *groan* from out of the city, and the soul of the wounded crieth out.

Repenting and *groaning* for anguish of spirit.

Thei spared not, but smote incessantly;
To satisfy hir malice thei were busie;
Thei spit in his face, thei smote here and there.
He *groined* full sore and swete many a tere.

Adown he kest it with so puissant wrest,
That back again it did aloft rebound,
And gave against his mother earth a *groanful* sound.

Such sheets of fire, such bursts of horrid thunder,
Such *groans* of roaring wind and rain, I never
Remember to have heard.

Many an heir
Of these fair edifices, for my wars,
Have I heard *groan* and drop.

Where sighs and *groans*, and shrieks that rend the air,
Are made, not marked!

So shall the world go on,
To good malignant, to bad men benign,
Under her own weight *groaning*.

Thus when without noise unknown
I have lived out all my span,
I shall die without a *groan*,
An old honest countryman.

I led to slaughter, and to slaughter leave;
And even from hence their dying *groans* receive.

Nothing can so peculiarly gratify the noble dispositions of humanity, as for one man to see another so much himself as to sigh his griefs and *groan* his pains.

The woods recede around the naked seat,
The Sylvans *groan*—no matter—for the fleet.
On the blazing pile his parent lay,
Or a loved brother *groaned* his life away.

Hence aching bosoms wear a visage gay,
And stifled *groans* frequent the hall and play.
To each his sufferings; all are men
Condemned alike to *groan*;
The tender, for another's pain;
The unfeeling, for his own.

GROAT, *n. s.* Belg. *groot* (i. e. great); Ital. *grosso*. A piece valued at four-pence; a proverbial name for a small sum. Groats, oats that have the hulls taken off.—*Ainsworth*

And yeve that Covent four-and-twenty grotes;
And yeve that frere a peny, and let him go.

Chaucer. The Sompnoures Tale.

I shall quiten every groat.

Id. Prologue to the Freres Tale.

My mother was wont

To call them woollen vassals, things created

To buy and sell with groats.

Shakspeare. Coriolanus.

I dare lay a groat,

A tertian ague is at least your lot.

Dryden's Fables.

Imagine a person of quality to marry a woman
much his inferior, and without a groat to her fortune.

Swift.

To build, to plant, whatever you intend,

To rear the column, or the arch to bend,

To swell the terrace, or to sink the groat,

In all let Nature never be forgot.

Pope.

GROCER, *n. s.* } This should be written

GROCERY, *n. s.* } grosser, from gross, a large quantity; a grocer originally being one who dealt by wholesale; or from *grossus* a fig, which their present state seems to favor.—Johnson. Minsheu says 'from Fr. *grossier*, ex *gros*, magnum.' Grocers' ware, such as tea, sugar, raisins, spice.

His troops being now in a country where they were not expected, met with many cart loads of wine, grocery, and tobacco.

Clarendon.

A grocer is a man who buys and sells tea, sugar, and plums, and spices, for gain.

Watts's Logick.

But still the offspring of your brain shall prove

The grocer's care, and brave the rage of Jove.

Garth.

GROCYN (William), a learned English divine, of the fifteenth century, born in Bristol, in 1442. He held a disputation at Oxford before king Richard III., who rewarded him liberally. In 1485 he was made a prebendary of Lincoln. In 1488 he travelled into Italy, and studied Greek under Politian and Demetrius Chalcondylas. Upon his return he taught it, and introduced the pronunciation of those masters into England. He was the friend and patron of Erasmus. He died at Maidstone, in 1522, of the palsy, aged eighty. His works are mentioned by Bayle. His Latin Epistle to Aldus Manutius is prefixed to Linacre's translation of Proclus de Sphæra. Venice, 1494.

GRODNO, a town, province, and government of Russian Poland, on the right bank of the Niemen: the town stands partly on a hill surrounded by several eminences. It consists of a mixture of wooden huts, and of houses once the residence of noblemen, but now in ruins. The population is about 5000, of whom the Jews form about 1500. In 1673 the Polish diet resolved that a third part of its meetings should be held at Grodno; but this rule was never strictly observed. It was the retreat of Stanislaus, during the troubles of 1795, and the place where he made a final abdication of his crown. Grodno has an academy, and in the neighbourhood are manufactures of silk, linen,

and fire-arms, established in 1776. It is 140 miles north-east of Warsaw, and 140 south-east of Königsberg.

The government of Grodno forming part of Lithuania, and adjacent to the governments of Wilna, Minsk, and Volhynsk, is fully 11,000 square miles in extent: population about 620,000. The surface is level, and much of it covered with wood; the rest is partly a light sandy soil, and partly marshy, but in general fertile. Agriculture is in a backward state; yet some corn is exported, and forms, together with the export of cattle, the only source of subsistence to the inhabitants: the little trade that is carried on is in the hands of Jews. This country is divided into eight circles, and lies between 51° 36' and 54° 19' of N. lat. It was formerly called the government of Slonim.

GROGERAM, *n. s.* } Fr. *gros*, grain; low
GROGRAM, *n. s.* } Latin *grossogramus*.—
GROGRAN, *n. s.* } Ainsworth. Stuff woven with large woof and a rough pile.

Certes they're neatly clothed: I of this mind am,
Your only wearing is your grogeram.

Donne.

Natolia affords great store of chamelots and grograms.

Sandys.

Some men will say this habit of John's was neither of camel's skin nor any coarse texture of its hair, but rather some finer weave of camelot, grogram, or the like.

Broune.

The natural sweetness and innocence of her behaviour shot me through and through, and did more execution upon me in grogram than the greatest beauty in town had ever done in brocade.

Addison.

The imperial flower, his neck with pearl attires;

The lily high her silver grogram rears,

The pansy her wrought velvet garment bears;

The red-rose, scarlet, and the provence, damask wears.

Fletcher's Purple Island.

Plain goody would no longer down;

'Twas madam in her grogram gown.

Swift.

GROIN, *n. s.* Of uncertain derivation.—Johnson. Minsheu says à Belg. *grom*. The part next above the thigh.

Antiplexus, a sonne of Priam, threw
His lance at Ajax through the preasse, which went
by him, and flew

On Leucus, wise Ulysses' friend: His groine it smote.

Chapman.

The fatal dart arrives,

And through the border of his buckler drives;

Passed through and pierced his groin; the deadly wound

Cast from his chariot, rolled him on the ground.

Dryden.

GROIN, among builders, is the angular curve made by the intersection of two semi-cylinders or arches: and is either regular or irregular. A regular groin is when the intersecting arches, whether semi-circular or semi-elliptical, are of the same diameters and height. An irregular groin is where one of the arches is semi-circular, and the other semi-elliptical.

GRONINGEN, a province and town at the north-east extremity of the Netherlands, bounded by the German Ocean on the north, by Hanover on the east, and by the Dutch provinces of Drenthe and Friesland on the south and west. Its superficial extent is about 770 square miles, and its population 140,000. The surface lies so

low, that the whole province is intersected by a multitude of canals and wet ditches, for the purpose of carrying off the water, and protected by dykes against inundations. In several parts there are swamps, and the soil is in general marshy. The wealth of the province is in its pastures, but corn is raised; and wood abounds in the south. In the towns there are manufactures of linen and woollen. The other sources of support are the fisheries along the coast, and some foreign trade. The province is divided into the three nearly equal districts of Groningen, Appingadam, and Winschoten; neither of the latter towns has 3000 inhabitants; and Delfzijl, a small sea-port, has not above 1000.

The town of Groningen is walled, and situated on the rivers Hunse and Fivel. It is of a circular form, and the houses in general are well built, and the streets regular. It has three public squares, and some handsome public buildings; in particular the prince's palace, the provincial assembly-house, the arsenal, and the custom-house. The Gothic church of St. Martin has a tower of great height. The university, founded in 1614, is endowed with the revenues of several monasteries, and consists of five faculties, with nineteen professors. There are here likewise academies for drawing, navigation, and agriculture; an establishment for the deaf and dumb, &c. The trade is much promoted by the Hunse being navigable for large vessels up to the town. The chief trade is in agricultural produce, the linen and woollen manufactures, and quills. 100 miles north-east of Amsterdam. Population 26,500.

GRONOVIA, in botany, a genus of the monogynia order, and pentandria class of plants: natural order thirty-fourth, cucurbitaceæ: petals five; stamina five, inserted into a campanulated cal.; the berry is dry, monospermous, and inferior. Species one: a Vera Cruz plant.

GRONOVIUS (John Frederic), a learned critic, born at Hamburg in 1613. Having travelled through Germany, Italy, and France, he was made professor of polite learning at Deventer, and afterwards at Leyden, where he died in 1671. He published, 1. *Diatriba in Statii*, &c. 2. *De Sestertiis*. 3. Correct editions of Seneca, Statius, Livy, Pliny's Natural History, Tacitus, Aulus Gellius, Phædrus, &c., with notes; and other works.

GROXOVIVS (James), son of the preceding, was educated at Leyden. He then went over to England, where he visited the universities, consulted the curious MSS., and formed an acquaintance with several learned men. He was chosen by the grand duke to be professor at Pisa, with a considerable salary, but returned into Holland, after he had resided two years in Tuscany, and consulted the MSS. in the Medicean library. In 1679 he was invited by the curators of the university of Leyden to a professorship; and his inaugural dissertation was so highly approved of, that the curators added 400 florins to his stipend, and continued it to his death in 1716. His principal works are, *The treasure of Greek antiquities*, in 13 vols. folio; and a great number of dissertations, and editions of ancient authors. He was compared to Schioppus for the virulence of his style; and the severity with which he

treated other great men who differed from him exposed him to just censure.

GROOM, *n. s.* Belg. *grom*. A boy; a waiter; a servant; a young man; a man newly married.

Rennen and crie, as thou werd wode,
On Æolus, the god of windes,
To blow out of all kindes
So loude, that he should ydrenche
Lorde and ladie, and grome and wenche,
Of all the Trojanes nation.

Chaucer. *The House of Fame*.

Then called she a groom, that forth him led
Into a goodly lodge. Spenser.

Think then, my soul! that death is but a groom,
Which brings a taper to the outward room. Donne.

From Egypt's kings ambassadours they come;
Them many a squire attends, and many a groom. Fairfax.

I presume for to intreat this groom,
And silly maid, from danger to redeem. Id.

In the time of Edward VI. lived Sternhold, whom
King Henry his father had made groom of his chamber,
for turning of certain of David's psalms into verse. Peacham.

Would'st thou be touched
By the presuming hands of saucy grooms? Dryden.

Amid the fold he rages, nor the sheep
Their shepherds, nor the grooms their bulls can keep. Id.

By this the brides are waked, their grooms are
dressed; Id.

All Rhodes is summoned to the nuptial feast. Id.
There many a groom, the busy cook attends,
In under offices. Fletcher's *Purple Island*.

— be grooms, and win the plate
Where once your nobler fathers won a crown. Cowper.

Groom is also applied to several superior officers belonging to the king's household, as groom of the chamber, groom of the stole. See **STOLE** and **WARDROBE**.

GROOVE, *n. s.* & *v. a.* Goth. *grauſ*; Sax. *grapan*; to dig or engrave. A deep cavern or hollow in mines; a channel cut with a tool: to cut any thing hollow.

He might, to avoid idleness, work in a groove or mine-pit therabouts, which at that time was little esteemed. Boyle.

The screw-plate is a kind of steel well tempered, with several holes in it, each less than other; and in those holes are threads grooved inwards, which grooves fit the respective taps that belong to them.

Moran's *Mechanical Exercises*.

Of the box every joint was well grooved. Swift.

GROOVE, among miners, is the shaft or pit sunk into the earth sometimes in the vein, and sometimes not.

GROOVE, among joiners, the channel made by their plough in the edge of a moulding, style, or rail, to put their pannels in, in wainscotting.

GROPE, *v. n.* & *v. a.* } Sax. *grapan*. To feel
Gro'p'er, *n. s.* } or search after any thing
where one cannot see: one who searches in the dark.

We grope for the wall like the blind, and we grope
as if we had no eyes. Isaiah lix. 10.

These curates ben so negligent and slow

To gropen tendrely a conscience.

Chaucer. *The Sompnours Tale*.

She gropeth slway forther with her hond
And fond the bed. Id. *The Reeves Tale*.

They meet with darkness in the clearest light;
And *grope* at noon, as if involved with night. *Sandys.*
In youth before I waxed old,
The blind boy, Venus' baby,
For want of cunning made me bold
In bitter hyve to *grope* for honny.

Spenser. Poems.

My sea-grown scarf about me, in the dark
Groped I, to find out them. *Shakspeare. Hamlet.*
How vigilant to *grope* men's thoughts, and to pick
out somewhat whereof they might complain.

Hayward.

They have left our endeavours to *grope* them out
by twilight, and by darkness almost to discover that,
whose existence is evinced by light. *Browne.*

A boy was *groping* for eels, and laid his hand upon
a snake. *L'Estrange.*

This, no doubt, is better for men than that they
should in the dark *grope* after knowledge; as St. Paul
tells us all nations did after God. *Locke.*

He heard us in our course,
And with his outstretched arms around him *groped*.

Addison.

O truth divine! enlightened by thy ray,
I *grope* and guess no more, but see my way.

Arbutnot.

But Strephon, cautious, never meant

The bottom of the pan to *grope*. *Swift.*

GROSE (Francis), Esq. F. A. S., an eminent
English antiquary, was born in 1731, and was
left an independent fortune; but had not a dis-
position to preserve it. He wrote, 1. The Anti-
quities of England and Wales, in 8 vols. 4to. and
8vo., which he began in 1773, and completed in
1787; containing 589 views, besides forty plans,
&c. 2. The Antiquities of Scotland, 2 vols.
4to. and 8vo., containing 100 views with a map.
3. The Antiquities of Ireland, 2 vols. 4to. and
8vo. 4. A Treatise on Ancient Armour and
Weapons, 4to., 1785, with a supplement in 1789.
5. A Classical Dictionary of the Vulgar Tongue,
8vo., 1785. 6. Military Antiquities, 2 vols. 4to.,
1786—88. 7. The History of Dover Castle,
4to., 1786. 8. A Provincial Glossary, with a Col-
lection of Local Proverbs and Popular Supersti-
tions, 8vo., 1788. 9. A Guide to Health, Beauty,
Honor, and Riches, 8vo. 10. Rules for Draw-
ing Caricatures, 8vo., 1788. 11. The Olio: a
collection of Essays, 8vo. In summer, 1789, he
set out on a tour in Scotland, and began to com-
municate his observations in folio numbers, with
four plates each, in 1790. Before he had com-
pleted this work, he went to Dublin, with the
intention of executing a similar work, with
views and descriptions of the antiquities of Ire-
land, executed in the same elegant manner with
those of Great Britain; but being seized with an
apoplectic fit, at the house of Mr. Hone in Dub-
lin, he died on the 12th of May, 1791, aged
about sixty. He had great skill in drawing,
which peculiarly qualified him for executing the
works in which he engaged: and, being of an
agreeable, humorous, and communicative dispo-
sition, he was much esteemed in the extensive
circle of his friends. He visited almost every
part of the three kingdoms. He married a lady
at Canterbury, by whom he had several children;
of whom captain Daniel Grose, after serving
several campaigns in America, was appointed
deputy governor of the settlement of Botany
Bay, in 1790.

Vol. X.

GROSS, *adj. & n. s.* } Swed. and Teut. *gross*;
GROSS'LY, *adv.* } Fr. *gros*; Ital. *grosso*;
GROSS'NESS, *n. s.* } Lat. *crassus*; barb. Lat.
grossus. Thick; bulky; enormous; unrefined;
inelegant; stupid; impure: gross, the substan-
tive, signifies the main body; the whole as op-
posed to parts: the number of twelve dozen; the
chief part; the main mass.

Wise men, that be over-fat and fleshy, go to sojourn
abroad at the temperate diet of some sober man; and
so, by little and little, eat away the *grossness* that is
in them. *Ascham.*

They can say that in doctrine, in discipline, in
prayers, and in sacraments, the church of Rome hath
very foul and *gross* corruptions. *Hooker.*

So far hath the natural understanding, even of
sundry whole nations, been darkened, that they have
not discerned, no, not *gross* iniquity to be sin. *Id.*

He ripely considered how *gross* a thing it were for
men of his quality, wise and grave men, to live with
such a multitude, and to be tenants at will under
them. *Id.*

Such kind of ceremonies as have been so *grossly*
and shamefully abused in the church of Rome, where
they remain, are scandalous. *Id.*

Certain general inducements are used to make
saleable your cause in *gross*. *Id.*

He hath ribbons of all the colours in the rainbow;
they come to him by the *gross*. *Shakspeare.*

I cannot instantly raise up the *gross*

Of full three thousand ducats. *Id.*

Treason and murder ever kept together,

As two yoke devils sworn to others' purpose;

Working so *grossly* in a natural cause,

That admiration did not whoop at them. *Id.*

And thine eyes

See it so *grossly* shown in thy behaviour,

That in their kind they speak it. *Id.*

What! are we cuckolds ere we have deserved it?

—Speak not so *grossly*. *Id. Merchant of Venice.*

To all sense 'tis *gross*

You love my son: invention is ashamed,

Against the proclamation of thy passion,

To say thou dost not. *Shakspeare.*

Examples *gross* as earth exhort me. *Id.*

The crows and coughts, that wing the midway air,
Shew scarce so *gross* as beetles. *Id. King Lear.*

The purpose is perspicuous even as substance,

Whose *grossness* little characters sum up. *Shakspeare.*

And I will purge that mortal *grossness* so,

That thou shalt like an airy spirit go. *Id.*

I was three or four times in the thought they were
not fairies; and yet the guiltiness of my mind drove
the *grossness* of the foppery into a received belief that
they were fairies. *Id.*

The cause of the epilepsy from the stomach is the
grossness of the vapours which rise and enter into the
cells of the brain. *Bacon.*

Comets, out of question, have likewise power and
effect over the *gross* and mass of things. *Id.*

The articulate sounds are more confused, though
the *gross* of the sound be greater.

Id. Natural History.

It is manifest, that when the eye standeth in the
finer medium, and the object is in the *gross-er*, things
shew greater; but contrariwise, when the eye is
placed in the *gross-er* medium, and the object in the
finer. *Id.*

This was my error, this my *gross* mistake,

Myself a demi votary to make. *Cowley.*

Belial came last, than whom a spirit more lewd

Fell not from heaven, or more *gross* to love

Vice for itself. *Milton's Paradise Lost.*

And in clear dream and solemn vision,
Tell her of things that no *gross* ear can bear. *Milton.*

Of elements,

The *grosser* feeds the purer; earth the sea,
Earth and the sea feed air. *Id. Paradise Lost.*

Then all this earthly *grossness* quit;
Attired with stars we shall for ever sit,
Triumphing over death. *Milton.*

What I have said has been forced from me, by
seeing a noble sort of poetry so happily restored by
one man and so *grossly* copied by almost all the rest.

Dryden.

The Belgians hoped, that with disordered haste,
The deep-cut keels upon the sands might run;
Or, if with caution leisurely we past,
Their numerous *gross* might charge us one by one.

Id.

You see the united design of many persons to make
up one figure: after they have separated themselves
in many petty divisions, they rejoin one by one in a
gross. *Id.*

Remember, son,

You are a general: all other wars require you;
For see the Saxon *gross* begins to move. *Id.*

It is made up only of that simple idea of an unit
repeated; and repetitions of this kind, joined together,
make those distinct simple modes of a dozen, a *gross*,
and a million. *Locke.*

Is not religion so perfectly good in itself, above all
in its Author, that, without the *grossest* sensuality, we
cannot but admire it? *Sprat.*

Several casuists are of opinion, that, in a battle,
you should discharge upon the *gross* of the enemy,
without levelling your piece at any particular person.

Addison's Freeholder.

The *gross* of the people can have no other prospect
in changes and revolutions than of publick blessings.

Addison.

If I speak of light and rays as endued with colours,
I would be understood to speak not philosophically
and properly, but *grossly*, and according to such con-
ceptions as vulgar people would be apt to frame.

Newton's Opticks.

This being the first colour which vapours begin to
reflect, it ought to be the colour of the finest and most
transparent skies, in which vapours are not arrived
to that *grossness* requisite to reflect other colours. *Id.*

There are two *gross* volumes concerning the power
of popes. *Baker.*

Or suck the mists in *grosser* air below,
Or dip their pinions in the painted bow. *Pope.*

For envied wit, like Sol eclipsed, was known
The' opposing body's *grossness*, not its own. *Id.*

Wealth in the *gross* is death, but life diffused,
As poison heals, in just proportion used. *Pope.*

But women now feel no such fire,
And only know the *gross* desire. *Swift.*

While it is so difficult to learn the springs and
motives of some facts, it is no wonder they should be
so *grossly* misrepresented to the publick by curious
inquisitive heads. *Id.*

Some men give more light and knowledge by the
bare stating of the question with perspicuity and just-
ness, than others by talking of it in *gross* confusion
for whole hours together. *Watts.*

The sun's oppressive ray the roseat bloom
Of beauty blasting, gives the gloomy hue,
And feature *gross*. *Thomson's Summer.*

There is a vain and imprudent use of their estates,
which, though it does not destroy like *gross* sins, yet
disorders the heart, and supports it in sensuality and
dulness. *Law.*

What a *grossness* is there in the mind of that man,
who thinks to reach a lady's heart by wounding her
ears! *Clarissa.*

But she dares never boast the present hour,
So *gross* the cheat, it is beyond her power. *Young.*

GROSSTESTE (Claude), a French protes-
tant divine, who came to London on the revo-
cation of the edict of Nantes. He was minister
of the Savoy. He wrote a treatise on the Inspira-
tion of the Sacred Books, and several sermons.
He died in 1713.

GROSSULARIA. See RIBES.

GROT, *n. s.* } Fr. *grotte*; Ital. *grotta*; Gr.
ΓΡΟΤΤΟ, *n. s.* } κρηττορ. A cave; a cavern
for coolness and pleasure.

Their careless chiefs to the cool *grottos* run,
The bowers of kings, to shade them from the sun.

Dryden.

In the remotest wood and lonely *grot*,
Certain to meet that worst of evils, thought.

Prior.

This was found at the entry of the *grotto* in the
Peak. *Woodward.*

Awful see the Egerian *grot*.

Pope.

No crowded in a *grotto's* gloom,
All hope extinct they wait their doom.

Beattie.

And the stained glass which lighted this fair *grot*
Tinted each ray. *Byron.*

GROTESQUE, *adj.* Fr. *grotesque*; Ital.
grotesco; Span. *grutesque*. Distorted of figure;
unnatural; wildly formed.

The champagne head

Of a steep wilderness, whose hairy sides
With thicket overgrown, *grotesque* and wild,
Access denied. *Milton's Paradise Lost.*

There is yet a lower sort of poetry and painting,
which is out of nature; for a farce is that in poetry
which *grotesque* is in a picture: the persons and ac-
tions of a farce are all unnatural, and the manners
false, that is, inconsistent with the characters of
mankind: *grotesque* painting is the just resemblance
of this. *Dryden.*

An hideous figure of their foes they drew,
Nor lines, nor looks, nor shades, nor colours true,
And this *grotesque* design exposed to publick view.

Id.

Palladian walls, Venetian doors,
Grotesque roofs, and stucco floors. *Pope.*

GROTESQUE, in sculpture and painting, some-
thing whimsical, extravagant, and monstrous;
consisting either of things that are merely ima-
ginary, or so distorted as to raise surprise and
ridicule. The word owes its derivation from
figures of this kind, being anciently much used
to adorn the grottos wherein the tombs of emi-
nent persons were enclosed.

GROTIUS (Hugo), or more properly Hugh
de Groot, was born at Delft in 1583. He made
so rapid a progress in his studies, that at fifteen
he had attained great knowledge in philosophy,
divinity, and civil law; and a yet greater profi-
ciency in polite literature, as appears by the
commentary he had made at that age on Martia-
nus Capella. In 1598 he accompanied the
Dutch ambassador into France, and was honored
with several marks of esteem by Henry IV. He
took his degree of L.L.D. in that kingdom; and,
at his return to his native country, pleaded at the
bar before he was seventeen years of age. He was
not twenty-four when he was appointed attorney-
general. In 1613 he settled at Rotterdam, and
was nominated syndic of that city; but did not
accept of the office, till a promise was made

him that he should not be removed from it. This prudent precaution he took, foreseeing, that the Arminian controversy, which had already given rise to many factions in the state, would occasion revolutions in the chief cities. The same year he was sent to England, on account of the divisions that reigned between the traders of the two nations, on the right of fishing in the northern seas; but he could obtain no satisfaction. He was afterwards sent to England, to persuade the king and the principal divines to favor the Arminians; and he had several conferences with king James I. on that subject. On his return to Holland his attachment to Barneveldt involved him in great trouble; for he was seized, and sentenced, in 1619, to perpetual imprisonment, and to forfeit all his goods and chattels. But after having been treated with great rigor for above a year and a half in his confinement, he was delivered by the advice and artifice of his wife, who having observed that his keepers, who had often fatigued themselves with searching and examining a great trunk of foul linen, which used to be washed at Gorkum, now let it pass without opening it, advised him to bore holes in it to prevent his being stifled, and then to get into it. He complied with this advice, and was carried to a friend's house in Gorkum; where dressing himself like a mason, and taking a rule and trowel, he passed through the market-place, and stepping into a boat went to Valvet in Brabant. Here he made himself known to some Arminians, and hired a carriage to Antwerp. At first there was a design of prosecuting his wife, who staid in the prison; and some judges were of opinion that she ought to be kept there in her husband's stead; however she was released by a plurality of voices, and universally applauded for her behaviour. He now retired into France, where he met with a gracious reception from that court, and Louis XIII. settled a pension upon him. Having resided there eleven years, he returned to Holland, on his receiving an invitation from Frederic Henry prince of Orange; but, his enemies renewing their persecution, he went to Hamburgh; where, in 1634, queen Christina of Sweden made him her counsellor and sent him ambassador into France. After having discharged the duties of this office above eleven years, he returned to give an account to queen Christina of his embassy, and in his journey visited Amsterdam. He was introduced to the queen at Stockholm; and there begged that she would grant him a dismissal, that he might return to Holland. This he obtained with difficulty. As he was returning, the ship in which he embarked was cast away on the coast of Pomerania; and, being sick, he continued his journey by land; but he was forced to stop at Rostock, where he died on the 28th of August, 1645. His body was carried to Delft, to be interred in the sepulchre of his ancestors. Notwithstanding the embassies in which he was employed, he composed a great number of works; the principal of which are, 1. *De Jure Belli et Pacis*, which is esteemed a master-piece. 2. *A Treatise on the Truth of the Christian Religion*. 3. *Commentaries on the Holy Scriptures*. 4. *The History and Annals of Holland*; and a great number of letters, all written in Latin.

GROTIUS (William), brother to Hugh, was an eminent lawyer, and wrote several books on jurisprudence. He died in 1662.

GROTON, a township of Connecticut in New London county, bounded on the west by the Thames, and on the south by Fisher's Island. It contains two parishes, and had 3946 citizens in 1795. It comprehends Fort Griswold, which defends the harbour of New London.

GROTON, a town in the above township, opposite to New London city. It was burned by general Arnold, on the 6th of September, 1781, and suffered loss to the amount of £23,217.

GROTTO, or GROTTA, in natural history, a large deep cavern or den in a mountain or rock. ELLEN HOLE, OKEY HOLE, PEAKE'S HOLE, and POOL'S HOLE, are famous among the natural caverns or grottos of England. See these articles. In grottos are frequently found crystals of the rock, stalactites, and other natural congelations, and those of an amazing beauty. See ANTIPAROS. At Foligno in Italy is another grotto, consisting of pillars and orders of architecture of marble, with their ornaments, &c., scarcely inferior to those of art.

GROTTO is also used for a little artificial edifice made in a garden, in imitation of a natural grotto. The outsides of these grottos are usually adorned with rustic architecture, and their inside with shell-work, fossils, &c., finished likewise with jets d'eau or fountains, &c. A cement for artificial grottos may be made thus:—Take two parts of white rosin, melt it clear, and add to it four parts of bees' wax; when melted together, add two or three parts of the powder of the stone you design to cement, or so much as will give the cement the color of the stone; to this add one part of the flower of sulphur: incorporate all together over a gentle fire, and afterwards knead them with your hands in warm water. With this cement the stones, shells, &c., after being well dried before the fire, may be cemented. Artificial red coral branches, for the embellishment of grottos, may be made in the following manner:—Take clear rosin, dissolve it in a brass-pan; to every ounce of which add two drams of the finest vermilion: when you have stirred them well together, and have chosen your twigs and branches, peeled and dried, take a pencil and paint the branches all over, whilst the composition is warm; afterwards shape them in imitation of natural coral. This done, hold the branches over a gentle coal fire, till all is smooth and even as if polished. In the same manner white coral may be prepared with white-lead, and black coral with lamp-black. A grotto may be built with little expense, of glass, cinders, pebbles, pieces of large flint, shells, moss, stones, counterfeit coral, pieces of chalk, &c., all bound or cemented together with the above-described cement.

GROVE, *n. s.* From grave. Sax. *gnafan*. A walk covered by trees meeting above.

And in the *grove*, at time and place ysette,
This Arcite and this Palamon ben mette.

Chaucer. The Knights Tale.

Colin! to heare thy rymes and roundelays,
Which thou wert wont on wasteful hilles to sing,

I more delight then larke in somner dayes,
 Whose eccho made the neighbour groves to ring.
Spenser. The Shepheard's Calendar.
 I looked toward Birnam, and anon methought
 The wood began to move:
 Within this three mile may you see it coming;
 I say, a moving grove. *Shakespeare. Macbeth.*
 Fortunate fields, and groves, and flowery vales;
 Thrice happy isles! *Milton.*

She left the flowery field, and waving grove.
Blackmore.

Banished from courts and love,
 Abandoned truth seeks shelter in the grove.
Granville.

Grove nods at grove, each alley has a brother,
 And half the platform just reflects the other.
Pope.

Can fierce passions vex his breast,
 While every gale is peace, and every grove
 Is melody? *Thomson's Spring.*
 Sweet were your shades, O ye primeval groves!
 Whose boughs to man his food and shelter lent;
 Pure in his pleasures, happy in his loves,
 His eye still smiling, and his heart content.

Beattie.

GROVE, in gardening, a small wood of trees. Groves are not only great ornaments to gardens, but also afford great relief against the violent heats of the sun, affording shade to walk under in the hottest parts of the day, when the other parts of the garden are useless; so that every garden is defective which has not shade. Groves are of two sorts, viz. either open or close. Open groves are such as have large shady trees, which stand at such distances as that their branches approach so near each other as to prevent the rays of the sun from penetrating through them. Close groves have frequently large trees standing in them; but the ground under these is filled with shrubs of underwood: so that the walks which are in them are private, and screened from winds; by which means they are rendered agreeable for walking at those times when the air is either too hot or too cold in other parts of the garden. These are often contrived so as to bound the open groves, and frequently to hide the walls or other enclosures of the garden: and when they are properly laid out, with dry walks winding through them, and on the sides of these sweet-smelling shrubs and flowers irregularly planted, they have a charming effect. Groves have been in all ages held in great veneration. The proseuchæ, and high places of the Jews, whither they resorted for the purposes of devotion, were probably situated in groves. See Joshua xxiv. 26. The proseuchæ in Alexandria, mentioned by Philo, had groves about them, because he complains that the Alexandrians, in a tumult against the Jews, cut down the trees of their proseuchæ. The ancient Romans had a sort of groves near several of their temples, which were consecrated to some god, and called *luci*, by antiphrasis, a non *lucendo*, as being shady and dark. The veneration which the ancient Druids had for groves is well known.

GROVE (Henry), a learned and ingenious presbyterian divine, born at Taunton in Somersetshire in 1683. Having obtained a classical education, he went through a course of academical learning under the Rev. Mr. Warren of

Taunton. He then removed to London, and studied under the Rev. Mr. Rowe, to whom he was nearly related. Here he contracted a friendship with Dr. Watts, which continued till his death; and, after two years, returned into the country, and began to preach with great reputation. Soon after beginning to preach, he married; and, on the death of Mr. Warren, succeeded him in the academy at Taunton; where he preached for eighteen years to two small congregations in the neighbourhood. In 1708 he published a piece entitled the Regulation of Diversions, drawn up for the use of his pupils. He next wrote several papers printed in the Spectator, viz. Numbers 588, 601, 626, 635. The last was republished, by the direction of Dr. Gibson, bishop of London, in the Evidences of the Christian Religion, by Addison. In 1725, Mr. James, his partner in the academy, dying, he succeeded him in his pastoral charge at Fulwood, near Taunton; and in this situation Mr. Grove continued till his death, which happened in 1738. Besides the above pieces, he wrote—An Essay towards a Demonstration of the Soul's Immortality; An Essay on the Terms of Christian Communion; The Evidence of our Saviour's Resurrection Considered; Some Thoughts concerning the Proof of a Future State from Reason; A Discourse concerning the Nature and Design of the Lord's Supper; Wisdom the first spring of Action in the Deity; A Discourse on Saving Faith; Miscellanies in prose and verse; and many Sermons, &c. After his decease his posthumous works were published by subscription, in 4 vols. 8vo., with the names of nearly 700 subscribers.

GROVEL, *v. n.* } Goth. *grufsl*; Isl. *grufide*,
 GROV'ELING, *adj.* } flat on the face. 'It may perhaps come by gradual corruption from ground fell,' says Johnson; but this seems a curious guess. To lie prone; to creep low on the ground; to be mean or without dignity.

The steel-head passage wrought,
 And through his shoulder pierced; wherewith to ground

He groveling fell, all gored in his gushing wound.
Spenser.

What see'st thou there? king Henry's diadem,
 Inched with all the honours of the world!
 If so, gaze on, and grovel on thy face,
 Until thy head be circled with the same.

Shakespeare.
 Oke mast and beech, and cornell fruit they eats,
 Groveling like swine on earth, in lowliest sort.
Chapman.

Now they lie
 Groveling and prostrate on yon lake of fire. *Milton.*
 Upon thy belly groveling thou shalt go. *Id.*
 Let us then conclude that all painters ought to require this part of excellence: not to do it, is to want courage, and not dare to shew themselves: 'tis to creep and grovel on the ground. *Dryden.*

I must disclaim whate'er he can express;
 His groveling sense will shew my passion less. *Id.*
 Several thoughts may be natural which are low and groveling. *Addison's Spectator.*

Wilt thou debase the heart which God refined?
 No; let thy heaven-taught soul to heaven aspire
 To fancy, freedom, harmony resigned;
 Ambitious groveling crew for ever left behind.

Beattie.

GROUND, *n. s.* Sax. *gruon*; Belg. *grond*; Dan. *grøndt*; Teut. *grund*. The earth considered as superficially extended, and therefore related to tillage, travel, habitation, or almost any action. The main mass of terrene matter is never called the ground. We never distinguish the terraqueous globe into ground and water, but into earth, or land, and water; again, we never say under earth, but under ground.

Israel shall go on dry *ground* through the sea.

Exod. xiv. 16.

She touched him with her harp, and raised him from the *ground*;

The shaken strings melodiously resound. *Cowley.*

Man to till the *ground*

None was, and from the earth a dewy mist

Went up, and watered all the *ground*. *Milton.*

From the other hill

To their fixed station, all in bright array,

The cherubim descended, on the *ground*

Gliding meteorous. *Id.*

A black bituminous gurge

Boils up from under *ground*. *Id.*

Hyde stamps, and straight upon the *ground* the swarms

Of current myrmidons appear in arms. *Marvell.*

And yet so nimbly he would bound,

As if he scorned to touch the *ground*. *Hudibras.*

The earth as distinguished from air and water.

And, as my blessed hap

And gode adventure was, right sone I founde

A tabernacle reised from the *grounde*

Where Venus sat and Cupido by her side.

Chaucer. The Court of Love.

I have made man and beast upon the *ground*.

Jeremiah.

There was a dew upon all the *ground*.

Julyses vi. 40.

They summed their wings, and soaring the' air sublime,

With clang despised the *ground*. *Milton.*

Too late young Turnus the delusion found;

Far on the sea, still making from the *ground*.

Dryden.

Milton's strong pinion, now not heaven can bound,
Now serpent-like in prose he sweeps the *ground*.

Pope.

Land; country.

The water breaks its bounds,

And overflows the level *grounds*. *Hudibras.*

When genial Spring a living warmth bestows,

And o'er the year her verdant mantle throws,

No swelling inundation hides the *grounds*,

But crystal currents glide within their bounds.

Gay.

Region; territory.

On heavenly *ground* they stood, and from the shore
They viewed the vast immeasurable abyss. *Milton.*

With these came they, who from the bordering flood
Of old Euphrates to the brook that parts

Egypt from Syrian ground, had general names

Of Baalim and Ashtaroth. *Id. Paradise Lost.*

Estate; possession.

Uneasy still within these narrow bounds,

Thy next design is on thy neighbour's *grounds*:

His crop invites, to full perfection grown;

Thy own seems thin, because it is thy own.

Dryden.

Land occupied.

The sea o'erflowed my *ground*,

And my best Flanders mare was drowned.

Milton.

The floor or level of the place.

Wherefore should I smite thee to the *ground*?

2 Sam. ii. 22.

Dagon was fallen on his face to the *ground*.

1 Sam. v. 4.

A multitude sit on the *ground*.

Matt. xv. 35.

Some part of the month of June, the water of this lake descends under *ground*, through many great holes at the bottom.

Brown.

Dregs; lees; fæces; that which settles at the bottom of liquors.

Set by them cyder, verjuice, sour drink, or *grounds*.

Mortimer.

Some insist upon having had particular success in stopping gangrenes, from the use of the *grounds* of strong beer, mixed up with bread or oatmeal.

Sharp's Surgery.

The first stratum of paint upon which the figures are afterwards painted.

We see the limner to begin with a rude draught, and the painter to lay his *grounds* with darksome colours.

Hakewill.

When solid bodies, sensible to the feeling and dark, are placed on light and transparent *grounds*, as, for example, the heavens, the clouds and waters, and every other thing which is in motion, and void of different objects; they should be more rough, and more distinguishable, than that with which they are encompassed.

Dryden's Dufresnoy.

The fundamental substance; that by which the additional or accidental parts are supported.

O'er his head

A well-wrought heaven of silk and gold was spread
Azure the *ground*, the sun in gold shone bright.

Cowley.

Indeed it was but just that the finest lines in nature should be drawn upon the most durable *ground*.

Pope.

Then wrought into the soul, let virtues shine,
The *ground* eternal as the work divine. *Young.*

The plain song; the tune on which descants are raised.

Get a prayer-book in your hand,
And stand between two churchmen, good my lord;
For on that *ground* I'll build a holy descant.

Shakspeare.

First hint; first traces of an invention; that which gives occasion to the rest.

Though jealousy of state the' invention found,

Yet love refined upon the former *ground*;

That way the tyrant had reserved to fly,

Pursuing hate, now served to bring two lovers nigh.

Dryden.

The first principles of knowledge.

The concords will easily be known, if the fore-
grounds be thoroughly beaten in.

Preface to Accidence.

Here statesmen, or of them they which can read,
May of their occupation find the *grounds*. *Donne.*

The *grounds* are already laid whereby that is unquestionably resolved; for having granted that God gives sufficient grace, yet when he co-operates most effectually, he doth it not irresistibly. *Hammond.*

After evening repasts, 'till bed-time, their thoughts will be best taken up in the easy *grounds* of religion, and the story of scripture. *Milton.*

The fundamental cause; the true reason; original principle.

And al the *grounde* of this his woful chauce.

Chaucer. Complaint of the Blacke Knight.

The use and benefit of good laws all that live under them may enjoy with delight and comfort, albeit the

grounds and first original causes from whence they have sprung be unknown. *Hooker.*

It is not easy to imagine how any such tradition could arise so early, and spread so universally, if there were not a real *ground* for it. *Wilkins.*

Nor did either of them ever think fit to make any particular relation of the *grounds* of their proceedings, or the causes of their misadventures. *Clarendon.*

Thou could'st not have discerned,
Fraud in the serpent, speaking as he spake,
No *ground* of enmity between us known. *Milton.*

In the solution of the Sabbatizer's objection, my method shall be, to examine, in the first place, the main *grounds* and principles upon which he buildeth, *White.*

He desired the steward to tell him particularly the *ground* and event of this accident. *Sidney.*
Sound judgment is the *ground* of writing well. *Roscommon.*

If it be natural, ought we not to conclude that there is some *ground* and reason for these fears, and that nature hath not planted them in us to no purpose. *Tillotson.*

Thus it appears, that suits at law are not sinful in themselves, but may lawfully be used, if there is no unlawfulness in the *ground* and way of management. *Kettellwell.*

Love once given from her, and placed in you,
Would leave no *ground* I ever would be true. *Dryden.*

The miraculous increase of the professors of Christianity was without any visible *grounds* and cause, and contrary to all human probability and appearance. *Atterbury.*

Upon that prince's death, although the *grounds* of our quarrel with France had received no manner of addition, yet this lord thought fit to alter his sentiments. *Swift.*

The field or place of action.

Here was thy end decreed, when these men rose;
And even with theirs this act thy death did bring,
Or hastened at the least upon this *ground*. *Daniel.*

The space occupied by an army as they fight, advance, or retire.

At length the left wing of the Arcadians began to lose *ground*. *Sidney.*

Heartless they fought, and quitted soon their *ground*,
While ours with easy victory were crowned. *Dryden.*

He has lost *ground* at the latter end of the day, by pursuing his point too far, like the prince of Conde at the battle of Seneffe. *Dryden's Fables. Preface.*

The intervening space between the flyer and pursuer.

Evening mist,

Risen from a river, o'er the marsh glides,
And gathers *ground* fast at the labourer's heels,
Homeward returning. *Milton's Paradise Lost.*
Superiors think it a detraction from their merit to see another get *ground* upon them, and overtake them in the pursuits of glory. *Addison's Spectator.*

Even whilst we speak our conqueror comes on,
And gathers *ground* upon us every moment. *Addison.*

The state in which one is with respect to opponents or competitors.

Had'st thou swayed as kings should do,
Giving no *ground* unto the house of York,
They never then had sprung. *Shakspeare. Henry VI.*

If they get *ground* and 'vantage of the king,

Then join you with them like a rib of steel,

To make them stronger. *Id. Henry IV.*

Whatever *ground* we may have gotten upon our enemies we have gotten none upon our vices, the worst enemies of the two; but are even subdued and led captive by the one, while we triumph so gloriously over the others. *Id.*

State of progress or recession.

I have known so many great examples of this cure, and heard of its being so familiar in Austria, that I wonder it has gained no more *ground* in other places. *Temple.*

The squirrel is perpetually turning the wheel in her cage: she runs apace, and wearies herself with her continual motion, and gets no *ground*. *Dryden.*

The foil to set a thing off.

Like bright metal on a sullen *ground*,
My reformation glittering o'er my fault,
Shall shew more goodly, and attract more eyes,
Than that which hath no foil to set it off. *Shakspeare.*

To fix on the *ground*.

To found, as upon cause, reason, or principle. *Wisdom groundeth* her laws upon an infallible rule of comparison. *Hooker.*

The church of England, walking in the good and old way of the orthodoxal primitive fathers, *groundeth* the religious observation of the Lord's day, and of other Christian holidays, upon the natural equity, and not upon the letter of the fourth commandment. *White.*

It may serve us to *ground* conjectures more approaching to the truth than we have hitherto met with. *Boyle.*

If your own actions on your will you *ground*,

Mine shall hereafter know no other bound. *Dryden.*

Some eminent spirit having signalized his valour, becomes to have influence on the people, to grow their leader in warlike expeditions; and this is *grounded* upon the principles of nature and common reason, which, where prudence and courage are required, rather incite us to fly to a single person than a multitude. *Swift.*

To settle in first principles or rudiments of knowledge.

Being rooted and *grounded* in love. *Eph. iii. 17.*

GROUND, the preterite and part. pass. of grind.

Now dull and rugged ere 'tis *ground*

And polished, looks a diamond. *Hudibras.*

Ground is much used in composition for that which is next the *ground*, or near the *ground*.

GROUND-ASH, *n. s.* A sapling of ash taken from the *ground*; not a branch cut from a tree.

A lance of tough *ground-ash* the Trojan threw,
Rough in the rind, and knotted as it grew. *Dryden. Æneid.*

Some cut the young ashes off about an inch above the *ground*, which causes them to make very large straight shoots, which they call *ground-ash*. *Mortimer's Husbandry.*

GROUND-BAIT, *n. s.* From *ground* and *bait*. A bait made of barley or malt boiled; which, being thrown into the place where you design to angle, sinks to the bottom, and draws the fish to it.

Take the depth of the place where you mean after to cast your *ground-bait*, and to fish. *Walton's Angler.*

GROUND-FLOOR, n. s. Ground and floor. The lower story of a house.

GROUND-IVY, n. s. Lat. *hedera terrestris*. Alehoof, or tunhoof.

Alehoof or *ground-ivy* is, in my opinion, of the most excellent use and virtue of any plants among us.

Temple.

GROUND-OAK, n. s. Ground and oak.

If the planting of oaks were more in use for underwoods, it would spoil the cooper's trade for the making of hoops, either of hasel or ash; because one hoop made of the young shoots of a *ground-oak*, would outlast six of the best ash.

Mortimer.

GROUND-PINE, n. s. Lat. *chamaepitys*. A plant.

The whole plant has a very singular smell, resembling that of resin; whence its name *ground-pine*. It grows on dry and barren hills, and in some places on the ditch banks by road sides.

Hill.

GROUND-PLATE, n. s. In architecture. The outermost pieces of timber lying on or near the ground, and framed into one another with mortises and tennons. In these also are mortises made to receive the tennons of the joists, the summer and girders; and sometimes the trimmers for the stair-case and chimney-way, and the binding joist.—*Harris*.

In the orthographical schemes there should be a true delineation, if it be a timber building, of the several sizes of the *ground-plates*, breast summers, and beams.

Mortimer.

GROUND-PLOT, n. s. The ground on which any building is placed.

Wretched Gynecia, where canst thou find any small *ground-plot* for hope to dwell upon?

Sidney.

A *ground-plot* square five hives of bees contains; Emblems of industry and virtuous gains.

Harte.

GROUND-RENT, n. s. Rent paid for the privilege of building on another man's ground.

A foot in front, and thirty-three five-sevenths deep, would bring in a *ground-rent* of five pounds.

Arbutnot on Coins.

The site was neither granted him, nor given; 'Twas nature's, and the *ground-rent* due to heaven.

Harte.

GROUND-ROOM, n. s. A room on the level with the ground.

I beseeched him hereafter to meditate in a *ground-room*; for that otherwise it would be impossible for an artist of any other kind to live near him.

Tatler.

GROUND'EDLY, adv. } These words
GROUND'LESS, adj. } (compounds from
GROUND'LESSLY, adv. } ground) signify
GROUND'LESSNESS, n. s. } firmness either in
GROUND'LING, n. s. } principles or sub-
GROUND'LY, adv. } stance, and are op-
GROUND'WORK, n. s. } posed to whatever

is fictitious, causeless, or superficial. A *ground-ling* is a fish which keeps at the bottom of the water, and hence a name applied to the vulgar. A *groundwork* is the first part of an undertaking; the foundation; the outline; the first principle of a science; or the original reason of a thing.

A man, *groundly* learned already, may take much profit himself, in using by epitome to draw other men's works, 'or his own memory sake, into shorter room.

Ascham.

The *groundwork* thereof is nevertheless true and certain, however they through ignorance disguise the same, or through vanity. *Spenser. State of Ireland.*

It offends me to the soul, to hear a robusteous perriwig-pated fellow tear a passion to tatters, to very rags, to split the ears of the *groundlings*.

Shakspeare. Hamlet.

The main skill and *groundwork* will be to temper them such lectures and explanations, upon every opportunity, as may lead and draw them in willing obedience.

Milton.

He hath given the first hint of speaking *ground-edly*, and to the purpose upon this subject. *Glancville*.

Divers persons have produced the like by spirit of vitriol, or juice of lemons; but have *groundlessly* ascribed the effect to some peculiar quality of those two liquors.

Boyle on Colours.

He durst not cite the words either of my book or sermons, lest the readers should have discovered the notorious falsehood and *groundlessness* of his calumny.

Tillotson.

A way there is in heaven's expanded plain,
Which, when the skies are clear, is seen below,
And mortals by the name of milky know;
The *groundwork* is of stars.

Dryden's Fables.

The moral is the first business of the poet, as being the *groundwork* of his instruction.

Dryden.

But when vain doubt and *groundless* fear

Do that dear foolish bosom tear.

Prior.

We have great reason to look upon the high pretensions which the Roman church makes to miracles as *groundless*, and to reject her vain and fabulous accounts of them.

Atterbury.

The party who distinguish themselves by their zeal for the present establishment, should be careful to discover such a reverence for religion, as may shew how *groundless* that reproach is which is cast upon them, of being averse to our national worship.

Frecholder.

GROUNDESEL, n. s. Sax. *grund* and *pile*, the basis, perhaps from Lat. *sella*. The timber or raised pavement next the ground.

The window-frame hath every one of its lights rabbetted on its outside about half an inch into the frame; and all these rabbets, but that on the *groundsel*, are grooved square; but the rabbet on the *groundsel* is levelled downwards, that rain or snow may the freelier fall off.

Moxon.

GROUNDESEL, n. s. Lat. *senecio*. A plant.

GROUP, n. s. & v. a. Fr. *groupe*; Ital. *gruppo*, a bunch or knot. See GRAPE. A crowd; a cluster; a hurdle; a number thronged together.

In a picture, besides the principal figures which compose it, and are placed in the midst of it, there are less *groups* or knots of figures disposed at proper distances, which are parts of the piece, and seem to carry on the same design in a more inferior manner.

Dryden's Dufresnoy.

The difficulty lies in drawing and disposing, or, as the painters term it, in *grouping* such a multitude of different objects, preserving still the justice and conformity of site and colouring.

Prior.

I cannot doubt but the poet had here in view the picture of Zetus, in the famous *group* of figures which represents the two brothers binding Dirce to the horns of a mad bull.

Addison.

You should try your graving tools

On this odious *group* of fools.

Swift.

Such were the sounds that thrilled the rocks along,
And unto ears as rugged seemed a song!

In scattered *groupes* upon the golden sand

They game—carouse—converse—or what the brand.

Byron. Corsair.

GROUPS, *Tue*, a name given by captain Cook to several islands in the South Pacific Ocean, in 1769; and extending from north-west by north, to south-east by south, about nine leagues. The two largest are separated from each other by a channel about half a mile broad, and surrounded by small islands, to which they are joined by reefs. These islands are supposed to have been first discovered by Roggewein. The southernmost lies in long. $142^{\circ} 42'$ W., lat. $18^{\circ} 12'$ S.

GROUPUS, a handsome sea-port on the coast of Brasil, South America. It has a fine and capacious harbour, with good anchorage. The climate is good; and the soil yields 100 fold for whatever is planted in it. It is particularly noted for its delicious fruits. Lat. $26^{\circ} 26'$ S.

GROUSE, *n. s.* Lat. *ericcus*. A kind of fowl; a heath-cock.

The 'squires in scorn will fly the house
For better game, and look for grouse. *Swift.*

GROUSE, or **GROWSE**. See **TETARO**.

GROUT, *n. s.* Sax. *gnuz*. In Scotland they call it groats. Coarse meal or pollard; that which purges off; a kind of wild apple.

Sweet honey some condense, some purge the *groust*;
The rest, in cells apart, the liquid nectar shout.

Dryden.

King Hardicanute, 'midst Danes and Saxons stout,
Caroused in nut-brown ale, and dined on *groust*:
Which dish its pristine honour still retains,
When each prince is crowned in splendour reigns.

King.

GROUTHEAD, or **GREATHEAD** (Robert), a learned bishop of Lincoln, born at Stow in Lincolnshire, or Stradbrook in Suffolk, in the end of the twelfth century. His parents were so poor, that when a boy he was obliged to do the meanest offices, and even to beg his bread; till the mayor of Lincoln, struck with his appearance, took him into his family, and put him to school. Here his ardent love of learning soon appeared, and procured him many patrons, who enabled him to prosecute his studies, first at Cambridge, afterwards at Oxford, and at last at Paris. In these three famous seats of learning he spent many years in the most indefatigable pursuit of knowledge, and became one of the most universal scholars of the age. He was master not only of the French and Latin, but also of the Greek and Hebrew languages, a very rare accomplishment in those times. Roger Bacon, who was intimately acquainted with him, says that he spent much of his time for almost forty years in the study of geometry, astronomy, optics, and other branches of mathematical learning, in all which he very much excelled. Theology was his favorite study, in which he read lectures at Oxford with great applause. In the mean time he obtained several preferments in the church, and was at length elected and consecrated bishop of Lincoln, A. D. 1235. In this station he soon became celebrated for the purity of his manners, the popularity of his preaching, the vigor of his discipline, and the boldness with which he re-proved the vices, and opposed the arbitrary mandates of the court of Rome; of this last we shall give one example. Pope Innocent IV. had granted to one of his own nephews, named Frederick, who was but a child, a provision to the

first canon's place in the church of Lincoln that should become vacant; and sent a bull to the archbishop of Canterbury, and Innocent, then papal legate in England, commanding them to see the provision made effectual; which they transmitted to the bishop of Lincoln. But that brave and virtuous prelate boldly refused to obey this unreasonable mandate, and sent an answer to the papal bull, containing a severe reproach against his holiness for abusing his power: 'If we except,' said he, 'the sins of Lucifer and Antichrist, there neither is nor can be a greater crime, nor any thing more contrary to the doctrine of the gospel, or more odious and abominable in the sight of Jesus Christ, than to ruin and destroy the souls of men, by depriving them of the spiritual aid and ministry of their pastors. This crime is committed by those who command the benefices intended for the support of able pastors, to be bestowed on those who are incapable of performing the duties of the pastoral office. It is impossible, therefore, that the holy apostolic see, which received its authority from the Lord Jesus Christ, for edification, and not for destruction, can be guilty of such a crime, or any thing approaching to such a crime, so hateful to God, and so hurtful to men. For this would be a most manifest corruption and abuse of its authority, which would forfeit all its glory, and plunge it into the pains of hell.' Upon reading this letter, his holiness became frantic with rage, and threatened to make the bishop an object of terror and astonishment to the whole world. 'How dare,' said he, 'this old, deaf, doating fool, disobey my commands? Is not his master the king of England my subject? Cannot he cast him into prison, and crush him in a moment?' But the cardinals induced the pope to think more calmly, and to take no notice of this letter. The bishop did not long survive this noble stand against the gross corruptions and tyranny of the church of Rome. He fell sick at his castle of Bugden that same year; and, sensible that his death was drawing near, he called his clergy into his apartment, and made a long discourse to them, to prove that the reigning pope Innocent IV. was Antichrist. With this exertion, his strength was so much exhausted, that he expired soon after, October 9th, 1253. A contemporary historian says, 'He was a free and bold reprimander of the pope and the king; an admonisher of the prelates; a corrector of the monks; an instructor of the clergy; a supporter of the studious; a censurer of the incontinent; a scourge and terror to the court of Rome; a diligent searcher of the scriptures; and a frequent preacher to the people. At his table he was hospitable, polite, and cheerful. In the church he was contrite, devout, and solemn; and in performing all the duties of his office he was venerable, active, and indefatigable.' The illustrious Roger Bacon has given this honorable testimony in his favor:—'Robert Grouthead, bishop of Lincoln, and his friend friar Adam de Marisco, are the two most learned men in the world, and excel all the rest of mankind both in divine and human knowledge.' This excellent prelate was a very voluminous writer, and composed a prodigious number of treatises on a

great variety of subjects in philosophy and divinity, a catalogue of which is given by Bayle.

GROW, *v. n. preter. grew, part. pass. grown.* Sax. *gnopan*; Belg. *groyen*; Goth. *groa*; Swed. *gro*. The general idea given by this word is procession or passage from one state to another. It is always change, but not always increase; for a thing may grow less, as well as grow greater. To vegetate; to have vegetable motion; to increase by vegetation.

He causeth the grass to *grow* for the cattle, and herb for the service of man. *Psalm civ. 14.*

It is not the *growing* of fruit that nourish man; but it is thy word which preserveth them. *Wisd. xvi. 26.*

To be produced by vegetation.

And the third apple of the three,
Which *groweth* lowest on the tree,
Who it beres, ne may not faile
That to his plesauce may avail.

Chaucer's Dreame.

A bag that *groweth* in the fields, at the first is hard like a tennis-ball, and white, and after *groweth* of a mushroom-colour, and full of light dust.

Bacon's Natural History.

In this country *groweth* abundance of that wood, which since is brought into Europe to die red colours.

Abbot.

But say, where *grows* the tree? from hence how far?

Milton.

In colder regions men compose
Poison with art; but here it *grows*.

Waller.

Those towers of oak o'er fertile plains might go,
And visit mountains where they once did *grow*. *Id.*
To shoot in any particular form.

Children, like tender osiers, take the bow;
And, as they first are fashioned, always *grow*.

Dryden's Juvenal.

To increase in stature.

The poor man had nothing, save one little ewe-lamb,
which he had bought and reared up; and it *grew* up
together with him and with his children.

2 Sam. xii. 3.

I long with all my heart to see the prince;
I hope he is much *grown* since last I saw him.

Shakspeare. Richard III.

To come to manhood from infancy; commonly
followed by *up*.

To mischief trained, e'en from his mother's womb,
Grown old in fraud, though yet in manhood's bloom,
Adopting arts, by which gay villains rise,
And reach the heights which honest men despise.

Churchill.

Of am I by the women told,
Poor Anacreon! thou *greatest* old.

Cowley.

Now the prince *groweth up* fast to be a man, and is
of a sweet and excellent disposition.

Bacon's Advice to Villiers.

The main thing to be considered, in every action of
a child, is how it will become him when he is bigger,
and whither it will lead him when he is *grown up*.

Locke.

We are brought into the world children, ignorant
and impotent; and we *grow up* in vanity and folly.

Wake.

But who can view the ripened rose, nor seek
To wear it? who can curiously behold
The smoothness and the sheen of beauty's cheek,
Nor feel the heart can never all *grow* old.

Byron. Child Harold.

To issue, as plants from a soil, or as branches
from the main trunk.

They will seem not struck into him, but *growing* out
of him.

Dryden's Æneid, Dedication.

To increase in bulk; to become greater, or
more numerous.

Bones, after full growth, continue at a stay: as for
nails, they *grow* continually.

Bacon's Natural History.

Then their numbers swell,
And *grow* upon us.

Denham.

Divisions *grow* upon us, by neglect of practick
duties: as every age degenerated from primitive piety,
they advanced in nice enquiries.

Decay of Piety.

To improve; to make progress.

Grow in grace, and in the knowledge of our Lord
and Saviour Jesus Christ.

2 Pet. iii. 18.

He then dispensed his best of legacies, his blessings;
most passionately exhorting the young *growing* hopes
of the family.

Fell.

As he *grew* forward in years he was trained up to
learning, under one Pronapides, who taught the Pelas-
gick letter, invented by Linus.

Pope.

To advance to any state.

They doubted whereunto this would *grow*.

Acts v. 24.

Nature, as it *grows* again towards earth,
Is fashioned for the journey dull and heavy.

Shakspeare.

The king, by this time, was *grown* to such an height
of reputation for cunning and policy, that every acci-
dent and event that went well was laid and imputed
to his foresight.

Bacon.

But when to ripened manhood he shall *grow*,
The greedy sailor shall the seas forego.

Dryden.

To come by degrees; to reach any state
gradually.

After they *grew* to rest upon number, rather compe-
tent than vast, they *grew* to advantages of place, cun-
ning diversions, and the like; and they *grew* more
skilful in the ordering of their battles.

Bacon's Essays.

The royal evil so malignant *grows*,
Nothing the dire contagion can oppose.

Marvell.

Verse, or the other harmony of prose, I have so
long studied and practised, that they are *grown* into a
habit, and become familiar to me.

Dryden.

The trespasses of people are *grown* up to heaven,
and their sins are got beyond all restraints of law and
authority.

Rogers.

To come forward; to gather ground.

Some seeing the end of their government nigh, and
troubles practice *growing* up, which may work trouble
to the next government, will not attempt redress.

Spenser on Ireland.

It was now the beginning of October, and Winter
began to *grow* fast on: great rain, with terrible thun-
der and lightning, and mighty tempests, then fell
abundantly.

Knolles.

To be changed from one state to another; to
become either better or worse; to turn.

A good man's fortune may *grow* out at heels.

Shakspeare.

Scipio Nasica feared lest, if the dread of that
enemy were taken away, the Romans would *grow*
either to idleness or civil dissension.

Abbot.

Tell me of liberty, the story's fine,
Until you all *grow* consuls in your wine.

Marvell.

Hence, hence, and to some barbarous climate fly,
Which only brutes in human form does yield,
And man *grows* wild in nature's common field.

Dryden.

The nymph *grew* pale, and in a mortal fright,
Spent with the labour of so long a fight.

Id.

Patient of command

In time he *grew*; and *growing* used to hand,
He waited at his master's board for food. *Id.*
We may trade and be busy, and *grow* poor by it,
unless we regulate our expences. *Locke.*

Delos, by being reckoned a sacred place, *grew* to be
a free port, where nations warring traded, as in a neu-
tral country. *Arbuthnot.*

As with cold lips I kissed the sacred veil,
The shrines all trembled, and the lamps *grew* pale.
Pope.

You will *grow* a thing contemptible, unless you can
supply the loss of beauty with more durable qualities.
Sieft.

Some for renown, on scraps of learning doat,
And think they *grow* immortal as they quote. *Young.*

By degrees the vain, deluded elf,
Grew out of humour with his former self. *Harte.*
To proceed as from a cause or reason.

Take heed now that ye fail not to do this: why
should damage *grow* to the hurt of the king?
Ex. iv. 22.

What will *grow* out of such errors, as masked
under the cloak of divine authority, impossible it is
that ever the wit of man should imagine, 'till time
have brought forth the fruits of them. *Hooker.*

Shall we set light by that custom of reading, from
whence so precious a benefit hath *grown*? *Id.*

Hence *grows* that necessary distinction of the saints
on earth and the saints in heaven; the first belonging
to the militant, the second to the triumphant church.
Pearson.

The want of trade in Ireland proceeds from the
want of people; and this is not *grown* from any ill
qualities of the climate or air, but chiefly from so
many wars. *Temple.*

To accrue; to be forthcoming.

Even just the sum that I do owe to you,
Is *growing* to me by Antipolis. *Shakspeare.*

To adhere; to stick together.

Honour and policy, like unsevered friends,
I' the' war do *grow* together. *Id. Coriolanus.*

The frog's mouth *grows* up, and he continues so for
at least six months without eating. *Walton.*

In burnings and scaldings the fingers would many
times *grow* together; the chin would *grow* to the
breast, and the arms to the sides, were they not
hindered. *Wiseman's Surgery.*

To swell: a sea term.

Mariners are used to the tumbling and rolling of
ships from side to side, when the sea is never so little
grown. *Raleigh.*

GROWN, *adj.* } Advanced in growth:
GROWTH, *n. s.* } covered or filled by the
growth of any thing.

I went by the field of the slothful, and by the vine-
yard of the man void of understanding; and lo, it
was all *grown* over with thorns, and nettles had
covered the face thereof. *Proverbs.*

Arrived at full growth or stature.

I saw lately a pair of China shoes, which I was
told were for a *grown* woman, that would scarce
have been big enough for one of our little girls. *Locke.*

Vegetation; vegetable life; increase of vegeta-
tion.

Deep in the palace of long *growth* there stood
A laurel's trunk of venerable wood.

Dryden's Æneid.

Those trees that have the slowest *growth*, are, for
that reason, of the longest continuance. *Atterbury.*

Product; production; thing produced; act of
producing.

Forbidding every bleak unkindly fog
To touch the prosperous *growth* of this tall wood.

Milton.

The trade of a country arises from the native *growths*
of the soil or seas. *Temple.*

I had thought, for the honour of our nation, that
the knight's tale was of English *growth*, and Chaucer's
own. *Dryden.*

Our little world, the image of the great,
Of her own *growth* hath all that nature craves,
And all that's rare, as tribute from the waves. *Valler.*

Increase in number, bulk, or frequency.
What I have tried, or thought, or heard upon this
subject, may go a great way in preventing the *growth*
of this disease, where it is but new. *Temple.*

Increase of stature; advance to maturity.

They say my son of York
Has almost overtaken him in his *growth*.

Shakspeare.

The stag, now conscious of his fatal *growth*,
To some dark covert his retreat had made.

Denham.

Though an animal arrives at its full *growth* at a
certain age, perhaps it never comes to its full bulk 'till
the last period of life. *Arbuthnot on Aliments.*

If parents should be daily calling upon God in a
solemn, deliberate manner, altering and extending
their intercessions, as the state and *growth* of their
children required, such devotion would have a mighty
influence upon the rest of their lives. *Law.*

Improvement; advancement.

It grieved David's religious mind to consider the
growth of his own estate and dignity, the affairs of re-
ligion continuing still in the former manner.

Hooker.

GROW'ER, *n. s.* From grow. An increaser.

It will grow to a great bigness, being the quickest
grower of any kind of elm. *Mortimer.*

To GROWL, *v. n.* *Flem. grollen.* To snarl
or murmur like an angry cur: to murmur; to
grumble.

Othello, neighbours—how he would roar about a
foolish handkerchief! and then he would *growl* so man-
fully. *Gay.*

They roam amid the fury of their heart,
And *growl* their horrid loves. *Thomson's Spring.*

Dogs in this country are of the size of common mas-
tiffs, and by nature never bark, but *growl* when they
are provoked. *Ellis.*

GROW'THEAD, *n. s.* } *Lat. capito.* From
Gro'wt'hol, *n. s.* } gross or greathead.
A kind of fish.—Ainsworth. An idle lazy fellow.
Obsolete.

Though sleeping one hour refresheth his song,
Yet trust not Hob *growthead* for sleeping too long.

Tusser.

GRUB, *v. a. & n. s.* } *Goth. graban.* preter.
GRUB'BLE, *v. n.* } *gröb.* to dig. To dig up;
root out of the ground; eradicate. A grub is a
small worm that eats holes in bodies; a dwarf:
to grubble, to feel in the dark.

There is a difference between a *grub* and a butterfly,
and yet your butterfly was a *grub*. *Shakspeare.*

John Romane, a short clownish *grub*, would bear
the whole carcase of an ox, yet never tugged with
him. *Carew.*

Thou hast a colour;

Now let me rowl and *grubble* thee:

Blind men say white feels smooth, and black feels
rough:

Thou hast a rugged skin; I do not like thee.

Dryden.

New creatures rise,

A moving mass at first, and short of thighs ;
 'Till shooting out with legs, and impeded with wings,
 The *grubs* proceed to bees with pointed stings. *Id.*
 Forest land,
 From whence the surly ploughman *grubs* the wood.

Id.

A foolish heir caused all the bushes and hedges
 about his vineyard to be *grubbed* up. *L'Estrange.*

The *grubbing* up of woods and trees may be very
 needful, upon the account of their unthriftiness.

Mortimer.

The *grub*,

Oft unobserved, invades the vital core ;
 Pernicious tenant ! and her secret cave
 Enlarges hourly, preying on the pulp
 Ceaseless.

Philips.

As for the thick woods, which not only Virgil but
 Homer mentions, they are most of them *grubbed* up,
 since the promontory has been cultivated and in-
 habited.

Addison on Italy.

GRUB, in zoology, is the English name of the
 hexapode worms, produced from the eggs of
 beetles, &c., and which at length are transformed
 into winged insects of the same species with
 their parents. See *ERTCA*.

GRUBENHAGEN, a principality of the
 kingdom of Hanover. It is fertile, but the
 greater part is mountainous, and, besides feed-
 ing a great number of sheep and black cattle,
 abounds with mines of silver, copper, lead, iron,
 sulphur, calamine, and zinc ; quarries of marble,
 slates, limestones, alabaster, and jasper of dif-
 ferent kinds. It has also some mines of gold,
 but these are not rich. The forests abound with
 oak, beech, firs, elms, &c. The inhabitants are
 Lutherans, and carry on linen manufactures.
Eimbeck is the capital. Population about
 60,000.

GRUBSTREET, *n. s.* The name of a street,
 near Moorfields, London, much inhabited at one
 time by writers of small histories, dictionaries,
 and temporary poems ; whence any mean pro-
 duction is called *Grubstreet*.

Χαῖρ Ἰθακή μετ' ἄεθλα, μετ' ἄλγεα πικρά
 Ἀσπασίως τίον ἔδρας ἰκάνομαι.

The first part, though calculated only for the me-
 ridian of *Grubstreet*, was yet taken notice of by the
 better sort.

Arbutnot.

I'd sooner ballads write, and *Grubstreet* lays.

Guy.

GRUCIUS (Nicolas), a French author of the
 sixteenth century, born at Rouen. He is said to
 have been the first who lectured on Aristotle in
 Greek. He wrote several works : the chief of
 which are, 1. A Treatise De Comitibus Romano-
 rum : 2. Tracts against Sigonius ; and A Trans-
 lation of Castanedo's History of the Indies. He
 died at Rochelle, in 1572.

GRUDGE, *v. a., v. n. & n. s.* } Sax. *gewræc*,
GRUDGE'INGLY, *adv.* } from Fr. *gruger*,

GRUTCH, *v. n. & n. s.* } according to
 Skinner, to grind or eat. In this sense we say
 of one who resents any thing secretly he chews
 it. *Grugnach*, in Welsh, is to murmur ; to
 grumble. *Grunigh*, in Scotland, denotes a
 grumbling morose countenance. To envy ; re-
 pine ; to give unwillingly ; to murmur : an old
 quarrel ; malevolence ; sullenness ; anger ; re-
 morse ; reluctance.

Grudge not one against another, brethren, lest ye
 be condemned. *James v. 9.*

He gan to *grutch*, and blamen it a lete.

Chaucer. Prologue to the Reves Tale.

For where a lover thinking promote,
 Envie wil *grutche*, repining at his lete.

Id. The Court of Love.

The poor at the enclosure doth *grutch*,

Because of abuses that fall,

Lest some men should have but too much,

And some again nothing at all.

Tusser's Husbandry.

They knew the force of that dreadful curse, where-
 unto idolatry maketh subject ; nor is there cause why
 the guilty sustaining the same should *grudge* or com-
 plain of injustice.

Hooker.

'Tis not in thee

To *grudge* my pleasures, to cut off my train.

Shakespeare.

Two households, both alike in dignity,

From ancient *grudge* break to new mutiny,

Where civil blood makes civil hands unclean. *Id.*

Let me go in to see the generals :

There is some *grudge* between 'em ; 'tis not meet

They be alone.

Id. Julius Cæsar.

Many times they go with as great *grudging* to serve
 in his majesty's ships, as if it were to be slaves in the
 galleys.

Raleigh.

Those to whom you have

With *grudge* preferred me. *Ben Jonson.*

But what we're born for we must bear,

Our frail condition it is such,

That what to all may happen here,

If't chance to me I must not *grutch*. *Id.*

In it he melted leaden bullets

To shoot at foes, and sometimes pullets ;

To whom he bore so fell a *grutch*,

He ne'er gave quarter to' any such. *Hudibras.*

What means this banishing me from your counsels ?
 Do you love your sorrow so well, as to *grudge* me part
 of it ?

Sidney.

Many countries about her were full of wars, which,
 for old *grudges* to Corinth, were thought still would
 conclude there.

Id.

He struggles into birth, and cries for aid ;

Then helpless in his mother's lap is laid :

He creeps, he walks ; and, issuing into man,

Grudges their life from whence his own began.

Dryden.

These clamours with disdain he heard,

Much *grudged* the praise, but more the robbed
 reward.

Id.

My *Dolabella*,

Hast thou not still some *grudgings* of thy fever ?

Id.

You steer betwixt the country and the court,

Nor gratify whate'er the great desire,

Nor *grudging* give what publick needs require.

Id. Fables.

E'en in the most sincere advice he gave,

He had a *grudging* still to be a knave. *Id.*

Let me at least a funeral marriage crave,

Nor *grudge* my cold embraces in the grave. *Id.*

Like harpies they could scent a plenteous board ;

Then to be sure they never failed their lord :

The rest was form, and bare attendance paid ;

Then drank and eat, and *grudgingly* obeyed. *Id.*

Do not, as some men, run upon the tilt, and taste
 of the sediments of a *grudging* uncommunicative dis-
 position.

Addison. Spectator.

They have *grudged* those contributions, which have
 set our country at the head of all the governments of
 Europe.

Addison.

Deep festered hate :

A *grudge* in both, time out of mind, begun,
And mutually bequeathed from sire to son.

Tate.

We do not *grudge* or repine at our portion, but are contented with those circumstances which the providence of God hath made to be our lot. *Nelson.*

Let us consider the inexhausted treasures of the ocean ; and though some have *grudged* the great share that it takes of the surface of the earth, yet we shall propose this too, as a conspicuous mark and character of the wisdom of God. *Bentley.*

I have often heard the Presbyterians say they did not *grudge* us our employments. *Swift.*

The god of wit, to shew his *grudge*,
Clapt ass's ears upon the judge. *Id.*

GRUEL, *n. s.* Fr. *gruan*, *gruelle*. Food made by boiling oatmeal in water ; any kind of mixture made by boiling ingredients in water.

Finger of birth-strangled babe,
Ditch-delivered by a drab ;
Make the *gruel* thick and slab.

Shakspeare. Macbeth.

Was ever Tartar fierce or cruel
Upon the strength of water *gruel* ? *Prior.*

Gruel made of grain, broths, malt drink not much hopped, posset-drinks, and in general whatever relaxeth. *Arbuthnot.*

But keen Xantippe scorning borrowed flame,
Can vent her thunders and her lightnings play
O'er cooling *gruel* and composing tea. *Young.*

GRUFF, *adj.* } Belg. *groff* ; Swed. *grof*.
GRUFFLY, *adv.* } Sour of aspect ; harsh of
GRUFFNESS, *n. s.* } manners ; rugged ; rough.
Hearse as applied to sounds.

The form of Mars high on a chariot stood,
All sheathed in arms, and *gruffly* looked the god.

Dryden.

The appellation of honour was such an one the *gruff*, such an one the stocky. *Addison.*

Around the fiend, in hideous order, sat
Foul bawling infamy and bold debate,
Gruff discontent through ignorance misled.

Garth.

GRUM, *adj.* } Gothic *grum*, anger,
GRUMBLE, *v. n.* } Swed. *grumla*, to trouble.
GRUMBLER, *n. s.* } To murmur with discontent ; to growl ; to make
GRUMBLING, *n. s.* } a deep hoarse noise as
GRUMTLY, *adv.* }
thunder ; to mutter.

A bridegroom

A *grumbling* groom, and that the virg shall find.

Shakspeare.

Thou *grumblest* and raillest every hour on Achilles,
and thou art as full of envy at his greatness as Cerberus is at Proserpina's beauty. *Id.*

I have served

Without or *grudge* or *grumbings*. *Id.*

The' accurst Philistian stands on the' other side,
Grumbling aloud, and smiles 'twixt rage and pride.

Cowley

The lion, though he sees the toils are set,
Yet pinched with raging hunger, scours away ;
Hunts in the face of danger all the day ;
At night, with sullen pleasure, *grumbles* o'er his prey.

Dryden.

Providence has allotted man a competency : all beyond it is superfluous ; and there will be *grumbling* without end, if we reckon that we want this, because we have it not.

L'Estrange.

Suitors, all but one, will depart *grumbling*, because they miss of what they think their due. *South.*

Thou *grumbling* thunder join thy voice. *Motteux.*

Like a storm

That gathers black upon the frowning sky,
And *grumbles* in the wind.

Rowe's Royal Convert.

L'Avare, not using half his store,

Still *grumbles* that he has no more. *Prior.*

Nie looked sour and *grum*, and would not open his mouth. *Arbuthnot.*

The half-pence are good half-pence, and I will stand by it ; if I made them of silver, it would be the same thing to the *grumbler*. *Swift.*

Vapours foul

Dash on the mountain's brow, and shake the woods
That *grumbling* wave below. *Thomson's Winter.*

'Right,' cry'd his lordship in a *grumbling* tone,
Much like a mastiff jealous of a bone. *Dr. Walcot.*

GRUME, *n. s.* } Fr. *grumeau* ; Lat.
GRUMOUS, *adj.* } *grumus*. A thick viscid
GRUMOUSNESS, *n. s.* } consistence of a fluid :
as the white of an egg, or clotted like cold blood.

—*Quincy.*

The cause may be referred either to the coagulation of the serum, or *grumousness* of the blood.

Wiseman's Surgery.

The blood, when let, was black, *grumous*, the red part without a due consistence, the serum saline, and of a yellowish green. *Arbuthnot.*

GRUNBERG, a considerable manufacturing town of Silesia, the chief place of a district in the principality of Glogau. The inhabitants are employed chiefly in manufacturing cloth. The environs of the town are fertile, and partly under the culture of the vine. Fullers' earth is also found here. Twenty miles north of Sagau, and thirty north-west of Gros Glogau. Population 8000.

GRUNSEL, *n. s.* More usually groundsil, unless Milton intended to preserve the Saxon *grunns*, says Dr. Johnson. The groundsel ; the lower part of the building.

Next came one

Who mourned in earnest, when the captive ark
Maimed his brute image, heads and hands lopped off
In his own temple, on the *grunsel* edge,
Where he fell flat, and shamed his worshippers.

Milton.

GRUNT, *v. n. & n. s.* } Lat. *grunnio* ; Goth.
GRUNTLE, *v. n.* } and Swed. *runte*, a
GRUNTER, *n. s.* } boar. To murmur like
GRUNTling, *n. s.* } a hog ; a young pig.

And neigh, and bark, and *grunt*, and roar and burn,
Like horse, hound, hog, bear, fire, at every turn.

Shakspeare.

Swine's snouts, swine's bodies, took they, bristles, *grunts*. *Chapman.*

Ran cow and calf, and family of hogs,

In panic horror of pursuing dogs ;

With many a deadly *grunt* and doleful squeak,

Poor swine, as if their pretty hearts would break.

Dryden.

From hence were heard

The *grunts* of bristled toars, and groans of bears.
And herds of howling wolves. *Id. Æneid.*

Lament, ye swine ! in *gruntings* spend' your grief,
For you, like me, have lost your sole relief. *Gay.*

Thy brinded boars may slumber undismayed,
Or *grunt* secure beneath the chestnut shade. *Tickel.*

The scolding qyeen to louder notes doth rise,

To her full pipes the *grunting* hog replies ;

The *grunting* hogs alarm the neighbours round.

Swift.

Cased all in loathsome mire : no word ; Gryll
could but grunt. *Fletcher's Purple Island.*

The sophist's rope of cobweb he shall twine,
Mope o'er the schoolman's peevishness ; or mourn
And delve for life in Mammon's dirty mine,
Sneak with the scoundrel fox, or grunt with glutton
swine. *Beattie.*

GRUTER (James), a learned philologist, and one of the most laborious writers of his time, was born at Antwerp in 1560. When a child, his father and mother, being persecuted for the Protestant religion by the duchess of Parma, carried him into England. He imbibed the elements of learning from his mother, who was one of the most learned women of the age, and besides French, Italian, and English, was a complete mistress of Latin, and well skilled in Greek. He studied at Cambridge, afterwards at Leyden, and at last applied himself wholly to polite literature. After travelling much he became professor in the University of Heidelberg ; near which city he died in 1627. He wrote many works ; the principal are, 1. A large collection of Ancient Inscriptions. 2. *Thesaurus Criticus*. 3. *Deliciæ Poetarum Gallorum, Italorum, et Belgarum, &c.*

GRUTLIN, a plain of Switzerland, near the lake of the Four Cantons, in the canton of Uri, famous for being the scene of the association of the three first cantons, in defence of their liberty, A. D. 1307.

GRUYERES, GRUYERS, or GRUYIRES, a town, and formerly county and bailiwick of Switzerland, in the canton of Friburg, famous for cheese ; which is exported to a considerable amount to France, Germany, and Italy. A dangerous insurrection broke out here in 1781, which threatened the destruction of the city of Friburg, before it was quelled by the assistance of troops from Berne. It lies fifteen miles south of Friburg. Long. 7° 23' E., lat. 46° 35' N.

GRYLLUS, the son of Xenophon, who slew the celebrated Theban general Epaminondas, and was also killed himself at the battle of Mantinea, A. A. C. 363. Xenophon, who was sacrificing when he heard of his death, instantly threw off his garland, but, upon being farther informed that his son had slain the enemy's general, immediately replaced it.

GRYLLUS, in entomology, a genus of insects, belonging to the order of hemiptera, comprehending the crickets, locusts, and grasshoppers. The general characters are these : the head is inflexed, armed with jaws, and furnished with palpi : the antennæ filiform ; the wings are deflected towards and wrapped round the sides of the body ; the under ones are folded up, so as to be concealed under the elytra : the thorax is flat and margined. All the feet are armed with two nails ; and the hind ones are formed for leaping. Under our article ENTOMOLOGY we have in some measure described the habits of this destructive genus of insects, and their depredations on particular occasions. We shall here, therefore, only enumerate the different species, with an account of some of their haunts, habits, &c.

G. campestris, the field cricket, and the domestic cricket, are varieties of the same species, differing only in color and habits ; the

latter being paler colored, and having more of a yellow cast, and the former more of a brown. The antennæ are as slender as a thread, and nearly equal to the body in length. The head is large, and round, with two large eyes, and three smaller ones of a light yellow color, placed higher on the edge of the depression, from the centre of which originate the antennæ ; the thorax is broad and short. In the males the elytra are longer than the body, veined, as it were rumpled on the upper part, crossed one over the other, and enfolding part of the abdomen, with a projecting angle on the sides ; they have also at their base a pale-colored band. In the females the elytra leave one-third of the abdomen uncovered, and scarcely cross each other ; and they are all over of one color, veined and not rumpled : nor do they wrap round so much of the abdomen underneath. The female, moreover, carries at the extremity of its body a hard spine, almost as long as the abdomen, thicker at the end, composed of two sheaths, which encompass two laminae : this implement serves the insect to sink and deposit its eggs in the ground. Both the male and female have two pointed soft appendices at the extremity of the abdomen. Their hinder feet are much larger and longer than the rest, and serve them for leaping. They are very shy and cautious, and, feeling a person's footsteps as he advances, they stop short in the midst of their song, and retire backward nimbly into their burrows, where they lurk till all suspicion of danger is over.

G. domesticus, the domestic or hearth cricket, does not require to be sought after for examination : it resides altogether within our dwellings, intruding itself upon our notice, whether we wish for it or not.

G. gryllotalpa, the mole cricket, is of a very unpleasant form. Its head, in proportion to the size of its body, is small and oblong, with four long thick palpi, and two long antennæ as slender as threads. Behind the antennæ are situated the eyes, and between those two eyes are seen three stemmata or less eyes, amounting to five in all, set in one line transversely. The thorax forms a kind of cuirass, oblong, almost cylindrical, which appears as it were velvety. The elytra, which are short, reach but to the middle of the abdomen, are crossed one over the other, and have large black or brown nervous fibres. The wings terminate in a point, longer not only than the elytra, but even than the abdomen. This latter is soft, and ends in two points or appendices of some length. But the chief singularity of this insect is in its fore feet, which are very large and flat, with broad legs, ending outwardly in four large serrated claws, and inwardly in two only ; between which claws the tarsus is situated. The whole animal is of a brown dusky color. It haunts moist meadows, and frequents the sides of ponds and banks of streams, performing all its functions in a swampy wet soil. With a pair of fore-feet, curiously adapted to the purpose, it burrows and works under ground like the mole, raising a ridge as it proceeds, but seldom throwing up hillocks. As mole crickets often infest gardens by the sides of canals, they are un-

welcome guests to the gardener, raising up ridges in their subterraneous progress, and rendering the walks unsightly. If they take to the kitchen quarters, they occasion great damage among the plants and roots, by destroying whole beds of cabbages, young legumes and flowers. When dug out, they seem very slow and helpless, and make no use of their wings by day; but at night they come abroad, and make long excursions. In fine weather about the middle of April, at the close of day, they begin to solace themselves with a low, dull, jarring note, continued for a long time without interruption, and not unlike the chattering of the fern owl, or goat-sucker, but more inward. About the beginning of May they lay their eggs, as Mr. White informs us, who was once an eye-witness: for a gardener, at a house where he was on a visit, happening to be moving on the 6th of that month, by the side of a canal, his scythe struck too deep, pared off a large piece of turf, and laid open to view a curious scene of domestic economy. There were many caverns and winding passages leading to a kind of chamber neatly smoothed and rounded, and about the size of a moderate snuff-box. Within this secret nursery were deposited near 100 eggs of a dirty yellow color, and enveloped in a tough skin, but too lately excluded to contain any rudiments of young, being full of a viscous substance. The eggs lay but shallow, and within the influence of the sun, just under a little heap of fresh mowed mould, like that which is raised by ants. When mole crickets fly, they move 'cursu undoso,' rising and falling in curves, like the other species mentioned before. In different parts of this kingdom people call them Fen-crickets, churr-worms and evechurrs, all very apposite names.

G. locustæ (the grylli of Fabricius), or locusts unarmed at the tail. This family is distinguished by having the tail purple: their antennæ are filiform or cylindrical, and half shorter than the abdomen; they have three stemmata, and three joints to the tarsi. According to the observation of the abbé Pouet, those which have their abdomen furnished with the tube or dart, above mentioned, lay their eggs in a stiff sort of earth which that instrument perforates. During the operation the dart opens; and, being hollow and grooved on each side within, the egg slides down along the grooves, and is deposited in the hole. Of those which have the tails simple, i. e. which have no dart, some have long wings, and some very short. The long winged sort lay their eggs on the bare ground, and have no use for a perforating instrument; but they cover them with a glutinous substance, which fixes them to the soil, and prevents their being injured either by wind or wetness. Those, again, which have short wings, deposit their eggs in the sand; and, to make the holes for this purpose, they have the power of elongating and retracting their abdominal rings, and can turn their body as on a pivot; in which operation long wings would have been a material impediment. The annals of most warm countries are filled with accounts of the devastations produced by locusts,

which sometimes appear in clouds of vast extent.

G. tettigoniæ, grasshoppers, or locusts armed at the tail. The females of this family are distinguished by a tubular dart at the extremity of their abdomen: in both sexes the antennæ are setaceous, and longer than the abdomen; and the tarsi composed of four articulations. They leap by the help of their hinder legs, which are strong and much longer than the fore ones. Their walk is heavy, but they fly tolerably well. Their females deposit their eggs in the ground, by means of the appendices which they carry in their tail, which consist of two laminæ, and penetrate the ground. They lay a great number of eggs at a time; and those eggs, united in a thin membrane, form a kind of group. The little larvæ that spring from them are wholly like the perfect insects, excepting in size, and their having neither wings nor elytra, but only a kind of knobs, four in number, which contain both, but undisplayed. The unfolding of them only takes place at time of the metamorphosis, when the insect has attained its full growth. In these insects, when examined internally, besides the gullet, we discover a small stomach; and, behind that, a very large one, wrinkled and furrowed within side. Lower down there is still a third; so that it is thought, and with some probability, that all the animals of this genus chew the cud, as they so much resemble ruminant animals in their internal conformation.

G. verrucivorus, the wart-eating grasshopper, has green wings, spotted with brown, and is caught by the common people in Sweden to destroy warts, which they are said to do by biting off the excrescence and discharging a corrosive liquor on the wound.

GRYNÆUS (Simon), a learned German, the son of a peasant of Suabia, born at Veringen, in Hohenzollern, in 1493. He was Greek professor at Vienna, and afterwards at Heidelberg, in 1523. Being a Protestant he was exposed to much persecution, and in 1531 took refuge in England; where he was received with great kindness by Sir Thomas More, to whom Erasmus had recommended him. He was the first who published the *Almagest* of Ptolemy in Greek. He also published a Greek Euclid, and Plato's works, with some commentaries of Proclus. He died at Basil in 1541.

GRYPHITES, in natural history, or crow's-stone, an oblong fossil shell, very narrow at the head, and becoming gradually wider to the extremity, where it ends in a circular limb; the head or beak of this is very hooked or bent inward. They are frequently found in our gravel or clay pits in many counties. There are three or four distinct species; some extremely round and convex on the back, others less so; and the plates of which they are composed are in some smaller and thinner, in others thicker and larger, in specimens of the same bigness.

GRYPHIUS (Sebastian), a celebrated printer of Lyons in France, was born in Suabia near Augsburg, in 1494. He restored the art of printing at Lyons, which was before exceedingly corrupted; and the books printed by him

are still valued by connoisseurs. He printed many books in Hebrew, Greek, and Latin, with new and very beautiful types; and his editions are no less accurate than elegant. Thus a certain epigrammatist has observed, that Robert Stephens was a very good corrector, Colinaeus a very good printer, but that Gryphus was both an able printer and corrector. He died in 1556, in his sixty-third year; and his business was carried on with reputation by his son Anthony Gryphus. One of the most beautiful books of Sebastian Gryphus is a Latin bible: it was printed in 1550, with the largest types that had then been seen, in 2 vols. folio.

GRYPHIUS. See GRIFFON.

GUADAGNI (Gaetono), in biography, a native of Vienza, one of the most celebrated opera singers of the last century, and also greatly admired for his dignity, grace, and intelligence, as an actor. He first came into England with a company of burletta singers, brought hither by Croza, an adventurous impresario, in 1748. The music he sung was the most simple imaginable; a few notes with frequent pauses, and opportunities of being liberated from the composer and the band, were all he wanted. And, in these seemingly extemporaneous effusions, he proved the inherent power of melody totally divorced from harmony, and unassisted even by unisonous accompaniment. Surprised at such great effects, from causes apparently small, musical critics frequently tried to analyse the pleasure he communicated to the audience, and found it chiefly arose from his artful manner of diminishing the tones of his voice, like the dying notes of the Æolian harp. Most other singers captivate by a swell, or messa di voce; but Guadagni, after beginning a note or passage with all the force he could safely exert, fined it off to a thread, and gave it all the effect of extreme distance, though neither his voice nor execution contributed much to charm or excite admiration. He finally quitted England in the summer of 1771; in 1772 he performed at Verona, and afterwards accompanied the electress dowager of Saxony to Munich, where he continued till 1776, when he appeared on the stage, for the last time, at Venice. After which he settled at Padua in the service of Sant' Antonio, where he lost his sight in 1786, by a paralytic stroke, and soon after his life.

GUADALAVIAR, a river of Spain, which rises on the confines of Arragon and New Castile, and running by Turvel, in Arragon, crosses the kingdom of Valencia, passes the town of that name, and soon after falls into the Mediterranean Sea a little below Valencia.

GUADALAXARA, a province and town of Spain, in New Castile; the town is seated on the Hieras, and contains nine churches, fourteen convents, and about 10,000 inhabitants. Here is a palace of the duke del Infantado, and a cathedral church of some eminence; also a large manufacture of cloth, carried on by the public authorities. It is fifty-six miles north-east of Madrid.

The province contains a territorial extent of 1050 square miles, and 122,000 inhabitants. It is very elevated land, intersected by mountains, and traversed by the Tagus and other streams.

The pasturage of sheep is the principal agricultural object. It is divided into three partidas and three tierras.

GUADALAXARA, a province or intendancy of Mexico, part of the former kingdom of New Galicia, almost twice the extent of Portugal. It is bounded on the north by the intendancies of Sonora and Durango, on the east by the intendancies of Zuatecas and Guanaxuato, on the south by the province of Valladolid, and on the west, for a length of 369 miles, by the Pacific Ocean. Its greatest breadth is 300 miles, and its greatest length (from south to north) 350 miles. It is crossed from east to west by the Rio de Santiago, which communicates with the lake of Chapala. All the eastern part of this province is the Table Land, and western declivity of the Cordilleras of Anahuac. The maritime regions, which stretch towards the great bay of Bayonne, are covered with forests, and abound in ship-building wood. But the climate is considered unhealthy. The interior is much better in this respect.

The Volcan de Colima of this province is the most western of the volcanoes of New Spain. The province contains two cities, six towns, and 322 villages. The most celebrated mines are at Arientos de Oburra, Bolanos, Hostiotipaquillo, Copala, and Guichihila. The population in 1803 was 630,500. The extent of surface 9612 square leagues.

GUADALAXARA, an episcopal city of Mexico, capital of the above intendancy, is both large and handsome, containing eight squares, many convents, and two colleges for education. It was built anno 1531, and is situated in a delightful and fertile plain, watered with several streams and fountains. It boasts a handsome aqueduct, and spacious gardens, replenished with excellent fruits. Here is a manufactory of cigars, and the natives make a sort of jars of a fine scented earth, in much request. Guadalaxara is about 280 miles north-west of Mexico, and contains 19,500 inhabitants.

GUADALOUPE, one of the Caribbee or Leeward Islands, lying about mid-way between Antigua and Martinico. It is forty-five miles long, thirty-eight broad, and, being of an irregular figure, is about 240 miles in circumference. It is divided into two parts by a small arm of the sea, which is not above six miles long, and from fifteen to forty fathoms broad. This canal, named the Salt River, is navigable, but only carries vessels of fifty tons burden. That part of the island which gives its name to the whole is, towards the centre, full of craggy rocks, where the cold is so intense, that nothing will grow upon them but fern and some useless shrubs covered with moss. On the top of these rocks a mountain called La Soufriere, or the Brimstone Mountain, rises to an immense height. It exhales, through various openings, a thick black smoke, intermixed with sparks that are visible by night. From all these hills flow numberless springs, which fertilise the plains below, and moderate the burning heat of the climate by a refreshing stream, so celebrated, that the galleons which formerly used to touch at the Windward Islands, had orders to renew their provision with

this pure and salubrious water. Such is that part of the island properly called Guadaloupe. That which is commonly called Grande Terre has not been so much favored by nature. It is indeed less rugged, but it wants springs and rivers. The soil is not so fertile nor the climate so wholesome. No European nation had taken possession of this island when 550 Frenchmen arrived there from Dieppe on the 28th of June, 1635. Their provisions were so ill-chosen, that they were spoiled in the passage, and were all exhausted in two months. St. Christopher's refused to spare them any: and their first attempts in husbandry could not as yet afford any thing. No resource was left but from the savages; but the superfluities of a people, who cultivate little, and never laid up stores, could not be great. The new-comers came to a resolution to plunder them; and hostilities commenced on the 16th of January, 1636. The Caribs, not thinking themselves in a condition openly to resist an enemy, who had so much the advantage from the superiority of their arms, destroyed their own provisions and plantations, and retired to Grande Terre, and the neighbouring islands. From thence the most desperate came over to Guadaloupe, and, concealing themselves in the forests, they attacked with their poisoned arrows all the Frenchmen who were hunting or fishing. During night, they burned the houses and destroyed the plantations. A dreadful famine was the consequence. The colonists were reduced to graze in the fields, and even to dig up dead bodies for their subsistence. At last the government of Aubert brought about a peace with the savages at the end of 1640. The remembrance of the hardships they had suffered proved a powerful incitement to cultivate all articles of immediate necessity; and afterwards induced an attention to those of luxury consumed in the mother country. Such as had escaped the calamities they had drawn upon themselves, were soon joined by some colonists from St. Christopher's, and from Europe. But still the prosperity of Guadaloupe was impeded by obstacles arising from its situation. The facility with which the pirates from the neighbouring islands could carry off their cattle, their slaves, and their crops, distressed them greatly. Intestine broils, arising from jealousies of authority, often disturbed the quiet of the planters. And the adventurers, who went over to the Windward Islands, disdaining a land that was fitter for agriculture than for naval expeditions, were easily drawn to Martinico by its convenient roads. In 1700 the number of inhabitants amounted only to 3825 white people, 325 savages, free negroes, and mulattoes; and 6725 slaves. There were only sixty small plantations of sugar, and sixty-six of indigo, cocoa, and cotton. But at the end of 1755 the colony was peopled with 9643 whites, and 41,140 slaves. Such was the state of Guadaloupe when it was conquered by the British, in April 1759. It was restored to France by the peace of 1763. By the survey in 1767, this island, including those of Desadea, St. Bartholomew, Marigalante, and Saints, contained 11,863 white people; 752 free blacks and mulattoes; 72,761 slaves; in all 85,376 souls. The

number of cattle was 5060 horses, 4854 mules, 111 asses, 17,378 horned cattle, 14,895 sheep and goats, and 2669 hogs; the number of plantations was 1983. The sugar works employed 414 mills. The annual produce of Guadaloupe and the adjacent islands was estimated many years ago at 46,000,000 lbs. of sugar, 21,000,000 of coffee, 320,000 of cotton, and 8000 of cocoa; besides logwood, ginger, rum, skins, &c. This island was again taken by the British in April 1794; retaken by the French, under Victor Hughes, in 1795; and, lastly, by the British in February, 1810. In 1812, according to a return to the house of commons, it contained, 12,747 whites, 94,328 slaves, and 7764 free blacks. Its exports in 1810 were—

12,700,437 lbs. of brown and other sugars.
1,334,387 gallons of liquor.
2,661,726 lbs. coffee.
112,208 do. cotton.
2,162 do. cacao.

In 1811.

8,216,249 lbs. of brown and other sugars.
1,380,816 gallons of liquor.
1,601,686 lbs. coffee.
219,009 do. cotton.
963 do. cacao.

Long. from 43° 24' to 44° 15' W. of Ferro, 11. from 15° 55' to 16° 37' N.

GUADALQUIVER, one of the most famous rivers of Spain, rises in Andalusia, near the confines of Granada, and running quite through Andalusia, by the towns of Baiza, Andaxar, Cordova, Seville, falls at last into the Bay of Cadiz.

GUADIANA, the ancient Anas, a large river of Spain, which rises in New Castile, and, passing across the high mountains, falls down to the lakes called Ojos of Guadiana; from whence it runs to Calatrava, Medellin, Mersda, and Badajoz, in Estremadura of Spain; and, after having traversed Alentejo in Portugal, separates Algarve from Andalusia, and falls into the bay of Cadiz, between Castro Marino and Agramonte.

GUADIX, a town of Spain, in Granada, with a bishop's see. It was taken from the Moors in 1253, who afterwards retook it, but the Spaniards again got possession of it in 1489. It is situated between the Sierra Nevada and the Alpuxaras Mountains, so that, from the elevation and the consequent cold, the inhabitants are precluded from cultivating olives and oranges. The country is adapted, however, to pasture, corn, and various fruits. The town has five churches and seven convents, with 8300 inhabitants. Here are a few manufactures of hemp and flax, also of silk. Twenty-eight miles E. N. E. of Grenada.

GUAIACUM, *n. s.* A physical wood.

Guaiacum is attenuant and aperient. It is excellent in many chronic cases, and was once famous for curing the venereal disease, which it still does singly in warmer climates, but with us we find it insufficient. We have a resin of it, improperly called gum *guaiacum*. *Hill.*

GUAIACUM, in botany, *lignum vitæ*, or pock-wood; a genus of the monogynia order, and decandria class of plants; natural order fourteenth,

gruinales: *cal.* quinquefid and unequal; the petals five, and inserted into the calyx: *caps.* angulated, and trilobular or quinquelobular.

1. *G. Afrum*, with many blunt-pointed leaves, is a native of the Cape of Good Hope. The plants retain their leaves all the year, but have never yet flowered in this country. This species is to be propagated by layers, and will live all the winter in a good green-house.

2. *G. officinale*, the common *lignum vitæ* used in medicine, is a native of the West India Islands, and the warmer parts of America. There it becomes a large tree, having a hard, brittle, brownish bark, not very thick. The wood is firm, solid, ponderous, very resinous, of a blackish yellow color in the middle, and of a hot aromatic taste. The smaller branches have an ash-colored bark, and are garnished with leaves divided by pairs of a bright green color. The flowers are produced in clusters at the end of the branches, and are composed of oval concave petals of a fine blue color. This species can only be propagated by seeds, which must be procured from the countries where it generally grows. They must be sown fresh in pots, and plunged into a good hot-bed, where they will come up in six or eight weeks. While young they may be kept in a hot-bed of tan bark under a frame during summer; but in autumn they must be removed into the bark stove, where they should constantly remain. The wood of this species is of great use both in medicine and in the mechanical arts. It is so compact and heavy as to sink in water. The outer part is often of a pale yellowish color; but the heart is blacker, or of a deep brown. Sometimes it is marbled with different colors. It is so hard as to break the tools used in felling it; and is therefore seldom used as fire wood, but is of great use to the sugar planters for making wheels and cogs to the mills. It is also often made into bowls, mortars, and other utensils. It is brought over to Britain in large pieces of 4 cwt. or 5 cwt. each; and, from its hardness and beauty, is in great demand for various articles of turnery ware. The wood, gum, bark, fruit, and even the flowers of this tree, possess medicinal virtues; but only the first three, particularly the wood and resin, are now in general use in Europe. The wood has little or no smell, except when heated, or while rasping, and then a slight aromatic one is perceived. When chewed it impresses a mild acrimony, biting the palate and fauces. Its pungency resides in its resinous matter, which it gives out in some degree to water by boiling, but spirit extracts it wholly. Of the bark there are two kinds; one smooth, the other unequal on the surface: they are both weaker than the wood; though, in a recent state, they are strongly cathartic. The gum, or resin, is obtained by wounding the bark in different parts of the tree, or by what has been called jaggings. It exudes copiously from the wounds, though gradually; and when a quantity is found accumulated upon the several wounded trees, hardened by exposure to the sun, it is gathered and packed in small kegs for exportation. This substance is of a friable texture, of a deep greenish color, and sometimes of a reddish hue; it has a pungent acid taste, but little or no smell unless

heated. It differs from resins in its habitudes with nitric acid, as Mr. Hatchett first showed. Its specific gravity is 1.229. It is transparent, and breaks with a resinous fracture. Its odor is not disagreeable, but when a very little of its powder, mixed with water, is swallowed, it excites a very unpleasant burning sensation in the fauces and stomach. Heat fuses it, with the exhalation of a somewhat fragrant smell.

Water dissolves a certain portion of it, acquiring a brownish tinge, and sweetish taste. The soluble matter is left when the water is evaporated. It constitutes nine per cent. of the whole, and resembles what some chemists call extractive. Guaiacum is very soluble in alcohol. This solution, which is brown colored, is decomposed by water. Aqueous chlorine throws down a pale blue precipitate from it. Guaiacum dissolves readily in alkaline lies, and in sulphuric acid; and in the nitric with effervescence. From the solution in the last liquid, oxalic acid may be procured by evaporation, but no artificial tannin can be obtained, as from the action of nitric acid on the other resins.

The tree also yields a spontaneous exudation from the bark, which is called the native gum, and is brought to us in small irregular pieces of a bright semipellucid appearance; it differs from the former in being much purer. In the choice of the wood, that which is the freshest, most ponderous, and darkest colored, is the best; the largest pieces are to be preferred; and the best method is to rasp them as wanted, for the finer parts are apt to exhale when the raspings or chips are kept. In choosing the resin prefer those pieces which have slips of the bark adhering to them, and that easily separate therefrom by a quick blow. The resin is sometimes mixed with the gum of the manchineal tree; but this is easily detected by dissolving a little in spirit of wine or rum. The true gum imparts a whitish or milky tinge, but the manchineal gives a greenish cast. Mouch advises a few drops of spirit, nitridule, to be added to the spirituous solution, and then to be diluted with water, by which the gum will be precipitated in a blue powder; but the adulteration will appear floating in white striae, &c. Guaiacum was first introduced into Europe as a remedy for the venereal disease in 1508. It was attended with great success in slight affections, but failed where the disease was deep rooted; and was at length superseded by mercury, to which it now only serves occasionally as an adjuvant in the decoctum lignorum, of which guaiacum is the chief ingredient. It is esteemed a warm stimulating medicine; strengthening the stomach and other viscera, and remarkably promoting the urinary and cuticular discharges; hence, in cutaneous defecations, and other disorders proceeding from obstructions of the excretory glands, and where sluggish serous humors abound, it is useful; rheumatic and other pains have often been relieved by it. It is also laxative. The watery extract, kept in the shops, proves considerably weaker than that made with spirit. This last extract is of the same quality with the native resin, and differs from that brought to us only in being purer. The gum or extracts are given from a few grains to a scruple

or half a drachm, which last dose proves for the most part considerably purgative. The official preparations of guaiacum are an extract of the wood, a solution of the gum in rectified spirit of wine, a solution of volatile spirit, and an empyreumatic oil distilled from the wood. The resin dissolved in rum, or combined with water, by mucilage or the yolk of an egg, or in form of the volatile tincture or elixir, is employed in gout and chronic rheumatism. The tincture or elixir has been given to the extent of half an ounce twice a day, and is sometimes usefully combined with laudanum.

3. *G. sanctum*, with many pairs of obtuse lobes, has many small lobes placed along the mid rib by pairs of a darker green color than those of the foregoing sort. The flowers are produced in loose bunches towards the end of the branches, and are of a fine blue color, with petals fringed on the edges. This species is also a native of the West India Islands, where it is called bastard lignum vite. It may be propagated like the last.

GUAILAS, or HUAILAS, a province of Peru, South America, bounded north-east and east by the province of Conchucos, south-east and south by that of Caxatambo, and west by that of Santa. It is forty-five miles long from north to south, and sixteen wide. In the middle the temperature is mild, and at either side cold, especially towards the east or mountainous part. It is watered by several streamlets. These, being connected, form the Santa Fe. This province is fertile in wheat and other grain: the whole year round there are crops of wheat, and they are putting the grain into the ground at one place, while it is ripe and ready to cut at another. It is the same with the various fruits. The province contains mines of silver, alum, and copper, and some gold.

GUAIRA, a town of South America, in the government of the Caraccas, and province of Venezuela, founded in 1588. It has a port, and is defended by a castle. Here a heavy surge generally rolls in from the ocean, which contributes greatly to augment its inconveniences, and the sand, being raised from the bottom, is carried along by the current, and deposited upon the anchors, so that in about a month's time it becomes impossible to hoist them. The worm also, which is common in all the ports of this part of South America, and which, in the course of a few months, eats into the ships' bottoms, so as to render them unfit for use, is peculiarly fatal here. The town of Guaira is defended by batteries, and so surrounded with mountains, that there is no visible horizon but that formed by the sea to the south; and the inhabitants frequently receive injury from the falling stones. The situation of the place accounts also for the intense heat: the thermometer of Reaumur constantly rising to 25° and 28°. The whole place was laid in ruins by an earthquake, 26th March 1812, which only lasted two minutes. The rocks and mountains were rent asunder, and hundreds of the inhabitants were seen mixed with the heaps of rubbish, and imploring assistance from their fellow citizens, who were all the while prostrating themselves before images. Guaira was attacked by

the English, without success, in 1739, and 1743. It is seven miles north of the city of Caraccas, and contains 6000 inhabitants. Long. 67° 2' W., lat. 10° 48' N.

GUALIOR, or GUALEOR, a celebrated fortress of Hindostan, in the province of Agra. By the nearest route it is upwards of 800 miles from Calcutta. In the ancient division of the empire it is classed in the Soubah of Agra, and is often mentioned in history. In the year 1008, and during the two following centuries, it was thrice reduced by famine. It must, in all ages, have been deemed a military post of consequence, both from its situation in respect to the capital, and from the peculiarity of its site. It stands on the principal road from Agra to Malwa, Guzerat, and the Deccan; near the place where it enters the hilly tract which advances from Bundelcund Malwa, and Agimere, along the banks of the Jumnah. Its palace was used as a state prison as early as 1317, and continued to be such until the downfall of the empire. Gualeor then appears to have fallen to the lot of a rajah of the Jat tribe; who assumed the government of the district in which it is situated, under the title of rana of Gohud. Since that period it has changed masters more than once; the Mahrattas having sometimes possessed it, and at other times the rana: but the means of transfer were always either famine or treachery. Gualeor was in the possession of Madajee Scindia, a Mahratta chief, in 1779, when the Bengal government undertook to siege it for the rana of Gohud. Captain Scott, then Persian interpreter to major Popham, in a letter to his brother, major John Scott, thus describes the fort and the occasion of its capture:—“The fortress of Gualeor stands on a vast rock of about four miles in length, but narrow, and of unequal breadth, and nearly flat at the top. The sides are so steep as to appear almost perpendicular in every part; for, where it was not naturally so, it had been scraped away; and the height from the plain below is from 200 to 300 feet. The rampart conforms to the edge of the precipice all round; and the only entrance to it is by steps running up the side of the rock, defended on the side next the country by a wall and bastions, and farther guarded by seven stone gateways, at certain distances from each other. The area within is full of noble buildings, reservoirs of water, wells, and cultivated lands; so that it is really a little district of itself. At the north-west foot of the mountain is the town, pretty large, and well built; the houses all of stone. To have besieged this place would be vain, for nothing but a surprise or blockade could have carried it. A tribe of banditti from the district of the rana had been accustomed to rob about this town, and once in the dead of night had climbed up the rock and got into the fort. This intelligence they had communicated to the rana, who often thought of availing himself of it, but was fearful of undertaking an enterprise of such moment with his own troops. At length he informed major Popham of it; who sent a party of the robbers to conduct some of his own spies to the spot. They accordingly climbed up in the night of the 3d of August, found the guards asleep, and thus, meeting with little re-

sistance, in the space of two hours this important and astonishing fortress was completely reduced, with the loss of only one man killed, and twenty wounded. On the side of the enemy Bapjee, the governor, was killed, and most of the principal officers wounded. Thus fell, on the 4th of August 1780, the strongest fortress in Hindostan, garrisoned by a chosen body of 1200 men; and which, before the capture of it by the British, was pronounced impregnable. In 1783 Madajee Scindia besieged this fortress, then possessed by the rana of Gohud, with an army of 70,000 men, and effected the reduction by the treachery of one of the rana's officers, who formed the plan of admission of a party of Scindia's troops: these were immediately supported by another party, who attacked an opposite quarter, and got admission also. It was retaken by the British in 1805, but afterwards ceded to the Mahrattas. Long. 78° 26' E., lat. 26° 14' N.

GUAM, or GUAHAN, the largest of the Ladrone Islands. It is about 120 miles in circumference; and has a town built in the European style, with a regular fort and church. The air is excellent, the water good, and the garden stuffs and fruits, the flocks of buffaloes, goats, hogs, and all kinds of poultry innumerable. When first discovered by Magellan in 1521, with the other eight principal islands that lie north of it, they were all crowded with inhabitants, but afforded no refreshment to navigators, except fish, bananas, cocoa-nuts, and bread fruit; and even these could not be procured but by force, amidst the showers of arrows and lances of the natives. The Spaniards carried thither from America the first stock of cattle, fowls, plants, seeds, fruits, and garden stuffs, which are all now found in such abundance. See LADRONE. Guam alone contained at this time upon its coasts more than 20,000 people. These fierce islanders, after having long defended, by cruel wars, the right of living like wild beasts, being at last obliged to yield to the Spanish arms, took the resolution of administering poisons to their women to procure abortions. This desperate resolution was persisted in with so much obstinacy in the nine Ladrone islands, that their population, which at the time of the discovery consisted of more than 60,000 souls, did not lately exceed 900. About fifty years ago the remains of the original natives were collected and established in the island of Guam. The principal town and settlement, Agana, is situated about twelve miles north-east of the landing place, on the shore, at the foot of some hills, in a beautiful well-watered country. There are smaller settlements of Indians round the island, on the shore. The centre is uncleared. The trees are fit for building houses and boats, and the forests very thick. Among the indigenous trees, the most remarkable are the cocoa-nut and bread-fruit. The woods also abound with guavas, bananas, plantains, citrons, lemons, oranges, the small dwarf thorny china orange with red fruit, and caper bush. As many of these trees are constantly in flower, they perfume the air with the most agreeable smells, and delight the eye with the richest colors. The rivers of Guam,

which are either rivulets or torrents, abound with excellent fish: turtle grow here as large as in the island of Ascension, but are not eaten either by the Indians or Spaniards. The crops cultivated are rice, maize, indigo, cotton, cocoa, and sugar-canes. The maize is of astonishing fertility. The gardens are stored with mangoes and pine-apples. The former is one of the finest fruits imaginable. Horses have been brought to Guam from Manilla, and asses and mules from Acapulco. The land rises gradually from the shore towards the centre by a gentle acclivity, but is not very mountainous. The indigenous inhabitants are such as they were described by Magellan; of short stature, rather ugly, black, and in general dirty, though much in the water. The women are handsome, well made, and of a reddish color. Both sexes have long hair. They have become gentle, honest, and hospitable. The men drink freely of the wine of the cocoa-nut. They are fond of music, dancing, and cock-fighting.

GUAMA, a large river of the province of Para, Brasil, which enters an arm of the Amazonas at the town of Para. There is a river of the same name to the north of Lima.

GUAMACHUCO, a province of Peru, bounded east by the province of Caxamarquilla, north-east by that of Chochapoyas, north by Caxamarca, north-west and west by Truxillo, and south by Conchucos. It is thirty leagues long, and ten wide, and for the most part cold; but is fruitful in maize, wheat, barley, &c. Here are also all sorts of cattle, particularly sheep, from the wool of which cloth is manufactured. Population 11,000. The capital is of the same name.

GUAMALIES, or HUAMALIES, a province of Peru, bounded north by the province of Pataz, east by the Andes, south-east by the province of Guanuco, south by that of Tarma, south-west by Caxatambo, and north-west by Conchucos. It is an extensive valley about 250 miles long from north to south, and from forty to ninety broad, through which runs the Amazon, rising about eighteen miles beyond its southern boundary. Towards the south the temperature is cold; but to the north the heat is intense. Several mines of quicksilver have been discovered in this province.

GUAMANGA, or HUAMANGA, a province and town of Peru, bounded north and north-east by the province of Guanta, south by that of Vilcas Huaman, and west by that of Castro-Vireina. It is high, and of cold temperature; yet it abounds in pasture and wheat. There are also some rich silver mines, which are, however, overflowed. The town was founded by Pizarro in an extensive and beautiful plain, watered by a river rising in the mountains. Its buildings are all of stone, and have gardens and orchards annexed. The public places and squares are magnificent, and the entrances are adorned with rows of trees. There is a university and a seminary enjoying a good revenue. Besides its present name, it has also the name of San Juan de la Victoria, in memory of the retreat of Manco, the inca, after he had well nigh conquered the Spaniards; also that of San Juan de la Frontera; but its most common name is Guama.

manga: 188 miles south-east of Lima, and 176 north-west from Cuzco.

GUANARE, a town of the Caraccas, in the province of Varinas, situated on a river of the same name. The streets are straight and wide, and the houses neat. There is an hospital, with a moderate revenue, and a large handsome parish church. It owes a part of its splendor to possessing an image of our lady of Comorato, to whose shrine numerous pilgrimages are made. Guanare has, towards the west, the most fertile lands, possessing immense herds of oxen and mules. They were formerly in the habit of raising tobacco of a very good quality. Population 12,300: 193 miles S.S.W. of Caraccas, and sixty-four miles south-east of Truxillo. Long. $66^{\circ} 55' 15''$ W., lat. $8^{\circ} 14'$ N. The river runs into the Apure.

GUANAXUATO, one of the intendancies of Mexico, wholly situated on the ridge of the Cordillera of Anahuac. Its capital, founded in 1554, is of the same name, and stands 6836 feet above the level of the sea. The ports and mines of the neighbourhood contain 70,000 inhabitants. The length of the intendancy, from the lake of Chapala to the north-east of San Felipe, is fifty-two leagues; and its breadth from the Villa de Leon to Celaya thirty-one leagues. The most elevated point of this mountainous country was found, by Humboldt, to be 9235 feet above the level of the sea. The cultivation of this fine province is almost wholly to be ascribed to the Europeans, who arrived there in the fifteenth century. The mines are very productive. From 1796 to 1803 they yielded nearly 40,000,000 of dollars, or £5,000,000 sterling annually. Humboldt estimates the surface of this province at 911 square leagues, and the population at 517,300 persons.

GUANCABELICA, or **GUANCAVELICA**, a town of Peru, the capital of the province of Angaraez. It is situated in a broken glen, formed by the Andes, and is so elevated, that the temperature is extremely cold, and the weather always changing. The mountains in the vicinity are rich in gold and silver ores. But it is chiefly remarkable for a mine of quicksilver. This mine yielded an immense produce; but, not being worked in a proper and regular manner, the pit fell in; and they are compelled now to dig in places less abundant in ore.

GUANO is a yellowish-brown earthy substance of a peculiar kind, without taste and of a smell resembling that of Castoreum. This substance, which for centuries has been used by the Peruvians as a manure, is the production of some neighbouring rocky islands in the South Sea, from whence large quantities are annually brought to the continent of America. The guano, says M. Humboldt, is found not only in the Chiche Islands, near Pisco, but it exists also on the parts of the coast, and its isles situated more to the south, at Ilo, Iza, and Arica.

The strata in which the guano is disposed are from fifty to sixty feet in thickness, and they are worked in the same manner as the iron ochre mines. It is an excellent manure for the Indian corn or maize; but, if too much of it be applied, the root is burnt and destroyed by it.

When exposed to the fire, the brownish-yellow color of the guano is converted into black; it gives out white fumes, and the smell of empyreumatic ammonia. Water dissolves part of it, becomes thereby of a reddish color, and acquires an acid taste. Potassa dissolves much more of it than water; the solution is of a deep brown color, and is produced under an abundant development of ammonia. The result of the chemical analysis made by Fourcroy and Vauquelin is, that the principal constituent part is concrete uric acid.

Klaproth obtained nearly the same results as the French chemists; his experiments prove that the essential component parts of the guano, exclusive of the admixed sand, are ammoniacal uric acid, phosphate of lime, oxalate of lime, and a residuum of animal colla, or similar animal inflammable component part. The oxalic acid, however, Klaproth supposes not to be an original constituent part of the guano, but the product of a long continued action of the atmospheric oxygen of the uric acid; an opinion founded on his own experience respecting the easy conversion of uric into oxalic acid, by the application of nitric and oxygenated muriatic acid. The proportion of the constituent parts is as follows:—ammoniacal uric acid 16; phosphate of lime 10; oxalate of lime 12.75; silica 4; muriate of soda 0.50; sandy admixture 28; water, inflammable animal remains, and loss, 28.75.

GUANTA, a province of Peru, bounded north and north-west by the province of Xauxa, north-east and east by the Andes, south and south-west by the provinces of Anganaes, Guamanga, and Castro Vireyna; on the south-east it touches upon the provinces of Anduhnailas and Vilcas-huaman. It extends in length sixty leagues from north-west to south-east, and is forty leagues broad; consisting chiefly of high lands and hot valleys, which yield fruits of all kinds, sugar, and cocoa. Population 10,000. Its capital is of the same name. The gold, silver, copper, and lead mines, which abound in this country, are neglected, the pits not being sunk to a sufficient depth. Some of the ores yield from nine to ten marks, and others twenty-two marks of silver of eight ounces in every 50 cwt. Fifty-three miles west from Guamanga, and 140 south-east from Lima. Long. $74^{\circ} 51'$ W., lat. $12^{\circ} 56'$ S.

GUANUCO, or **HUANUCO**, a town and province of Peru, bounded north and east by the desert, south-east and south by the province of Tarma, and west by the south part of the province of Guamalies. The town stands in the royal road of the incas; and every where are to be seen the ruins of some of their superb edifices. Long. $75^{\circ} 36'$ W., lat. $10^{\circ} 6'$ S.

GUAPORE, a large river of Brasil, which, according to Mr. Mawe, has its rise in the province of Matto Grosso, in lat. $14^{\circ} 42'$ S. Sixty miles north-east of Villa Bella; and, running north 360 miles, flows into the Arinos, and their conjoint streams form the great river Tapayos.

GUARANTEE, *n. s.* } *Fr. garant, garan-*
GUARANTY, *n. s.* } *tir.* A power who undertakes to see stipulations performed.

God, the great *guarantee* for the peace of mankind, where laws cannot secure it, may think it the concern of his providence. *South.*

A prince distinguished by being a patron of Protestants, and *guarantee* of the Westphalian treaty.

Addison on the War.

An oath is a promise made to God, and God is our superior, superior to kings. And he is also the *guarantee* and avenger of all breach of faith and injustice. *Lesley.*

GUARAPICHE, a river of South America, in Cumana, which rises in the eastern declivity of mount Brigantín, and running in a winding course through mountains and unknown countries, enters the gulf of Paria, between the point of Paria and the mouth of the Orinoco, in lat. 10° 8' N. It receives the waters of numerous and considerable streams.

GUARD', <i>v. a., v. n. & n. s.</i>	} Ital. <i>guardia</i> ; Fr. <i>garder</i> , from our word ward, the <i>w</i> being changed by the French into <i>g</i> ; as Gales for

GUARD'SHIP, <i>n. s.</i>	

Wales. See *WARD*. To watch over and protect ; to defend ; to preserve ; to provide against objections ; to adorn ; to be in a state of caution. A guard is a limited number of men whose business it is to watch by way of prevention ; a part of the hilt of a sword. Guardage is a state of wardship. Guardian is one that has the care of an orphan ; a repository or storehouse. Guardship is a king's ship to guard the coast.

The *guard* bare them, and brought them back into the guard chamber. *1 Kings xiv. 28.*

Give him a livery
More *guarded* than his fellows.

Shakspeare.

See a fellow

In a long motley, *guarded* with yellow. *Id.*

Where is Duncan's body ?

—Carried to Colmeskill,

The sacred storehouse of his predecessors,

And *guardian* of their bones. *Id.*

I am sorry for her, as I have just cause, being her uncle and her *guardian*.

Id. Much Ado About Nothing.

I gave you all,

Made you my *guardians*, my depositaries ;

But kept a reservation to be followed

With such a number. *Id. King Lear.*

The great alteration which he made in the state ecclesiastical, caused him to stand upon his *guard* at home. *Davies.*

And since love ne'er will from me flee,

A mistress moderately fair,

And good as *guardian* angels are,

Only beloved, and loving me. *Cowley.*

They missed courts, *guards*, a gay and numerous train,

Our judges, like our laws, were rude and plain. *Id.*

Up into heaven, from paradise, in haste

The' angelick *guards* ascended, mute, and sad

For man. *Milton's Paradise Lost.*

That of four seas dominion, and of all their *guarding*,
No token should appear but a poor copper farthing.

Marvell.

Naked the graces *guarded* you from all
Dangers abroad, and now your thunder shall.

Waller.

So on the *guardless* herd, their keeper slain,
Rushes a tyger in the Libyan plain. *Id.*

With lifted hands, and gazing eyes,
His *guards* behold him soaring through the skies.

Dryden.

Your power you never use, but for defence,
To *guard* your own or other's innocence. *Id.*

Fixed on defence, the Trojans are not slow
To *guard* their shore from an expected foe. *Id.*

Now he stood collected and prepared,
For malice and revenge had put him on his *guard*.

Id.

My charming patroness protects me unseen, like my
guardian angel ; and shuns my gratitude like a fairy,
who is bountiful by stealth, and conceals the giver
when she bestows the gift. *Id.*

Temerity puts a man off his *guard*.

L'Estrange.

It is wisdom to keep ourselves upon a *guard*.

Id.

The curate stretched his patent for the cure of
souls, to a kind of tutelary *guardianship* over goods
and chattels. *Id.*

He must be trusted to his own conduct, since there
cannot always be a *guard* upon him, except what you
put into his own mind by good principles. *Locke.*

Others are cooped in close by the strict *guards* of
those whose interest it is to keep them ignorant. *Id.*

One would take care to *guard* one's self against
this particular imperfection, because it is that which
our nature very strongly inclines us to. *Addison.*

The port of Genoa is very ill *guarded* against the
storms. *Id. on Italy.*

A rich land, *guardless* and undefended, must needs
have been a double incitement. *South.*

Hocus, with two other of the *guardians*, thought
it their duty to take care of the interest of the three
girls. *Arbutnot.*

Thus shall mankind his *guardian* care engage,

The promised father of the future age. *Pope.*

Mean while Minerva, in her *guardian* care,
Shoots from the starry vaults through fields of air.

Id.

They, usurping arbitrary power, had their *guards*
and spies, after the practice of tyrants. *Swift.*

Theseus was the first who established the popular
state in Athens, assigning to himself the *guardianship*
of the laws, and chief commands in war. *Id.*

How blessed am I, by such a man led !

Under whose wise and careful *guardship*

I now despise fatigue and hardship. *Id.*

To *guard* against such mistakes, it is necessary to
acquaint ourselves a little with words. *Watts.*

Unless corruption first deject the pride

And *guardian* vigour of the freeborn soul,

All crude attempts of violence are in vain.

Thomson.

Man's caution often into danger turns,

And his *guard* falling crushes him to death.

Young's Night Thoughts.

If, ye powers divine !

Ye mark the movements of this nether world,

And bring them to account, crush, crush those vipers.

Who, singled out by a community

To *guard* their rights, shall for a gnash of air

Or paltry office sell 'em to the foe.

Miller's Mahomet.

The lost in all things differing from the other,

Fall from an hill, and close together go,

Embracing as they run ; each with his brother

Guarded with double trenches sure they flow.

Fletcher's Purple Island.

The *guards* mechanically formed in ranks,

Playing at beat of drum their martial pranks,

Shouldering and standing as if struck to stone,
While condescending majesty looks on. *Cowper.*

A gordly sincere no doubt! but made
More easy by the absence of all men
Except his majesty, who with her aid,
And guards, and bolts, and now and then
A slight example, just to cast a shade
Along the rest, contrived to keep his den
Of beauties, cool as an Italian convent,
Where all the passions have alas but one vent.

Byron.

Secure in *guardet* coldness, he had mixed
Again in sacred safety with his kind,
And deemed his spirit now so firmly fixed
And sheathed with an invulnerable mind,
That if no joy, no sorrow lurked behind.

Byron. Child Harold.

GUARD, in the military art, is a duty performed by a body of men, to secure an army or place from being surprised by an enemy. In garrison the guards are relieved every day: hence every soldier mounts guard once every day in time of peace, and much oftener in time of war. See HONORS.

GUARD, ADVANCED, or van-guard. See ADVANCE-GUARD.

Artillery GUARD is a detachment from the army to secure the artillery when in the field. Their corps de garde is in the front of the park of artillery, and their sentries are dispersed round the same. This is generally a forty-eight hours guard; and upon a march this guard marches in the front and rear of artillery, and must be sure to leave nothing behind. If a gun or waggon breaks down, the officer that commands the guard is to leave a sufficient number of men to assist the gunners and matrosses in raising it.

Artillery quarter GUARD is frequently a non-commissioned officer's guard from the royal regiment of artillery, whose corps de garde is always in the front of their encampment.

Baggage GUARD is always an officer's guard, who has the care of the baggage on a march. The waggons should be numbered by companies, and follow one another regularly; vigilance and attention in the passage of hollow ways, woods, and thickets, must be strictly observed by this guard.

Forage GUARD, a detachment sent out to secure the foragers, and who are posted at all places, where either the enemy's party may come to disturb the foragers, or where they may spread too near the enemy, so as to be in danger of being taken. It consists both of horse and foot, who must remain on their posts till the foragers are all come off the ground.

Grand GUARD, three or four squadrons of horse, commanded by a field officer, posted at about a mile or a mile and a half from the camp, on the right and left wings, towards the enemy, for the better security of the camp.

Main GUARD is that from which all other guards are detached. Those who are mounting guard assemble at their respective captain's quarters, and march from thence to the parade in good order; where, after the whole guard is drawn up, the small guards are detached to their respective posts: then the subalterns throw lots for their guards, who are all under the command of the captain of the main guard. This guard

mounts in garrison at different hours, according to the pleasure of the governor.

Piquet GUARD, a number of horse and foot, always in readiness in case of an alarm: the horses are generally saddled, and the riders booted. The foot draw up at the head of the battalion, frequently at the beating of the tat-too; but afterwards return to their tents, where they hold themselves in readiness to march. This guard is to resist in case of an attack, until the army get ready.

Quarter GUARD is a small guard commanded by a subaltern officer, posted in the front of each battalion, 222 feet before the front of the regiment.

Rear GUARD, that part of the army which brings up the rear on a march, generally composed of all the old grand guards of the camp. The rear-guard of a party is often eight or ten horse, about 500 paces behind. Hence the advance-guard, going out upon a party, form the rear-guard in their retreat. Rear-guard is also a corporal's guard placed in the rear of a regiment, to keep good order.

Standard GUARD, a small guard under a corporal, out of each regiment of horse, who mount on foot in the front of each regiment, at the distance of twenty feet from the streets, opposite the main street.

Trench GUARD only mounts in the time of a siege, and sometimes consists of three, four, or six battalions, according to the importance of the siege. This guard must oppose the besieged when they sally out, protect the workmen, &c.

GUARDS also imply the troops kept to guard the king's person, and consist both of horse and foot.

Foot GUARDS are regiments of foot appointed for the guard of his majesty and his palace. There are three regiments of them, numerically titled. They were raised in 1660; and the command of the first given to colonel Russel, that of the second to general Monk, and the third to the earl of Linlithgow. The second is always called the Coldstream, from a place named Coldstream, a small market town in Berwickshire, where the men were first raised. This regiment in point of standing is older than the first, having been raised sooner, and commanded by general Monk, from whom it originally was called Monk's regiment or corps; and in compliment to whom it was made one of the three royal regiments by Charles II.

Horse-grenadier GUARDS were divided into two troops, called the first and second troops of horse-grenadier guards. The first troop was raised in the year 1693, and the command given to lieutenant-general Cholmondeley: the second in 1702 and the command given to lord Forbes. This corps was reduced in 1788, and the officers, &c., were allowed to retire upon full pay.

Horse GUARDS, in Britain, are gentlemen chosen for their bravery, to be entrusted with the guard of the king's person; and were formerly divided into four troops named numerically. But the four troops are now turned into two regiments of life-guards. Although the life-guards generally do duty about the metropolis, it must be recollected, that they were not raised for that specific purpose only

They are enlisted for general service, like the men of the line or foot-guards, and no stipulation of any sort is made with them.

With respect to rank, in addition to what has already been said on that subject, it is necessary to state, that the majors in the life-guards rank as lieutenant-colonels, and, by his majesty's order, they can only exchange with lieutenant-colonels. The lieutenant-colonels rank as full colonels, and cannot exchange with any one under that rank. For the like reason that rank would not be obtained by an exchange; a major of the life-guards cannot exchange with a major in the line, nor a lieutenant-colonel with one of the same rank. This corps distinguished itself at the memorable battle of Waterloo in 1815. They are now made cuirassiers.

Yeomen of the Guard were first raised by Henry VII. in 1485. They were a kind of pompous foot-guards to the king's person; and are generally called the Beef-Eaters. They were anciently 250 men of the first rank under gentry; and of larger stature than ordinary, each being required to be six feet high. At present there are but 100 in constant duty, and seventy more not on duty; and when any one of the 100 dies his place is supplied out of the seventy. They go dressed after the manner of king Henry VIII's time. Their first commander or captain was the earl of Oxford, and their pay is 2s. 6d. per day.

The Scots Guards, a celebrated band, which once formed the first company of the ancient gardes du corps of France.

GUARD, in fencing and the broad sword exercise. See **FENCING** and **SWORD EXERCISE**.

GUARD-BOAT, a boat appointed to row the rounds amongst the ships of war which are laid up in any harbour, &c., to observe that their officers keep a good looking-out, calling to the guard-boat as she passes, and not suffering her crew to come on board without having previously communicated the watch-word of the night.

GUARDIAN, in law, signifies one who has the custody and education of such persons as have not sufficient discretion to take care of themselves and their own affairs, as children and idiots. The guardian's business is to take the profits of the minor's lands to his use, and to account for the same; to sell all moveables within a reasonable time, and to convert them into land or money, unless the minor is near of age, and may want such things himself; and to pay interest for the money in his hands, that might have been so placed out; in which case it will be presumed that the guardian made use of it himself. He is to sustain the lands of the heir, without making destruction of any thing thereon, and to keep them safely for him: if he commits waste on the lands, it is a forfeiture of the guardianship; 3 Edward I. And where persons, as guardians, hold over any land, without the consent of the person who is next entitled, they shall be adjudged trespassers, and shall be accountable: 6 Ann. cap. xviii.

GUARDIAN OF THE CINQUE PORTS. See **WARDEN** and **CINQUE PORTS**.

GUARDIAN OF THE SPIRITUALITIES, he to whom the spiritual jurisdiction of any diocese is

committed, during the vacancy of the see. He may be either guardian in law, or jure magistratus, as the archbishop is of any diocese within his province; or guardian by delegation, as he whom the archbishop or vicar general doth for the time depute.

GUARDIARA, a river of Spain which rises in New Castile, runs through the provinces of La Mancha and Estremadura; then enters Portugal a few miles west of Badajoz, and, after running through the province of Alentejo, falls into the Atlantic between Ayamonte and Castromarin.

A GUARD-SHIP is a vessel of war appointed to superintend the marine in a harbour or river, and to see that the ships which are not commissioned have their proper watchward kept duly, by sending her guard-boats around them every night. She is also to receive seamen who are impressed in the time of war.

GUAREA, in botany, a genus of the monogynia order, and octandria class of plants: cal. quadrifid: the petals four; the nectarium cylindric, having the anthera in its mouth: caps. quadrilocular and quadrivalvular: seeds solitary. Species one only, a West Indian tree with a strong musky odor.

GUARINI (Guarino), a native of Verona, descended of an illustrious family, celebrated as having been the first who taught Greek after the restoration of letters. He had acquired their language at Constantinople. He died in 1460.

GUARINI (John Baptist), a celebrated Italian poet, grandson to the preceding, born at Ferrara, in 1537. He was secretary to Alphonso duke of Ferrara, who entrusted him with several important commissions. After the death of that prince he was successively secretary to Vincent de Gonzaga, to Ferdinand de Medicis, grand duke of Tuscany, and to Francis Maria de Feltri duke of Urbino. He was well acquainted with polite literature; and acquired lasting reputation by his Italian poems, especially by his Pastor Fido, the most admired of all his works, and of which there have been innumerable editions and translations. He died in 1612.

GUATIMALA, one of the governments into which the Spanish possessions in America were formerly divided. It extended on the narrow part of the continent of America, from the provinces of Oaraca and Vera Cruz, in Mexico, southward to Veragua, on the isthmus of Darien, and includes various districts but little known. According to another division of this country, the following are the provinces of which it is composed, namely, Tabasco, Chiapa, Guatimala, Yucatan, Honduras, Nicaragua, and Vera Paz. Guatimala is extremely fertile, and well peopled, and so much the better cultivated, as the soil, convulsed with volcanoes, contains almost no metallic mines. Its general appearance is fertile in the extreme; and it produces abundantly corn, cochineal, honey, wax, cotton, the sugar-cane, indigo, maize, pimento, and chocolate. The farming districts produce cattle and sheep. The whole country is mountainous; but of the particular ridges little is known. On the western shore, from Oaxaca and Veragua, the country is dreadfully subject to the most tremendous earthquakes,

which have at times involved whole cities in ruins, and exterminated complete tribes. No fewer than twenty volcanoes are known to exist here which are in constant activity. The western coast is in general, as in most other parts of America, the healthiest. In some parts the temperature is exceedingly hot and moist. The rains last from April to September, when violent storms are frequent.

GUATIMALA PROPER, a province of the above government, extends about 130 leagues along the coast of the Pacific Ocean, and is in some places from thirty to forty in breadth. It is bounded on the north-east by Vera Paz and Chiapa, on the east by Honduras, on the south-west by the Pacific Ocean, on the south-east by Nicaragua, and on the north and west by Oaxaca. The country is for the most part mountainous, and covered with forests of fine wood. The valleys are fertile, and produce the most delicate fruits. It also abounds in corn, cattle, indigo, and cochineal.

GUATIMALA, SANTIAGO DE, the capital of the above province, was founded in 1524. At first it was founded on the declivity of a mountain, at whose summit was a volcano, in a valley of three miles in breadth, and was then called St Jago. It contained about 7000 families: in this situation the unfortunate city was, in the year 1751, overwhelmed by an earthquake, and by the matter from the volcano. Another and a more tremendous convulsion again destroyed this place in 1775, the greater part of the inhabitants being buried in the ruins. The city was again rebuilt on the spot where it now stands, which is twenty-five miles to the south of the old town. It is a magnificent place. Population 19,000.

GUAVA, in botany. See *PSIDIUM*.

GUAYAQUIL, is the largest and most important district of Quito, Colombia: it begins at Cape Passado, 21° S. of the equinoctial line, and, stretching south, includes the island of Puna; being terminated by Piura in Peru, and mostly a continued plain. The river Guayaquil is not only the largest but the most important of all the streams in the jurisdiction. It rises in the Andes, and, pursuing a serpentine course, flows into the Pacific in the Bay of Puna. The torrents, which flow in all directions from the mountains, contribute to swell this river, and it inundates the country to a great extent. Its mouth is about three miles wide at Isla Verde; and at Guayaquil still broader. The distance on it from this city to the custom-house of Babahoyo is twenty-four leagues and a half, and it is navigable four leagues further. The tides reach as far as the custom-house in summer, but in winter the current is so strong, that the tides are often imperceptible. The mouth of the river is so full of shifting sands, that the passage of large vessels is rendered very dangerous. Its banks are decorated with country-seats, and cottages inhabited by fishermen. The other large rivers are those called Yaguache, Baba, and Daule, along the banks of which most of the Indians have formed their habitations.

During the winter months this district is infested by insects and vermin, and is subject to dreadful storms and inundations, which oblige

the farmers to send their cattle to the Andes. In the rainy season, fevers, dysenteries, diarrhæas, the black vomit or yellow fever, and other disorders, are common, and carry off great numbers of people. At this period, also, snakes, scorpions, vipers, and scolopendras, find their way into the houses, and are sometimes even found in the beds. The boba, a serpent of immense size, is also common. These, with swarms of mosquitoes, and other venomous insects, render the towns very unpleasant during this season; and alligators, of an enormous size, cause the rivers and flooded places to be very dangerous. The inundations spread to such an extent, in some parts, that Babahoyo, one of the departments, is converted into a large lake, and the villages, which are always on heights, can be approached only with boats. These floods add, however, very greatly to the fertility of the country, as the cacao plantations and meadows thrive exceedingly when the water subsides. In the summer, the heat being moderated by the sea and land breezes, the number and activity of all these creatures is much decreased; and this season, which is the coldest, renovates the inhabitants, who have been rendered listless and indolent by the suffocating heat which prevails during the rains.

Guayaquil grows cacao, tobacco, wax, cotton, timber for naval and architectural purposes, sugar, maize, and plantains; and rears great quantities of cattle. The quantity of cacao gathered annually in Guayaquil, for exportation and home consumption, amounts to 50,000 loads, at £81 the load. The rivers furnish fish in great plenty, but the city is scantily supplied, owing to the putridity which so soon takes place in transporting fresh fish. The coasts abound with lobsters, oysters, and most kinds of salt-water fish. All the rivers in the vicinity of Guayaquil abound with large alligators, some of which are five yards in length. They destroy vast quantities of the fish, and are usually seen basking on the marshy shores, or employed in catching their food: they feed also on flies, mosquitoes, &c., which they catch by keeping their huge mouths open until filled with these insects, which soon happens in a country where the air swarms with them. Calves and colts in the meadows, as well as dogs and other small animals, often fall a prey to these amphibious creatures, who approach the pastures in which they feed in the night, and carry them off. Many of the small rivers on the coasts of Spanish America are said to contract a musky smell and taste, from the vast numbers of alligators with which they abound; and it is even asserted that seamen are aware of the presence of these animals, by the peculiar white color of the water which they frequent, but, nevertheless, do not refrain from supplying their ships with that article from such streams, as it has never been discovered that the change in taste, smell, and color, imparts any noxious quality to the fluid.

Guayaquil exports the produce of its departments to Peru, Panama, and Quito, receiving European goods from Tierra Firme; from New Spain and Guatimala, naphtha, tar, cordage, and indigo. In the annual domestic and foreign

trade of Guayaquil, the exportations, of which the principal article is cacao, are valued in good seasons at £119,170, whilst the importations in a like period arise to £260,000 sterling.

Guayaquil is divided into seven departments, Puerto Viejo, Punta de Santa Elena, the island of Puna, Yaguache, Babahoyo, Baba, and Daule. The capital of the whole district is Guayaquil, a city of considerable importance at the bottom of the gulf of Guayaquil, and at the mouth of the river of the same name, in 2° 12' S. lat., and 79° 6' W. long. In 1693 great additions were made to it, on the other side of a branch of the river, which now divides the city into two parts, known by the names of the New and Old towns, communicating with each other by a long bridge. The houses are constructed mostly of wood or whitened earth. It has suffered repeatedly by conflagration, and was reduced to ashes in 1764; since which the government have forbid the inhabitants to thatch their houses with straw. The streets of the New Town are straight, wide, and well paved. Arcades run along before all the houses, so that the people can walk protected from the rain and sun. It is now one of the handsomest towns of South America. It has a handsome church, college, convents, and an hospital. There is also a treasury and revenue office, for the receipt of the Indian capitation tax, the duties on imports and exports, and other taxes. The number of inhabitants is 10,000. The women are proverbially handsome, which causes many Europeans to marry and settle here.

Guayaquil was named a royal dock-yard in 1767, and the abundance of excellent timber produced in its neighbourhood renders it very fit for this purpose. The balsam tree, and several others, yield excellent knees, and are celebrated for resisting worms and rot. Notwithstanding these advantages, the building of vessels is neglected, and the river and coasting trade is carried on in balsas, which receive the cargoes of the vessels arriving from Europe, Lima, or Panama. These balsas or rafts are peculiar to the coast of the provinces of Cundinamarca. They are made of five, seven, or nine trunks of an exceedingly light tree called balsa; and are made larger or smaller, according as they are wanted for fishing, for the coasting trade, or for the rivers. The city is defended by three forts; two on the borders of the river, and the other inland.

GUBEN, a handsome town of the Prussian States in Lower Lusatia, seated on the Neisse, and seventy miles north-east of Dresden. It has a manufacture of cloth, and a good trade in flax and linen. Inhabitants about 6000.

GUERNATION, *n. s.* Latin *gubernatio*. Government; superintendency; superior direction.

Perhaps there is little or nothing in the government of the kingdoms of nature and grace, but what is transacted by the man Jesus, inhabited by the divine power and wisdom, and employed as a medium or conscious instrument of this extensive *gubernation*.

Watts.

GU'DGEON, *n. s.* Fr. *goujon*. A small fish found in brooks and rivers, easily caught, and therefore made a proverbial name for a man easily cheated; a bait or allurements.

But fish not with this melancholy bait,
For this fool's *gudgeon*, this opinion.

Shakspeare.

This he did to draw you in, like so many *gudgeons*,
to swallow his false arguments.

Swift.

'Tis true, no turbot dignify my boards;

But *gudgeons*, flounders, what my Thames affords.

Pope.

GUDGEON, in ichthyology, a species of cyprinus. See CYPRINUS. These fish, though small, are of a pleasant taste, very little inferior to smelt. They spawn twice in summer; and their feeding is much like the barbel in streams and on gravel, slighting all kinds of flies: but they are easily taken with a small red worm, fishing near the ground; and, being a leather-mouthed fish, will not easily get off the hook when struck. They may be fished for with float, the hook lying on the ground; or by hand, with a running line on the ground, without cork or float. But, although the small red worm is the best bait for these fish, yet wasps, gentles, and cadbaits do very well. They may also be fished for with two or three hooks at once, and afford pleasant sport, where they rise any thing large. When angling for them, stir up the sand or gravel with a long pole; this will make them gather faster to that place, and bite faster and more eagerly.

GUELDERLAND, a province of the Netherlands, bounded on its respective frontier lines by Overysse, Westphalia, North Brabant, Holland, and Utrecht. Its extent is about 2020 square miles; its population 243,000. The surface is level, but not so flat as part of the Netherlands. The soil is in some parts heavy and turfy, in others light, and, on the whole, not very fertile. The province is watered by the Rhine, the Waal, the Yssel, the Leck, and the Maese, and several large canals. The principal productions are buck-wheat, potatoes, fruit, tobacco, and hops; The pasturage is very good. The inhabitants are employed chiefly in agriculture, but also in manufactures; linen being made in this province, also paper and leather. Guelderland is the seat of many old Dutch families, who are unconnected with trade.

The chief branch of commerce is the transit of goods from the coast to the interior of Germany. The duties are nominally only 3 per cent. ad valorem, but considerably exceed this limit on wine and other articles, of which the bulk is large in proportion to the value. The greater part of the inhabitants are Protestants. The province sends six members to the states-general, and in point of jurisdiction is under the high court at the Hague. The provincial states consist of ninety members. Guelderland is divided into four districts, viz. Arnheim, with 74,000 inhabitants; Nimeguen, with 49,000; Zutphen, with 79,000; and Thiel, with 46,200. These, however, do not comprise the whole extent of the ancient duchy of Gueldres. After the declaration of independence, made by the maritime provinces of the Netherlands, three of the quarters, viz. Nimeguen, Zutphen, and Arnheim (constituting Lower Gueldres), joined the league of Utrecht in 1579, and formed the Dutch province of Guelderland. The fourth (of Ruremonde), then called Upper Gueldres, remained

subject to Spain until the peace of Utrecht, when it was made over to the king of Prussia. Part of it was afterwards ceded by Prussia to the United Provinces, and the whole in 1795 to France. This lasted till 1814, when the whole once more changed masters: a part of Upper Guelders is included in the Prussian province of the Rhine; but the greater part belongs to the Netherlands, and is included in the province now described.

GUELDER, or **GELDERS**, a small town of the Prussian states, in the government of Cleves: it was the chief town of Prussian Guelderland, and originally gave name to the whole province. It now has only 1550 inhabitants, who are employed in manufactures. The castle, one of the strongest fortresses in the Netherlands, was demolished in 1764. Twenty miles S. S. E. of Cleves, and thirty N. N. W. of Dusseldorff.

GUELPH, the surname of the royal family of Great Britain.

GUELPHS, or **GUELF**s, a celebrated faction in Italy, antagonists of the Gibelins. The Guelphs and Gibelins kept Germany and Italy in perpetual agitation during the greater part of three centuries. The former supported the pretensions of the popes, the latter those of the emperor. Their rise is referred by some to the time of Conrad III., A. D. 1139; by others to that of Frederic I.; and by others to that of his successor Frederic II., A. D. 1240, upon his being excommunicated by pope Gregory IX. But the most probable opinion is that of Maimbourg, who says, that the two factions arose from a quarrel between two ancient and illustrious houses on the confines of Germany, viz. the Henries of Gibelins, and the Guelphs of Adorf. The name Guelph is said to have been formed from Welfe, or Welfo, on the following occasion:—The emperor Conrad III. having taken the duchy of Bavaria from Welfe VI., brother of Henry, duke of Bavaria, Welfe, assisted by the king of Sicily, made war on Conrad, and thus gave birth to the faction of the Guelphs. Others derive the name from the German Wolf, on account of the grievous evils committed by that cruel faction: others deduce the denomination from that of a German called Guelef, who lived at Pistoye; adding, that his brother, named Gibel, gave his name to the Gibelins. It is said by some, that the Gibelins, when driven out of Italy long after the year 1229, at which period the contest between them and the Guelphs ran very high, and settled at Amsterdam, were the inventors of the mercantile practice of re-change, or re-exchange, on bills of exchange, on account of the damages and charges they were put to, and the interest of the money of their bills protested, which had been given to them for the effects they had been obliged to leave behind them.

GUEMENE'E, a neat town of Brittany, situated in the department of the Loire Inferieure. Nine miles north of Blain. Population 3600.

GUERANDE, a large town of Brittany, in the department of the Loire Inferieure, between the mouth of the Vilaine and the Loire. It contains 7200 inhabitants, and has extensive manufactures of salt. Thirty-six miles west of Nantes, and thirteen south of Roche Bernard.

GUERDON, *n. s.* Fr. *guerdon, gardon*. A reward; a recompense, in a good and bad sense. A word now no longer in use.

The sixth thing that shuld move a man to contrition is the hope of three things,—that is to say, forgiveness of sinne; and the yeft of grace for to do wel; and the gloree of heven with whiche God shal *guerdon* man for his good dedes.

Chaucer. The Persones Tale.

I love as well as ye;

And lenger have served hire in my degre;

And if she should have loved for long loryng,

To me, alone, had be the *guerdonyng*.

Id. Assemblie of Fowles.

But Love, alas! quite him so ill his wage,

With cruel daunger, plainly at the laste

That with the dethe *guerdonlesse* he paste.

Id. Complaint of the Blacke Knight.

But to the virgin comes, who all this while

Amazed stands herself so mocked to see,

By him who has the *guerdon* of his guile,

For so misfeigning her true knight to be. *Spenser.*

Fame is the spur that the clear spirit doth raise

To scorn delights, and live laborious days;

But the fair *guerdon* when we hope to find,

And think to burst out into sudden blaze,

Comes the blind fury with the abhorred sheers,

And slits the thin-spun life. *Milton.*

Fame is the thirst of youth,—but I am not

So young as to regard men's frown or smile

As loss or *guerdon* of a glorious lot;

I stood and stand alone, remembered or forgot.

Byron.

GUERICHE, or **GUERICKE** (Otho), a native of Prussia, the most celebrated mathematician of his time, was born in 1602. He is said to have been the inventor of the air-pump; and was author of several works in natural philosophy, the chief of which is his *Experimenta Magdeburgica*. He died in 1686.

GUERNSEY, one of the most considerable of a group of islands on the French coast, once a dependency of the duchy of Normandy, and the only remains of the ancient sovereignty of England over France. They are situated in the gulf of St. Malo, from three to six leagues from the French coast.

Guernsey, the largest, (the Sarnia of Antoninus), is thirteen miles long and eight broad. On the south and south-west the shores are high, precipitous, and broken by deep ravines. On the north and east they are low, indented by bays separated by rocky head-lands, and lined with sunken rocks, which with the strength of the currents are a strong natural defence to the island.

The climate is humid, and the winters stormy. The face of the island is diversified by moderate hills, and watered by numerous streams, serving to turn mills and fertilising the valleys, every inch of which is cultivated with the greatest care, affording the pleasing appearance of industry and its attendant comfort, which is conspicuous in the neat seats of the gentry surrounded by orchards and gardens, and the clean habitations of the peasantry.

The chief produce of the island is corn and apples, and the principal manufacture that of worsted jackets, caps, and stockings, of the first of which there is a great consumption by seamen. Guernsey sends vessels to the Newfound-

land fishery, and in war fits out many privateers; in peace smuggling with the coast of England is an organised business, the objects being French brandies and lace, &c. Some emery stone is also exported, there being a rock of this substance on the island.

The Norman feudal laws are still in use in these islands, but meliorated by time, which has worn down their oppression; they are collected in a book called 'le grand Costumier.' The king's writs from Westminster cannot be executed in these islands, and consequently they offer an asylum for insolvent debtors; neither are they bound by any act of the British legislature unless specifically named, nor can these acts be put in force until sanctioned by the civil government of the islands. The Norman French is the language most generally spoken, and many Norman customs are observed. An appeal lies from the courts of the island to the king in council. The population is about 15,000. St. PIERRE is the chief town; which see. Among the marine productions found on the shores are the sea aure, delicate shell-fish, the sea mouse, aphrodite aculeator, and the sea anemone.

Among the curiosities of the coast is La Cave Mahie, on a level with the sea near Prevolet Point on the south; from an entrance of nine feet wide and six high, it expands to fifty feet in height and breadth and 200 feet in length, ending in granite points. The base of the island is entirely of this substance, and several of its heights consist of conical ascents of this grand substratum, raised apparently by a power acting vertically.

GUESS, *v. a. & n. s.* } Germ. *gissen*; Goth. *gissa*; Isl. *giska*; Swed. *gissa*. Any thing put together without design; to judge without certain principles; to conjecture either on probabilities or by accident. A guesser is one who judges without certain knowledge.

Ye sawe the lettir that she wrote I gesse,
Naie, never yet iwis, quod Troilus.
Chaucer. Troilus and Creseide.
Incapable and shallow innocents!
You cannot guess who caused your father's death.
Shakespeare.

Let not your ears despise my tongue for ever,
Which shall possess them with the heaviest sound
That ever yet they heard.
—Hum! I guess at it. *Id. Macbeth.*

The enemy's in view; draw up your powers:
Hard is the guess of their true strength and forces.
Shakespeare.

I have a letter *guessingly* set down. *Id.*
He that, by reason of his swift motions, can inform himself of all places and preparations, should he not very often guess rightly of things to come, where God pleaseth not to give impediment? *Raleigh's History.*

Longer I durst not stay, but soon I guessed
Ye were the two she meant; with that I sprung
Into swift flight, till I had found you here;
But further know I not. *Milton's Comus.*

Quoth she, there are no bargains driven,
No marriages, clapped up in heaven;
And that's the reason, as some guess,
There is no heaven in marriages. *Hudibras.*
His *guesse* was usually as near to prophecy as any man's. *Fell.*

One may *guess* by Plato's writings, that his meaning, as to the inferior deities, was, that they who would have them might, and they who would not might let them alone; but that himself had a right opinion concerning the true God. *Stillingsfleet.*

There issue swarming bands
Of ambushed men, whom, by their arms and dress,
To be Taxcallan enemies I guess. *Dryden.*

A poet must confess
His art's like physick, but a happy guess. *Id.*

It is a wrong way of proceeding to venture a greater good for a less, upon uncertain *guesses*, before a due examination, *Locke.*

We may make some *guess* at the distinction of things, into those that are according to, above, and contrary to reason. *Id.*

If Xerxes was able to call every common soldier by his name in his army, it may be *guessed* he got not this wonderful ability by learning his lessons by heart. *Id.*

This problem yet, this offspring of a *guess*,
Let us for once a child of truth confess. *Prior.*
It is the opinion of divers good *guessers*, that the last fit will not be more violent than advantageous. *Pope.*

If fortune should please but to take such a crotchit,
To thee I apply, great Smedley's successor,
To give thee lawn sleeves, a mitre and rochet,
Whom wouldst thou resemble? I leave thee a *guesser*.
Swift.

The same author ventures to *guess* at the particular fate which would attend the Roman government. *Id.*

Nor can imagination *guess*;
How that ungrateful charming maid
My purest passion has betrayed. *Id.*
No man is blest by accident, or *guess*,
True wisdom is the price of happiness. *Young.*
You *guess* each circumstance of Edwin's birth.
Beattie's Minstrel.

'There is a tide in the affairs of men,
Which, taken at the flood'—you know the rest,
And most of us have found it now and then;
At least we think so, though but few have *guessed*
The moment. *Byron.*

GUEST, *n. s.* } Sax. *gert, girt*;
GUEST'RITE, *n. s.* } Welsh *gwest*; Swed.
GUEST-CHAMBER, *n. s.* } and Teut. *gast*; Goth. *giest*. One entertained at the house or table of another; a stranger; guestrite, offices due to a guest; guest-chamber, a chamber of entertainment.

Where is the *guestchamber*, where I shall eat the passover with my disciples? *Mark xiv. 14.*

They all murmured, saying, that he was gone to be *guest* with a man that is a sinner. *Luke xix. 7.*

Whilom, ther was dwelling in Oxenforde,
A riche gnof, that *gestes* held to borde.
Chaucer. The Miller's Tale.

No wonder is though that she be astoned
To see so gret a *gest* come in that place;
She never was to none swiche *gestes* woned.
For which she loked with ful pale face.

Id. The Clerkes Tale.
Methinks a father
Is, at the nuptial of his son, a *guest*
That best becomes the table. *Shakespeare.*

Those happiest smiles
That played on her ripe lip, seemed not to know
What *guests* were in her eyes; which parted thence
As pearls from diamonds dropt. *Id.*

Ulysses so dear

A gift esteemed it, that he would not beare
In his black fleets that *guest-rite* to the war.

Chapman.

O desarts, desarts! how fit a *guest* am I for you,
since my heart can people you with wild ravenous
beasts, which in you are wanting? *Sidney.*

Tell my royal *guest*

I add to his commands my own request. *Dryden.*

But here the Mother of the Maids drew near
With 'Ladies it is time to go to rest;
I'm puzzled what to do with you, my dear,'
She added to Juanna, their new *guest*. *Byron.*

GUETTARDA, in botany, a genus of the heptandria order, and monœcia class of plants: natural order thirty-eighth, tricoceæ: MALE CAL. cylindrical: cor. cleft into seven parts, and funnel-shaped: FEMALE CAL. cylindrical: cor. cleft into seven parts; one pistil, and the fruit a dry plum. Species four; natives of the West Indies.

GUGGLE, *v. n.* Ital. *gorgoliare*. To sound as water running with intermissions out of a narrow-mouthed vessel.

GUIANA, an extensive country of South America, bounded on the east and north-east by the Atlantic Ocean and the Oronoco; on the south by the Amazon; and on the west by Grenada and New Andalusia, in Terra Firma, from which it is separated on the west and north by the Oronoco. It extends above 1200 miles in length, from north-east to south-west; i. e. from the mouth of the Oronoco to that of the Amazon, and from 300 to 600 in breadth. The Portuguese, French, and Dutch, all formed settlements along the coast. Dutch Guiana, as we have stated in our article AMERICA, SOUTH, is now wholly ceded to Great Britain.

GUIANA, FRENCH, occupies 160 leagues of coast from the Maroni on the north to the Carapona on the south; this latter, which falls into

the Amazon in 6° 30' N. lat., being agreed on as the limit by France and Portugal in 1801. The French first established themselves on this coast in 1625, and gave it the name of equinoc-tial France; but in 1654 they again abandoned their only establishment at Cayenne, and the Dutch sought to fix themselves on it, but the French, returning in 1664, drove them out, and, though the island was again taken by the Dutch in 1676 they were obliged to restore it the following year.

In 1809 the colony was captured by the English and Portuguese forces combined, but it was restored to France by the peace of 1814.

The whole coast of French Guiana is lined by drowned mangrove islands and mud banks, which bar the mouths of the numerous rivers, and the navigation of which is also generally impeded by ledges of rock. The rains which prevail from January to July, form stagnant ponds and marshes, that render the climate exceedingly unhealthy. The currents are very strong and irregular along this coast. The colony has never been of any considerable advantage to France, as will appear from the following statements of its population and exports.

Population of the colony, exclusive of Cayenne Island.

	1775.	1788.	1798.
Whites	1,300	1,307	1,800
Free people of color		394	
Slaves	8,000	10,748	
	9,300	12,449	

In 1772 Cayenne Island contained only ninety white families, 125 caribbs, and 1500 slaves.

The exports of the colony were:—

	Sugar.	Coffee.	Cacao.	Cotton.	Rocou.	Wood.	Hides.
	<i>quint.</i>	<i>quint.</i>	<i>quint.</i>	<i>quint.</i>	<i>quint.</i>	<i>quint.</i>	No.
1775.	340	900	1000	1000	6000	1400	350
1788.	20	159	210	925	Indigo 50		

The only place worthy of mention, north of Cayenne, is Sinamari, a miserable post containing in 1798 only fifteen or sixteen huts, the remains of a settlement founded in 1763. Cayenne Island lies in the mouth of the Oyak River, forming two branches. The northernmost, named Cayenne River, has but thirteen feet soft mud; the southern branch is called the Mahuri. The island is sixteen leagues in circuit, and is extremely unhealthy; for, the interior being lower than the shores, the rain water stagnates and forms putrid marshes. The town is built on the north-west point of the island, and is a wretched place, the streets steep and narrow, and paved with sharp stones.

Among the numerous islands off Cayenne, the only ones deserving mention are the Two Con-stables, or Gunners, barren conical rocks whitened with birds' dung. The Malingre Islands, three leagues south-east of Cayenne, are almost inaccessible; on one of them is an hospi-

tal for lepers, this malady being very common at Cayenne.

South of Cayenne the principal rivers are the Approuak, which has twelve feet depth at its entrance; the Oyapok, which empties itself west of Cape Orange; the Cassipour, Coanwine, &c.

GUIANA, PORTUGUESE, occupies the left bank of the Amazons. See AMAZONS.

The two principal mouths are here separated by the swampy alluvion island Caviana; besides which, many similar islands are formed by its mud.

The only places in Portuguese Guiana, of which any thing is known, are the little fort of Macapa, and the fortified village of Paru, both on the Amazons.

GUICCIARDINI (Francis), a celebrated his-torian, born at Florence in 1482. He professed the civil law with reputation, and was employed in several embassies. Leo X. gave him the go-vernment of Modena and Reggio, and Clement

VII., that of Romagna and Bologna. Guicciardini was also lieutenant-general of the pope's army, and distinguished himself by his bravery on several occasions; but, Paul III. having taken from him the government of Bologna, he retired to Florence, where he was made counsellor of state, and was of great service to the house of Medicis. He at length retired into the country to write his history of Italy, which he composed in Italian, and which extends from 1194 to 1532. This history is greatly esteemed, and was continued by John Baptist Adriani, his friend. He died in 1540.

GUICCIARDINI (Lewis), nephew of the preceding, wrote a history of the Low Countries and Memoirs of the Affairs of Europe, from 1530 to 1560. He wrote with great spirit against the persecution of the duke d'Alva, for which he imprisoned him. He died in 1583.

GUIDE, *n. s. & v. a.* } Fr. *guide*; Ital. *guidu*;
 GUIDAGE, *n. s.* } Span. and Port. *guia*;
 GUIDANCE, *n. s.* } *ab* גיד, to lead a troop
 GUIDELESS, *adj.* } or army. — Minsheu.
 GUIDER, *n. s.* } To direct, lead, influence, or govern; to regulate and superintend. A guide is one who directs the way or conduct of another: guidance, an old word which signifies the reward given to a guide: guideless, having no superintendent or governor.

And for to maken you the more mery
 I wol myselven gladly with you ride,
 Right at my owen cost, and be your guide.

Chaucer. *Prologue to Cant. Tales.*

Calliope, thou sister wise and sly!
 And thou Minerva guide me with thy grace,
 That language rude my matter not deface.

Id. *The Court of Love.*

They charge me with neglecting the guidance of wiser men.

Spenser.

Who the *guide* of nature, but only the God of nature? In him we live, move, and are. Those things which nature is said to do, are by divine art performed, using nature as an instrument: nor is there any such knowledge divine in nature herself working, but in the *guide* of nature's work.

Hooker.

Our *guider* come! to the Roman camp conduct us.

Shakspeare.

Can knowledge have no bound, but must advance
 So far to make us wish for ignorance?

And rather in the dark to grope our way,
 Than, led by a false *guide*, to err by day?

Denham.

They have all the same pastoral *guides* appointed, authorised, sanctified, and set apart by the appointment of God, by the direction of the Spirit, to direct and lead the people of God in the same way of eternal salvation.

Pearson.

While yet but young his father died,

And left him to an happy *guide*.

Waller.

Upon these, or such like secular maxims, when nothing but the interest of this world *guides* men, they many times conclude that the slightest wrongs are not to be put up.

Kettlewell.

There fierce winds o'er dusky valleys blow,

Whose every puff bears empty shades away,

Which *guideless* in those dark dominions stray.

Dryden.

The ambitious Swede, like restless billows tost,
 Though in his life he blood and ruin breathed,
 To his now *guideless* kingdom peace bequeathed.

Id.

Some truths are not by reason to be tried,

But we have sure experience for our *guide*.

Id.

That person, that being provoked by excessive pain, thrust his dagger into his body, and thereby, instead of reaching his vitals, opened an imposthume, the unknown cause of all his pain, and so stabbed himself into perfect health and ease, surely had great reason to acknowledge chance for his surgeon, and Providence for the *guider* of his hand.

South.

Whosoever has a faithful friend to *guide* him in the dark passages of life, may carry his eyes in another man's head, and yet see never the worse.

Id.

Particular application must be left to Christian prudence, under the *guidance* of God's Holy Spirit, who knows our necessity before we ask, and our ignorance in asking.

Rogers.

As to those who lived under the *guidance* of reason alone, without the assistance of supernatural light, it is highly probable that miracles, or a message from the dead, would persuade them.

Atterbury.

A prince ought not to be under the *guidance* or influence of either faction, because he declines from his office of presiding over the whole, to be the head of a party.

Swift.

Women neglect that which St. Paul assigns them as their proper business, the *guiding* of the house.

Decay of Piety.

The new light served to *guide* them to their neighbours' coffers.

Id.

This to the young—but thy experienced age

Wants not the *guidance* of a former sage.

Sewell.

How empty learning, and how vain is art,

But as it mends the life and *guides* the heart

Young.

Once more upon the waters! yet once more,
 And the waves bound beneath me as a steed
 That knows his rider. Welcome to their roar,
 Swift be their *guidance* wherso'er they lead.

Byron. *Childe Harold.*

GUIDI (Alexander), an eminent Italian poet, born at Pavia in 1650. At Rome he attracted the notice of queen Christina, of Sweden, who retained him at her court; he also obtained a considerable benefice from Pope Innocent XI. and a pension from the duke of Parma. For an important political service he rendered the state of Milan, with prince Eugene, he was enrolled among the nobles and decurions of that town; he died in 1712. His exterior form was unfavorable; he was short and crooked, his head was large, and he was blind of his right eye. His works were published at Verona in 1726.

GUIDO ARETIN. See ARETIN.

GUIDO RENI. See RENI.

The GUIDON is a flag borne by the king's life-guard, broad at one extreme, and almost pointed at the other, and divided into two. It is the ensign or flag of a troop of horse guards.

GUIDON, the officer who bears the guidon, is that in the horse-guards which the ensign is in the foot; and takes place next below the cornet.

GUIDONS, guidones, or schola guidonum, were a company of priests established by Charlemagne, at Rome, to conduct and guide pilgrims to Jerusalem, to visit the holy places: they were to assist them in case they fell sick, and to perform the last offices to them in case they died.

GUIENNE, a province in the south-west of France, to the north of Gascony, and separated from it by the river Garonne: the other principal rivers are the Dordogne, the Lot, the Yarn, and

Aveyron. The modern division of this extensive district is into the five departments of the Gironde, the Lot and Garonne; the Dordogne, the Lot, and the Aveyron. The soil is various, being in many places sandy, in others fertile, but in general well adapted to the culture of the vine; and the collective population is about 1,000,000. In the fourteenth century this part of France was long the scene of war between the French and English, under Edward III. and the Black Prince.

GUJERAT, or GURAT, a large province of Hindostan, chiefly situated between the twenty-first and twenty-fourth degrees of northern latitude. It is bounded on the north by the province of Ajmeer, on the east by Malwah and Khandeish, on the south by Aurungabad and the sea, and on the west by a sandy desert, the gulf of Cutch, and the sea; and has been computed to be 320 miles long, by about 180 broad. Parts of this country are fertile in cotton, tobacco, indigo, gum, and sugar; but other portions are very barren. This province is intersected by the Puddar, the Myhic, the Nerbudda, the Taptee, and other rivers, which, being navigable from the sea to a considerable distance, afford much facility both to trade and piracy.

On the north-west, along the bank of the Puddar or Bunass, there is a fenny tract, in which they breed excellent horses and camels, and the cattle are superior to those of any other part of India. Some of their bullocks, which are in general white, with large humps, are sixteen hands high, and will trot in a carriage as fast as good horses. Agriculture is impeded in many places by a want of water, the peasants being obliged to dig wells 100 feet deep; and their crops and flocks being frequently carried off by robbers. The cultivators of the soil are the lower classes of Hindoos, called Coolies, Wheels, and Grassias; the Rajpoot, or military tribe, form a second class; Brahmins the third; Jains the fourth; Mahommedans and their descendants a fifth; genuine Mahommedans and their descendants a sixth; and Parsees (fire worshippers) a seventh; all of whom, except the last, are subdivided into innumerable sects. The one most deserving of notice is that called Angrea, whose profession is to convey money, jewels, bills of exchange, &c., from one part of the country to the other. They have been frequently known to die in defence of the property confided to them. In this province they have hospitals for old or deceased animals.

The Gujaraty language nearly resembles the old Hindy, and is written in the Dewanagari character; but in the large towns a mixed language is generally spoken. Infanticide and self-immolation were till lately very common. It was in Gujerat that the Parsees, or followers of the Magi, were first received by a Hindoo chief, possessor of the town and district of Seyjan, who granted them his protection, on condition of their changing their mode of dress, and laying aside their arms. They are now numerous, and a very inoffensive and industrious race, following the religion of Zoroaster. They have a great aversion to extinguish a fire, and boast that they still possess the sacred flame brought by their ancestors from Persia, nearly 1200 years ago.

The ancient capital of the province was Netherwalla or Puttan (the city). Its present capital is Ahmedabad; but it possesses also the following towns or cities, viz. Surat, Broach, Cambay, Gogo, and Champaneer. Before the discovery of the Cape of Good Hope, there were few countries in the world that carried on a more extensive commerce, or that exhibited a greater progress in the arts.

This country was first subjected by the Musulman arms, A. D. 1022, when Mahmoud, sultan of Ghizne, on his way to plunder the temple of Somnath, took the capital, and, the Rajpoot prince Byram Deo having fled, Mahmoud placed a Brahmin on the throne. The Rajpoots, however, soon recovered their authority; and, in the year 1179, one of them, named Bin Deo, defeated the Mahommedans with great slaughter. It was again overrun by Cuttub, the Afghan king of Delhi, in 1202; and a third time in 1297, by the troops of Alla I., who brought away with him Cumladi, the beautiful wife of the rajah, who became his spouse.

In 1390 the emperor Mohammed the IVth. appointed one of his father's slaves, by birth a Bramin, to the government of Gujerat, who, upon the death of the emperor in the year 1396, assumed the royal dignity and title of Muzuffier Shah. His family retained possession of Gujerat for nearly a century and a half. His grandson, sultan Ahmed, founded the city of Ahmedabad. In the year 1535 the emperor Homayon invaded Gujerat, and possessed himself of all its principal holds; but, when he was obliged to abandon his throne, a nephew of the last sultan got possession of the province; and it continued to be ruled by that dynasty in a very divided state, till the year 1572, when, the emperor Akbar having advanced against it, Sultan Muzuffier surrendered himself and kingdom into the imperial hands. From that period Gujerat again became one of the provinces of the empire, and so continued till the death of Aurungzebe. It was shortly after that event invaded by the Mahrattas. Surat and some other towns were, however, defended by their governors, who retained their allegiance to the court of Delhi. During the war of 1780 the British got possession of a portion of it; and at present the best parts of it belong to them, to the Guicowar, and to the Peshwa. The British territory consists of a considerable tract on both sides of the gulf of Cambay, and includes the populous cities of Surat, Broach, Cambay, Kaira, and Gogo. The sea coast between the gulf of Cambay and Cutch is occupied by different independent chiefs. The northern and western borders are also possessed by a number of barbarous plunderers.

GUTLANDINA, the nickar tree, a genus of the monogynia order, decandria class of plants; natural order thirty-third, lomentacæ: cal. monophyllous and salver-shaped; the petals, inserted into the neck of the calyx, nearly equal; the seed-vessel a legumen. There are, species

1. *G. bonduca*, the yellow nickar.

2. *G. bonducella*, the gray nickar. These are climbing plants, natives of the West Indies, where they rise to twelve or fourteen feet: the

flowers come out at the wings of the stalks; and are composed of five concave yellow petals. They are succeeded by pods about three inches long and two broad, closely armed with slender spines, opening with two valves, each enclosing two hard seeds, about the size of pistol bullets, of a yellowish color.

3. *G. moringa*, the *morunga nickar*, is a native of Ceylon, and some places on the Malabar coast. It rises to twenty-five or thirty feet, having flowers produced in loose bunches from the sides of the branches, and composed of an unequal number of petals. These plants, being natives of warm climates, require to be kept through the winter in a stove in this country. They are propagated by seeds; but those of the *bonduca* are so hard, that unless they are soaked some days in water before they are put into the ground, or placed under the pots in the tan-bed to soften their covers, they will remain for years without vegetating. The roots of the *moringa* are scraped when young, and used by the inhabitants of Ceylon and Malabar as those of horse-radish are in Europe. The wood dyes a beautiful blue color. It is the *lignum nephriticum*, or nephritic wood of the dispensatories; and is brought over in large, compact, ponderous pieces, without knots, of a whitish or pale yellow color on the outside, and dark-colored or reddish within: the bark is usually rejected. This wood imparts to water or rectified spirit a deep tincture; appearing, when placed between the eye and the light, of a golden color; in other situations blue; pieces of another wood are sometimes mixed with it, which give only a yellow color to water. It has scarcely any smell, and very little taste. It has been recommended in difficulty of urine, nephritic complaints, and all disorders of the kidneys and urinary passages.

GUILD, *n. s.* Sax. *gild*; Goth. *gild*; Belg. and Swed. *gild*; Teut. *gilde*. A society; a corporation; a fraternity or company, combined together by orders and laws made among themselves. Hence the common word *gild* or *guild-hall* proceeds, being a fraternity or commonality of men gathered into one combination, supporting their common charge by mutual contribution: and Belg. *gild* is also a contribution.

Wel semed eche of hem a fayre burgeis,
To sitten in a *gild* halle on a deis.
Everich, for the wisdom that he can,
Was shapeliich for to ben an alderman.

Chaucer. Prologue to Cant. Tales.

Towards three or four o'clock
Look for the news that the *guild* hall affords.

Shakspeare. Richard III.

In woollen cloth it appears, by those ancient *guilds* that were settled in England for this manufacture, that this kingdom greatly flourished in that art.

Hale's Origin of Mankind.

As when the long-eared milky mothers wait
At some sick miser's triple-bolted gate,
For their defrauded absent foals they make
A moan so loud, that all the *guild* awake. *Pope.*

GUILD, DEAN OF. Every royal borough in Scotland has a dean of *guild*, who is the next magistrate below the bailie. He judges of controversies among men concerning trade; disputes between inhabitants touching buildings, lights, water-courses, and other nuisances; calls

courts, at which his brethren of the *guild* are bound to attend; manages the common stock of the *guild*; and amercers and collects fines.

GUILDFORD, or **GULDEFORN**, a borough town of Surrey, on the Wye, near the ruins of an old castle. In the Saxon times it was a royal villa, where many of the Anglo-Saxon kings used to pass their festivals. It is a corporation consisting of a mayor, recorder, aldermen, &c.; and has sent two members to parliament ever since parliaments commenced. The great road from London to Chichester and Portsmouth lies through this town; and the assizes are held here. Here were formerly two monasteries, the remains of one of which afford accommodation for the judges during the assizes; and part is converted into a boarding-school. The structure is Gothic. Its manufactory formerly was cloth, of which there are still some small remains. Here is a school founded by king Edward VI.; an almshouse endowed with lands, worth £300 a-year; and two charity schools for thirty boys and twenty girls. There are three fine churches. There is a fine circular course for horse races near the town, which begin when the Newmarket races are ended. King William III. founded a plate of 100 guineas to be run for here every May, and used to honor the race with his presence; there are also three subscription plates run for, exclusive of private matches; these are often very brilliantly attended, and the town is crowded with the numerous visitants. The ancient cockpit is now converted to a butter and poultry market. The Wye is made navigable to the town, and by it a great quantity of timber is carried to London, not only from this neighbourhood, but from Sussex and Hampshire woods, thirty miles off. Guildford is thirty miles south-west of London.

GUILD-HALL, or **GILD-HALL**, the great court of judicature for London. In it are kept the mayor's court, the sheriff's court, the court of hustings, court of conscience, court of common council, chamberlain's court, &c. Here also the judges sit upon *nisi prius*, &c. See *LONDON*.

GUILE , <i>n. s.</i>	} Old Fr. <i>guille</i> , <i>gille</i> ; the same with wile Deceit; cunning; trea- chery; secretly mis- chievous, or artful; in- sidious: guileless im- plies the opposite of such characteristics, or simply honest; open; sincere.
GUILFUL , <i>adj.</i>	
GUILFULLY , <i>adv.</i>	
GUILFULNESS , <i>n. s.</i>	
GUILLESS , <i>adj.</i>	

GUI'LER, *n. s.*

implies the opposite of such characteristics, or simply honest; open; sincere.

Of all this world is emperor

Gile, my father, the trechour.

Chaucer. Romaunt of the Rose.

The strong the feble overgothe;
But I, that were my simple clothe,
Robbe bothe the robbed and robbours.
And *gile* the *giled* and *gilours*. *Id.*

A *gilour* shal himself begiled be.

Id. The Reves Tale.

But he was wary wise in all his way,
And well perceived his deceitful sleight;
Ne suffered lust his safety to betray;
So goodly did beguile the *guiler* of the prey

Spenser

With fawning words he courted her awhile,
And looking lovely, and oft sighing sore,

Her constant heart did court with divers *guile* ;
But words and looks, and sighs she did abhor. *Id.*

The way not to be inveigled by them that are so
guileful through skill, is thoroughly to be instructed in
that which maketh skilful against *guile*. *Hooker.*

I trained thy brethren to that *guileful* hole,
Where the dead corps of Bassianus lay.

Shakspeare.

Without expence at all,
By *guileful* fair words, peace may be obtained.
Id. Henry VI.

When I have most need to employ a friend,
Deep, hollow, treacherous, and full of *guile*,
Be he to me ! This do I beg of heaven,
When I am cold in zeal to you or yours.

Shakspeare.

We may, with more successful hope, resolve
To wage by force or *guile* eternal war. *Milton.*

Nor thou his malice and false *guile* condemn :
Subtle be needs must be who could seduce
Angels. *Id. Paradise Lost.*

He saw his *guileful* act
By Eve, though all unwitting, seconded
Upon her husband. *Id.*

To whom the tempter *guilefully* replied. *Milton.*

The *guileful* phantom now forsook the shroud,
And flew sublime, and vanished in a cloud.

Dryden's Æneid.

GUILIM (John), of Welsh extraction, was born in Herefordshire, about 1565. Having completed his education at Brazen Nose College, Oxford, he became a member of the College of Arms in London; and was made *rouge croix* pursuivant, in which post he died in 1621. He published, in 1610, a celebrated work, entitled the Display of Heraldry, in folio, which has gone through many editions.

GUILLOTINE, an engine of decapitation, decreed by the French National Assembly to be the sole punishment of persons condemned to death, on the 20th of March, 1792; so named from Dr. Guillot, a member of the assembly, who proposed it as an instrument of mercy, by giving the criminal a more expeditious death than any other means can afford. Its effect, it must be allowed, is instantaneous. This machine consists of two upright posts, ten feet high, joined at the top by an horizontal piece of timber. At four feet from the bottom is a cross bar, on which the neck of the criminal is laid, over which there falls a similar bar, shaped like the front board of our pillory. On the inner faces of the frame are grooves, along which the extreme edges of an axe slide up and down. This axe is heavily laden with lead, and is so contrived that the oblique edge falls upon the neck in a diagonal direction, so as to sever the culprit's head from his body by a sliding cut. The upright side of the axe is wholly included in the groove which guides it, by means of a cord and pulley, up to a catch or pin, with which a separate cord is connected. The criminal is prepared for his fate by the executioner, who, having first cut off his hair, ties him in a standing posture to a board, which he afterwards inclines, so as to lay the body horizontally with the face downwards, and with the head advanced over a basket placed for its reception. The string being pulled by the executioner, the axe descends, and the head is severed in an instant. Louis XVI.,

his queen and aunt, and multitudes of persons of both sexes, and of all ranks, who were attached to the royal cause in France, suffered death in this way.

This machine is not, however, a new invention, but only an improvement on an instrument used in Scotland and at Halifax, and called the maiden. The cloths, at the first erection of the woollen manufactures, having been often stolen in the night, a law was made, by which the magistrates of Halifax were empowered to execute all offenders, if they were taken in the fact, or owned it, or if the stolen cloth was found upon them, provided the crime was committed, and the criminal apprehended, within the liberties of the forest of Hardwick. Those found guilty were thus executed: an axe was drawn by a pulley to the top of a wooden engine, and fastened by a pin, which being pulled out, the axe fell down in an instant. If they had stolen an ox, horse, or any other beast, it was led with them to the scaffold, and there fastened by a cord to the pin, that held up the axe; and when the signal was given by the jurors, who were the first burghers within the several towns of the forest, the beast was driven away, and the pin plucked out, upon which the axe fell, and beheaded the criminal.

'This instrument,' says Mr. Pennant, 'was very freely used during the reign of Elizabeth: the records before that time were lost: twenty-five suffered in her reign, and at least twelve from 1623 to 1650; after which I believe the privilege was no more exerted. This machine of death is now destroyed; but I saw one of the same kind in a room under the parliament-house at Edinburgh, where it was introduced by the regent Morton, who took a model of it as he passed through Halifax, and at length suffered by it himself. It is in form of a painter's easel, and about ten feet high: at four feet from the bottom is a cross bar, on which the felon lays his head, which is kept down by another placed above. In the inner edges of the frame are grooves; in these is placed a sharp axe, with a vast weight of lead, supported at the very summit with a peg; to that peg is fastened a cord, which the executioner cutting, the axe falls, and decapitates the culprit.'

GUILT, *n. s.*

GUILTILY, *adv.*

GUILTINESS, *n. s.*

GUILTLESS, *adj.*

GUILTLESSLY, *adv.*

GUILTLESSNESS, *n. s.*

GUILT'Y, *adj.*

Sax. *gylt*, originally signifying the fine or mulct paid for an offence; afterward the offence itself. Goth. and Swed. *gilde*. See GUILD. The contrary to innocence, as wickedness; crime; a state of corruption and sin; chargeable with misconduct; guiltless is innocent; blameless; free from guilt.

We are verily *guilty* concerning our brother, in that we saw the anguish of his soul when he besought us, and we would not hear. *Gen. xlii. 21.*

Then shall the man be *guiltless* from iniquity, and this woman shall bear her iniquity. *Numbers v. 31.*

And although that bis Ire hir *gilt* accused;

Yet, in his Reson, he hem both excused.

Chaucer. The Knightes Tale.

A Breton book, written with Evangelies, Was fet, and on this book he swore anon
She *giltif* was. *Id. The Man of Lawes Tale*

And aske mercy, and *giltlesse*? what nede?

And if that I complaine what life I lede.

You ricketh not; that know I out of drede.

Id. Anselida and False Arcite.

I am in this commanded to deliver

The noble duke of Clarence to your hands:

I will not reason what is meant hereby;

Because I will be *giltless* of the meaning.

Shakspeare.

Many worthy and chaste dames thus,

All *giltless*, meet reproach. *Id. Othello.*

Close pent up *guilt*s

Rive your concealing continents, and ask

These dreadful summoners grace. *Shakspeare.*

Is there not a ballad of the king and the beggar?—
The world was *guilty* of such a ballad some three ages
since. *Id. Love's Labour Lost.*

Marked you not

How that the *guilty* kindred of the queen

Looked pale, when they did hear of Clarence death?

Shakspeare.

The last was I that felt thy tyranny:

O, in the battle think on Buckingham,

And die in terrour of thy *guiltiness*. *Id.*

I should be *guiltier* than my *guiltiness*. *Id.*

Bloody and *guilty*; *guiltily* awake,

And in a bloody battle end thy days:

Think on lord Hastings, and despair, and die.

Id. Richard III.

It was neither *guilt* of crime, nor reason of state,
that could quench the envy that was upon the king
for this execution. *Bacon's Henry VII.*

Thou, who doest all thou wishest at thy will,

And never willest aught but what is right,

Preserve this *giltless* blood they seek to spill;

Thine be my kingdom. *Fairfax.*

I would not have had any hand in his death, of
whose *giltlessness* I was better assured than any man
living could be. *King Charles.*

The *guilty* serpents, and obscene beasts,

Creep conscious to their secret rests:

Nature to thee does reverence pay,

Ill omens and ill sights removes out of thy way.

Cowley.

The *giltless* damsel, flying the mad pursuit

Of her enraged stepdame Guendolond,

Commended her fair innocence to the flood,

That staid her flight with his cross-flowing course.

Milton's Comus.

A good number, trusting to their number more than
to their valour, and valuing money higher than equity,
felt that *giltlessness* is not always with ease oppressed.

Sidney

He thought his flight rather to proceed of a fearful
guiltiness than of an humble faithfulness. *Id.*

Guiltless of greatness, thus he always prayed,

Nor knew nor wished he that those vows he made

On his own head should be at last repaid. *Dryden.*

The teeming earth yet *giltless* of the plough,

And, unprovoked, did fruitful stores allow. *Id.*

With mortal hatred I pursued his life,

Nor he, nor you, were *guilty* of the strife;

Nor I, but as I loved; yet all combined,

Your beauty and my impotence of mind. *Id.*

Farewell the stones

And threshold, *guilty* of my midnight moans. *Id.*

No penance can dissolve our *guilty* fame,

Nor tears, that wash out sin, can wash out shame.

Prior.

, like a dog, could bite as well as whine,

And first complained whence'er the *guilt* was mine.

Pope.

Thou knowest how *giltless* first I met thy flame,

When love approached me under friendship's name.

Id.

When these two are taken away, the possibility of
guilt, and the possibility of innocence, what restrain-
can the belief of the creed lay upon any man?

Hammond on Fundamentals.

All the tumult of a *guilty* world,

Tost by ungenerous passion, sinks away.

Thomson.

A pert prim prater of the northern race,

Guilt in his heart, and famine in his face.

Churchill.

GUINEA, *n. s.* From Guinea, a country in
Africa abounding with gold. A gold coin
valued at one and twenty shillings.

By the word gold I must be understood to design a
particular piece of matter; that is, the last *guinea* that
was coined. *Locke.*

Ladies, whose love is constant as the wind:

Cits, who prefer a *guinea* to mankind. *Young.*

GUINEA, a large tract of country on the west
coast of the continent of Africa, which some geo-
graphers have extended to all the country be-
tween the Gambia and Benguela, dividing it
into *Upper* and *Lower*; while others confine it
to the coast between the Mesurado and Cross
River. We take a middle course, indicated by
similarity of climate and seasons, and consider
Guinea as comprised between the Gambia and
Cape Lopez Gonsalvez.

Our navigators give the name of *Windward
Coast* to the space between the Rio Grande and
Cape Palmas, because the winds are generally
from the north, and consequently it lies to
windward relative to the gulf of Guinea.

That from the Mesurado to Cape Palmas is
named the *Grain Coast*, from a species of pepper
called by the natives manigatta, and by Euro-
peans the grain of Paradise.

The *Ivory* or *Tooth Coast* extends from Cape
Palmas to the river Frisco or Lagos, and derives
its name from the quantity of elephants' teeth
procured on it, these animals it is thought being
particularly attracted to this part of the coast by
its abundance of sugar canes, of which they are
extremely fond. This extent of coast is free
from danger, and may be sailed along within a
league.

The *Quaqua Coast*, from the river Frisco to
Assinee. This extent is more usually included
in the *Ivory Coast*.

The *Gold Coast*, according to different writers,
commences at Assinee, at Cape Apollonia, and
at Cape Three Points, and generally is terminated
at the river Volta. It has its name from the quan-
tity of gold-dust brought by the negroes for sale,
and which they collect in the sands of the brooks
and torrents.

The *Slave Coast* extends from the Volta to
Cross River. It is sometimes subdivided into
Dahomey, or *Ilidiah*, from the Volta to Porto
Nova; *Benin* from the latter river to that of
Formosa, and *Ouary* to Cross River. See DA-
HOMEY.

The coast from Cross River to Cape Lopez has
no general appellation, but is marked by the
names of its negro tribes, *Biaffra* and *Calbonga*,
and *Kalabar* and *Gabon*, from the rivers of these
names.

On the west coast of Africa, washed by the
Atlantic from the strait of Gibraltar to the Sene-
gal, there is no river of any consequence, and

not a single port. The coast of Guinea has, it is true, a great number of rivers, but most of them are barred and inaccessible to ships, and the ports formed by the islands that line it are few and inconvenient. Beyond this region the great extent to the Cape of Good Hope has but two or three rivers, and an equal number of ports. All the rivers of Africa, within the tropics, are subject to periodical inundations, caused by the heavy rains, when the sun is vertical in the equatorial region. The banks of most of the rivers of Guinea are either marshy and covered with impenetrable mangrove, or close forests, and in few instances afford any dry elevated grounds; there are, however, spots on the banks of the Sierra Leone, which offer a picturesque and varied mountainous scenery. The whole west coast of Africa is beaten by a violent surf, and infested by sharks, while the rivers abound in equally voracious alligators, and the fresh water swamps with the hippopotamus.

The climate of the west coast of Africa, from the latitude of 20° N. to the equator, is in general extremely destructive to Europeans, though some spots are found more salubrious than others. The rainy season commences throughout this tract in May, lasts till October, and is at its height in June and July, with almost constant thunder and lightning. The exhalations from the marshes, formed by the overflowing of the rivers, from the rank vegetation on their banks, and from the vegetable and animal corruption which covers the ground, produce mortal dysenteries and inflammatory fevers. During the dry season, from November to May, the climate is less unhealthy, the atmosphere being then clear, and the heat tempered by sea breezes. In Senegambia the greatest heat is in July, when the thermometer rises in the open air to 120° or even 130° , and in the night never falls below 100° . The winds during the wet season on this coast blow constantly from the north with strong southerly currents, by means of which vessels run from the Senegal to Gorée in twenty-four hours, while it requires ten or fifteen days to beat back. During the dry season the thermometer varies in the day between 88° and 68° , and during the night, when there are heavy dews, falls to 60° .

The coast between the Gambia and Cape Verga, a distance of 250 miles, is formed by a chain of low and fertile islands separated from the main, and from each other, by narrow but deep straits. Beyond Cape Verga these low islands are succeeded by an elevated coast, which increases in height till south of Sierra Leone it presents alpine peaks apparently of volcanic origin. On this extent of coast the rains commence the same time as to the north, but are not so intense nor the climate so insalubrious: the extremes of the thermometer throughout the year are 63° and 98° , from May to August. North-west winds are most prevalent, and south-west in September and October. In November, December, and January, north-east winds prevail, with fogs, and the thermometer descends the lowest. In February, March, and April, land and sea breezes are pretty regular, the latter from the south-west in the evening. On this

coast between June and October tornadoes are frequent, and chiefly come from between the east and south-east; they blow with all the violence of a hurricane, but seldom longer than an hour or two, and their approach is denoted by black heavy clouds, rising in the south-east an hour before their arrival. Other writers say these storms are announced by a small white cloud, but this captain Beaver positively contradicts from the experience of seventy of them; of which sixty-three came from between east and south-east, two at E. N. E., three at north-east, and two at north-west. The word tornado is Portuguese, and signifies a whirlwind.

Between Sierra Leone and Cape Palmas the prevailing winds are from north-west and N. N. W., but after passing this cape they blow throughout the gulf of Guinea from south-west to S. S. W. The general current sets to the south-east to Cape Palmas, round which it curves to the E. N. E into the gulf. On the equator, in the gulf of Guinea, the current sets at times strong to the west, chiefly in June, July, and August, and particularly at the new and full moon.—Horsburgh's Ind. Direct. We are inclined to attribute this westerly current to the great quantity of fresh water emptied into the eastern port of the gulf during these rainy months.

The *Grain*, *Ivory*, and *Gold* Coasts are low and thickly wooded; but inland, at a short distance, the country is pleasantly diversified with hills and plains extremely fertile, and with abundance of good water, an article that is both scarce and bad near the shore. The seasons are similar to those already noticed, but the heat is greater on the Gold Coast than even in Senegambia, the thermometer rising in the open air to 134° . On the whole coast of Guinea, from the Gambia to Cape Lopez, a singular wind, called the harmattan, blows from the interior of Africa, occasionally in December, January, and February. It has no regular period of duration, sometimes continuing only a few hours, at others for several days; it is cold, and always attended with a dense dry fog, through which the sun at noon appears of a pale red. The extreme dryness of this wind withers the leaves of vegetables. At some seasons it is considered malignant, probably after wet weather, when it is loaded with marsh miasma; at others it arrests the progress of epidemic diseases. From the whitish powder which seems to compose the fog, and which subsides on the earth, it has been supposed that this wind blows from some volcano in the unexplored interior of Africa. On the coast of Sierra Leone it blows from the E. S. E., on the Gold Coast from north-east, and towards Cape Lopez from N. N. E.

The *Slave* Coast, between the rivers Volta and Formosa, is low and in general thinly wooded; it is lined by a chain of lagoons, separated from the sea by a narrow border of land, called by the French *La Pré*, the meadow, and which are formed by the overflowing of the rivers. From the Formosa to the Camerons the coast is intersected by the mouths of numerous rivers, by some supposed to be branches of the Niger, which still conceals its embouchure from the researches of geographers. These rivers carry out

great quantities of mud, which elevate the bottom of the sea, and it seems probable that the projecting land of Cape Formosa, which separates the gulf of Benin and Biafra, is entirely formed of alluvion. A considerable number of elephants frequent this part of the coast; but their tusks are said to be of an inferior ivory. The fresh water swamps are also frequented by the hippopotamus. Between the rivers Cameroons and S. Benito, the coast is mountainous, and in the tract called the high land of Ambozes some of the peaks are thought to equal that of Tenerife in elevation.

After crossing the equator the wet season is from September to November, the rains prevailing at each side of the equator in the respective summer solstice; they are also retarded in going to the south, commencing at Loango in December and lasting till March. After passing Loango there is strictly speaking no wet season.

A brief sketch of the general character of the tribes inhabiting this coast will not be uninteresting.

From the Gambia to the Cassamança occur the *Feloops*, a tribe of idolaters, who are described as melancholy and revengeful, but also honest and grateful. The succeeding tribes on the coast are the *Bagnons*, on the banks of the St. Domingo, who are said to be peaceful cultivators; the *Papels* and *Balontes* occupy the coast of St. Domingo and the Courbali, and are painted as ferocious and inhospitable. The *Papels* worship trees, ox horns, and all sorts of visible objects. When their king dies a new one is elected in a singular manner; the corpse of the deceased monarch is placed on a bier, encircled by the chief nobles, and being tossed up in the air, the noble on whom it falls in its descent is thereby duly elected.

The *Biagers* occupy the right bank of the Rio Grande: they are somewhat civilised and addicted to commerce. Between the Rio Grande and Nunez is the tribe of *Nadoes*, whose lands are well cultivated and produce indigo and cotton, but with whom it is necessary to be guarded. The Bissagos Islands are inhabited by different tribes of idolaters, generally ferocious and treacherous, adorning their huts with the scalps of their enemies; and, in the island of Bissao, the favorite wives of the king are sacrificed on his death and burnt with his corpse.

The negroes of the Grain Coast are said to be jealous of strangers, and are little known. The Ivory Coast to Cape La Hou is also occupied by an unfriendly and warlike tribe, described as anthropophagi, whence the Portuguese give them the name of *malos gentes*. East of Cape La Hou are the *Quaquas*, or *boás gentes*, who, like the Hindoos, are divided into casts, the son always following the profession of the father.

The coast between the Volta and Benin is subject to the king of DAHOMEY, which see.

The negroes of Benin are nearly as barbarous as the Dahomeys. Their king, who can bring 100,000 fighting men to the field, is worshipped as a demi-god, is supposed to live without food, and, when he appears to die, is thought, like the Grand Lama, to revive under another human form. Here human victims are sacrificed to the

evil principle; and, in their feasts, the king and nobles dip their coral necklaces in the blood of the victims, and pray to the gods, that they may never be deprived of this mark of pre-eminence.

The tribes between Benin and Loango are little known. A second tribe of *Biagers* inhabit the banks of the Formosa, and are said to sacrifice their children to the devil. To them succeed the *Calbongas*, occupying the country through which run the Rio del Rey and San Benito: they are painted as the least civilised of the negro nations, going naked, and selling their children and relations as slaves.

The *Camma* and *Gobbi* succeed the Calbongas, and extend to Cape Lopez: they resemble their southern neighbours of Loango.

Under this vague and general denomination we have thus sketched the great features and general appearance of this coast. ASHANTEI, SIERRA LEONE, and other places of particular importance, will be treated of in their respective places of the alphabet.

For the progress of modern discovery in this neighbourhood, see the latter part of the article AFRICA.

GUINEA-DROPPER, *n. s.* Guinea and dropper. One who cheats by dropping guineas.

Who now the *guineadropper's* bait regards,
Tricked by the sharper's dice, or juggler's cards.

Gay.

GUINEA-HEN, *n. s.* A fowl, supposed to be of Guinea.

GUINEA-HEN. See NUMIDA.

GUINEA-PEPPER, *n. s.* Lat. *capsicum*. A plant.

GUINEA-PEPPER. See CAPSICUM.

GUINEA-PIG, *n. s.* A small animal with a pig's snout, brought, it is believed, from Africa.

GUINEA-PIG. See CAVIA.

GUINEA-WHEAT. See ZEA.

GUINEA-WORMS. See DRACUNCULI.

GUISE, *n. s.* The same with *wise*, Fr. *guise*; Sax. *pira*; the *p* or *w* being changed, as is common, into *g*. See GUILLE. Manner; external demeanor; practice; custom; fashion, either in conduct or attire.

And, as the *guise* was in his coun'tree,
Ful high upon a char of gold stood he.

Chaucer. *The Knights Tale*.

Yet had nature taught her after her *guise*
To know her foe, and dread him evermore.

Wyatt.

His own sire, and master of his *guise*.

Did often tremble at his horrid view. Spenser.

Lo you! here she comes: this is her very *guise*;
and, upon my life, fast asleep: observe her, stand close.

Shakspeare. *Macbeth*.

Thus women know, and thus they use the *guise*,
T' enchant the valiant and beguile the wise.

Fairfax.

I have drunke wine past my usuall *guise*;
Strong wine commands the foo'r, and moves the wise.

Chapman.

This would not be slept;

Old *guise* must be kept. Ben Jonson.

The pomp of kings they should confess

At their crownings to be less

Than a lover's humblest *guise*

When at his mistress' feet he lies.

Cowley.

They stand a horrid front
Of dreadful length, and dazzling arms, in *guise*
Of warriors old, with ordered spear and shield,
Awaiting what command their mighty chief
Had to impose. *Milton's Paradise Lost.*

Back, shepherds, back :
Here be without duck or nod,
Other trippings to be trod,
Of lighter toes and such court *guise*
As Mercury did first devise. *Milton.*

When I was very young, nothing was so much
talked of as rickets among children, and consumptions
among young people : after these the spleen came in
play, and then the scurvy, which was the general
complaint, and both were thought to appear in many
various *guises*. *Temple.*

The swain replied, it never was our *guise*
To slight the poor, or aught humane despise.

The Hugonots were engaged in a civil war, by the
specious pretences of some, who, under the *guise* of
religion, sacrificed so many thousands to their own
ambition. *Swift.*

Their external shapes are notoriously accommodated
to that law or *guise* of life that nature has designed
them. *Morc.*

Thus hid in arms she seemed a goodly knight,
And fit for any warlike exercise :
But when she list lay down her armour bright,
And back resume her peaceful maiden's *guise* ;
The fairest Maid she was that ever yet
Prisoned her locks within a golden net,
Or let them waving hang, with roses fair beset.

Fletcher's Purple Island.
And answered like a statesman, or a prophet,
In such *guise* that she could make nothing of it.

Byron.

GUISE (Henry), duke of. See LORRAIN.
GUITAR, *n. s.* Fr. *guitare* ; Ital. *ghitara*.
A stringed instrument of music.

And as wel could he play on a *gitterre*.
Chaucer. The Millers Tale.

allads and eggs, and lighter fare,
Tune the Italian spark's *guitar*. *Prior.*
And there are songs and quavers, roaring, hum-
ming,

Guitars, and every other sort of strumming. *Byron.*

GUITAR, a stringed instrument, in which the
strings are fastened to a bridge fixed to the lower
part of the belly, and supported by a nut at the
end of the neck. The strings are governed by
pegs or metal pins at the back of the neck. The
instrument had at first but four strings, which
have since been increased to five double strings,
of which the first three are tuned unisons, and
the fourth and fifth octaves to each other. Some-
times the fifth string has no octave lest it should
overpower the rest ; and the first string is so often
false that it is frequently played single. This in-
strument is tuned and played so many different
ways, that it must be strung according to the
pitch and tuning. There are two ways of per-
forming on this instrument, either by sweeping
or pinching the strings. The most extensive,
and the most susceptible of execution, is the
pinching of the strings. The arpeggios are more
harmonious, because all the strings are in vibra-
tion ; but they must be touched very lightly and
delicately with the right hand, and with firm-
ness, and correct position of the left hand, to
produce a good effect. The strings are pinched
or thrummed between the rose and the bridge ;

but the arpeggios ought to be made between the
rose and the last fret of the neck, that is, about
the middle of the strings, to avoid the harshness
resulting from the playing too near the bridge,
where the strings are more stubborn and unma-
nageable than towards the middle.

GULCH, *n. s.* ? From Lat. *gulo*.—Skinner.
GULCHIN, *n. s.* A little glutton.

GULDENSTÆDT (John Anthony), M. D.,
was born at Riga, April 26th, 1745, and in 1763
was admitted into the medical college of Ber-
lin. He completed his studies at Frankfort upon
the Oder, where, in 1767, he received his degree.
Being invited to Petersburg, in 1768, he was
created adjunct, and in 1770 member of the
Imperial Academy, and professor of natural his-
tory. In June, 1761, he set out upon his travels,
and was absent seven years. From Moscow,
where he continued till March 1769, he passed
to Voronetz, Tzaritzin, Astracan, and Killar, near
Persia. In 1770 he examined the districts
watered by the Terek, Suisha, and Alksai, in
the east extremity of Caucasus ; and in 1771
penetrated into Ossetia, in the highest part of
the same mountain ; where he collected vocabula-
ries of the languages spoken in those regions.
Having visited Cabarda, and the north of Cauca-
sus, he proceeded to Georgia, and was admitted
to prince Heraclius, who was encamped ten
miles from Tefflis, and whom he followed in
spring to Koketia, and explored the south dis-
tricts inhabited by the Turcoman Tartars in the
company of a Georgian magnate, whom he had
cured of a dangerous disorder. In July he
passed into Imeretia ; penetrated into the middle
chain of mount Caucasus, visited the confines of
Mingrelia, Middle Georgia, and Eastern and
Lower Imeretia ; and after escaping many immi-
nent dangers, returned to Kislar on the 18th of
November, where he passed the winter, collect-
ing various information concerning the neighbour-
ing Tartar tribes of Caucasus, particularly the
Lesgees. In the following summer he journeyed
to Cabardo Major, continued his course to
mount Beslton, the highest point of the first
ridge of the Caucasus, inspecting the mines of
Madshar, and went to Tcherkash upon the Don.
Thence he made expeditions to Azof and
Taganrog, and thence along the new limits to
the Dnieper ; he finished this year's route at Kre-
mentschuk, in New Russia. In the following
spring, he was proceeding to Crim Tartary ; but,
receiving an order of recal, he returned through
the Ukraine to Moscow and St. Petersburg,
where he arrived in March 1775. Upon his re-
turn he began to arrange his papers ; but, before
he could finish them for the press, was seized
with a violent fever, which carried him off in
March 1781. A list of his writings is given in
Coxe's Travels.

GULES, *adj.* Fr. *gucules*. Perhaps from *goulet*,
the throat. Red ; a barbarous term of heraldry.

Follow thy drum ;
With man's blood paint the ground : *gules, gules* ;
Religious canons, civil laws are cruel ;
Then what should war be ? *Shakspeare. Timon.*

He whose sable arms,
Black as his purpose, did the knight resemble,
When he laid couched in the ominous horse,

Hath now his dread and black complexion smeared
With heraldry more dismal; head to foot,
Now he is total *gules*. *Shakspeare.*

His seven-fold targe a field of *gules* did stain;
In which two words he bore: his word, 'Divide and
reign.' *Fletcher's Purple Island.*

GULE OF AUGUST, the day of St. Peter ad vincula, which is celebrated on the 1st of August. It is called the gule of August from gula, a throat, because one Quirinus, a tribune, having a daughter diseased in her throat, went to pope Alexander, the sixth from St. Peter, and desired of him to see the chains that St. Peter was chained with under Nero; which request being granted, she, on kissing the chains, was cured of her disease; whereupon the pope instituted this feast in honor of St. Peter. Hence the day was called also that of St. Peter ad vincula.

GULES, a corruption of the French word gueules, which in heraldry signifies red, is represented in engraving by perpendicular lines. See diagram. This color is by the generality of the English heralds ranked before azure. But the ci-devant French heralds preferred azure.

GULF, *n. s.* } Fr. *golfe*; Ital. *golfo*; Gr. *GULFY*, *adj.* } *κοιλος*; Goth. *gialfur*. A deep, concave, receptacle for water; a bay; an unfathomable abyss; a whirlpool or eddy; figuratively applied to any thing insatiable, as woe, or despair;—thus hell is termed a fiery gulf.

Thence turning back, in silence soft they stole,
And brought the heavy corse with easy pace
To yawning *gulf* of deep Avernus' hole.

The Venetian admiral withdrew himself farther off
from the island Corfu, into the *gulf* of the Adriatick.

I know thou'd'st rather
Follow thine enemy in a fiery *gulf*,
Than flatter him in a bower. *Shakspeare.*

Scull of dragon, tooth of wolf,
Witches mummy; maw and *gulf*
Of the ravening salt sea shark;
Root of hemlock, digged i' the dark. *Id.*

England his approaches makes as fierce
As waters to the sucking of a *gulf*. *Id.*

Rivers arise; whether thou be the son
Of utmost Tweed, or Ouse, or *gulfy* Don.

This is the *gulf* through which Virgil's Alecto shoots
herself into hell: the fall of waters, the woods that
encompass it, are all in the description. *Addison.*

The sea could not be much narrower than it is,
without a great loss to the world; and must we now
have an ocean of mere flats and shallows, to the utter
ruin of navigation, for fear our heads should turn
giddy at the imagination of gaping abysses and un-
fathomable *gulfs*? *Bentley.*

At their native realms the Greeks arrived,
All who the war of ten long years survived,
And scaped the perils of the *gulfy* main. *Pope.*
High o'er a *gulfy* sea the Pharian isle
Fronts the deep roar of disemboing Nile. *Id.*

What dreadful pleasure! there to stand sublime,
Like shipwrecked mariner on desert coast,
And view the enormous waste of vapour, tost
In billows, lengthening to the horizon round,
Now scooped in *gulfs*, with mountains now embosomed.

Beattie's Minstrel.

A **GULF**, in geography, is a capacious bay between two promontories, sometimes taking the name of a sea, when very extensive; but particularly when it only communicates with the sea by a strait. Such are the Euxine or Black Sea, called the gulf of Constantinople; the Adriatic Sea, or the gulf of Venice; the gulf of Lyons, near France, and the gulf of Sierra, near Barbary. All these are in the Mediterranean. There are the gulfs of Mexico, St. Lawrence, and California, in North America; the gulf of Persia, or the Red Sea, between Persia and Arabia; the gulf of Bengal in India; and the gulfs of Cochin-China and Kamtschatka, near those countries.

GULF STREAM. See FLORIDA, BAY OF.

GULL, *v. a.* & *n. s.* } Fr. *guiller*; Goth. *GULL-CATCHER*, *n. s.* } *gocla*, *guala*; Teut. *GULLER*, *n. s.* } *gillen*. To cheat; *GULLERY*, *n. s.* } trick, or deceive. Gull is the name of a sea-bird: a stupid animal; one easily cheated: guller, an impostor, or knave: gullery a cheat: gull-catcher, one who catches silly people.

Being fed by us you used us so,
As that ungente *gull*, the cuckow bird,
Useth the sparrow. *Shakspeare. Henry IV.*

Why have you suffered me to be imprisoned,
Kept in a dark house, visited by the priest,
And made the most notorious geck and *gull*
That e'er invention played on. *Id. Twelfth Night.*

I should think this a *gull*, but that the white-
bearded fellow speaks it.

Id. Much Ado about Nothing
If I do not *gull* him into a nay word, and make
him a common recreation, do not think I have wit
enough to lie straight in my bed.

Here comes my noble *gull-catcher*. *Id.*

Yet love these sorceries did remove, and move
Thee to *gull* thine own mother for my love.

That paltry story is untrue,
And forged to cheat such *gulls* as you.

He would have *gulled* him with a trick,
But Mart was too too politick. *Id.*

For this advantage age from youth has won,
As not to be out-riden, though out-run;
By fortune he was now to Venus trined,
And with stern Mars in Capricorn was joined:
Of him disposing in his own abode,
He soothed the goddess, while he *gulled* the god.

The Roman people were grossly *gulled* twice or
thrice over, and as often enslaved in one century, and
under the same pretence of reformation. *Id.*

By their designing leaders taught,
The vulgar, *gulled* into rebellion, armed. *Id.*
They are not to be *gulled* twice with the same trick.

Either they have these excellencies they are praised
for, or they have not; if they have not, 'tis an appar-
ent cheat and *gull*. *Government of the Tongue.*

The eagle soars alone: the *gull* and crow
Flock o'er their carrion, just as mortals do. *Byron.*

GULL, in ornithology. See LARUS.

GULLET, *n. s.* } Fr. *goulet*; Lat. *gula*;
GULOSITY, *n. s.* } Dut. *golfen*. The passage
GULP, *v. a.* & *n. s.* } through which the food
passes, called by anatomists oesophagus: a small
stream, or lake. Gulosity is greediness, or

gintony: gulp, to swallow eagerly, or suck down without intermission.

Out of the hardy bones, knocken they
The moary; for they causten nought away
That may go through the *gullet* soft and sote.

Chaucer. The Pardoner's Tale.

England his approaches makes as fierce
As waters to the sucking of a *gulf*. *Shakspeare.*

The Euxine sea and the Mediterranean, small *gul-*
lets, if compared with the ocean. *Heylyn.*

It might be his doom

One day to sing

With *gullet* in string.

Denham.

Many have the *gullet* or feeding channel which have
no lungs or windpipes; as fishes which have gills,
whereby the heart is refrigerated; for such thereof as
have lungs and respiration are not without wizzon, as
whales and cetaceous animals.

Browne's Vulgar Errors.

As oft as he can catch a *gulp* of air,
And peep above the seas, he names the fair.

Dryden.

He loosens the fish, *gulps* it down, and as soon as
ever the morsel was gone wipes his mouth.

L'Estrange.

I see the double flaggon charge their hand;
See them puff off the froth, and *gulp* amain,
While with dry tongue I lick my lips in vain.

Gay.

The liquor in the stomach is a compound of that
which is separated from its inward coat, the spittle
which is swallowed, and the liquor which distils from
the *gullet*. *Arbuthnot.*

In deep suspirations we take more large *gulps* of
air to cool our heart, overcharged with love and sor-
row. *More.*

'Give me the oyster, then—'tis well—'

He opens it, and at one sup,

Gulps the contested trifle up,

And smiling gives to each a shell.

Somerville.

To *GULLY*, *v. n.* Corrupted from gurgle. To
run with noise.

GULLYHOLE, *n. s.* From gully and hole. The
hole where the gutters empty themselves in the
subterraneous sewer.

GUM, *n. s.* & *v. a.* Lat. *gummi*; Gr. *κομμη*.

GUMMINESS, *n. s.* } A vegetable substance,

GUMMOSITY, *n. s.* } differing from a resin,

GUMMOS, *adj.* } in being more viscid

GUMMY, *adj.* } and less friable, and generally

dissolving in aqueous menstrua.—
Quincy. Sax. *Eoma*; Dut. *gumme*. The fleshy
covering that invests and contains the teeth. To
close or smear with gum: gummy and gummous
are applied to whatsoever consists, is productive
of, or overgrown with, gum.

That for to speken of *gomme*, herbe or tre,

Comparison may none inaked be.

Chaucer. Prologue to Legend of Good Women.

The babe that milks me,

I'd pluck my nipple from his boneless gums.

Shakspeare.

One whose eyes,

Albeit unused to the melting mood,

Drop tears as fast as the Arabian trees

Their medicinal *gum*.

Id. Othello.

From the utmost end of the head branches there
issueth out a *gummy* juice, which hangeth downward
like a cord. *Raleigh.*

He ripens spices, fruit, and precious *gum*,

Which from remotest regions hither come. *Wallar.*

The clouds

Tine the slant lightening; whose thwart flame driven
down,

Kindles the *gummy* bark of fir and pine. *Milton.*

Nor all the *gummy* stores Arabia yields.

Dryden.

How each arising alder now appears,

And o'er the Po distils her *gummy* tears. *Id.*

The yawning youth, scarce half awake, essays

His lazy limbs and dozy head to raise;

Then rubs his *gummy* eyes, and scrubs his pate. *Id.*

Her maiden train,

Who bore the vests that holy rites require,

Incense, and odorous *gums*, and covered fire. *Id.*

Observations concerning English amber, and rela-
tions about the amber of Prussia, prove that amber is
not a *gummos* or resinous substance drawn out of
trees by the sun's heat, but a natural fossil.

Woodward.

Sugar and honey make windy liquors, and the elas-
tick fermenting particles are detained by their innate
gummosity. *Floyer.*

The tendons are involved with great *gumminess* and
collection of matter. *Wiseman's Surgery.*

The eyelids are apt to be *gummed* together with a
viscous humour. *Id.*

She untwists a wire, and from her *gums*

A set of teeth completely comes.

Flowers whose wild odours breathe but agonies,

And trees whose *gums* are poison.

Byron.

GUM is the mucilage of vegetables, and is of
no particular smell or taste. It becomes viscous
and tenacious when moistened with water; totally
dissolves in water into a liquid, more or less
glutinous in proportion to the quantity of the
gum; not dissolving in vinous spirits or in oils;
burning in the fire to a black coal, without melt-
ing or catching flame; suffering no dissipation
in the heat of boiling water. The true gums are
gum arabic, gum tragacanth, gum senega, the
gum of cherry and plum trees, and such like.
All others have more or less of resin in them.
See CHEMISTRY. For more particular descrip-
tions of the gums, and also of the gum-resins,
see CHEMISTRY, Index.

GUM ELASTIC is treated of under the title of
CAOUTCHOUC both in the article CHEMISTRY and
in its alphabetical place. GUAIACUM is also
separately noticed in the body of the work.

GUM, in gardening, a kind of gangrene inci-
dent to fruit-trees of the stone kind, arising from
a corruption of the sap, which, by its viscosity,
not being able to make its way through the fibres
of the tree, is, by the protrusion of other juice,
made to extravasate and ooze out upon the bark.
When the distemper surrounds the branch, it
admits of no remedy; but when only on one
part of a bough, it should be taken off to the
quick, and some cow dung clapped on the wound,
covered over with a linen cloth, and tied down.
M. Quintinie directs to cut off the morbid branch
two or three inches below the part affected.

GUM ARABIC is the produce of a species of
Mimosa. Its chief use in medicine is from its
glutinous quality, which serves to incrassate and
obtain thin acrid humors, and thus is useful
in coughs, alvine fluxes, hoarsenesses, gripes,
&c. In a dysuria the true gum arabic is more
cooling than the other simple gums. One ounce
of gum arabic renders a pint of water consi-
derably glutinous: four ounces give it a thick

syrupe consistence: but for mucilage, one part gum to two parts water is required; and for some purposes an equal proportion will be necessary. Hasselquist relates an instance of the extraordinary nutritive virtues of this gum, which happened to an Abyssinian caravan, whose provisions were consumed, when they had still two months to travel. 'They were then obliged to search for something among their merchandise wherewith they might support nature; and found nothing more proper than gum arabic, of which they had carried a considerable quantity along with them. This served to support above 1000 persons for two months; and the caravan at last arrived at Cairo without any great loss of people either by hunger or diseases.'

GUMMA, a sort of venereal excrescence on the periosteum of the bones.

GUMBINNEN, a modern government of East Prussia, comprising Prussian Lithuania, and bounded by Russia, the kingdom of Poland, and the government of Königsberg. Its superficial extent is 6150 square miles, with 350,000 inhabitants, of whom the majority are Lutherans; next to them are the Calvinists; and last the Catholics. Prussian Lithuania is the most fertile part of East Prussia; but manufactures are nearly unknown. In 1710 it was almost depopulated by the plague; and two years after the king of Prussia admitted into the country several thousand emigrants from Switzerland, France, the Palatinate, and Franconia. In 1731, and 1734, more than 20,000 Saltzburghers came hither. These settlers cleared the superfluous woods, drained the marshes, and cultivated the land with much success. The native Lithuanians are now but few in number. During the seven years' war this province suffered severely from the Russians, but the government granted funds for its relief. Prussian Lithuania was formerly divided into the circles of Insterburg, Oletzko, and Schestien. Since the erection of the government of Gumbinnen, smaller divisions have been adopted; it contains nine circles, viz. Gumbinnen, Oletzko, Johannisburg, Memel, Stallupönen, Tilsit, Niederungen, Angerburg, and Rhein.

GUMBINNEN, a town of East Prussia, on the Pissa, and the chief place of the new government above described. It is regularly and neatly built; the chief object of commerce is corn, though the manufactures of woollen, linen, and leather, are not inconsiderable: it is exposed to hazard from land floods. The inhabitants are chiefly protestants, and service is performed both in the German and Lithuanian languages. Population 5300. Sixty-five miles east of Königsberg.

GUMS, in anatomy, the hard fleshy substance in either jaw, through which the teeth spring from the jaw-bone. See **ANATOMY**. The gums are apt to become spongy, and to separate from the teeth; but the cause is often a stony kind of crust, formed therein, which, when separated, the gums soon return to their former state, especially if rubbed with a mixture of the infusion of roses four parts, and the tincture of myrrh one. The scurvy is another disorder which sometimes affects the gums, when not manifest in any other part.

GUN, *n. s.*

GUN'NEL, *n. s.*

GUN'NER, *n. s.*

GUN'NERY, *n. s.*

GUN'-POWDER, *n. s.*

GUN'-SHOT, *n. s. & adj.*

GUN'-SMITH, *n. s.*

GUN'-STICK, *n. s.*

GUN'-STOCK, *n. s.*

GUN'-STONE, *n. s.*

GUN'-WALE, *n. s.*

Of this word there is no satisfactory etymology, Dr. Johnson says. Mr. Lye observes, that gun in Iceland signifies battle; but when guns came into use we had no commerce with Iceland. 'May not gun come by gradual corruption from *canne*, *ganne*, *gunne*? *Canne* is the original of cannon.' Mr. Thomson refers to the Scot. *gyn*, or *gin* (engine). The general name for fire-arms; the instrument from which shot is discharged by fire. *Gunnel*, corrupted from *gun-wale*. *Gunner* (cannonier) he whose employment is to manage the artillery in a ship. *Gunnery*, the science of artillery; the art of managing cannon. *Gun-powder*, the powder put into guns to be fired. It consists of about fifteen parts of nitre, three parts of sulphur, and two of charcoal: the proportions are not exactly kept. *Gun-shot*, made by the shot of a gun: the reach or range of a gun; the space to which a shot can be thrown. *Gun-smith*, a man whose trade is to make guns. *Gun-stick*, the rammer, or stick, with which the charge is driven into a gun. *Gunstock*, the wood to which the barrel of the gun is fixed. *Gun-stone*, the shot of cannon. They used formerly to shoot stones from artillery. *Gun-wale*, or *gunnel*, of a ship, that piece of timber which reaches on either side of the ship from the half-deck to the fore-castle, being the uppermost bend which finishes the upper works of the hull in that part, and wherein they put the stanchions which support the waste tree; this is called the *gun-wale*, whether there be guns in the ship or not; also the lower part of any port, where ordnance are, is termed the *gun-wale*.—Harris.

The knyght with his meyne went to se the wall.
And the wards of the town as to a knyght befall;
Devising, en tentifflick, the streghes al about;
And appointed to his sone the perel and the dout
For shot of arblost and of bowe, and eke for shot of
gonne

Unto the wardes of the town, and how it might be
wonne. *Chaucer. The Pardoner and Tapstere.*

And eke within the castel were;
Springoldes, *gonnes*, bowes, and archers.

Id. Romaunt of the Rose.

With grisly sounc, out goeth the grete *gonne*.

Id. Legend of Good Women.

The emperor, smiling, said that never emperor was
yet slain with a *gun*. *Knolles's History.*

Tell the pleasant prince, this mock of his
Hath turned his ball to *gunstones*, and his soul
Shall stand sorecharged for the wasteful vengeance
That shall fly with them. *Shakspeare. Henry V.*

The nimble *gunner*

With lynstock now the devilish cannon touches,
And down goes all before him. *Id.*

These dread curses, like the sun 'gainst glass,
Or like an overcharged *gun*, recoil
And turn upon thyself. *Id. Henry VI.*

They slew the principal *gunners*, and carried away
their artillery. *Henry VIII.*

Such as do build their faith upon

The holy text of pike and *gun*.

Decide all controversies by

Infallible artillery.

Hudibras.

Gun-powder consisteth of three ingredients, saltpetre, small-coal, and brimstone.

Broune's Vulgar Errors.

Those who are come over to the royal party are supposed to be out of *gun-shot*.
Dryden.

It is of particular esteem with the *gun-smiths* for stocks.
Mortimer.

The timber is used for bows, pullies, screws, mills, and *gun-stocks*.
Id. Husbandry.

Burning by *gun-powder* frequently happens at sea.

Wiseman.

The symptoms I have translated to *gun-shot* wounds.

Id.

Even a *gun-stick* flying into fame.

Stuart.

For health and idleness to passion's flame

Are soil and *gun-powder*; and some good lessons

Are also learnt from Ceres and from Bacchus

Without whom Venus will not long attack us. *Byron.*

A *GUN* is a weapon of offence, which forcibly discharges a ball, or other hard and solid matter, through a cylindric tube, by means of inflamed gun-powder. See *GUNPOWDER*. The word gun now includes most species of fire-arms; pistols and mortars being almost the only ones excepted from this denomination. They are divided into great and small guns: the former including all that we also call *CANNON*, *ORDNANCE*, or *ARTILLERY*; the latter including *MUSKETS*, *CARABINES*, *MUSQUETOONS*, *BLUNDERBUSSSES*, *FOWLING-PIECES*, &c. See these articles, particularly *ARTILLERY* and *ORDNANCE*.

GÜNDELIA, in botany, a genus of the polygama segregata order, and syngenesia class of plants; natural order forty-ninth, composite: cal. none: florets tubular and hermaphrodite: the receptacle bristly, with scarcely any pappus. Species one only; an American plant.

GUNDWANAH, or *GOANDWANAH*, an extensive province of Hindostan, stretching from 19° to 25° of N. lat. On the north it is bounded by Allahabad and Bahar, and on the south by Orissa and the river Godavery. To the east it has parts of Orissa, Bengal, and Bahar, and to the west Malwah, Berar, and Allahabad. Its length may be estimated at 400 miles, by about 130 in breadth. It is divided into four districts, Gurrah-Mundela, Choteesgur, Nagpore, and Chandah. Its principal towns are Nagpore, Gurrah, Ruttunpore, Deogur, Ryepore, Sumbulpore, and Bustar. The greater part of the province is mountainous, woody, poor and unhealthy, but it possesses diamond mines. The more fertile portions belong to the Nagpore Maharrattas, the remainder to various chiefs of the Goonds, who, although professing the Hindoo religion, eat animal food, and are in a very uncivilised state. The Maharrattas exact from them a moderate tribute. A considerable portion of it is now included in Malwah.

A *GUNNER* is an officer appointed to fire the guns, either by sea or land. In the Tower of London, and other garrisons, as well as in the field, this officer carries a field staff, and a large powder-horn in a string over his left shoulder. He marches by the guns; and, when there is any apprehension of danger, his field-staff is armed with a match. His business is to lay the gun, to pass, and to help to load and traverse her.

GÜNNERA, in botany, a genus of the diandria order, and gynandria class of plants. The

amentum consists of uniflorous scales; there is neither calyx nor corolla; the germen is bidentate, with two styles and one seed. Species three: one a native of the Cape, the other two from South America.

GUNNERY is the art of charging, directing, and exploding fire-arms, as cannons, mortars, muskets, &c., to the best advantage. This art depends greatly on having the guns and shot of a proper size and figure, and well adapted to each other. See *ORDNANCE*. As both the theory and practice of gunnery are intimately connected with the subject of *PROJECTILES*, we shall refer the reader to that article: under which not only the practical part of gunnery, but whatever relates to the action of gun-powder, the velocity it communicates to bullets, the resistance which the atmosphere opposes to their motion, and the curves they describe, will be fully treated of.

GUNPOWDER is a composition of saltpetre, sulphur, and charcoal, mixed together, and usually granulated; which easily takes fire, and when fired, expands with great vehemence, by its elastic force. To this powder we owe all the action and effect of guns, ordnance, &c., so that the modern military art in a great measure depends on it.

The invention of gun-powder is usually ascribed to one Bartholdus Schwartz, a German monk, who discovered it about the year 1320; it is said to have been first used in war by the Venetians against the Genoese in the year 1380. Thevel says its inventor was one Constantine Anelzen, a monk of Friburg. Peter Mexia says it was first used by Alphonsus XI., king of Castile, in the year 1242. Ducange adds, that there is mention made of this powder in the registers of the chambers of accounts of France, so early as the year 1338; and our countryman friar Bacon expressly mentions the composition in his treatise *De Nullitate Magie*, published at Oxford in the year 1216. Some indeed are of opinion, that the Arabians or the latter Greeks were the first inventors of gun-powder about the middle ages of our era; because its Arabic name is said to be expressive of its explosive quality. Considerable improvements have lately been made in the composition of gun-powder by the Chinese.

The method of making gun-powder recommended by colonel James is:—take saltpetre, sulphur, and charcoal; reduce these to a fine powder, and continue to beat them for some time in a stone mortar with a wooden pestle, wetting the mixture occasionally with water, so as to form the whole into a uniform paste, which is afterwards reduced to grains, by passing it through a sieve; and in this form, being carefully dried, it becomes the common gun-powder. For greater quantities mills are used, by means of which more work may be performed in one day than a man can do in 100.

This destructive powder is composed of seventy-five parts nitre, nine sulphur, and sixteen of charcoal in the 100.

To refine the saltpetre.—Put into a copper, or any other vessel, 100 cwt. of rough nitre, with about fourteen gallons of clean water, and let it boil gently for half an hour, and as it boils take

off the scum; then stir it about in the copper, and before it settles, put it into your filtering bags, which must be hung on a rack, with glazed earthen pans under them, in which sticks must be laid across for the crystals to adhere to: it must stand in the pans for two or three days to shoot: then take out the crystals and let them dry. The water that remains in the pans must be boiled again for an hour, and strained into the pans as before, and the saltpetre will be quite clear and transparent; if not, it wants more refining; to effect which, proceed as usual, till it is well cleansed of all its earthy parts.

To pulverise the saltpetre, take a copper kettle whose bottom must be spherical, and put into it fourteen pounds of refined saltpetre, with two quarts or five pints of clean water; then put the kettle on a slow fire: and when the saltpetre is dissolved, if any impurities arise, skim them off; and keep constantly stirring it with two large spatulas till all the water exhales; and when done enough it will appear like white sand, and as fine as flour; but, if it should boil too fast, take the kettle off the fire, and set it on some wet sand, by which means the nitre will be prevented from sticking to the kettle. When you have pulverised a quantity of saltpetre, be careful to keep it in a dry place.

As we have not noticed the method of making charcoal in quantities, under that head, we may here subjoin a few remarks on that important constituent of gunpowder. Common charcoal contains only sixty-four parts of diamond, or pure carbon, and thirty-six of oxygen in every 100. The charcoal of commerce is usually prepared from young wood, which is piled up near the place where it is cut, in conical heaps covered with earth, and burnt with the least possible access of air. When the fire is supposed to have penetrated to the centre of the thickest pieces, it is extinguished by entirely closing the vents. When charcoal is wanted very pure, the product of this mode of preparing it will not suffice; for the manufactory of the best gunpowder, it is distilled in iron cylinders; chemists prepare it in small quantities, in a crucible covered with sand, and, after they have thus prepared it, they pound it, and wash away the salts it contains by muriatic acid; the acid is removed by the plentiful use of water, and afterwards the charcoal is exposed to a low red heat. Pure charcoal is perfectly tasteless, and insoluble in water.

Mr. Marshall furnishes us with a very minute account of the manufacture of charcoal. The wood having been selected, and the site or hearth being determined upon, the turf is pared off, and the sods laid on one side. The wood, about ten cords, is then laid in a ring, somewhat wider than the intended hearth; beginning on the outer circumference of the ring, with the smallest of the round wood: laying the larger pieces of top wood, and the cloven roots or but-ends, towards the hearth.

With these last, some of them nearly as large as bushel blocks, they begin to make their pile; leaving a sort of chimney in the middle (a vertical aperture from a foot to eighteen inches wide); and, round this core of blocks, set up the

top wood, which has previously been cut at the time of cording, in a smooth and equable manner joining the pieces, or rather fitting them in, as close to each other as possible: placing the convex side of the logs outward; and thus forming the pile in the shape of an inverted bowl, nearly semi-globular. The pile being formed, it is tiled with sods; which are pointed, to keep in the heat the better, by filling up the seams with fine pulverised mould.

The chimney is now filled with short pieces of dry wood: near the top a live coal is put; over this one layer more of dry pieces; and, upon these, a close cap of seed is placed; nevertheless, this one coal, not larger than the first, and excluded from the open air, is sufficient to set the pile on fire. As the pieces in the chimney burn away, they are replaced with fresh ones: thus feeding the fire with fresh fuel. Close-paled hurdles are placed on the windward side of the heap, to prevent the fire from acting partially.

When the fire begins to show itself at the outward skirts of the bottom of the pile, it is known that the coal is fully burnt (or rather that the wood is sufficiently charred), which it will be, in a pile of ten cords, and in dry weather, in seven or eight days. The fire, during the whole time, is carefully kept from breaking out, by throwing mould or ashes upon the weak parts; so that, though the fire passes through every part of the wood, little or none of the matter of fire escapes.

It is a curious fact, that, notwithstanding the intense heat, no part of the tree is entirely consumed; for it is found that even the moss comes out as entire as when it went in; the only apparent change is in its being rendered friable, and of a black color. Wood that is charred shrinks considerably during the process of charring; but there is no visible derangement of parts. One of the smaller pieces, which is not broken in the drawing, appears as entire when it comes out, as when it went into the pile. The brittleness after charring, however, shows that the texture of the wood is altered, by the action of the fire.

As soon as the fire disappears, on the outside of the heap, the workmen begin to 'draw the coal:' an operation which is done by running a peel between the coal and the hearth; raising up the coal in such a manner as to let the mould and ashes of the sods fall through between the pieces upon the more inward parts still full of fire. If this make its appearance in any particular spot, a peel full of ashes is immediately thrown against it.

Having got sufficiently near to the fire, the coals raised by the peel are raked off, with long-toothed iron rakes: the teeth about a foot long, and standing about six inches apart: the handle and head of wood, except a plate of iron on the back, with which the small coal is gathered together. No sieve, nor any rake with finer teeth than the above, is used. The coal being light is readily brought to the surface of the ashes and dirt; and, when there, is easily collected (though with a kind of slight) with the back of the rake. The side thus drawn, being rounded up and se-

cured with ashes, another, the coolest part, is drawn in the same manner, till the whole packet is taken from the kiln.

Charcoal newly prepared, absorbs moisture with avidity; it also absorbs oxygen and other gases, which are condensed in its pores in quantity many times exceeding its own bulk, and are given out unaltered. Fresh charcoal allowed to cool without exposure to air, and the gas then admitted, will absorb in the following proportion: one part of charcoal will absorb 2.25 times its bulk of atmospheric air immediately, and 75 more in four or five hours; of oxygen gas about 1.8 immediately, and slowly 1 more; of nitrogen gas 1.65 immediately; of nitric oxide 8.5 very slowly; of hydrogen gas about 1.9 immediately; carbonic acid gas 14.3 immediately. The greater part of these gases are expelled by a heat below 212° , and a portion even by immersing the charcoal in water. These absorptions are promoted by a low temperature; but, at an elevated temperature, charcoal has such an affinity for oxygen, that it will abstract it from almost all its combinations. Hence its utility in reviving metals. Fossil coal, and all kinds of bitumen, contain a large quantity of carbon: it is also contained in oils, resins, sugar, and animal substances.

Charcoal is one of the most unchangeable substances; if the access of air be prevented, the most intense heats have no other effect than that just mentioned of hardening it, and rendering its color a deeper black. Insoluble in water, and incapable of putrefaction, it undergoes no change by mere exposure or age; and stakes and other materials of wood which have been charred, or superficially converted into charcoal, have been preserved from decay for thousands of years; the ancients availed themselves of this mode of preparing stakes which were to be driven into the ground for foundations and other purposes.

Gun-powder, says major James, for some time after the invention of artillery, was of a composition much weaker than what we now use, or that ancient one mentioned by Marcus Græcus: but this, it is presumed, was owing to the weakness of their first pieces, rather than to their ignorance of a better mixture; for the first pieces of artillery were of a very clumsy, inconvenient make, being usually framed of several pieces of iron bars, fitted together lengthways, and then hooped together with iron rings; and as they were first employed in throwing stone shot of a prodigious weight, in imitation of the ancient machines, to which they succeeded, they were of an enormous bore. When Mahomet II. besieged Constantinople, in the year 1453, he battered the walls with stone bullets, and his pieces were some of them of the caliber of 1200lb. but they could not be fired more than four times in the twenty-four hours, and sometimes they burst by the first discharge. And Guicciardin, in the first book of his history, informs us, that so large a portion of time between the different chargings and dischargings of one of those pieces, that the besieged had sufficient time to repair at their leisure the breaches made in their walls by the shock of such enormous stones. But as mathematical knowledge increased in Europe, that of

mechanics gradually advanced, and enabled artists, by making brass cannon of a much smaller bore for iron bullets, and a much greater charge of strong powder in proportion to their calibres, to produce a very material and important change in the construction and fabric of those original pieces. Accordingly this historian, in the same book of his history, informs us, that about 114 years after the first use made of those unwieldy pieces by the Venetians, in the war which they carried on against the Genoese in the year 1380, the French were able to procure for the invasion of Italy a great number of brass cannon mounted on carriages drawn by horses; and that these pieces could always keep pace with the army.

Gun-powder was not at first grained, but in the form of fine meal, such as it was reduced to by grinding the materials together; and it is doubtful whether the first graining of it was intended to increase its strength, or only to render it more convenient for the filling it into small charges, and the loading of small arms, to which alone it was applied for many years, whilst meal powder was still made use of in cannon. But at last the additional strength, which the grained powder was found to acquire from the free passage of the fire between the grains, occasioned the meal-powder to be entirely laid aside. The coal for making gun-powder is either that of willow or hazle; but the lightest kind of willow is found to be the best, well charred in the usual manner, and reduced to powder. Corned powder was in use in Germany as early as the year 1568; but it was first generally used in England in the reign of Charles I.

It has been recommended by a French writer to preserve gun-powder at sea by means of boxes which should be lined with sheets of lead. M. De Gentien, a naval officer, tried the experiment by lodging a quantity of gun-powder, and parchment cartridges, in a quarter of the ship which was sheathed in this manner. After they had been stowed for a considerable time the gun-powder and cartridges were found to have suffered little from the moisture; whilst the same quantity, when lodged in wooden cases, became nearly half rotted.

The proof of gun-powder, by the board of ordnance, is thus effected:—They first take out of the several barrels of gun-powder a measure full, of about the size of a thimble, which is spread upon a sheet of fine writing paper, and then fired: if the inflammation be very rapid, the smoke rises perpendicular, and if the paper be neither burnt nor spotted, it is then judged to be good powder. Then two drams of the same powder are exactly weighed, and put into an eprouvette; which, if it raises a weight of 24lbs. to the height of three inches and a half, is received into the king's magazine as proof.

Several instruments have been invented to try the strength of gun-powder; but they have generally been complained of as inaccurate. Count Rumford, in the *Philosophical Trans.* vol. 71. gives an account of a method of trying the strength of it, to which the reader can also refer; but the simple method of the board of ordnance seems to answer every purpose. The following are stated to be the proportions of the different

ingredients for making gunpowder, by different powers in Europe :—

	England.	France.	Sweden.	Poland.	Italy.	Russia.
	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.
Saltpetre .	75	75	75	80	76	70
Sulphur . .	10	9½	9	8	12	11½
Charcoal .	15	15½	16	12	12	18½
Pounds .	100	100	100	100	100	100

GUNPOWDER, in law. By stat. 12, Car. II. c. 4. the exportation of gunpowder was allowed if the price did not exceed £5 per barrel.—By 59 Geo. III. c. 73, this restriction as to price is repealed : but power is reserved to the crown to prohibit the exportation at any time.—And see as to Ireland, stat. 49 Geo. III. c. 76.

To obtain an exclusive patent for the sole making or importation of gunpowder or arms, or to hinder others from importing them, incurs the penalties of præmunire by stat. 16 Car. I. c. 21. 1. Jac. II. c. 8. See stat. 46 Geo. III. c. 121. By 12 Geo. III., c. 61, all former acts relative to the making, keeping, and carrying, of gunpowder, are repealed; and by this act it is provided, that no person shall make gunpowder but in the regular manufactories, established at the time of making the statute, or licensed by the sessions pursuant to the provisions in sect. 13, &c., on forfeiture of the gunpowder, and 2s. per pound.

The chief provisions are as follow :—Pestle-mills not to be used, on the like penalty. Only 40lbs. of powder to be made at one time under one pair of stones; except Battle-powder, a fine fowling powder so called, made at Battle and elsewhere in Sussex. Not more than 40 cwt. to be dried at one time in one stove. Only the quantity absolutely necessary for immediate use to be kept in or near the place of making, except in brick or stone magazines, fifty yards at least from the mill. All gunpowder-makers to have a brick or stone magazine near the Thames below Blackwall, to keep the gunpowder when made, on penalty of £25 per month; and £5 a day for not removing it when made, with all possible diligence. No dealer is to keep more than 200lbs. of powder, nor any person not a dealer more than 50lbs., in the cities of London and Westminster, or within three miles thereof; or within two miles of the king's palaces or magazines, or half a mile of any parish church; on pain of forfeiture and 2s. per pound; except in licensed mills; or to the amount of 300lbs. for the use of collieries within 200 yards of them. Not more than twenty-five barrels to be carried in any land carriage, nor more than 200 barrels by water (unless going beyond sea or coastwise); each barrel to contain not more than 100lbs. Various means are directed for the safe conveyance in both cases, and to prevent all danger and delay, sect. 18—22. Outward-bound ships to take in, and homeward-bound to discharge

their gunpowder at or below Blackwall; and be searched by the officers of the Trinity-house. General exceptions are made as to his majesty's mills, storehouses, and magazines; and as to powder sent with the army or militia; and exported or carried coast-wise below Blackwall.

Erecting powder-mills, or keeping magazines near a town, is a nuisance at common-law, punishable by indictment or information; but by 46 Geo. III., c. 121, the importation into Great Britain of gunpowder, arms, &c., manufactured in Ireland, is permitted, notwithstanding the stat. 1 Jac. II. c. 8.

GUNTER (Edmund), M. A. and B. D., a celebrated mathematician, born in Hertfordshire in 1581. He studied at Westminster and Oxford, where he graduated in 1606 and 1615. Being eminent for his knowledge in the mathematics, he was, in 1613, chosen professor of astronomy in Gresham College, where he distinguished himself by his lectures and writings. He invented several useful instruments which bear his name; and published Canon Triangulorum, and a work on the Sector, Cross-staff, &c. He died at Gresham College, in 1626.

GUNTER'S QUADRANT. See QUADRANT.

GUNTER'S SCALE, called by navigators simply the gunter, is a large plain scale, generally two feet long, and about an inch and a half broad, with artificial lines delineated on it, of great use in solving questions in trigonometry, navigation, &c.

GUNTOOR, a district of Hindostan, on the western side of the bay of Bengal, called the Northern Circars. It is also called Moortiznagur, and lies immediately north of the Carnatic, and south of the river Kistnah. This district was the Jagier of Bassalut Jung, the brother of the nizam, when the British took possession of the other Circars in 1766, on which account he was allowed to retain it during his life. He died in 1782, but the nizam did not give it over for more than six years. It is about forty miles in length, but a low flat country, calculated for growing rice. Its principal sea-port is Mootapilly, and its chief towns are Condavir and Guntoor. Under the present system of management, it has been united to Palnaud, and is governed by a British judge, collector, &c.

GUNTOOR, the capital of the above district, and station of the civil establishment, possesses a small fort. Long. 80° 30' E., lat. 16° 20' N.

GURGE, *n. s.* Lat. *gurgies*. Whirlpool; gulf.

Marching from Eden he shall find
The plain wherein a black bituminous *gurge*
Boils out from under ground.

Milton's Paradise Lost.

GURGION, *n. s.* The coarser part of the meal, sifted from the bran.

GURGLE, *v. n.* Ital. *gorgoliare*. See GUGGLE. To fall or gush with noise, as water from a bottle.

Then when a fountain's *gurgling* waters play,
They rush to land, and end in feasts the day. *Pope.*
Pure *gurgling* rills the lonely desert trace,
And waste their musick on the savage race. *Young.*

GURNARD, *n. s.* } Fr. *gournal*. A kind
GURNIT. } of sea-fish.

If I be not ashamed of my soldiers I am a sowced garnet: I have misused the king's press damnably.

Shakespeare. Henry IV.

GURRUMCONDAH, a district of Hindostan, in the Carnatic, situated between the thirteenth and fourteenth degrees of northern latitude, and seventy-eighth and seventy-ninth of eastern longitude. It is mountainous, and was some years ago ceded by the nizams to the British. It is included in the collectorship of Cuddapah. Gurrumcondah, the capital, is defended by a strong-built fort, but has been often taken and retaken by the Mahrattas, the Mysoreans, and the Nizams. By the latter it was ceded to the British in the year 1800.

GUSH, *v. n. & n. s.* Dutch, *gostelen*; Gothic, *gysa*, to pour forth. To flow, or rush, with violence; an emission of fluid in a large quantity on a sudden.

A sea of water gushed from the gaping wound,
That her gay garments stained with filthy gore.

Spenser.

If a lung-vein be bursted, generally at the first cough a great gush of blood is coughed up.

Harvey.

The gaping wound gushed out a crimson flood.

Dryden.

The covering of this abyss was broken asunder, and the water gushed out that made the deluge.

Burnet.

Incessant streams of thin magnetic rays

Gush from their fountains with impetuous force,

In either pole, then take an adverse course.

Blackmore.

Line after line my gushing eyes o'erflow,

Led through a sad variety of woe.

Pope.

On either hand the gushing waters play,

And down the rough cascade white dashing fall.

Thomson.

There's music in the sighing of a reed;

There's music in the gushing of a rill.

Byron.

In a gushing stream

The tears rushed forth from her unclouded brain,

Like mountain mists at length dissolved in rain.

Id.

GUSSET, *n. s.* Fr. *gousset*. Any thing sewed on to cloth in order to strengthen it.

GUST, *n. s.*

Fr. *goust*; Ital. *gusto*;

GUSTABLE, *adj.* Isl. *guster*; Lat. *gustus*.

GUSTATION, *adj.* Sense of taste; height of

GUSTFUL, *adj.* sensual enjoyment; turn of

GUSTO, *n. s.* fancy; a violent blast of

GUSTY, *adj.* wind,—written by Spenser

for jousts and tournaments. Gustable and gus-

tation signify the quality of taste, or act of

tasting. Gusto a relish; gusty weather, is stormy;

tempestuous.

For jolly knight he seemed, and fair did sit,

As one for knightly gusts and fierce encounters fit.

Spenser.

She led calm Henry, though he were a king,

As doth a sail, filled with a fretting gust,

Command an argosie to stem the waves.

Shakespeare.

You may as well forbid the mountain pines

To wag their high tops, and to make a noise,

When the are fretted with the gusts of heaven.

Id.

To kill, I grant, is sin's extreme gust;

But, in defence, by mercy 'tis made just.

Id.

Once upon a raw and gusty day,

The troubled Tyber chafing with his shores.

Id. Julius Caesar.

Presently come forth swarms and volleys of libels,
which are the gusts of liberty of speech restrained.

Bacon's Henry VII.

This position informs us of a vulgar error, terming the gall bitter; whereas there is nothing *gustable* sweeter.

Harvey.

As when fierce northern blasts from the Alps descend,

From his firm roots with struggling gusts to rend

An aged sturdy oak.

Denham.

They, fondly thinking to allay

Their appetite with *gust*, instead of fruit

Chewed bitter ashes, which the offended taste

With spattering noise rejected.

Milton.

The gullet and conveying parts partake of the nerves of *gustation*, or appertaining unto sapor.

Brown.

Whether his valour they so much admire,

Or that for cowardice they all retire,

As heaven in storms they call in *gusts* of state,

On Monk and parliament yet both do hate.

Marvell.

We have lost, in a great measure, the *gust* and relish of true happiness.

Tillotson.

Part stay for passage, 'till a *gust* of wind

Ships o'er their forces in a shining sheet.

Dryden.

Where love is duty on the female side,

On theirs mere sensual *gust*, and sought with surly pride.

Id. Fables.

My sight, and smell, and hearing were employed,

And all three senses in full *gust* enjoyed.

Dryden.

The principal part of painting is to find what nature has made most proper to this art, and a choice of it may be made according to the *gust* and manner of the ancients.

Id.

In reading what I have written, let them bring no particular *gusto* along with them.

Id.

Old age shall do the work of taking away both the *gust* and comfort of them.

L'Estrange.

Pardon a weak distempered soul, that swells

With sudden *gusts*, and sinks as soon in calms,

The sport of passions.

Addison's Cato.

Pleasant *gusts* gratify the appetite of the luxurious.

Derham.

Destroy all creatures for thy sport or *gust*,

Yet cry, if man's unhappy, God's unjust.

Pope.

What he defaults from some dry insipid sin, is but to make up for some other more *gustful*.

Decay of Piety.

GUSTAVIA, in botany, a genus of the polyandria order, and monadelphia class of plants: cal. none; the petals are very numerous; the berry multilocular: SEEDS appendaged. Species two; fine tall trees of Surinam and Guiana.

GUSTAVUS I. king of Sweden, son of Eric Vasa, duke of Gripsholm. Christian II. king of Denmark, having made himself master of Sweden, confined Gustavus at Copenhagen; but he, making his escape, wandered long in the forests, till the cruelties of the tyrant having occasioned a revolution, he was first declared governor of Sweden, and then, in 1513, elected king. He introduced Lutheranism into his dominions, and died in 1560. See SWEDEN.

GUSTAVUS ADOLPHUS, THE GREAT, king of Sweden, was born at Stockholm in 1594, and succeeded his father Charles IX. in 1611. He espoused the cause of the Protestants in Germany, who were oppressed by Ferdinand I. He was a great warrior, and gained many victories (see SWEDEN), but was killed in the battle of Lutzen, where his troops got the victory, and defeated two of the emperor's armies, in November, 1632.

GUSTAVUS III. See SWEDEN.

GUSTROW, a walled town of Mecklenburg-Schwerin, in the principality of Wenden, situated on the Nebel. It has six gates, a castle, and about 6000 inhabitants. Here are several breweries and brandy distilleries: sixteen miles south of Rostock, and twenty-nine east of Wismar.

GUT, *n. s. & v. a.*

GUTTLE, *v. a. & v. n.*

GUTTLER, *n. s.*

GUZZLE, *v. n., v. a. & n. s.* } Germ. *kutteln*;
 } Goth. *guid*; Scot.
 } *ketc.* A long
 } membranous canal reaching from the stomach to the anus, called intestines; the stomach; figuratively used for gluttony: to gut is to eviscerate; to draw; to plunder of its contents: a guttler one who feeds luxuriously; a greedy eater or gormandiser. Guzzle has principal reference to greediness in drinking; to swallow with immoderate gust.

God for his manace him so sore smote,

With invisible wound, ay incurable,

That, in his *guttles*, carfe it so and bote,

That his peines weren importable;

And certainly the wreche was resonable,

For many a mannes *guttles* did he peine.

Chaucer. The Monkes Tale.

This lord wears his wit in his belly, and his *guts* in his head.

Shakspeare. Troilus and Cressida.

A viol should have a lay of wire-strings below, close to the belly, and then the strings of *guts* mounted upon a bridge, that by this means the upper strings stricken should make the lower resound.

Bacon's Natural History.

The fishermen save the most part of their fish: some are *guttet*, splitted, powdered, and dried.

Carew's Cornwall.

Apicius, thou did'st on thy *guts* bestow

Full ninety millions; yet, when this was spent,

Ten millions still remained to thee; which thou,

Fearing to suffer thirst and famishment,

In poisoned potion drankest.

Hakewill on Providence.

And crammed them 'till their *guts* did ake,

With cawdle, custard, and plum-cake. *Hudibras.*

Well seasoned bowls the gossip's spirits raise,

Who while she *guzzles* chats the doctor's praise.

Roscommon.

In Nero's arbitrary time,

When virtue was a guilt, and wealth a crime,

A troop of cut-throat guards were sent to seize

The rich men's goods, and *gut* their palaces.

Dryden.

With false weights their servants' *guts* they cheat,

And pinch their own to cover the deceit. *Id.*

His jolly brother, opposite in sense,

Laughs at his thrift; and, lavish of expence,

Quaffs, crams, and *guttles* in his own defence. *Id.*

They fell to lapping and *guzzling*, till they burst themselves.

L'Estrange.

The fool spit in his porridge, to try if they'd hiss: they did not hiss, and so he *guttled* them up, and scalded his chops. *Id.*

Tom Brown, of facetious memory, having *guttet* a proper name of its vowels, used it as freely as he pleased. *Addison.*

The intestines or *guts* may be inflamed by any acrid or poisonous substance taken inwardly.

Arbuthnot on Diet.

GUTHALUS, or **GUTTALUS**, in ancient geography, is thought to be the Viardus of Ptolemy; now called the Oder.

GUTHRIE (William), was born in 1620, at Pitforthly, in Angus. He was educated at St.

Andrews for the Scotch kirk, and in 1644 was placed as minister in the parish of Finwick, but after holding his preferment twenty years, was ejected as a nonconformist. He wrote the Christian's great Interest, still held in esteem. His death took place in 1665.

Another **WILLIAM GUTHRIE**, who has been confounded with the above, was born at Breichen, in the same county, in 1701, or 1703; and, after passing through a course of study at Aberdeen, quitted his native country in consequence of a love affair, and commenced author in London. Here he published a History of England, in 3 vols. folio; A Translation of Quintilian, in 2 vols. 8vo.; as also one of some of Cicero's works. The Friends, a novel, 2 vols.; and Remarks on English Tragedy, 8vo. The Geographical Grammar, which goes under his name, is said to have been compiled by Knox, a bookseller in the Strand. A History of Scotland in 10 vols.; a History of the Peerage, 4to.; and a Universal History, in 13 vols., are also ascribed to him. Mr. Guthrie finally obtained a pension, and a commission of the peace for Middlesex. He died in 1770.

GUTTA, *n. s.* a Latin term for drop.

GUTTÆ. See ARCHITECTURE.

GUTTE ANGLICANÆ, English drops, a chemical preparation esteemed of great virtue against vapors and lethargic affections, and purchased at £5000 by king Charles II. from the inventor, Dr. Goddard. It is a spirit drawn by the retort from raw silk, and rectified with an essential oil.

GUTTA ROSACEA, in medicine, a red or pimpled face; a distemper, which, though not always owing to hard drinking, is most incident to tipplers.

GUTTA SERENA, a disease in which the patient, without any apparent fault in the eye, is deprived of sight. See MEDICINE.

GUTTATED, *adj.* } Latin *gutta, guttula*.

GUTTULOUS, *adj.* } Besprinkled with drops, or in the form of a drop.

Ice is plain upon the surface of the water, but round in hail, which is also a glaciation, and figured in its *guttulous* descent from the air.

Browne's Vulgar Errors.

GUTTENBURG, or **GUTTEMBERG** (John), one of the reputed inventors of the art of printing, was born at Mentz, in 1400, of wealthy parents. In 1427 he was at Strasburgh, as a merchant; but returned to Mentz in 1430, and, between that time and 1439, appears to have made some trials of printing with metal or other types. In 1446 he entered into partnership with Fust, the result of which was the publication of the celebrated Bible of 637 leaves, the first considerable specimen of printing with metal types. John Gutenberg died in 1467.

GUTTER, *n. s. & v. a.* } Lat. *guttur, gut-*

GUTTURAL, *adj.* } *turalis*. A passage

GUTTURALNESS, *n. s.* } for water; a longitudinal hollow: the verb signifies to drain or cut in hollows. Guttural is descriptive of sounds pronounced with the throat.

Be as be maie; for earnest or for game,

He shall awake, and rise, and go his waie

Out at this *gutter*, or that it be daie.

Chaucer. Legend of Gode Women.

My cheeks are *guttered* with my fretting tears.

Sundys.

Tempests themselves, high seas, and howling winds,

The *guttered* rocks, and congregated sands,
Traitors enteepled to clog the guiltless keel,
As having sense of beauty, do omit

Their mortal natures, letting safe go by

The divine Desdemona. *Shakspeare. Othello.*

The Hebrews have assigned which letters are labial, which dental, and which *guttural*. *Bacon.*

In attempting to pronounce the nasals, and some of the vowels spiritaly, the throat is brought to labour, and makes that which we call a *guttural* pronunciation. *Holder.*

First in a place, by nature close, they build

A narrow flooring, *guttered*, walled, and tiled.

Dryden.

These *gutter* tiles are in length ten inches and a half. *Maron.*

Rocks rise one above another, and have deep *gutters* worn in the sides of them by torrents of rain.

Addison on Italy.

GUTTY, in heraldry, a term used when any thing is charged or sprinkled with drops. In blazoning, the color of the drops is to be named. GUTWORT, *n. s.* Gut and wort. An herb.

GUY, *n. s.* From guide. A rope used to lift any thing into the ship.

Guy, in ships, is a large slack rope, extending from the head of the main-mast to the head of the fore-mast, and having two or three large blocks fastened to the middle of it, to sustain the tackle used to hoist in and out the cargo of a merchant ship.

GUY (Thomas), an eminent bookseller, son of a coal-dealer in Southwark. He commenced business about 1668 with a stock of £250. The English bibles being then very badly printed, Mr. Guy contracted with the university of Oxford for their privilege of printing them, and carried on a great trade in them for many years. Thus he began to accumulate money, and being a single man, and very penurious, he daily increased his store. The bulk of his fortune, however, was acquired by purchasing seamen's tickets during queen Anne's wars, and South Sea stock, in 1720. It is said that at one time he was about to marry his maid-servant, and that it was only her extravagance in one instance induced him to alter his intentions. The girl looking on the paviors at work, near his door, remarked a broken place that they had not repaired; when they told her that Mr. Guy had directed them not to go so far. 'Well,' she said, 'do you mend it, and tell him I bade you.' But she had presumed too much on her influence over her careful lover, with whom a few extraordinary shillings expense turned the scale against her; he renounced his matrimonial scheme, and commenced a builder of hospitals. He was seventy-six years of age when he formed the design of building the hospital which bears his name, and lived to see it roofed in; dying in 1724. The charge of erecting this vast pile amounted to £18,793, and he left £219,499 to endow it. He also erected an alms-house with a library at Tamworth in Staffordshire, for which he was representative in parliament, for fourteen

poor men and women; and left £125 a-year for their pensions.

GUYON (J. M. de la Mothe.) See MOTHE. GUYTON MORVEAU. See MORVEAU.

GUZ, an Indian measure, equal to one yard English.

GUZMAN (Dominic de), founder of the Dominican order of monks, was born at Calaroga in Old Castile, 1170. He preached against the Albigenses, when pope Innocent III. made a crusade against that unhappy people: and was inquisitor in Languedoc, where he founded his order, which was confirmed by the Lateran council in 1215. He died at Bologna in 1221, and was canonised. See DOMINICANS.

GYBE, *n. s. & v. a.* See GIBE.

The vulgar yield an open ear,

And common courtiers love to *gybe* and fleer.

Spenser.

Ready in *gybes*, quick answered, sancy, and as quarrelous as the weazel. *Shakspeare. Cymbeline.*

GYBING, the act of shifting any boom sail from one side of the mast to the other. By a boom sail is meant any sail whose bottom is extended by a boom, the fore-end of which is hooked to its respective mast; so as to swing occasionally on either side of the vessel, describing an arch, of which the mast will be the centre. As the wind or the course changes, it becomes necessary to change the position of the boom, with its sail, which is accordingly shifted to the other side of the vessel, as a door turns upon its hinges. The boom is pushed out by the effort of the wind upon the sail, and is restrained in a proper situation by a strong tackle communicating with the vessel's stern, called the sheet. It is also confined on the fore part by the guy.

GYERGYO, or Szent Miklos, a market-town of Transylvania, the chief place of the district of Esik. The Armenians, who form the chief part of the population, carry on some manufactures of ornamental works of leather. Long. 25° 36' E., lat. 46° 39' N.

GYGES, a Lydian, to whom Candaules, king of the country, showed his wife naked. See LYDIA. According to Plato, Gyges descended into a chasm of the earth, where he found a brazen horse, whose sides he opened, and saw within the body the carcass of a man, from whose finger he took a brazen ring. This ring, when he put it on his finger, rendered him invisible; and by means of it he introduced himself to the queen, murdered her husband, married her, and usurped the crown of Lydia!

GYMNASARCHIA, in antiquity, the director of the gymnasium. He had two deputies under him; the Nystarcha, and the Gymnastes.

GYMNASTICALLY, *adv.* } *Fr. gymmique,*
GYMNASTIC, *adj.* } *gymnastique; Gr.*

GYMNIC, *adj.* } *γυμνικός, γυμναστικός.* Pertaining to athletic exercise; consisting of leaping, wrestling, running, throwing the dart, or quoit: athletically made.

The country hath his recreations, the city his several *gymnicks* and exercises, may-games, feasts, wakes, and merry meetings to solace themselves.

Burton's Anatomy of Melancholy.

Have they not sword-players and every sort Of *gymnic* artists, wrestlers, riders, runners?

Milton.

Such as with agility and vigor are not *gymnastically* composed, nor actively use those parts. *Browne.*

The Cretans wisely forbid their servants *gymnasticks* as well as arms; and yet your modern footmen exercise themselves daily, whilst their enervated lords are softly loling in their chariots. *Arbuthnot.*

GYMNASTICS. From *γυμνασιον*, naked, because the ancient exercises of this kind were performed naked; a modern name for certain exercises ancient and modern, which have been thus distinguished. The ancient gymnasium was little more than a school for warriors, those exercises only being encouraged, the advantages of which were seen in the field: hence boxing and the pancratium fell into disrepute, solely because the corpulence they encouraged was injurious to the military character. Thus Plutarch says, 'It would take three shields to cover a pugilist;' and Cato enquires, 'Of what service can a man be to his country who is nothing but belly?' The modern gymnasium has no such pretensions: in it the arts of war are not cultivated; but the manly exercise of the limbs, the consequent vigor of the muscles, and the health and robustness necessarily ensuing, are its main objects. This article, therefore, naturally divides itself into, I. The History of Gymnastics, ancient and modern. II. The more particular description of modern Gymnastic exercises.

PART I.

HISTORY OF GYMNASTICS.

With regard to the history of gymnastic exercises, their origin, it is evident, must be nearly coeval with the first congregation of men into societies. At that time, when agility and strength were the principal requisites of a warrior, when leaping, hurling the javelin, racing, wrestling, &c., were exercises which alone would fit men for the field, enable them to repel the attacks of their neighbours, or in turn to become themselves the aggressors; when the defence of their own property, or the seizure of that of others, was the employment of a principal part of their lives, the gymnastic art would undoubtedly occupy a prominent place in the education of youth. Accordingly we find, the elders of those primitive governments soon instituted periodical games; they gave prizes and honors to the conquerors, and excited in every possible way the emulation of the young men, till the Olympic games, originally the periodical race of four brethren, in process of time became the occupation of days, the data by which time was reckoned, and the cause of war between celebrated cities and even entire nations. Almost all the early writers notice the ancient games of the gymnasium, and among the first are those celebrated at the funeral of Patroclus, as recorded by Homer in the twenty-third book of the *Iliad*. Even then the art wanted but little of perfection, for we find that the Greeks had not only the simple foot-race, and the manly wrestling-match, but also the chariot-race, the combats of the cestus, and of the sword, hurling the discus and the javelin, and exercising with the bow; nor did Ulysses or Tydides think it beneath them to join in the combat or the race. Not long after, these exercises were applied to the medical art. Accord-

ing to Plato, one Herodiceus, a little prior to Hippocrates, was the first who introduced them into physic; and his successors, convinced of their usefulness, continued the practice. Hippocrates has given instances of it, where he treats of exercise in general, and of the particular effects of walking, with regard to health; also of the different sorts of races on foot or horse-back; leaping, wrestling, the exercise of the suspended ball, chironomy, unctions, frictions, rolling in the sand, &c. But, as physicians did not adopt all the gymnastic exercises in their practice, they were divided between them and the masters of martial and athletic exercises, who kept schools, the number of which greatly increased in Greece; and gymnasia, places appropriated solely to these exercises, soon made their appearance in the principal cities. Lacedæmon was the first place where they were built, and three soon after were erected at Athens. According to Vitruvius, the gymnasia were a knot of buildings united, sufficiently capacious to hold many thousands of people at once; and having room for philosophers, and the professors of the sciences, to read their lectures; and wrestlers, dancers, and others, to exercise at the same time. They consisted of twelve parts, viz. 1. The exterior porticoes, where the philosophers, rhetoricians, mathematicians, and physicians, read public lectures, and where they also disputed and rehearsed their performances. 2. The ephebeum, where the youth assembled very early, to exercise in private without any spectators. 3. The coryceum, apodyterion, or gymnasterion, a kind of wardrobe, where they were stripped, either to bathe or exercise. 4. The elæthesium, alipterion, or unctuarium, appointed for the unctions, which either preceded or followed the use of the bath, wrestling, pancratia, &c. 5. The conisterium or comistra, in which they covered themselves with sand or dust, to dry up the oil or sweat. 6. The palaestra, properly so called, where they practised wrestling, the pugillate, pancratia, and other exercises. 7. The sphaisterium or tenniscourt, reserved for exercises wherein they used balls. 8. Large unpaved alleys, which comprehended the space between the porticoes and the walls wherewith the edifice was surrounded. 9. The xysti or porticoes for the wrestlers in winter or bad weather. 10. Other xysti or open alleys, for fine weather, some of which were quite open, and others planted with trees. 11. The baths, consisting of several different apartments. 12. The stadium, a large space of a semicircular form, covered with sand, and surrounded with seats for the spectators.

The principal gymnastic exercises of the ancients were five in number. They began with the *foot-race* (*δρομος*), which was the most ancient and in the greatest esteem, as it enabled the warrior to make a sudden assault or a quick retreat; and Homer, therefore, constantly entitles his hero Achilles '*πῶτατος ὄκις*, swift of foot.' David also, in his eulogy on Saul and Jonathan, exclaims, 'They were swifter than eagles, they were stronger than lions.' The victorious racer gave his name to the Olympiad. Sometimes they ran in armour, and were then called *ἀπαιτοδρομοί*.

—*Αλμα*, or the exercise of leaping, ranked second, and was generally performed with oval weights of lead, having holes in them through which the leapers put their fingers, and by these they poised and assisted forward their bodies. The proficiency of some of these was very great: Pausanias assures us, that Phaulus of Crotona leaped fifty-two feet.—The *hurling of the discus* (*δίσκος*), a quoit of stone, brass, or iron, was among the most ancient of these sports. It was thrown under the hand as the quoit is now in England, and the object was to hurl it further than another could do.

The *wrestling* of the ancients (*παλη*) required equal strength and agility. They never encountered till all their joints had been fomented and suppled with oil to prevent strains, and to elude the grasp of their antagonists. After having anointed their whole bodies, they rolled themselves in sand to prevent excessive perspiration, and were then considered ready to enter the lists. The victory was adjudged to him who had given his antagonist three falls. *Πεγμαχία*, or the exercise of boxing, was the last both in order and in estimation. As well as a certain fleshiness of arm, and stoutness, if not corpulence of body, to increase the force of their own blows and to lessen the injury of their antagonist's, a certain regimen was requisite, regular sleep, rest, and provisions, which but ill prepared the combatants for the privations of war. In this exercise also the victory was never decided till one of the parties fairly yielded, either by holding up a finger, or demanding quarter. This, however, seemed so contrary to the obstinate character of Grecian valor, that one of the parties was generally slain; and the laws of Sparta absolutely prohibited her citizens from ever engaging in it, as a Spartan was 'taught to disdain saving his life by yielding to his opponent, and the life of a Greek was not to be sacrificed to the amusement of an hour.'

At first they used never to box but with naked fists and arms, afterwards they covered the wrists and hands with leather thongs, and at length fought with their arms and fists perfectly cased in leather, loaded with plummets of lead. These tremendous gloves were called *Cæstus*, and the following description of those of Eryx, the brother of Acestes, king of Sicily, sufficiently proves the direful nature of the combat:—

In medium geminos immani pondere cæstus
Proiecit; quibus acer Eryx in prælia suctus
Ferre manum, duroque intendere brachia tergo.
Obstupere animi; tantorum ingentia septem
Terga boum plumbo insuto ferroque rigabant.

Æneid lib. v. l. 401.

—He threw

Two ponderous gauntlets down in open view,
Gauntlets, which Eryx went in fight to wield,
And sheath his hands with in the list'd field.
With fear and wonder seized, the crowd beholds
The gloves of death, with seven distinguished folds
Of tough bull-hides: the space within is spread
With iron, or with loads of heavy lead. *Dryden.*

The *Pancrætium* also (Gr. *παγκράτιον*) is worthy of notice. It was a contest in which both wrestling and boxing were united, and the combatants often threw themselves upon the

ground, and continued the fight by biting, scratching, pinching, kicking, or any other method of annoying their antagonists. This was continued till one of them yielded; and it often happened that he who in wrestling would have conquered, was, in the *Pancrætium*, compelled to give in. In the time of Homer all these exercises were performed in drawers, which, indeed, were not laid aside before the thirty-second Olympiad. One Orseppus, a wrestler, is said to have been the first who introduced the practice of contending naked: for, having been worsted by his drawers entangling him, he threw them aside, and the rest afterwards imitated him.

From the Greeks the Romans derived these exercises, and improved them to the highest degree of magnificence. But the declension of the empire involved the ruin of the arts, and, among others, that of gymnastics. The attempts to revive and improve them, at the close of the last century, it is now our business to notice.

Germany was the first country that attempted the revival of these ancient and manly sports. At Schnepphenthal, near Gotha, Salzmann first framed a course of gymnastics, which was improved and arranged by Gutsmuth, who published the first modern treatise on the subject in 1793. In Denmark the government, intent on a plan of public education, issued an order that a piece of ground should be allotted to every public school for the practice of these exercises; and, in 1804, no less than sixteen of these establishments were formed in that kingdom. In 1810 a gymnasium was erected at Berlin by the Prussian government, and placed under the direction of M. Jahn, by whose exertions several similar institutions have been formed in various parts of Prussia and Germany. In fact, no large academy is now considered perfect in those countries which does not include a course of gymnastics in its system. In 1817 appeared Gutsmuth's complete System of Gymnastic Exercises, to which, in the course of the article, we shall find it necessary to refer.

Early in the spring of 1826 a meeting was held in London at the Mechanics' Theatre, Southampton Buildings, Dr. Gilchrist in the chair, to consider of the practicability of establishing a London Gymnastic Society. Professor Voelker of Germany came forward and offered to give his instructions gratuitously, and another gentleman present advanced the money for the erection of the apparatus. A society was soon formed, and they purchased a piece of ground on the higher part of Spa Fields, near Pentonville. From its elevation it is dry, and capacious enough to accommodate about 300 gymnasts. These are arranged in classes according to their size and capacity; and the various poles, &c., are constructed of different sizes accordingly. At the ringing of a bell each class changes the exercise in which it has been previously engaged, and begins a new one, according to a plan prescribed by the director. The success of the undertaking has, we think, exceeded even the expectation of the most sanguine of the projectors. In about two months they numbered 700 pupils; and it was soon seen that similar places might be erected with advantage in various parts of the

suburbs of London. Similar societies have been formed at Hackney, Bethnal Green, Knightsbridge, &c.

PART II.

DESCRIPTION OF THE MODERN GYMNASTIC EXERCISES.

The ancient and modern gymnastics must not be confounded. The present professors of the art entitle it 'a revival of the ancient exercises of the Greeks;' but he who should visit Pentonville with the hope of watching the striving of the dusty wrestler, the combat of the Paneratum, or the hurling of the discus, will indeed be disappointed. He will see but little in the 'leaping stand,' or the 'climbing scaffold,' of the London gymnasium to remind him of the Grecian academy or the Roman amphitheatre. The ancient gymnastics fitted men for the field, and for the fatigues of war—the moderns profess only to improve the constitution; to enable men to encounter without injury the close air of the counting house or the drawing room; to endure without trouble the fatigues of a city life. To strengthen all the muscles of the body being their object, the exercises are necessarily of different kinds. The principal ones are six in number: we commence with the most simple and natural.

RUNNING

As it is evidently necessary to the performance of several of the other exercises, the young gymnast must particularly endeavour to acquire a swift and easy method of running. The most common fault is the taking too short and swift steps, which soon fatigue, and the progress is not so great in proportion as when the steps are longer though less quickly performed. It is also more difficult to breathe in time with such steps, and the runner consequently sooner loses his wind. About 350 or 400 feet is the best length for a course; though for very young or weak pupils 250 may be found sufficient, and when a party first begin this exercise, they should start in the military 'double-quick time.' This will prevent strains, either from the violence of starting or the sudden exertion of the race, for which the body might be unprepared. Indeed sufficient attention has never been paid to swift running in time, and consequently a line can scarcely be at all kept by persons when running with only a moderate degree of swiftness.

LEAPING.

Leaping is the best bodily exercise for the lower members, and therefore occupies a very prominent place in all modern gymnastics. In order, however, to practise this with ease, initiatory exercises are often necessary. We frequently meet with persons of considerable muscular strength, who, from their habits of life, are so sluggish and unwieldy that they know not how to exert it. The ploughman, who with ordinary fatigue would guide the plough all day through the hardest furrows, would be unable probably to leap a ditch to save his life. These preliminary exercises are hopping, and striking the lower part of the back with the feet and the knees against the breast. In hopping care should be

taken to make the steps short and quick, keeping the arms crossed and the head erect. After these exercises have in some degree brought the muscles of the thigh into play, and rendered the knee-joints sufficiently flexible, the pupil may begin leaping. Of leaps there are several different kinds, viz. the long leap with or without a run, the high leap with or without a run, the deep leap, or the same leaps with a pole, all of which are very differently performed.

1. *The long leap without a run* is an excellent exercise, particularly for the muscles of the feet, calves, and thighs. It is performed merely by the elastic power of the feet, assisted by a swinging of the hands. The long leaps are best performed over a ditch about a foot deep, and increasing in breadth from one end to the other thus:—

taking care that the margin of one side, A, be composed of loose sand to the extent of about two feet and a half, in order that a slip in descending may not strain the feet of the leaper. The broadest end of the ditch need not exceed twenty feet, and the breadth should diminish gradually to about four and a half. Continued jumping from one end to another of a long piece of ground is also recommended as an excellent preparatory exercise.

2. *The high leap without a run.*—In order to practise the high leaps it is necessary to construct a leaping stand, which is generally made in the following manner:—Two upright posts, *a* and *b* in the diagram, are fixed in the ground at the distance of about twelve feet from each other, and having holes drilled in them at every inch for the insertion of the pegs *c, c*, over which a cord is kept extended by the two weights fastened to its extremities:—

The leap over the cord must always be made from the side of the stand, opposite to which the string is laid, in order that it may give way if struck by the feet. This stand therefore allows of leaping from one side only, and even then the weight often occasions the string to entangle the leaper, although his feet carry it off the pegs. A better stand may be made (if the leapers are not very numerous) with poles that shut up in three joints, one within the other, similar to some fishing-rods. These being drawn out to any required length, and supported in their position by means of small pegs, a thin light cane in place of the string is laid along the top of the two poles, which are slightly grooved to receive it. See plate II. GYMNASTICS, fig. 2. This will be found to fly off with the slightest touch, and never to embarrass the pupil: a circumstance worthy of consideration, as a fall when leaping to the height of eight or ten feet often produces serious injury. This stand may also be used with equal safety from either side; but the poles cannot be set so far asunder as in the other, it being difficult to procure a thin cane that is straight above five feet in length. In order to learn the high leap without a run, the pupil is directed to place himself at about the distance of four feet from the stand, and having excited the elastic power of his feet by a preliminary leap of about three feet, he springs over the cane. The two leaps should be made very light, and follow one another instantaneously, that the force of the first spring be not lost. It is better for young pupils to begin this with the cane no higher than the knees; but many persons will spring over a cord at the height of the pit of the stomach.

3. *The deep leap* is a spring from one side of a ditch to the other, which is considerably lower, or indeed from any high place to a low one, and is best performed with the assistance of the hands. By contriving to throw himself partly on his hands, and let the weight of his descent thus gradually pass over to the feet, the gymnast will soon be enabled to leap from a height, that to an unpractised eye would appear dangerous. By continual practise on the ladder of the climbing-stand (see plate I. GYMNASTICS), for instance, he will in time be enabled to leap with comparative ease from a two pair of stairs window, and thus have a considerable advantage in case of fire over the idle or the sedentary man, to whom a leap from the first floor would be often fatal. For exercise this leap is often performed without the assistance of the hands, and great care must then be taken to fall on the ball of the toes, instead of the heels, as otherwise a very considerable shock may be given to the body. *Dropping* also from a height is often connected with this exercise, and great care must then be taken to keep the knees slack, and the body rather forward in the descent. These exercises must on no account be performed after a meal, as the shock on a full stomach may sometimes occasion hernia.

4. *The long leap with a run* is to be practised over the ditch shown above, and the run should never exceed twenty-five feet. The steps should be small, and increase in rapidity as they ap-

proach the leaping-place; long steps are to be particularly avoided, as they considerably diminish the force of the run. As it is evident that the spring can be finally made with only one foot, and most persons leap best with the right, some little practise is required to enable the leaper to so far measure the distance with his eye, as to bring that foot forward to leap with. When descending, the feet should be kept close together, the knees slack, and the chest well thrown forward, and on arriving at the ground a light spring should be again made to lessen the shock of the fall; though if the opposite margin be formed of loose sand to the depth of about three feet, as before recommended, no shock can be felt. Many young leapers, however, by throwing the feet too forward, fall backward on coming to the ground, or by separating the legs give to one of them alone the whole weight of the descent, and thereby are apt to receive some unpleasant strains. But, of all the faults of young beginners, the most common is that of endeavouring to hurl themselves along without leaping to a sufficient height: they thus come quickly to the ground, and generally fall on their faces by the strength of their own leap. A person who can leap three or four times the length of his body, may be said to be a good leaper, though he will remain as a gymnast far behind Phaulus of Crotona, who leaped fifty-two feet at the Olympic games.

5. *The high leap with a run* may be performed either by bending the legs under the body as close as possible, immediately on leaving the ground; or by throwing the left leg over the cane, and drawing the right sharply up to the bottom of the back; or by throwing them together, either to the right or left side, to prevent their catching against the obstacle over which you leap. The run, &c., is the same as in the preceding exercise; and many leapers will in this manner clear a wall considerably above their own height. At Greenwich this exercise is combined with a game of carrying off a ring on the top of a sword while in the act of leaping, and this accustoms the pupils to spring with great precision and coolness.

6. *The long leap with a pole*.—We are now come to leaping with a pole, which has been said to be '*rautting*, in which the leaper, instead of supporting himself by an intervening object, carries with him a pole, which he places in whatever spot he chooses.' This is, however, by no means correct; the support given by a wall, bar, or other fixed object over which you have to move, and on which the hands must be moved, bears but little resemblance to a moveable pole which swings with your body, and on which you in a manner hang. The pole should be from about six feet to ten, or even thirteen, feet long, and about two inches thick at the bottom, tapering to about an inch at the top: ash is the best wood, as fir, though more easily procured straight, is more liable to crack. This pole is held with the right hand about the height of the head, and the left a little higher than the hips. The run is the same as before, but the leap must be made with the left foot. The leaper then swings round to the right of the pole, making a turn, so that his body faces, on his reaching the opposite

bank of the ditch, the side from which he set out. The body should be kept near the pole, and the swing must be carefully given, lest, by pulling the pole in a direction lateral to the ditch, you should fall sideways into the ditch. The spring and the fixing of the pole must be made at the same moment, as otherwise the swing is not so strongly made; and, in proportion as he becomes more expert, the leaper may advance his hands higher up the pole, and thereby have a more powerful swing. The feet should be stretched out as far as possible to reach the opposite bank, and if this should be lower than the one from which the leap is taken, the hands should be slid down the pole while in the act of leaping. This exercise is very common in Lincolnshire, Cambridgeshire, and the other fen counties which abound with dykes; but it is there common to throw the body strongly against the pole, and, letting it pass between the legs, to ride over, as it were, upon it.

7. *The high leap with a pole* greatly resembles the preceding one, except that, the sweep being smaller, the hands must be more raised, and the legs quickly turned, to prevent their coming in contact with the cord. The left hand should grasp the pole at the same distance from the bottom that the cord is from the ground. The pole is not always fixed at the same distance in front of the stand, but further, in proportion to the height of the leap. The swinging upward is principally effected by the force of the spring as connected with the quick motion occasioned by the run, which, being suddenly checked by the fixing of the pole, changes its horizontal direction to one of a slanting ascent, and thus carries the body of the leaper over the cord or cane. At the same time the leaper must observe to fix the pole right before him, and not either to the right or left, as otherwise the force of the run will throw him from the pole. The best criterion of a good leap is, that the pupil descend in an equal balance to the ground, that is to say, he is not compelled to run backward to keep himself from falling, which is too often the case. The descent should take place on the balls of the toes, and the knees should be slackened to prevent any shock.

VAULTING, or the art of leaping over an object with the assistance of the hands, requires next to be attended to.—This is performed by placing the hands on the wall, bar, or gate, over or upon which you vault, and at the same time giving a spring; swinging yourself round, and descending with your face towards the object. The leaning of the hands not only gives direction to, but considerably assists the swing, and thereby augments the muscular power of the arms, shoulders, &c., as well as of the legs. In order that this exercise may be practised with ease and safety, wooden horses, whose sides and backs are commonly stuffed with wool, and covered with leather, are to be erected in the gymnasium. 1. The pupil places himself in front of the horse, makes one preparatory leap, and then, fixing both hands on it and springing up, throws his right leg over: the body is then suspended by the support of the hands, and descends gradually to the riding position. In order to dismount, the rider swings himself on his hands, first forward and then

backward, and then, closing his feet, throws them both over to the ground. A person may soon learn to mount a horse of any size in this manner.

Vaulting over the horse ought to be frequently practised, as it is applicable in so many instances. With a short run a person may soon learn to throw himself over the height of his chest, and, by shifting the hands, over a very broad table. Vaulting on, in a standing position, is performed with a short run; the pupil then places his hands at a little distance from one another on the object, and, at the same time, leaping up, draws his knees forcibly towards his breast, so that the feet come up between the hands; the gymnast then, quitting the horse with his hands, stands upright. If he wish to seat himself sideways on the horse, he need only, instead of standing, continue to throw forward his feet, and he will be able to seat himself on the saddle; or, should he still continue his leap, he will go over the horse straight forward.

SWINGING ON THE BAR.—This, though an exercise not so directly applicable to the accidents of active life as leaping, vaulting, or climbing, greatly augments the muscular power of the body, and must never be omitted in the gymnasium. Bars should therefore be erected similar to those shown in Plate III. GYMNASTICS, and if possible they should be under cover from the rain and the sun. In order to construct these stands, erect two strong posts (*a* and *b*, fig. 4), about six feet high and eighteen feet asunder, and on the top of them fix a thick transverse beam, rounded at the top to give a more easy grasp to the hand. Then fix three upright posts *c*, *c*, *c*, about five feet in height, and on them, in conjunction with the post *b*, fasten two other transverse poles *d*, *d*, at the distance of about three feet from one another. You will then have the single bar *A*, and the double bars *B*, as represented in the plate. The exercises on these bars are so various that we cannot be expected to describe them in detail. On the double bars the principal ones are performed, either by raising the body on the two hands as the pupil is represented doing, *B*, Plate III., or by swinging along them, or lowering and raising himself by degrees, by the strength of his arms only. On the single bar the most difficult is the seizing the bar with both the hands on the same side and raising the body by pulling upward, the feet being meanwhile closed and hanging down. This exercise is very fatiguing, and, though many persons will go through it nine or ten times successively, twenty times will tire the strongest man. Hanging by the arms and legs, or by the arms or legs alone, and swinging in different ways round the bar, are the other exercises on this bar. They should, indeed, never be neglected, as they greatly facilitate the gymnast's progress in the following exercise.

CLIMBING.—The uses and advantages of this art are too evident to need any particularisation. In order to practise it in all its varieties, different kinds of stands or scaffolds have been recommended. The best is recommended in a work entitled *Instructions in all kinds of Gymnastic Exercises*, by a Military Officer. Plate I. represents this stand, with all its appurtenances. It

is formed of two strong posts fixed firmly in the ground, about twenty feet high and about forty from each other. Over these is fastened the strong beam *AB*, to which are fastened the ropes, poles, &c. The mast *a* is also fixed in the ground, and to it two ladders *b*, *c*, are attached. To the great cross beam, *AB*, are fastened two poles *d*, *e*, two thick ropes *f*, *g*, and a rope ladder *h*. The standing place, *i*, is useful as a resting place, and to accustom the nerves to look down without fear from a considerable height. The first thing for pupils to attend to in climbing is to be able to ascend and descend the ladder quickly, without fear, and carrying up with them some burden. When they can easily do this they may begin to ascend and descend the inside of the ladder; this also being accomplished, let them endeavour to descend it with their hands only. The last exercise on the ladder is to ascend it with the hands, the feet mean while hanging loose; this indeed requires considerable exertion, for the whole weight of the body must not only be supported but raised by one arm only, while the other catches at the second step above the head. Climbing the rope ladder is much more difficult than is generally supposed, for, the bottom of the ladder hanging loose, a person unaccustomed to it receives no support from his feet, but rather trouble as they fly from under him and give his arms very strong jerks. By degrees, however, he learns to keep his feet stretched out, and thus to avail himself of their assistance. The gymnast may now begin to climb the upright pole; this is done by alternately holding on and raising the arms and legs, and requires nothing but a tight hold by the legs and a strong pull with the arms. On the slant pole it is more difficult, as the weight of the body depends more on the arms. Climbing the mast is still more difficult, as it cannot be grasped by the hands, and therefore the climber must lay fast hold of his left arm with his right hand, and his right arm with his left. The other methods of climbing the ropes, &c., are better learned by practice and actual inspection than any instructions, however detailed. See Plate I, GYMNASTICS.

WRESTLING is sometimes included in the gymnastic exercises, but to this it is our intention to give a separate article. See WRESTLING.

GYMNOPYRIS, in natural history, a name given by Dr. Hill to pyrite of a simple internal structure not covered with a crust. See PYRITES. Of these there are only two species: 1. A green variously shaped kind. 2. A botryoid kind. The first is the most common of all the pyrites, and appears under a great diversity of shapes. It is very hard and heavy, readily gives fire with steel, but will not at all ferment with aquafortis. The second is very elegant, its usual color is an agreeable pale green; but what most distinguishes it is, that its surface is always beautifully elevated into tubercles of various sizes, resembling a cluster of grapes.

GYMNOSPERMOUS, *adj.* γίμνος and σπέρμα. Having the seeds naked.

GYMNOSOPHISTS, Greek, Γυμνοσophists, i.e. a naked philosopher. A set of Indian phi-

losophers, famous in antiquity, so called from their going naked. There were some of these sages in Africa; but the most celebrated of them were in India. They believed the immortality and transmigration of the soul: they placed the chief happiness of man in a contempt of the goods of fortune and the pleasures of sense, and gloried in having given faithful and disinterested counsels to princes and magistrates. It is said that when they became old and infirm, they threw themselves into a pile of burning wood, in order to prevent the miseries of an advanced age. One of them, named Calanius, thus burnt himself in the presence of Alexander the Great. Apuleius describes the gymnosophists thus:—‘They are all devoted to the study of wisdom, both the elder masters and the younger pupils; and what to me appears the most amiable thing in their character is, that they have an aversion to idleness and indolence: accordingly, as soon as the table is spread, before the food be brought, the youths are all called together from their several places and offices, and the masters examine them what good they have done since the sun-rise: here one relates something he has discovered by meditation; another has learned something by demonstration; and those who have nothing to allege why they should dine, are turned out to work fasting.’ The great leader of the gymnosophists, according to Jerome, was one Buddas, or Butta, who is ranked by Suidas among the Brahmins. He makes Buddas the preceptor of Manes the Persian, the founder of the gymnosophists.

The African gymnosophists dwelt upon a mountain in Ethiopia, near the Nile, without either house or cell. They did not form themselves into societies, but each had his private recess, where he studied and performed his devotions by himself. If any person had killed another by accident, he applied to these sages for absolution, and submitted to whatever penances they enjoined. They lived solely upon the fruits of the earth. Lucan ascribes to these gymnosophists several discoveries in astronomy.

The Indian gymnosophists dwelt in the woods, where they lived upon the wild products of the earth, and never drank wine nor married. Some of them practised physic, and travelled from one place to another; these were particularly famous for their remedies against barrenness. Some of them, likewise, pretended to practise magic, and to foretell future events.

GYMNOSPERMIA. See BOTANY.

GYMNOTUS, in ichthyology, a genus of fishes belonging to the order of apodes. They have two tentacula at the upper lip: the eyes are covered with the common skin; there are five rays in the membrane of the gills; the body is compressed, and carinated on the belly with a fin. There are nine species, the most remarkable of which is the *G. electricus*, or electric eel, called by the French anguille tremblante. This fish is a native of the warmer regions of Africa and America, where it inhabits the larger rivers, and is particularly found in those of Surinam. In Africa it is said chiefly to occur in the branches of the river Senegal. It is a fish bearing a general resemblance to a large eel, though somewhat

thicker in proportion, and of a much darker color. It is usually seen in the length of three or four feet.

A very accurate description of this fish was given by Dr. Garden in the Philosophical Transactions of 1775, who had three of them in his possession.

'To catch the gymnoti with nets,' says Humboldt, 'is very difficult, on account of the extreme agility of the fish, which bury themselves in the mud like serpents. We would not employ the barbasco, that is to say, the roots of the piseid^{er} erythrina and jacquinia armillaris, because, when thrown into the pool, they intoxicate or benum these animals. These would have enfeebled the gymnoti; the Indians therefore told us, that they would fish with horses. We found it difficult to form an idea of this extraordinary manner of fishing; but we soon saw our guides return from the savannah, which they had been scouring for wild horses and mules. They brought about thirty with them, which they forced to enter the pool. The extraordinary noise caused by the horses' hoofs makes the fish issue from the mud, and excites them to combat. These yellowish and livid eels, resembling large aquatic serpents, swim on the surface of the water, and crowd under the bellies of the horses and mules. A contest between animals of so different an organisation furnishes a very striking spectacle. The Indians, provided with harpoons and long slender reeds, surround the pool closely; and some climb upon the trees, the branches of which extend horizontally over the surface of the water. By their wild cries, and the length of their reeds, they prevent the horses from running away, and reaching the bank of the pool. The eels, stunned by the noise, defend themselves by the repeated discharge of their electric batteries. During a long time they seem to prove victorious. Several horses sink beneath the violence of the invisible strokes which they receive from all sides in organs the most essential to life; and, stunned by the force and frequency of the shocks, disappear under the water. Others, panting, with mane erect, and haggard eyes, expressing anguish, raise themselves, and endeavour to flee from the storm by which they are overtaken. They are driven back by the Indians into the middle of the water; but a small number succeed in eluding the active vigilance of the fishermen. These regain the shore, stumbling at every step, and stretch themselves on the sand, exhausted with fatigue, and their limbs benumbed by the electric shocks of the gymnoti.

'We obtained five large eels, the greater part of which were but slightly wounded. The temperature of the waters in which the gymnoti habitually live, is about 86° of Fahrenheit, and their electric force, it is said, diminishes in colder waters. The gymnotus is the largest of electrical fishes. I measured some that were from five feet to five feet three inches long; and the Indians assert, that they have seen them still longer. We found that a fish of three feet ten inches long weighed 12 lbs. The transverse diameter of the body was three inches five lines. The gymnoti of Cano de Bera are of a fine olive-green color. The under part of the head is yellow, mingled with red. Two rows of

small yellow spots are placed symmetrically along the back, from the head to the end of the tail. Every spot contains an excretory aperture. In consequence, the skin of the animal is constantly covered with a mucous matter, which, as Volta has proved, conducts electricity twenty or thirty times better than pure water. It is in general somewhat remarkable, that no electrical fish, yet discovered in the different parts of the world, is covered with scales. It would be temerity to expose ourselves to the first shock of a very large and strongly irritated gymnotus. I by chance you receive a stroke before the fish is wounded, or wearied by a long pursuit, the pain and numbness are so violent, that it is impossible to describe the nature of the feeling they excite. I do not remember having ever received from the discharge of a Leyden jar a more dreadful shock than that which I experienced by imprudently placing both my feet on a gymnotus just taken out of the water. I was affected the rest of the day with a violent pain in the knees, and in almost every joint.

'When Mr. Bonpland held it by the head, or by the middle of the body, while I held it by the tail, and, standing on the moist ground, did not take each other's hand, one of us received shocks, when the other did not feel. It depends upon the gymnotus to act toward the point where it finds itself the most strongly irritated. The discharge is then made at one point only, and not at the neighbouring points. If two persons touch the belly of the fish with their fingers, at an inch distance, and press it simultaneously, sometimes one, sometimes the other, will receive the shock. In the same manner, when one insulated person holds the tail, and another pinches the gills, or pectoral fin, it is often the first only by whom the shock is received. It did not appear to us, that these differences could be attributed to the dryness or dampness of our hands, or to their unequal conducting power. The gymnotus seemed to direct its strokes sometimes from the whole surface of its body, sometimes from one point only.

'On cutting a very vigorous fish through the middle of the body, the fore part alone gave me shocks. The shocks are equally strong, in whatever part of the body the fish is touched; it is most disposed, however, to dart them forth when the pectoral fin, the electrical organ, the lips, the eyes, or the gills are pinched. Sometimes the animal struggles violently with a person holding it by the tail, without communicating the least shock. Nor did I feel any when I made a slight incision near the pectoral fin of the fish, and galvanised the wound by the simple contact of two pieces of zinc and silver. The gymnotus bent itself convulsively, and raised its head out of the water, as if terrified by a sensation altogether new; but I felt no vibration in the hands which held the two metals. The most violent muscular movements are not always accompanied by electric discharges. The action of the fish on the organs of man is transmitted and intercepted by the same bodies that transmit and intercept the electrical current of a conductor charged by a Leyden vial, or Volta's pile. In employing very delicate electrometers in a

thousand ways, insulating them on a plate of glass, and receiving very strong shocks, which passed through the electrometer, I could never discover any phenomenon of attraction or repulsion. The same observation was made by Mr. Fahlberg at Stockholm. This philosopher, however, has seen an electric spark, as Watsh and Ingenhousz had done before him at London, by placing the gymnotus in the air, and interrupting the conducting chair by two gold leaves pasted upon glass, and a line distant from each other. No person, on the contrary, has ever perceived a spark issue from the body of the fish itself. We have irritated it for a long time during the night, at Calabozo, in perfect darkness, without observing any luminous appearance.'

GYNECEUM, in antiquity, the apartment of women, a separate room in the inner part of the house, where they employed themselves in spinning, weaving, and needle-work.

GYNECOCRACY, *n. s.* Gr. *γυναικοκρατία*; Fr. *gynecocratie*. Petticoat government; female power.

GYNECOCRATUMENI, from *γυνή*, woman, and *κρατῆμενος*, vanquished, an ancient people of Sarmatia Europæa, inhabiting the east banks of the Tanais, near its influx into the Palus Mæotis; thus called because they were under the dominion of women. F. Hardouin, in his notes on Pliny, says, they were thus called, because, after a battle which they lost against the Amazons on the banks of the Thermodoon, they were obliged to become the husbands of the Amazons. See *AMAZONS*.

GYNANDRIA, from *γυνή*, a woman, *ανδρ*, a man. The twentieth class in the sexual system, consisting of plants with hermaphrodite flowers, in which the stamina are placed upon the style, or a pillar-shaped receptacle, resembling a style, which rises in the middle of the flower, and bears both the stamina and pointal. See *BOTANY*.

GYONGYOS, a large well-built town of Hungary, situated on the side of a mountain. The inhabitants, about 8000, manufacture woolen and leather, and trade in wine and cheese, also to a great amount in alum brought from the works of Parad, a small town at seven miles distance. Twenty-one miles W.S.W. of Erlau.

GYPSIES, or Egyptians, an outlandish tribe of vagabonds, called Bohemians in France, and Gitanos in Spain; who, disguising themselves in uncouth habits, smearing their faces and bodies, and speaking a canting language, wander up and down, under pretence of telling fortunes, curing diseases, &c., abuse the people, trick them out of their money, and steal all they can come at. They are a strange kind of commonwealth of wandering impostors and jugglers, who made their first appearance in Germany about the beginning of the sixteenth century. Munster, who is followed and relied upon by Spelman, fixes the time of their appearance to 1417; but, as he owns that the first whom he ever saw were in 1529, it is probably an error of the press for 1517; especially as, when sultan Selim conquered Egypt in 1517, several of the natives refused to submit to the Turkish yoke, and revolted under one Zinganeus; whence the Turks called them Zinganeas; but, being at

length surrounded and banished, they agreed to disperse in small parties all over the world, where their supposed skill in the black art gave them a universal reception in that age of superstition and credulity. In a very few years they gained such a number of idle proselytes (who imitated their language and complexion), that they became troublesome, and even formidable, to most of the states of Europe. Hence they were expelled from France in 1560, and from Spain in 1591. And the government of England took the alarm much earlier; for in 1530 they are described by stat. 22 Hen. VIII. c. 10, as 'an outlandish people calling themselves Egyptians, using no craft nor feat of merchandise, who have come into this realm, and gone from shire to shire and place to place, in great companies, and used great, subtle, and crafty means to deceive the people; bearing them in hand that they by palmistry could tell men's and women's fortunes; and so many times by craft and subtlety have deceived the people of their money, and also have committed many heinous felonies and robberies.' Wherefore they are directed to avoid the realm and not to return under pain of imprisonment and forfeiture of their goods and chattels; and, upon their trials for any felony which they may have committed, they shall not be entitled to a jury de medietate lingue. And afterwards it is enacted, by stat. 1 & 2 Ph. & Mary c. 4, and 5 Eliz. c. 20, that, if any such persons shall be imported into the kingdom, the importer shall forfeit £40. And if the Egyptians themselves remain one month in the kingdom, or if any person being fourteen years old, whether natural born subject or stranger, who has been seen or found in the fellowship of such Egyptians, or who has disguised him or herself like them, shall remain in the same one month at one or several times, it is felony without benefit of clergy. Sir M. Hale says, that, at one Suffolk assizes, no fewer than thirteen persons were executed upon these statutes a few years before the Restoration. But, to the honor of humanity, there are no instances more modern than this of carrying these laws into practice; and the last sanguinary act is itself now repealed by 23 Geo. III., c. 54.

In Scotland they seem to have enjoyed some share of indulgence; for a writ of privy seal, dated 1594, supports John Faw, lord and earl of Little Egypt, in the execution of justice on his company and folk, conformably to the laws of Egypt, and in punishing certain persons there named, who rebelled against him, left him, robbed him, and refused to return home with him. James's subjects are commanded to assist in apprehending them, and in assisting Faw and his adherents to return home. There is a like writ in his favor from Mary queen of Scots, in 1553; and in 1554 he obtained a pardon for the murder of Ninian Small. So that it appears he had staid long in Scotland, and from him this strolling people received the name of Faw's gang, which they still retain.

It is incredible how this banditti have spread over the earth. They wander about in Asia and Africa and most of the European nations. Spain

is supposed by Mr. Twiss to contain 40,000, by others 60,000, and by some 120,000. But in September and October, 1800, they were almost totally extirpated by the plague. They abound in Italy, and are scattered through France, Germany, Denmark, Sweden and Russia. For nearly four centuries they have wandered through the world; and in every region, and among every people, whether barbarous or civilised, they have continued unchanged. Their origin has been generally believed to be from Egypt. Thomasius, Salmon, and Sig. Grisellini, have endeavoured to prove it. M. Grellman, however, traces it from Hindostan, and the cause of their emigration from the bloody wars of Timur Beg in India, in 1403—9.

GYPSUM, selenite, or plaster-stone. The properties of gypsum, according to Cronstedt, are, 1. It is looser and more friable than calcareous earth. 2. It does not effervesce with acids, or at most in a very slight degree. 3. It falls into powder in the fire very readily. 4. When burnt, without being made red-hot, its powder readily concretes with water into a mass which soon hardens; but without any sensible heat being excited in the operation. 5. It is nearly as difficult of fusion as limestone; and shows almost the same effects upon other bodies with limestone, though sulphuric acid seems to promote the vitrification. Magellan, however, says that most of the gypsa, particularly the fibrous, melt in the fire pretty easily by themselves. 6. When melted with borax it puffs and bubbles very much, and for a long time during the fusion. Magellan says, when a small quantity of gypsum is melted with borax the glass becomes colorless and transparent; but some sorts of sparry gypsa, melted with borax, yield a fine yellow transparent glass, resembling the topaz; but, if too much of the gypsum is used in proportion to the borax, the glass becomes opaque. 7. When burnt with any inflammable matter, it emits a sulphureous smell, and may thus be decomposed, as well as by either of the fixed alkaline salts: in this last method there ought to be five or six times as much salt as gypsum. 8. The residuum shows some signs of iron. The species are, 1. Friable gypseous earth, white, found in Saxony. 2. Indurated gypsum, of a solid texture, or alabaster, the particles of which are not visible. This is sometimes found unsaturated with vitriolic acid. It is easily cut, and takes a dull polish. It is of several kinds. Fabroni tells us, that various fine alabasters are met with in Italy: twenty-four quarries of them, each of a different color, being worked out at Volterra. 3. Gypsum of a scaly texture, or common plaster of Paris. See **PLASTER**. 4. Fibrous gypsum, or plaster-stone, has two varieties, viz. with coarse or with fine fibres. It is white. 5. Selenites, or spar-like gypsum, by some also called glacies manæ, and confounded with the clear and transparent mica. It is of two kinds: clear and transparent, or yellowish and opaque; and abounds every where. 6. Crystallised gypsum, or gypseous drusen. This is found composed of wedge-shaped, and sometimes of capillary crystals; sometimes white and sometimes yellowish. 7. Stalactical gypsum is of many different forms and colors. In large pieces it commonly

varies between white and yellow, and likewise in its transparency. It is used as alabaster in several works. England abounds with gypseous substances. There are plenty in Derby, Nottingham, and Somerset shires, so fine as to take a polish like alabaster. A very fine semipellucid alabaster is found in Derbyshire. Fine fibrous tales are also found in many other places. Very fine gypseous drusen is found in Sheppey Isle, and some exceedingly beautiful, large, and clear as crystal, in the salt-works at Nantwich in Cheshire. The selenites rhomboidalis abounds in England, particularly in Shotoverhill, in Oxford, though rare in other counties. Sheppey affords spar-like gypsa, of a fibrous nature, and accreting like the radiations of a star on the septaria, and thence called stella septarii.

GYRATION, *n. s.* } Lat. *gyrus*, *gyro*; Fr. *gyre*, *n. s.* } *giver*. The act of turning.
GYRED, *adj.* } ing any thing about:
GYREFUL, *adj.* } gyre is a circle described by any thing moving in an orbit: gyreful is changeable.

But, evermore this is the manere,
To reve a wight that moste is to him dere
To prove in that thy *gyerful* violence
Thus am I lost, thee helpeh no defence.

Chaucer. Troilus and Cresside.

Does the wild haggard tower into the sky,
And to the south by thy direction fly?
Or eagle in her *gyres* the clouds embrace?

Sandys.

Ne thenceforth his approved skill to ward,
Or strike, or hurlen round in warlike *gyre*,
Remembered he; ne cared for his safe guard,
But rudely rag'd.

Spenser.

Hamlet with his doublet all unbraced,
No hat upon his head his stockings loose
Ungartered, and down *gyred* to his ankle.

Shakespeare.

Which from their proper orbs not go
Whether they *gyre* swift or slow. *Drayt.* *Ecl.* 2.
Quick and more quick he spins in giddy *gyres*,
Then falls, and in much foam his soul expires.

Dryden.

GYRINUS, in zoology, a genus of insects of the coleoptera order. The antennæ are cylindrical, stiff, and shorter than the head: the eyes are four, two on the upper, and two on the under part of the head. See **ENTOMOLOGY**. *G. natator*, the common water flea, is one-third of an inch long; of a bright black color; the feet yellow, flat, and large. It runs with great celerity in circles on the surface of the water, and is very difficult to catch.

GYRON, in heraldry, an ordinary of two straight lines, issuing from divers parts of the escutcheon, and meeting in the Fesse point.

GYVES, *n. s.* } Welsh, *gervyn*. Fetters;
GYVE, *v. a.* } chains for the legs: to fetter, shackle, or ensnare.

The poor prisoners, boldly starting up, break off their chains and *gyves*.

Knolles.

With as little a web as this, will I ensnare as great a fly as Cassio. Ay, smile upon her, do. I will *gyve* thee in thine own courtship.

Shakespeare.

The villains march wide betwixt the legs, as if they had *gyves* on.

Id.

And, knowing this, should I yet stay,
Like such as blow away their lives,
And never will redeem a day,
Enamoured of their golden *gyves*?

Ben Jonson.

H.

H is in English, as in other languages, a note of aspiration, sounded only by a strong emission of the breath, without any conformation of the organs of speech, and is therefore by many grammarians accounted no letter. The *h* in English is scarcely ever mute at the beginning of a word, or where it immediately precedes a vowel; as *house*, *behaviour*; where it is followed by a consonant it has no sound, according to the present pronunciation; but anciently it made the syllable guttural.

'The strong emission of the breath, however,' as Mr. Todd observes, 'is usually withheld from *hair*, *herb*, *hostler*, *honest*, *honor*, *humor*, and by some from *humble*.'

It is pronounced by a strong expiration of the breath between the lips, closing, as it were, by a gentle motion of the lower jaw to the upper, and the tongue nearly approaching the palate. It seems to be agreed, that our H, which is the same with that of the Romans, derived its figure from the Hebrew ה. The Phœnicians, and most ancient Greeks and Romans, used the same figure with our H, which in the series of all these alphabets keeps its primitive place, being the eighth letter; though the O afterwards occupied its place in the Greek alphabet, and its form was changed to X; while its former figure, H, was used for the seventh letter, Eta, or long *e*. But in the beginning this H was only used for an aspiration, whereof they wrote ΗΕΡΟΔΟ instead of ηρώδου, ΗΟΔΟΙ instead of ὁδοί, ΗΕΚΑΤΟΝ, instead of εκατον, centum; from whence it comes, that the H formerly denoted 100. H was also joined with weak consonants instead of an aspiration; they using to write ΤΗΕΟΣ instead of Θεός, and the like.

Anciently the *h* was put for *ch*; thus *Chlodovans* was formed *Hludovicus*, as it is read on all the coins of the ninth and tenth centuries; and it was on this account that they wrote *Hludovicus* with an *h*. In course of time, the sound of the *h* being much weakened, or entirely suppressed, the *h* was dropt, and the word was written *Ludovicus*. In like manner we read *Hlotairi*, *Hlovis*, &c. H subjoined to *c* sometimes gives it the sound of *sh*, as in *Charlotte*; but more frequently that of *tsh*, as in *charity*, *chitchat*, *church*, &c.; and not seldom that of *k*, as in *character*, *Achilles*, &c.; though the latter and all other Greek proper names ought rather to have the guttural sound, agreeably to their original pronunciation. H subjoined to *p* and *t*, also alters the sound of these letters; giving the former the sound of *f*, as in *philosophy*, &c. and the latter that of the Greek O, as in *theology*, *truth*, &c.; and in some English words, as *the*, *that*, *these*, &c., a still harder sound. As an abbreviation, H was used by the ancients to denote *homo*, *hæres*, *hora*, &c. Thus H. B. stood for *hæres honorum*, and H. S. corruptly for *L. S.* sesterce; and H. A. for *Hadrianus*. As a numeral, H denotes 100; and with a dash over it, H̄ 100,000.

HA, *interj.* Lat. *ha*. An expression of wonder, surprise, or alarm; a sudden question; an expression of laughter: it is used with reduplication.

He saith among the trumpets, *ha, ha*, and he smell-eth the battle afar off. *Job*, xxxix. 25.

And out at the dores sterten they anon;
And saw the fox toward the wode is gon,
And bare upon his back the cok away.
They crieden out, harow and wala wa!
A ha the fox and after him they ran.

Chaucer. *The Nonnes Preestes Tale*.

You shall look fairer ere I give or hazard:
What says the golden chest? *ha!* let me see.

Shakspeare.

Ha, ha, 'tis what so long I wished and vowed;

Our plots and delusions

Have wrought such confusions,

That the monarch's a slave to the crown. *Dryden*.

Ha! what art thou! thou horrid headless trunk!
It is my Hastings! *Roué's Jane Shore*.

HAAK, *n. s.* A fish.

HAARLEM. See HARLEM.

HABAKKUK, הַבְּקִי, Heb. i. e. a wrestler, one of the twelve minor prophets, whose prophecies are taken into the canon of the Old Testament. There is no precise time mentioned in Scripture when he lived; but, from his predicting the destruction of Jerusalem by the Chaldeans, it is evident that he prophesied before Zedekiah, probably about the time of Manasseh. He is reported to have been the author of several prophecies which are not extant: but all that are indisputably his are contained in three chapters.

HABEAS CORPUS is the great remedy in English law in cases of false imprisonment. See IMPRISONMENT.

HABERDASHER, *n. s.* According to Minshew from Germ. *habt ihr duss*, have you this; the expression of a shopkeeper offering his wares to sale. Mr. Thomson says, from Teut. *haabver-tauscher*, from *haab*, have. One who sells small wares; a pedlar.

Because these cunning men are like *haberdashers* of small wares, it is not amiss to set forth their shop.

Bacon.

A *haberdasher*, who was the oracle of the coffee-house, declared his opinion.

Addison.

HABERE FACIAS POSSESSIONEM. A judicial writ that lies where one hath recovered a term for years in action of ejectione firmæ, to put him into possession; and one may have a new writ, if a former be not well executed. If the sheriff deliver possession of more than is contained in the writ of habere facias possessionem, an action on the case will lie against him, or an assize for the lands. The sheriff cannot return upon this writ that another is tenant of the land by right, but must execute the writ, for that will not come in issue between the demandant and him.

HABERE FACIAS SEISINAM. A writ directed to the sheriff, to give seisin of a freehold estate recovered in the king's courts, by ejectione firmæ, or other action. The sheriff may raise:

the posse comitatus in his assistance, to execute these writs; and may break open the doors to deliver possession and seisin thereof; but he ought to signify the cause of his coming, and request that the doors may be opened. This writ also issues sometimes out of the records of a fine, to give the cognisee seisin of the land whereof the fine is levied. There is also a writ called *habere facias seisinam*, ubi rex habuit annum, diem, et vastum; for the delivery of lands to the lord of the fee, after the king hath had the year, day, and waste in the lands of a person convicted of felony.

HABERGEON, *n. s.* Fr. *haubergeon*; low Lat. *halbergium*. Armour to cover the neck and breast; breast-plate; neck-piece; gorget.

And over that an *habergeon*

For percing of his herte.

Chaucer. Rime of Sire Thopas.

With him ther wenten knyghtes many on;—

Some wol ben armed in an *habergeon*,

And in a brest plate and in a gipon.

Id. The Knightes Tale.

—She resolved, unweeting to her syre,

Advent'rous knighthood on herselfe to don;

And counseld with her nourse her maides attyre

To turne into a massy *habergeon*;

And bade her all thinges put in readines anon.

Spenser. Faerie Queene.

And halbert some, and some a *habergion*;

So every one in arms was quickly dight. *Fairfax.*

Then put on all thy gorgeous arms, thy helmet

And brigandine of brass, thy broad *habergeon*.

Milton. Samson Agonistes.

The shot let fly, and grazing

Upon his shoulder, in the passing,

Lodged in Magnano's brass *habergeon*.

Hadibras.

HABERGEON, **HABERGETUM**. From Fr. *haut*, high, and *berg*, armour, was a coat of mail; an ancient piece of defensive armour, in form of a coat, descending from the neck to the middle, and formed of little iron rings or meshes, linked into each other.

HABERT, a French family of talent of the seventeenth century; Germain Habert was abbot of Notre Dame de Cerisi, and one of the first members of the French Academy. He died in 1653, leaving several poems, the best of which is entitled *Metamorphose des Yeux d'Iris*, changés en Astres, 1639, 8vo. He also wrote the *Life of Cardinal de Berulle*, 1646, 4to, and paraphrased some of the Psalms.—Philip Habert, his brother, killed at the siege of Emmerich, in 1637, was also one of the first members of the Academy, and wrote *The Temple of Death*, a poem. There was also a celebrated doctor of the Sorbonne, Isaac Habert, who distinguished himself by several controversial works on Grace, in confutation of Jansenius, and by his Latin poetry. He was bishop of Valres in 1645, and died in 1668.—Lewis Habert, another French ecclesiastic of note, and a doctor of the Sorbonne, was born in 1637, and died in 1718. He was author of a *Complete Body of Divinity*, in Latin, 7 vols. 12mo, 1700.

HABICOT (Nicholas), a celebrated French surgeon, born at Bonny, in Gatinois, who acquired great reputation by his skill, and by his writings. He wrote a *Treatise on the Plague*,

and several other curious works. He died in 1624.

HABITUDE, *n. s.*

French, *habiliment*, *habiliter*, *habilité*, *habitable*, *habilleur*, *habitude*; Lat. *habitus*, *habibilis*, *habitatio*, *habitulo*. A habit is the state of having, or being, and applicable to appearance, as dress, clothes, garments, which are habiliments; to mind, as qualifications; faculty or ability acquired by frequently

doing the same thing, as habitude: to the capacity of being dwelt in, as habitable: a habitation is a place of abode; habitator is an inhabitant of such dwelling: habitual is customary; established by repetition; used both in a good and evil sense.

And eke remembre thine *habilitie*

May not compare with hire; this wel thou wot.

Chaucer. The Court of Love.

And, eke, in eche of the pinacles

Weren sondrie *habitaclies*,

In whiche stoden, all withouten

Full (the castle all abouten)

Of all maner of minstres

And jestours, that tellen tales.

Id. House of Fame.

He was out cast of mannes compaignie;

With asses was his *habitation*.

Chaucer. The Monkes Tale.

In many places nightingales,

And alpes, and finches, and wodewales,

That in hir swete song deliten

In thilke places as thei *habiten*.

Id. Romaunt of the Rose.

Where art thou, man, if man at all thou art,

That here in desert hast thine *habitaunce*,

And these rich heaps of wealth do'st hide apart

From the world's eye, and from her right usance?

Spenser's Faerie Queene.

He the fairest Una found,

Strange lady, in so strange *habilliment*,

Teaching the satyres.

Id.

Wisdom, to the end she might save many, built her house of that nature which is common unto all; she made not this or that man her *habitation*, but dwelt in us.

Hooker.

My riches are these poor *habilliments*,

Of which if you should here disfurish me,

You take the sum and substance that I have.

Shakspeare.

I shifted

Into a madman's rags, I assume a semblance

The very dogs disdain'd; and in this habit

Met I my father.

Id. King Lear.

If you have any justice, any pity;

If ye be any thing but churchmen's *habits*.

Shakspeare.

He hath a better bad *habit* of frowning than the count Palatine.

Id.

Present yourself and your fair princess

Before Leontes:

She shall be *habited* as it becomes

The partner of your bed. *Id. Winter's Tale.*

The things are but *habitations* towards arms; and what is *habitation*, without intention and act?

Bacon.

Divers persons in the house of commons were attainted, and thereby not legal, nor *habilitate* to serve in parliament, being disabled in the highest degree.

Id.

By means of our solitary situation, we know well most part of the *habitable* world, and are ourselves unknown.

Id.

The torrid zone is now found *habitable*.

Corley.

That was her torrid and inflaming time;
This is her *habitable* tropique clime.

Donne.

Palaces,

For want of *habitation* and repair,

Dissolve to heaps of ruins.

Denham.

Having called to his memory Sir George Villiers, and the clothes he used to wear, in which at that time he seemed to be *habited*, he thought him to be that person.

Clarendon.

Amplitude almost immense, with stars

Numerous, and every star perhaps a world
Of destined *habitation*.

Milton.

God oft descends to visit men

Unseen, and through their *habitations* walks

To mark their doings.

Id.

Sin, there in power before

Once actual; now in body, and to dwell

Habitual *habitant*.

Id.

Hell at last

Yawning received them whole, and on them closed,
Hell their fit *habitation* fraught with fire

Unquenchable, the house of woe and pain.

Id.

Not to earth are those bright luminaries

Officious; but to the earth's *habitant*.

Id.

The will of God is like a streight unalterable rule; but the various comportments of the creature, either thwarting this rule, or holding conformity to it, occasion several *habitudes* of this rule unto it.

Hale.

The sun's presence is more continued unto the northern inhabitants; and the longest day in Cancer is longer unto us than that in Capricorn unto the southern *habitators*.

Browne.

We cannot conclude this complexion of nations from the vicinity or *habitude* they hold unto the sun.

Id.

The cutting of the Equinoctial line decides that controversy of the *habitableness* of the torrid zone.

More.

Men are first corrupted by bad counsel and company, and next they *habituat*e themselves to their vicious practices.

Tillotson.

Both the poets being dressed in the same English *habit*, story compared with story, judgment may be made betwixt them.

Dryden.

The scenes are old, the *habits* are the same

We wore last year.

Id.

It is impossible to gain an exact *habitude*, without an infinite number of acts and perpetual practice.

Id.

Look round the *habitable* world, how few

Know their own good, or knowing it pursue.

Id.

No civil broils have since his death arose,

But faction now by *habit* does obey;

And wars have that respect for his repose,

As winds for halcyons when they breed at sea.

Id.

Mankind is willing to continue in a pleasing error, strengthened by a long *habitude*.

Id.

They *habited* themselves like those rural deities, and imitated them in their rustick dances.

Id.

By length of time

The scurf is worn away of each committed crime:

No speck is left of their *habitual* stains;

But the pure ether of the soul re-appears.

Id.

'Tis impossible to become an able artist, without making your art *habitual* to you.

Id.

His knowledge in the noblest useful arts,

Was such dead authors could not give;

But *habitudes* with those who live.

Id.

To write well, one must have frequent *habitudes* with the best company.

Id.

Those ancient problems of the spherical roundness of the earth, the being of antipodes, and of the *habitableness* of the torrid zone, are abundantly demonstrated.

Ray.

As by the objective part of perfect happiness we understand that which is best and last, and to which all other things are to be referred; so by the formal part must be understood the best and last *habitude* of man toward that best object.

Norris.

It results from the very nature of things, as they stand in such a certain *habitude*, or relation to one another.

South.

Art is properly an *habitual* knowledge of certain rules and maxims.

Id.

The last fatal step is, by frequent repetition of the sinful act, to continue and persist in it, 'till at length it settles into a fixed confirmed *habit* of sin; which, being that which the apostle calls the finishing of sin, ends certainly in death; death not only as to merit, but also as to actual infliction.

Id.

Habitual evils change not on a sudden

But many days must pass and many sorrows.

Rowe's *Ulysses*.

There are among the statues several of Venus, in different *habits*.

Addison on Italy.

Thy ear, inured to charitable sounds,

And pitying love, must feel the hateful wounds

Of jest obscene, and vulgar ribaldry,

The ill-bred question, and the loud reply,

Brought by long *habitude* from bad to worse.

Must hear the frequent oath, the direful curse.

Prior.

Rocks and mountains, which in the first ages were high and craggy, and consequently then inconvenient for *habitation*, were by continual deterration brought to a lower pitch.

Woodward.

Internal graces and qualities of mind sanctify our natures, and render us *habitually* holy.

Atterbury.

The force of education is so great, that we may mould the minds and manners of the young into what shape we please, and give the impressions of such *habits*, as shall ever afterwards remain.

Id.

Such as live in a rarer air are *habituat*ed to the exercise of a greater moral strength.

Arbuthnot.

Powers celestial to each other's view

Stand still confest, though distant far they lie,

Or *habitants* of earth, or sea, or sky.

Pope.

The clergy should content themselves with wearing gowns and other *habiliments* of Irish drapery.

Swift.

In all the *habitudes* of life,

The friend, the mistress, and the wife,

Variety we still pursue.

Id.

The clergy are the only set of men who wear a distinct *habit* from others.

Id.

HABINGTON (William), an English poet and historian, was the son of Thomas Habington, esq. He was born in 1605, at Hendlip, in Worcestershire; and educated at St. Omer's. He died in 1654, and left several MSS. in the hands of his son. His printed works are, 1. Poems under the title of Castura. 2. The Queen of Arragon, a tragic-comedy. 3. Observations upon History. 4. The History of Edward IV. king of England, written in a very florid style, and published at the desire of Charles I.

HABIT is particularly used for the uniform garments of the religious, conformable to the rule and order whereof they make profession: as the habit of St. Benedict, of St. Augustine, &c. In this sense we say absolutely, such a person has taken the habit; meaning he has entered upon a noviciate in a certain order. So he is said to quit the habit, when he renounces the order. See Vow. The habits of the several religious are not supposed to have been calculated for singularity or novelty: the founders of the orders, who were at first inhabitants of deserts and solitudes, gave their monks the habits usual among the country people. Accordingly the primitive habits of St. Anthony, St. Hilarion, St. Benedict, &c., are described by the ancient writers as consisting chiefly of sheep skins, the common dress of the peasants of that time. The orders established in and about cities and inhabited places took the habit worn by other ecclesiastics at the time of their institution. What makes them differ so much from each other, as well as from the ecclesiastical habit of the present times, is, that they have always kept invariably to the same form; whereas the ecclesiastics and laics have been changing their mode on every occasion.

HAB'NAB, *adv.* *Hap ne hap, or nap; as would would, or ne would: will, nill, or ne will; that is, let it happen or not.* At random; at the mercy of chance; without any rule or certainty of effect.

He circles draws and squares,
With cyphers, astral characters;
Then looks 'em o'er to understand 'em,
Although set down *habnab* at random.

Hudibras.

HACHA, a town, province, and river of Granada, South America. The province was formerly of considerable extent, but is now much reduced, being only eight leagues in length from north to south, and four wide east and west. It has the Atlantic Ocean on the north, and Lake Maracaibo on the east. The river, which runs from south to north, was once famous for its pearl fisheries. It enters the Atlantic Ocean in lat. 11° 31' 30" N., and at the mouth stands the town of this name.

HACK, *v. a.* Sax. *hacan*; Dut. *hacken*; Fr. *hacher*, from Sax. *acape* an axe. To cut into small pieces; to chop; to cut slightly with frequent blows; to mangle with unskilful blows. It bears commonly some notion of contempt or malignity; to speak with hesitation.

It nedeth not you more to tellen
(To maken you to long to dwellen)
Of these like yates florishynges;
Ne of compaces, ne karvynges;
Ne the *hackyng* in masonries,
As corbettes and imageries.

Chaucer. House of Fame.

What a slave art thou, to *hack* thy sword as thou hast done, and say it was in fight? *Shakspeare.*

Richard the Second here was *hacked* to death. *Id.*
I'll fight 'till from my bones my flesh be *hacked*. *Id.*
Disarm them, and let them question; let them keep their limbs whole, and *hack* our English. *Id.*

One flourishing branch of his most royal root
Is *hacked* down, and his summer leaves all faded,
By Envy's hand, and Murder's bloody axe. *Id.*

He put on that armour, whereof there was no one piece wanting, though *hackt* in some places, bewraying some fight not long since passed. *Sidney.*

Burn me, *hack* me, hew me into pieces.

Dryden

Not the *hackt* helmet, nor the dusty field,
But purple vests, and flowery garlands please.

Addison.

But fate with butchers placed thy priestly stall,
Meek modern faith to murder, *hack*, and maul.

Pope.

Dost not thou know the fate of soldiers?

They're but ambition's tools, to cut a way
To her unlawful ends; and when they're worn,
Hacked, hewn with constant service, thrown aside
To rust in peace and rot in hospitals.

Southern's Loyal Brothers.

HACK, *v. n.*

Welsh, *hacknai*;

HACKNEY, *n. s. & v. a.* } Teut. *hackenye*; Fr.

HACQUETON, *n. s.* } *haquene*; old Fr.

haquat. To hackney; to become common; to prostitute: hackney, a hired horse; a prostitute; a hireling; any thing let out for hire: hacqueton, a piece of armour.

His *hackney*, which that was al pomeelegris,
So swatte that it was wonder for to see;
It seemed as he had priked miles thre.

Chaucer. The Clanones Yemannes.

He didde, next his white lere,
Of cloth of lake fin and clere,
Abreche and eke a sherte;
And next his sherte, an *haketon*.

Id. The Rime of Sire Thopas.

You may see the very fashion of the Irish horseman
in his long hose, riding shoes of costly cordwain, his
hacqueton, and his habergeon. *Spenser.*

He is long *hackneyed* in the ways of men.

Shakspeare.

Light and lewd persons were as easily suborned to make an affidavit for money, as post-horses and *hackneys* are taken to hire. *Bacon.*

These notions young students in physick derive from their *hackney* authors. *Harvey.*

That is no more than every lover

Does for his *hackney* lady suffer. *Hudibras.*

Who, mounted on a broom, the nag

And *hackney* of a Lapland hag,

In quest of you came hither post. *Id.*

Three kingdoms rung

With his accumulative and *hackney* tongue.

Roscommon.

Shall each spurgalled *hackney* of the day,
Or each new pensioned sycophant, pretend
To break my windows. *Pope.*

A wit can study in the streets;

Not quite so well, however, as one ought;

A *hackney* coach may chance to spoil a thought.

Id.

Thy coach of *hackney*, whisky, one horse chair.

Byron. Child Harold.

HACKET (John), bishop of Litchfield and Coventry, was born in 1592. In 1623 he was made chaplain to James I. and prebendary of Lincoln, and obtained several other promotions, but lost them during the commotions of 1645. He then lived retired at Chesham until the Restoration, when he recovered his preferments. In 1661 Charles II. made him bishop of Litchfield and Coventry. Finding the cathedral almost battered to the ground, he in eight years finished a church superior to the former, towards which he himself contributed £20,000. He also laid

out £1000 on a prebendal house. He died in 1670. He published, before he entered into orders, a comedy entitled *Loyola*, which was twice acted before King James I. After his death was published *A Century of his Sermons* on several remarkable Subjects, and *The Life of Archbishop Williams*, both in folio.

HACKLE, *n. s.* & *v. a.* } Probably from
HAG'GLE, *v. a.* & *v. n.* } Fr. *hacher*, or from
HAG'GLER, *n. s.* } hack, to cut. Hackle is raw silk, or any flimsy substance: to hackle, to dress flax: haggle, to cut, chop, or mangle: haggler, one that cuts; and, figuratively, one that is tedious in making a bargain: these are corruptions from hackle.

Suffolk first died, and York all *haggled* o'er,
Comes to him where in gore he lay insteeped.

Shakspeare.

Take the *hackle* of a cock or capon's neck, or a plover's top: take off one side of the feather, and then take the *hackle* silk, gold or silver thread, and make these fast at the bent of the hook. *Walton.*

HACKNEY, in geography, is the name of a very extensive and thickly populated parish, in the vicinity of London, in the hundred of Ossulton, Middlesex. It comprises several hamlets, amongst which are Upper and Lower Clapton on the north, Dalston, Shacklewell, and Kingsland on the west, and Homerton on the east. The old parish church of St. John's, of which but the tower now remains, was a fine Gothic edifice, built in the reign of Edward II. The new one, a fine modern structure on a larger scale, was begun in 1792, agreeably to an act of parliament; but the steeple was not erected till 1814, and, being found too light and weak to bear the fine peal of bells belonging to the church, the old tower was left standing, and in it the bells are now rung. In Wells-street is a new and handsome chapel of ease, erected on a piece of ground given by the Rev. Mr. Norris, after the design of Mr. J. Savage. Brooke House, now a receptacle for lunatics, was formerly the seat of the noble family whose name it bears; St. John's palace, an ancient house in Wells-street, now let out in small tenements, is believed to have been the residence of the prior of the order of St. John of Jerusalem; and south of Lea-bridge, in this parish, are the Temple mills, once the property of the knights templars, but now used as lead and corn mills, and to raise water for the supply of Clapton and Homerton. At the bottom of Hackney marsh, through which runs the river Lea, have been discovered some remains of an ancient and extensive stone causeway, which appears, from the coins found here, to have been one of the Roman highways through the island. The vicarage is valued at £20, and the rectory valued at £26 is a sinecure.

HACKNEY COACHES are said to derive their name from many of the Londoners, in the seventeenth century, residing at Hackney, and, in consequence, often hiring coaches and horses: in time, therefore, hired coaches in general became so called.—These first began regularly to ply under this name in London in 1625, when they were only twenty in number; and in 1635 they were

so much increased, that king Charles I. issued out an order of council to restrain them. In 1637 he allowed fifty hackney coachmen, each of whom might keep twelve horses. In 1652 their number was limited to 200; and in 1654 it was extended to 300. In 1661 400 were licensed, at £5 each annually. In 1694 700 were allowed, and taxed by the 5 & 6 of W. & M. at £4 a-year each. By 9 Anne, c. 23, 800 coaches were allowed in London and Westminster; but by 8 Geo. III., cap. 24, the number was increased to 1000, which are licensed by commissioners, and pay a duty of 5s. per week. They have been more lately increased to 1200. Hackney coachmen refusing to go at, or exacting more than, their limited hire, are subject to a forfeit of from 10s. to £3, which the commissioners have power to determine. Every hackney coach must have check strings, and every coachman plying without them incurs a penalty of 5s. The drivers must give way to persons of quality and gentlemen's coaches, under the penalty of £5. The duty arising from licenses to hackney coaches and chairs, in London, forms a branch of the king's perpetual revenue, governed by commissioners, and is a public benefit; as the expense of it is not felt, and its regulations have established a competent jurisdiction, whereby a very refractory race of men are kept in order. As tables of hackney coach fares and regulations may be had at every respectable stationer's it will be needless to give any further account of them.

HACQUET (Balthasar), an eminent naturalist, was born at Conquet, in Brittany, in 1740. He left France while young for Austria, and became professor of surgery at the Lyceum of Laybach, in Carniola, and perpetual secretary of the Imperial Society of Agriculture and the Arts. In 1788 the emperor of Germany made him professor of natural history at the University of Lemberg, and member of the council of mines at Vienna. He died in 1815. Besides *Travels in the Alps and Carpathian Mountains*, and a number of memoirs in periodical works, he was the author of *Oryctographia Carniolica*, or, the *Physical Geography of Carniola, Istria, and parts of the neighbouring countries, Leipsic, 1778—1789, 4 vols. 4to.*

HAD. The *prct.* and *part. pass.* of HAVE, which see. *I had better, you had better, &c.*, means the same as, *it would be better for me or you; or it would be more eligible; it is always used potentially, not indicatively: nor is have ever used to that import. We say likewise, it had been better or worse.*

For, certes our Lord Jesu Crist hath spared us so benignity in our follies; that if he ne *had* pitee on mannes soule, a sory song might we alle sing.

Chaucer. The Persones Tale.

*I had rather be a country servant maid,
Than a great queen with this condition.*

Shakspeare.

*Had we not better leave this Utica,
To arm Numidia in our cause? Addison's Cato.*

HADDINGTON, an ancient borough in a parish of the same name in East Lothian which joins with Jedburgh, Dunbar, Lauder, and North Berwick, in sending a member to parliament. it consists of four streets, which intersect each

other nearly at right angles. It is governed by a provost, three bailies, dean of guild, treasurer, twelve councillors, and seven deacons. It was the birth-place of J. Knox, the celebrated reformer. Before the Reformation it had an abbey, now in ruins, founded in 1178 by Ada, mother of king Malcolm IV., and William I. of Scotland. It has a manufacture of coarse woollens, two fairs, and a weekly market, the greatest in Scotland for grain. It is seventeen miles east of Edinburgh.

HAD'DOCK, *n. s.* Fr. *hadot*. A sea fish of the cod kind, but small.

The coast is plentifully stored with pilchards, herrings, and *haddock*. *Carac.*

HADDOCK. See **GADUS**.

HADDON (Dr. Walter) was born in 1516. He distinguished himself by writing a fine Latin style, which he acquired by a constant study of Cicero. He was a strenuous promoter of the Reformation under Edward VI., and succeeded bishop Gardiner in the mastership of Trinity Hall, Cambridge. He concealed himself in Mary's reign; but acquired the favor of queen Elizabeth, who sent him one of the three agents to Bruges in 1566, to restore commerce between England and the Netherlands. He was also engaged with Sir John Cheke in drawing up in Latin The Code of Ecclesiastical Law, published in 1571 by the learned John Fox, under the title of Reformation legum Ecclesiasticarum; his other works are published under the title of Lucubrations. He died in 1572.

HADELN, a fertile district of Hanover, at the mouth of the Elbe, forming a part of the province of Bremen. It has on its confines the Elbe, and the territory of Hamburg, and has an area of about 126 square miles. Population 16,000.

HADERSLEBEN, a district of Danish Sleswick, 680 square miles in extent, and containing 35,000 inhabitants. The number of parishes is sixty.

HADERSLEBEN, a town of the above district, situated on a bay of the Little Belt. Population 3200. It has a harbour for small vessels, and some trade; but the principal means of its support is the passage to Funen. Twenty-four miles east of Ribe.

HADES, sometimes signifies the invisible regions of the dead, sometimes the place of the damned, and sometimes the grave. In Greek authors it signifies the regions of the dead. See **HELL**.

HADLEY, a town of Suffolk, seated on the Preston. It has a handsome church, a chapel of ease, and a Presbyterian meeting-house. Large quantities of yarn are spun for the Norwich manufacture. On the top of the steeple, which affords a fine view of Essex, there is an iron pot originally placed there as a beacon.

HADRAMAUT, a province of Arabia, occupying the southern coast upon the Indian Ocean, from Yemen to Ommon. Many of the hilly districts are fertile, and this, along with the province of Yemen, formed the Arabia Felix of the ancients. Since trade has flowed in other directions, Hadramaut has fallen into a state of great decline. It continues, however, to export

frankincense, gum-arabic, dragon's blood, myrrh, and aloes (from Socotora). It has also a few manufactures of coarse cloths, carpets, and the knives called Jambea. The maritime trade is chiefly carried on by foreigners, the Arabs of Mascat. Both the coast and the interior are divided into a number of independent states.

HEMAGOGOS, among physicians, a compound medicine, consisting of fetid and aromatic simples, mixed with black hellebore, and prescribed in order to promote the menstrua and hæmorrhoidal fluxes; as also to bring away the lochia.

HEMANTHUS, the blood-flower, a genus of the monogynia order, and hexandria class of plants: nat. order ninth, spathaceæ. Involucrum hexaphyllous and multiflorous: cor. sex-partite superior; berry trilocular. Species fourteen; the principal are,

H. coccineus, with plain tongue-shaped leaves, rises about a foot high, with a stalk supporting a cluster of bright red tubulous flowers. It has a large bulbous root, from which in autumn come out two broad flat leaves of a fleshy consistence, shaped like a tongue, which turn backward on each side, and spread on the ground, so that they have a strange appearance all the winter. In the spring these decay; so that from May to the beginning of August they are destitute of leaves. The flowers are produced in the autumn, just before the leaves come out.

H. puniceus, with large spear-shaped waved leaves, grows about a foot high, and has flowers of a yellowish red color. These are succeeded by berries, which are of a beautiful red color when ripe. This species should be constantly kept in a dry stove. These plants are natives of the Cape of Good Hope, and do not propagate very fast in Europe, their roots seldom putting forth many off-sets. The best method of managing them is to have a bed of good earth in a bricked pit, where they may be covered with glasses, and in hard frost with mats and straw. The earth in the frame should be two feet deep, and the frame should rise two feet above the surface, to allow height for the flower-stems to grow. The roots should be planted nine or ten inches asunder; and in winter, if they are protected from frost, and not suffered to have too much wet, but in mild weather exposed to the air, they will flower every year, and the flowers will be much stronger than with any other management.

HÆMATEMESIS, in medicine, from *αἷμα*, blood, and *ἐμέω*, I vomit, signifies a vomiting of blood. The causes of hæmatemesis have been the subject of much speculation. The time of life in which it principally occurs, and the circumstance of being peculiar to the female sex, induced physicians to imagine that it was intimately connected with the menstrual flux, the suppression of which has generally been considered as the sole cause of the disease; it has been said to be a hæmorrhage vicarions of the menses. Dr. Cullen, after stating that a plethora in the vessels of the stomach, where there is a general plethoric state of the habit, although it might be supposed to give rise to hæmatemesis, is in fact not found

by experience to do so; and that such a plethoric state of the system is probably induced by the suppression of the menses; is at length compelled to admit that some particular circumstances of the stomach itself must be supposed to exist which 'determine an afflux of blood to that organ, and may therefore occur without any considerable or dangerous plethora prevailing in the system.' The peculiar circumstances, in this instance, he supposes to be the connexion and consent which we know to subsist between the uterus and the whole of the alimentary canal, and especially that principal part of it, the stomach.

The usual practice adopted for the cure of hæmatemesis consists in the use of refrigerant, or cooling medicines, as they have been called, such as the neutral salts; to which some have added the use of spermaceti and oleaginous matters. If the disease, notwithstanding the exhibition of these medicines, continued for some time, then powerful astringents and sedatives, such as alum, the tincture of muriated iron, digitalis, &c., were resorted to, with the occasional interposition of a gentle laxative, such as the castor oil.

The experience of Dr. James Hamilton, in the Royal Infirmary at Edinburgh, led him to connect hæmatemesis with a constipated state of the alimentary canal, and therefore to attempt the cure of the disease by the exhibition of cathartics. After having adopted this mode of treatment during a period of ten years, Dr. Hamilton thus states his opinion of its efficacy. 'I have followed the practice, which this case suggested, in the instances of the ailment which I have since met with; and my success has been so uniform, that I now lay it down as a certain position, that the proper exhibition of purgative medicines affords sure and effectual means of removing hæmatemesis.' The medicines which Dr. Hamilton employed with this view were various; combinations of calomel and jalap, aloetic pills, neutral salts, &c., occasionally aided by the use of injections.

Whether we may suppose the loaded bowels to impede the hepatic and abdominal circulation, and thus to occasion a venous plethora in the stomach and intestines; or whether the languid circulation in these parts, and the slow action of the bowels, may be alike the consequence of the general languor of the system; or whether any other hypothesis be resorted to, the value of the practical fact is neither diminished nor augmented.

Having discussed the ordinary form of hæmatemesis at some length, we have only a few words to add relative to some other modifications of the disease, which depend upon more serious disorder of the stomach itself, of other organs, or of the system at large. Success in the cure of these varieties of bloody vomiting is doubtful in the extreme, and very difficult to be attained; for the constitution itself is undermined in these cases, by acute disease, or by previous irregularities and intemperance, in addition to the local mischief.

The organic derangements of the stomach, which are accompanied by vomiting of blood, are those arising from wounds or other mechani-

cal injury to its structure, which in general are speedily fatal. These are included in the second species of Sauvages *Hæmatemesis traumatica*; to which may be added the ninth, or *H. cholericæ*, as far as regards its origin from corrosive poison swallowed; and the fourth, or *H. ab hyrudine*, in which the internal coat of the stomach has been wounded by a leech, swallowed in drinking ditch water. In cancer and scirrhus of the stomach, a blackish matter, resembling the grounds of coffee, is commonly ejected by vomiting; but, as this is not in a fluid state, it can scarcely be denominated hæmatemesis.

Morbid enlargements of the neighbouring viscera, the spleen, pancreas, and liver, aneurism of the aorta, and compression of that artery, have all been assigned as occasional causes of hæmatemesis. In the records of physic, Dr. Cullen observes, there are many instances of vomitings of blood, which were accompanied with a tumefied spleen, which had compressed the *vas breve*, and thereby prevented the return of venous blood from the stomach. It is also possible that an obstruction of the liver, resisting the free motion of the blood in the *vena porta*, may sometimes interrupt the free return of the venous blood from the vessels of the stomach, and thereby occasion a vomiting of blood; but the instances of this are neither so frequent, nor so clearly explained, as those of the former case. In the *morbus niger* of authors, and the *malena* of Sauvages, the black and grumous blood is sometimes thrown out by vomiting, as well as discharged downwards, and is considered as originating in a venous plethora in the intestinal canal, connected with obstructed viscera. This forms the twelfth species of Sauvages, or *H. atra*.

There are two or three conditions of the constitution in which hæmatemesis is liable to occur, and in which it is to be deemed a hopeless symptom. The first of these is the last stage of acute fevers, in which spontaneous hæmorrhage takes place from different parts of the body, and is usually considered as the most decided symptom of the malignancy and putrescency of the disease. In typhus, scarlet-fever, small-pox, &c., this sort of hæmorrhage occasionally closes the scene. Hence the aphorism of Hippocrates, '*qui sanguinem vomit, si quidem sine febre, salutare; si verò cum febre, malum.*' The other constitutional condition is that which is found in scurvy, and in the purpura hæmorrhagica, hæmorrhæa petechialis, or purples, as the disease has been variously denominated. In the highest degree of these maladies, blood flows from every part of the body, internal and external, where the cuticle or investing membrane is delicate and thin, and hæmorrhage from the stomach is one form of the discharge.

HÆMATOCELE, in surgery, denotes a swelling of the serotum, or of the spermatic cord, caused by blood. The term is derived from the Greek *αἷμα*, blood, and *κῆλη*, a tumor.

HÆMATYTES, the blood-stone, a hard mineral substance, red, black, or purple, but the powder of which is always red. It is found in masses, spherical, semi-spherical, pyramidal, or cellular, i. e. like a honeycomb. It contains a large quantity of iron: 40 lbs. of this metal have

been extracted from a quintal of stone; but the iron is of such a bad quality, that this ore is not commonly smelted. The great hardness of hæmatites renders it fit for burnishing metals.

HÆMATOPUS, the sea pye, in ornithology, a genus belonging to the order of grallæ. The beak is compressed, with an equal wedge-shaped point; the nostrils are linear; and the feet have three toes without nails. There is but one species, viz. the

H. ostralegus, or oyster-catcher, a native of Europe and America. It feeds upon shell-fish near the sea-shore, particularly oysters and limpets. On observing an oyster, which gapes wide enough for the insertion of its bill, it thrusts it in and takes out the inhabitant: it will also force the limpets from their adhesion to the rocks with sufficient ease. It also feeds on marine insects and worms. With us these birds are often seen in considerable flocks in winter: in summer they are met with only in pairs, though chiefly near the sea or salt rivers. The females lay four or five eggs, on the bare ground, on the shore, above high-water mark; they are of a greenish gray, blotched with black. The young are said to be hatched in about three weeks. These birds are pretty wild when in flocks; yet they are easily tamed, if taken young.

HÆMATOXYLON, or **HÆMATOXYLUM**, log-wood, or Campeachy wood; a genus of the monogynia order, and decandria class of plants, natural order thirty-third, lomentacæ: **cal.** quinquepartite: petals five: **caps.** lanceolated, unilocular, and bivalved: the valves navicular, or keeled like a boat. Of this genus there is only one species, viz.

H. Campechianum. It grows naturally in the bay of Campeachy at Honduras, and other parts of the Spanish West Indies, where it rises from sixteen to twenty-four feet high. The stems are generally crooked, and seldom thicker than a man's thigh. The branches, which come out on each side, are crooked, irregular, and armed with strong thorns, garnished with winged leaves, composed of three pairs of obscure lobes indented at the top. The flowers come in a racemus from the wings of the leaves, standing erect, and are of a pale yellowish color, with a purple impalement. They are succeeded by flat oblong pods, each containing two or three kidney seeds. The trees are cut up into billets or junks, the bark and white sap of which are chipped off, and the red part, or heart, is sent to England for sale. See **LOGWOOD**.

HÆMORRHAGIA, or **HÆMORRHAGE**; from *haima*, blood, and *ρρηναι*, to burst forth; in medicine, a flux of blood at any part of the body; arising either from a rupture of the vessels, when too full or too much pressed; or from an erosion of them, when the blood is too sharp and corrosive. **Hæmorrhagia**, among the ancient Greeks, was only used for a flux of blood at the nose; but the moderns extend the name to any flux of blood, whether by the nose, mouth, lungs, stomach, intestines, matrix, or any other part.

HÆMORRHOIDAL, an appellation given by anatomists to the arteries and veins going to the *intestinum rectum*.

HÆMORRHOIDS, or piles, an issue of

blood from the hæmorrhoidal vessels. See **MEDICINE** and **SURGERY**.

HEMUS, in ancient geography, a vast ridge, running from Illyricum towards the Euxine, so high as to afford a prospect both of the Euxine and Adriatic Seas.

HAEN (Anthony De), M.D., an eminent German physician of the eighteenth century. He was privy counsellor and physician to the empress Mary-Theresa, queen of Hungary and Bohemia. He was author of many works, of which the principal are his *Ratiò Medendi*, in 17 vols. 8vo., and a *Treatise on Magic*. He died in 1776.

HERETICO COMBURENDO, a writ which anciently lay against a heretic, who, having once been convicted of heresy by his bishop, and having abjured it, afterwards falling into it again, or into some other, was thereupon committed to the secular power. It is thought by some to be as ancient as the common law itself; however, the conviction of heresy by the common law was not in any petty ecclesiastical court, but before the archbishop in a provincial synod, and the delinquent was delivered up to the king to do with him as he pleased: so that the crown had a control over the spiritual power. But by 2 Hen. IV., cap. 15, the diocesan alone, without the intervention of a synod, might convict of heretical tenets; and unless the convict abjured his opinions, or if after abjuration he relapsed, the sheriff was bound *ex officio*, if required by the bishop, to commit the unhappy victim to the flames, without waiting for the consent of the crown. This writ was actually executed on two Anabaptists in the 7th of Elizabeth, and on two Arians in the 9th of James I. Sir Edward Coke was of opinion that this writ did not lie in his time; but it is now taken away by stat. 29 Car. II. cap. 9. But this statute does not take away or abridge the jurisdiction of Protestant archbishops or bishops, or any other judges of any ecclesiastical courts, in cases of atheism, blasphemy, heresy, or schism, and other damnable doctrines and opinions; but they may prove and punish the same according to his majesty's ecclesiastical laws, by excommunication, deprivation, degradation, and other ecclesiastical censures not extending to death, in such sort, and no other, as they might have done before the making of this act. See **HERESY**.

HAERLEM. See **HARLEM**.

HAERLEM MEER, a large lake of the Batavian republic, in the department of Amstel, between Haerlem, Amsterdam, and Leyden; navigable by boats.

HAR, an extensive bay or gulf of Pomerania, formed by the Oder, and separated from the Baltic by the islands of Usedom and Wallin. It is divided into the Great and Little Haf. Its length is thirty-six miles, and its breadth varies from one to nine miles. This is a common name on this coast for a gulf or bay.

HAFEZ (Khodja Schemseddin Mohammed), a popular Persian poet, flourished in the fourteenth century, and chiefly resided at Schiraz. His poetry consists of odes, mingling conviviality with love and sentiment. He declined the invitation of the sultan Ahmed to visit Bagdad.

'Two affectionate friends,' he said, 'two glasses of old wine, a tranquil indolence, a book, and a shady grove, are blessings which I would not sacrifice for all the happiness of this world or the next.' He died at Schiraz, where a monument was erected for him, which was overturned by an earthquake in October, 1825. The date of his death has been differently stated; but it may be fixed in 1399. Sir William Jones gave the public two of his odes in an English dress, which are extremely beautiful. We may also notice Nott's Select Odes of Hafez, translated into English verse, with the original text, 1787, 4to.; and Hindley's Persian Lyrics, from the Divan—I—Hafez, with Paraphrases in verse and prose, 1800, 4to.

HAFT, *n. s. & v. a.* Sax. *hæft*; Dutch, *heft*; from to have, or hold. A handle; that part of any instrument that is taken into the hand. To haft is to set in a handle as the blade of a knife.

The knyf I know wel iknowe :

* * * * *

That wele I woot there is noon like to seek al Cristen londes

For three precious stoneyes been within the *haft*
Perfitlick yecouchit, and sotillick by craft
Endeudit in the *haft* and that right coryously
A saphir and a salidone, and a rich ruby.

Chaucer. The Merchant's Second Tale.

This brandished dagger

I'll bury to the *haft* in her fair breast. *Dryden.*

These extremities of the joints are the *hafts* and handles of the members. *Id. Dufresnoy.*

A needle is a simple body, being only made of steel; but a sword is a compound, because its *haft* or handle is made of materials different from the blade.

Watts.

HAG, *n. s. & v. a.*

HAGGARD, *adj.*

HAG'GARD, *n. s. & adj.*

HAG'GARDLY, *adv.*

HAG'GISH, *adj.*

Saxon, *hægerre*, a goblin; Dut. *heckle*, a witch; Ger. *hager*. A witch; fury; enchantress; or an ugly old woman: haggard signifies wild; irreclaimable; thin; deformed with passion; lean; rugged; or, perhaps, ugly. A haggard is any thing untameable; a species of hawk: to hag is to torment, or harass with terror.

Does the wild haggard tower into the sky,
And to the south by thy direction fly? *Sandys.*

As haggard hawk, presuming to contend
With hardy fowl above his able might,

His weary pounces all in vain doth spend,
To truss the prey too heavy for his flight.

Færie Queene.

I will be married to a wealthy widow,
Ere three days pass, which has as long loved me
As I have loved this proud-disdainful haggard.

Shakspeare.

Out of my door, you witch! you *hag*, you baggage,
you polcat, you runnion! *Id.*

She's too disdainful;

I know her spirits are as coy and wild,
As haggard as the rock. *Id.*

But on us both did haggish age steal on
And wore us out of act. *Id.*

Thus spoke the impatient prince, and made a
pause:

His foul *hags* raised their heads, and clapt their
hands;

And all the powers of hell, in full applause,
Flourished their snakes, and tost their flaming
brands. *Crashaw.*

That makes them in the dark see visions,
And *hag* themselves with apparitions. *Hudibras.*

I enlarge my discourse to the observations of the
aires, the brancher, the ramish hawk, and the haggard.
Walton.

I spied a withered *hag*, with age grown double,
Picking dry sticks, and mumbling to herself.

Otway's Orphan.

Such affectations may become the young;
But thou, old *hag*, of threescore years and three,
Is shewing of thy parts in Greek for thee? *Dryden.*

For her the rich Arabia sweats her gum;
And precious oils from distant Indies come,
How haggardly see'er she looks at home. *Id.*

Fearful besides of what in fight had passed,
His hands and haggard eyes to heaven he cast. *Id.*

A haggard carrion of a wolf, and a jolly sort of dog,
with good flesh upon's back, fell into company
together. *L'Estrange.*

How are superstitious men haggad out of their wits
with the fancy of omens, tales, and visions. *Id.*

Where are the conscious looks, the face now pale,
Now flushing red, the downcast haggard eyes,
Or fixt on earth, or slowly raised! *Smith.*

Beneath the gloomy covers of an yew,
In a dark grot, the baleful haggard lay,
Breathing black vengeance, and infecting da.

Gorth.

HAGAR, Heb. *הגר*, i. e. a stranger, a native of Egypt, the servant of Sarah, concubine of Abraham, mother of Ishmael, and ancestor of the Arabians. Her history, and the repeated divine interpositions for the preservation of her and her son, are recorded in Gen. xvi. and xxi.

HAGARENES, or HAGARITES, a branch or tribe of the descendants of Ishmael, so named from his mother. Some make the name synonymous with Ishmaelites, Arabians, and Saracens; but Asaph, in Psalm lxxxiii, ver. 6, mentions them as distinct from the other Ishmaelites. They dwelt in Arabia Felix, according to Pliny. Strabo joins them with the Nabathæans, and Chaylotæans, whose habitation was rather in Arabia Deserta. Others think their capital was Petra. or Agra, and, if so, they dwelt in Arabia Petraa. The Reubenites, in the days of Saul, made war with the Hagarites, and became masters of their country east of Gilead. This therefore was the true country of the Hagarites. In the reign of Jeroboam II. 44,760 Israelites defeated them, and took 100,000 prisoners, with immense booty (1 Chron. v. 10, 19—21). When Trajan came into Arabia he besieged the capital of the Hagarites, but could not take it. The Hagarites valued themselves upon their wisdom. See Baruch, iii. 23.

HAGEDORN (Frederick De), a celebrated German poet, born at Hamburg, where his father was resident for Frederick IV. king of Denmark, in 1708. He finished his studies at Jena; and, in 1728, published a number of poetical pieces in Germany, which were well received. He afterwards came to England, and, at his return, was made secretary to the English Hamburg Company. In 1738 he published his Fables and Tales, the first German collection of the kind. He afterwards published Moral Poems, Epigrams, and five books of Songs;

which of all his poetical pieces are most esteemed. He died in 1754.

HAGGAI, Heb. **חגי**, i. e. pleasant, the tenth of the minor prophets, was born, in all probability, at Babylon, A. M. 3457, whence he returned with Zerubbabel. By command from God (Ezra v. 1, 2, &c.) he exhorted the Jews, after their return from the captivity, to finish the rebuilding of the temple, which they had intermitted for fourteen years. To encourage them, he assured them that the glory of this latter house should be greater than the glory of the former; which was accordingly fulfilled, when Christ honored it with his presence; for, with respect to the building, the latter was nothing in comparison of the former. The Jews say that he died in the last year of the reign of Darius, at the same time with the prophets Zechariah and Malachi. Epiphanius says, he was buried at Jerusalem with the priests. The Greeks keep his festival on the 16th of December, and the Latins on the 4th of July.

HAGGESS *n. s.* From hog or hack. A mass of meat, generally pork, chopped, and enclosed in a membrane. In Scotland it is commonly made in a sheep's maw of the entrails of the same animal, cut small, with suet and spices.

HAGIOGRAPHIA, from **ἅγιος**, holy, and **γραφω**, to write. Those books of scripture called by the Jews Cetubim. The name is very ancient, St. Jerome making mention of it. The Jews divide the sacred writings into three classes:—1. The law, or the five books of Moses; 2. The Prophets, which they call Neviim; and the Cetubim, **כתובים**, called by the Greeks, &c. **Hagiographa**; comprehending the book of Psalms, Proverbs, Job, Daniel, Ezra, Nehemiah, Chronicles, Canticles, Ruth, Lamentations, Ecclesiastes, and Esther. Kimchi, Maimonides, and Elias Levita, call these books the Writings, by way of eminence.

HAGUE, a town of South Holland, in the department of Delft. In Latin it is called **Haga Comitis**; in French, **La Haye**; in Dutch, **der Haag**, or **'S. Graavenhage**, i. e. the Earl's Grove, from the wood near which it is built, and in which the earls of Holland had a country house. It is one of the most considerable towns in the Netherlands, pleasantly situated, and exceedingly beautiful. It stands in a dry soil, higher than the surrounding country; the air is tolerably pure, and the environs and approaches superior to those of most towns in Holland. From the sea the access is by a long and beautiful avenue, nearly two miles in length; on the land side the approach is by a road leading from the south-east, on which there is a pleasant prospect of the Hague and the woods to the north of the town.

The principal streets are straight, wide, and handsome, paved with a light-colored brick, and containing canals, trees, and neat bridges. The largest is the Voorhout, and contains numerous elegant edifices; but the most attractive part is the public square, called the Vyverburg, of an oblong form, with a beautiful walk, and an avenue of trees on one side, while the other is bordered by a large basin of water. The old palace is an enormous pile of building, present-

ing specimens of almost all species of architecture; it contains a number of valuable paintings; and was once the meeting place of the states-general. The mansion of the family of Bentuck, that of prince Maurice, and the new palace begun by William III., are all worth attention. The number of churches is fourteen; and there are several charitable institutions.

In the environs of the Hague are a number of villas; but their principal ornament is the palace of the Orange family, a mile to the north of the town. The wood, principally composed of stately oaks, two English miles in length, and three quarters of a mile in breadth, is full of labyrinths and elegant garden ground. The house has nothing princely, except some public rooms, and a gallery of paintings. At a distance of about a mile and a half in a south-east direction is the castle of Ryswyck, which gave name to the well-known treaty of 1697.

The Hague being deprived of the residence of the seat of government, on the invasion of the French in 1795, did not recover the disadvantage until several years after the re-instatement of the Orange family in 1813. Its inhabitants took an early and active part in the insurrection against the French in the latter part of that year, after the battle of Leipsie; and the prince of Orange arrived here from England on the 30th of November. The Hague is now, along with Brussels, the alternate residence of the king of the Netherlands, and legislature. A manufacture of porcelain, and the printing of French books, are the chief branches of industry. It never was a place of trade. The population was computed in 1817 at 42,000. It is twelve miles north-west of Rotterdam, and thirty-two south-west of Amsterdam. Long. 4° 23' E., lat. 52° 4' N.

HAGUE (Charles), Mus. Doct., was born at Tadcaster, Yorkshire, in 1769. At ten years old he was sent to Cambridge, where his brother then resided, for the purpose of instruction, and became the pupil of Mahini, and the elder Hellenaal. In 1785 he came to London, where he had the benefit of Saloman's and Dr. Cooke's instructions. In 1799, having taken the degree of music-bachelor four years previously, he succeeded Dr. Randall in the professorship of music at Cambridge. He set to music the ode for the installation of his royal highness the duke of Gloucester as chancellor of the university. His other compositions are, *By the Waters of Babylon*, an anthem, and a great variety of glees, &c., remarkable for the purity of their harmony. Dr. Hague died June 18th, 1821.

HAGUENAU, a considerable town of France, in Alsace, anciently an imperial town. It was taken by the French in 1673; the imperialists retook it in 1702; after which it was several times taken and retaken by both parties; but at last the French obtained possession of it in 1706. It is divided by the Motter into two parts, and is seated in the Forest of Haguenau, fifteen miles north of Strasburg, and 255 east of Paris. Near it the French in December, 1793, defeated the allied army, and took 500 prisoners, with sixteen pieces of cannon. It has manufactures of tobacco, madder, and earthenware. About 400 acres of the town was burnt to the ground by

accident in 1800. Population 7000. Twenty-one miles north of Strasburg.

HAH, interj. An expression of sudden effort. Her coats tucked up, and all her motions just, She stamps, and then cries *hah!* at every thrust.

Dryden.

HAHN (Simon Frederick), a celebrated German historian. At ten years of age he was not only far advanced in the Latin, but understood several living languages. At fourteen he delivered a speech on the origin of the cloister at Bergen, his birth-place, which was printed; and in 1708 he published a Continuation of Meibomius's Chronicle of Bergen. After having for several years given public lectures at Halle, he became, at the age of twenty-four, professor of history at Helmstadt; and was at length counsellor, historiographer, and librarian, to George I. He died in 1729, aged thirty-seven. Besides several other works, he wrote, 1. The History of the Empire, vol. I.; 2. *Collectio Monumentorum Veterum et Recentium Ineditorum*, 2 vols. 8vo.

HAIL, interj. & v. a. } Saxon, *hæl*, health;
HALE, adj. } *hail*, therefore, is the same as *salve* of the Latins, or *hygieinê* of the Greeks, health be to you.—Johnson. A term of salutation now used only in poetry; health be to you. It is used likewise to things inanimate. To hail is to salute, or welcome; to approach with reverence; to call to: hale, healthy; sound.

Anon, as I hem overtoke, I said:
Heile, frendes! whither purpose ye to wend.

Chaucer. Court of Love.

My seely sheep like well below,
For they been hale enough I trow,
And liken their abode.

Spenser.

Hail, hail, brave friend!
Say to the king the knowledge of the broil. *Shaksp.*
Her sick head is bound about with clouds:
It does not look as it would have a hail,
Or health wished in it, as on other morns.

Ben Jonson.

Hail active Nature's watchful life and health!

Her joy, her ornament, and wealth!

Hail to thy husband Heat and thee!

Thou world's beauteous bride, the lusty bridegroom he!

Cowley.

The angel hail

Bestowed, the holy salutation used

Long after to blest Mary, second Eve. *Milton.*

Farewell, happy fields,

Where joy for ever dwells! *hail* horrors! hail

Infernal world! and thou profoundest hell

Receive thy new possessor! *Id.*

All hail, he cried, thy country's grace and love!

Once first of men below, now first of birds above.

Dryden.

Thrice call upon my name, thrice heat your breast,
And hail me thrice to everlasting rest. *Id.*

A galley drawing near unto the shore was hailed by a Turk, accompanied with a troop of horsemen. *Knolles.*

Hail to the sun! from whose returning light

The cheerful soldier's arms new lustre take. *Rowe.*

Some of these wise partizans concluded the government had hired two or three hundred hale men, to be pinioned, if not executed, as the pretended captives.

Addison.

His stomach too begins to fail;

Last year we thought him strong and hale,

But now he's quite another thing:

I wish he may hold out 'till Spring. *Swift.*

HAIL, n. s. & v. n. } Sax. *hagel*. Drops of
HAIL-SHOT, n. s. } rain frozen in their fall;
HAIL-STONE, n. s. } ing: hail-shot are small-
HAIL'Y, adj. } shot scattered like hail;

hail-stone, a simple particle or ball of hail: *haily* showers consist partially or entirely of hail.

My people shall dwell in a peaceful habitation when it shall hail, coming down on the forest.

Isa. xxxii. 19.

You are no surer, no,

Than is the coal of fire upon the ice,

Or *hail-stone* in the sun.

Shakespeare.

The master of the artillery did visit them sharply with murdering *hail-shot*, from the pieces mounted towards the top of the hill.

Hayward.

Thunder mixed with hail,

Hail mixed with fire, must rend the Egyptian sky.

Milton.

The sulphurous hail

Shot after us in storm, o'erblown hath laid

The fiery surge that from the precipice

Of Heaven received us falling. *Id. Paradise Lost.*

Hard *hail-stones* lie not thicker on the plain,

Nor shaken oaks such showers of acorns rain.

Dryden.

From whose dark womb a rattling tempest pours,
Which the cold North congeals to *haily* showers.

Pope.

HAIL, in natural history, a meteor generally defined frozen rain, but differing from it in that the hailstones are not formed of single pieces of ice, but of many little spherules agglutinated together. Neither are these spherules all of the same consistence; some being hard and solid like perfect ice; others soft, and mostly like snow hardened by a severe frost. Sometimes the hailstone has a kind of core of this soft matter; but more frequently the core is solid and hard, while the outside is formed of a softer matter. Hailstones are of various figures; some round, others pyramidal, crenated, angular, thin, and flat, and some stellated, with six radii like the small crystals of snow. Natural historians record various instances of surprising showers of hail, in which the hailstones were of extraordinary magnitude. Mezeray, speaking of the war of Louis XII. in Italy in 1510, relates, that there was for some time a horrible darkness, thicker than that of night; after which the clouds broke into thunder and lightning, and there fell a shower of hailstones, or rather (as he calls them) pebble stones, which destroyed all the fish, birds, and beasts, of the country. It was attended with a strong smell of sulphur; and the stones were of a bluish color, some of them weighing 100 lbs. Hist. de France, tom. II. p. 339. At Lisle in Flanders, in 1686, hailstones fell of a very large size; some of which contained in the middle a dark brown matter, which, thrown on the fire, gave a very great report. Philosophical Transactions, No. 203. Dr. Halley and others relate, that in Cheshire, Lancashire, &c., April 29th, 1697, a thick black cloud, coming from Caernarvonshire, disposed the vapors to congeal in such a manner, that for about the breadth of two miles, which was the limit of the cloud, in its progress for sixty miles, it did inconceivable damage; not only killing all sorts of fowls, and other small animals, but splitting trees, knocking down horses and men, and even ploughing up

the earth; so that the hailstones buried themselves under ground an inch or an inch and a half deep. The hailstones, many of which weighed five ounces, and some half a pound, being five or six inches about, were of various figures: some round, others half round; some smooth, others embossed and crenated; the icy substance of them was very transparent and hard, but there was a snowy kernel in the middle of them. In Hertfordshire, May 4th, 1697, after a severe storm of thunder and lightning, a shower of hail succeeded, which far exceeded the former: some persons were killed by it, their bodies beaten all black and blue; vast oaks were split, and fields of rye cut down as with a scythe. The stones measured from ten to thirteen or fourteen inches about. Their figures were various, some oval, others picked, some flat. *Philosophical Transactions*, No. 229. Hail, so far as has been discovered, never produces any beneficial effect. Rain and dew invigorate and give life to the whole vegetable tribe; frost, by expanding the water contained in the earth, pulverises and renders the soil fertile; snow covers and preserves the tender vegetables from being destroyed by too severe a frost. But hail does none of these. In winter it lies not sufficiently close to cover vegetables from the nipping frosts; and in spring and summer it not only has a chilling and blasting effect, but often does great damage to the more tender plants by the weight of the stones. In great hail storms the damage done in this manner is prodigious. Hail is one of the natural phenomena for which it is difficult to account in any satisfactory manner. It is certain that, on the tops of mountains, hailstones, as well as drops of rain, are very small, and continually increase in bulk, till they reach the lower grounds. It would seem, therefore, that during their passage through the air they attract the congealed vapor, which increases them in size. But here we are at a loss how they come to be solid hard bodies, and not always soft, and composed of many small stars like snow. The flakes of snow, no doubt, increase in size as they descend, as well as the drops of rain or hailstones; but why should the one be in soft crystals, and the other in large hard lumps, seeing both are produced from congealed vapor? Some modern philosophers ascribe the formation of hail to electricity. Signior Beccaria supposes hail to be formed in the higher regions of the air, where the cold is intense, and where the electric matter is very copious. In these circumstances, a great number of particles of water are brought near together, where they are frozen, and in their descent collect other particles, so that the density of the substance of the hailstone grows less and less from the centre; this being formed first in the higher regions, and the surface being collected in the lower. Drops of rain and hail agree in this, that the more intense the electricity that forms them, the larger they are. Motion is known to promote freezing, and so the rapid motion of the electrified clouds may produce that effect. A more intense electricity also, he thinks, unites the particles of hail more closely than the more moderate electricity does those of snow. In like manner we see thunder

clouds more dense than those that merely bring rain; and the drops of rain are larger in proportion, though they fall not from so great a height.

HAILBRON, a strong town of Germany in Wirtemberg, famous for its baths; seated on the Neckar, five miles north-east of Stuttgart. Long. 9° 25' E., lat. 49° 19' N.

HAILES, *LORD*. See **DALRYMPLE**.

HAILLAM (Bernard de Girard), lord of, a celebrated French historian. After having made some figure in the literary world, Charles IX. made him historiographer of France, in 1571. His history of France extends from Pharamond to the death of Charles VII., and is the first complete history of that kingdom composed in the French tongue. He was honored by Henry III. with several marks of favor. He died at Paris in 1610.

HAINAN, one of the most considerable islands of Asia, subject to China, and belonging to the province of Quang-ton. It has on the north the province of Quang-si; on the south the channel between the bank Paracel and the east coast of Cochin China; on the west the same kingdom and part of Tong-king; and on the east the Chinese Sea. Its extent from east to west is between sixty and seventy leagues, and from north to south forty-five; and about 480 miles in circumference. Kaun-tehou-fou is the capital. Hainan lies near San-cian, between 18° and 20° N. lat.

HAINAULT, an inland province of the Netherlands, bounded on one side by the French frontier, and on the other sides by Flanders, South Brabant, and the province of Namur. It has a superficial extent of 1700 square miles, beautiful undulating plains, and a fruitful soil: it is watered by the Scheldt, the Sambre, and the Haine. To the east it is woody; but corn and valuable pastures are found every where. The mineral productions are iron, lead, and marble, and coal in large quantities. The manufactures are woollens, cottons, linen, lace, glass, iron and earthenware. Enghein, Senefie, Steinkirk, Fleurus, Malplaquet, Fontenoy, and other scenes of celebrated conflicts, are all in this province. The chief towns, Tournay, Mons, and Charleroi, give name to the three districts of the province, which sends eight deputies to the representative assembly of the Netherlands. In former ages this was called the county of Hainault, and, in its most extensive sense, comprised a considerable part of what is now the French departments of the North and of the Ardennes; a country still sometimes called French Hainault. The treaty of 1814 gave the Netherlands this province, as it had been formerly held by Austria; but that of 1815 added to it the cantons of Beaumont, Merbe-le-Chateau, and Dour, formerly belonging to French Hainault. The population of the whole province is 473,000.

HAIR, *n. s.*

HAIR-BRAINED, *adj.*

HAIR-BREADTH, *n. s.*

HAIR-CLOTH, *n. s.*

HAIR-LACE, *n. s.*

HAIR-LESS, *adj.*

HAIR-INESS, *n. s.*

HAIR-Y, *adj.*

Saxon hap. One of the common teguments of the body, found upon all the parts of the body, except the soles of the feet and palms of the hands. The compounds have varieties of mean-

ing, most of which are obvious, except hair-brained, which should rather be written hare-brained, and which means inconstant, unsettled, wild as a hare. Wild; irregular; unsteady. Hair-breadth, hair and breadth, a very small distance; the diameter of a hair. A miraculous escape is called a hairbreadth escape. Haircloth is stuff made of hair very rough, which is worn for purposes of mortification or self-denial. Hairlace, hair and lace. The fillet with which women tie up their hair. Hairless, hairiness, and hairy, are descriptive of the state of being covered with hair or deprived of it.

Seven hundred chosen men left-handed could sling stones at an *hairbreadth*, and not miss.

Judges xx. 16.

And every child ware, of leves grene
A fresh chaplet upon his *haires* bright.

Chaucer. The Floore and the Lease.

Hire bright *here* kembed was, untressed all.

Id. The Knight's Tale.

Ne she was gaie, freshe, ne jolife,

But semed to be full ententif

To gode workes and to faire :

And therto she had on an *haire*.

Id. Romaunt of the Rose.

Naughty lady,

These *hairs* which thou do'st ravish from my chin,

Will quicken and accuse thee. *Shakspeare.*

Much is breeding ;

Which, like the coursers' *hair*, hath yet but life,

And not a serpent's poison. *Id.*

I spoke of most disastrous chances,

Of moving accidents by flood and field ;

Of *hairbreadth* 'scapes in the imminent deadly breach.

Id.

He is a curer of souls, and you a curer of bodies :
if you should fight you go against the *hair* of your profession. *Id.*

If thou takest more

Or less than just a pound ; if the scale turn

But in the estimation of a *hair*,

Thou diest. *Id.*

She his *hairy* temples then had rounded

With coronet of flowers. *Id.*

White beards have armed their thin and *hairless*
scalps

Against thy majesty. *Id.*

Let's leave this town ; for they are *hairbrained*
slaves,

And hunger will enforce them be more eager. *Id.*

The custom of their ancestors they slight

And change their shirts of *hair* for robes of gold.

Bancroft's fall of Mortimer.

Some worms are commonly resembled to a woman's
hairlace or fillet, thence called *tanizé*, *Harvey.*

A *hair* 'twixt south and south-west side,

He could distinguish and divide

On either which he would dispute

Confute, change hands, and still confute.

Hudibras.

He judges to a *hair* of little indecencies, and knows
better than any man what is not to be written.

Dryden.

Storms have shed

From vines the *hairy* honours of their head. *Id.*

Shall the difference of *hair* only, on the skin, be a
mark of a different internal constitution between a
changeling and a drill ? *Locke.*

It is composed of reeds and parts of plants woven
together, like a piece of *haircloth*. *Grew.*

Far up the stream the twisted *hair* he throws,
Which down the murmur'ing current gently flows.

Gay's Rural Sports.

If Molly happens to be careless,

And but neglects to warm her *hairlace*,

She gets a cold as sure as death. *Swift*

Her brow was overhung with coins of gold,

That sparkled o'er the auburn of her *hair*,

Her clustering *hair* whose longer locks were rolled

In braids behind, and though her stature were

Even of the highest for a female mould,

They nearly reached her heel. *Byron. Don Juan.*

HAIR consists of small filaments issuing out of the pores of the skins of animals; and serving most of them as a covering. See ANATOMY. Hair grows longest on the head, chin, and breast; in the arm-pits, and about the privities. Hairs ordinarily appear round or cylindrical; but the microscope also discovers triangular and square ones; which diversity of figure arises from that of the pores, to which the hairs always accommodate their form. Their length depends on the quantity of the proper humor to feed them, and their color on the quality of that humor: whence, at different stages of life, the color usually differs. Their extremities split into two or three branches, especially when kept dry, or suffered to grow too long; so that what appears only a single hair to the naked eye, seems a brush to the microscope. The hair of a mouse, viewed by Mr. Derham with a microscope, seemed to be one single transparent tube, with a pith made up of fibrous substances, running in dark lines, in some hairs transversely, in others spirally. The darker medullary lines, he observes, were small fibres convolved, and lying closer together than in the other parts of the hair. They run from the bottom to the top of the hair; and, he imagines, may serve to make a gentle evacuation of some humor out of the body. Hence the hair of hairy animals may not only serve as a fence against cold, &c., but as an organ of insensible perspiration, &c. Citizen Mongé has made some curious observations on hair and wool. The surfaces of these bodies, he says, are not smooth; they seem to be formed rather of small laminae placed over each other, in a slanting direction from the root towards the point, like the scales of fish; or of zones placed one upon another, as in the horns of animals. When a hair is laid hold of by the root in one hand and drawn between the fingers of the other, from the root towards the point, scarce any friction or resistance is perceived, and no noise is heard; but if, grasping it by the point, it be passed in the same manner between the fingers of the other hand, from the point towards the root, a resistance is felt, a tremulous motion is evident to the touch, and a noise may be distinctly heard. It is obvious, therefore, that the texture of the surface of hair is not the same from the root towards the point, as it is from the point towards the root. These observations are equally applicable to the filaments of wool. The surface of these bodies is therefore formed of rigid laminae laid upon each other like tiles, from the root to the point. And it is this structure which is the principal cause of the disposition to felting, which the hair of animals generally possess.

The ancients held the hair a sort of excre-

ment, fed only with excrementitious matters, and no proper part of a living body. They supposed it generated of the fuliginous parts of the blood exhaled by the heat of the body to the surface, and there condensed in passing through the pores. Their chief reasons were, that the hair being cut will grow again, even in extreme old age, and when life is very low: that in hectic and consumptive people, where the rest of the body is continually emaciating, the hair thrives; nay, that it will even grow again in dead carcases. They added that hair does not feed and grow like the other parts, by intromission, i. e. by a juice circulating within it; but, like the nails, by juxtaposition. But the moderns are agreed, that every hair properly and truly lives, and receives nutriment to fill it like the other parts; which they prove hence, that the roots do not turn gray in aged persons sooner than the extremities, but the whole changes color at once; which shows that there is a direct communication, and that all the parts are affected alike. In strict propriety, however, it must be allowed, that the life and growth of hairs is of a different kind from that of the rest of the body; and is not immediately derived therefrom, or reciprocated therewith. They derive their food from some juices in the body, but not from the nutritious juices of the body; whence they may live, though the body be starved. Wulferus, in the Philosophical Collections, gives an account of a woman buried at Norimberg, whose grave being opened forty-three years after her death, hair was found issuing forth plentifully through the clefts of the coffin. The cover being removed, the whole corpse appeared in its perfect shape; but, from the crown of the head to the sole of the foot, covered over with thick set hair, long and curled. The sexton going to handle the upper part of the head with his fingers, the whole fell at once, leaving nothing in his hand but a handful of hair: there was neither skull nor any other bone left; yet the hair was solid and strong.

By the Jews hair was worn naturally long, just as it grew; but the priests had theirs cut every fortnight, while waiting at the temple: they used scissars only. The Nazarites, while their vow continued, were forbidden to touch their heads with a razor. See NAZARENE. The falling off of the hair, or a change of its color, was regarded amongst the Hebrews as a sign of the leprosy. Black hair was esteemed by them as the most beautiful. Absalom's hair was cut once a year, and is said to have weighed 200 shekels, or 31 ozs. The law of God gives no particular ordinances with respect to the hair. The hair of both Jewish and Grecian women engaged a principal share of their attention, and the Roman ladies seem to have been no less curious with respect to theirs. They generally wore it long, and dressed it in various ways, ornamenting it with gold, silver, pearls, &c. On the contrary, the men amongst the Greeks and Romans, and amongst the later Jews, wore their hair short, as may be collected from books, medals, statues, &c. This formed a principal distinction in dress betwixt the sexes. This observation illustrates a passage in St. Paul's

epistle to the Corinthians (1 Cor. ix. 4—6), where he forbids the Corinthian women, when praying by divine inspiration, to have their hair dishevelled; because this made them resemble the heathen priestesses, when actuated by the pretended influence of their gods. Amongst the Greeks, both sexes, a few days before marriage, cut off and consecrated their hair as an offering to their favorite deities. It was also customary among them to hang the hair of the dead on the doors of their houses previous to interment. They likewise tore, cut off, and sometimes shaved their hair, when mourning for their deceased friends, which they laid upon the corpse or threw into the pile, to be consumed together with the body. The ancients imagined that no person could die till the topmost hair was cut off; and this act they supposed was performed by the invisible hand of death, or Iris, or some other messenger of the gods. Thus Virgil describing the death of Dido, lib. iv says,

Nam quia nec fato, meritâ nec morte peribat;
Sed misera ante diem, subitoque accensa furor;
Nondum illi flavum Proscipini vertice cinem
Abstulerat, Stygioque caput damnaverat Orco.
Ergo Iris croceis per cælum roscida pennis,
Mille trahens varios adverso Sole colores,
Devolat, et supra caput astiuit: Hunc ego Diti
Sacrum jussa fero, teque isto corpore solvo.
Sic ait, et dextrâ cinem secat: omnis et unâ
Dilapsus calor, atque in ventos vita recessit.

Whatever was the fashion, with respect to the hair, in the Grecian states, slaves were forbidden to imitate the freemen. Their hair was always cut in a particular manner, called *θριξ ἀνδραποδική*, which they no longer retained after they procured their freedom. Both the Greeks and Romans wore false hair. The ancient Gauls esteemed it an honor to have long hair; hence the appellation *Gallia Comata*. Julius Caesar, on subduing the Gauls, made them cut off their hair, as a token of submission. In imitation of this, such as afterwards quitted the world, to live in cloisters, had their heads shaven, to show that they bid adieu to all earthly ornaments, and made a vow of perpetual subjection to their superiors. The ancient Britons were proud of the length and beauty of their hair, and were at much pains in dressing it. Some of them carried this to an extravagant height. A young warrior who was taken prisoner, and condemned to be beheaded, requested that no slave might be permitted to touch his hair, which was remarkably long and beautiful, and that it might not be stained with his blood. Not content with the natural color of their hair, which was commonly fair or yellow, they used washes to render it still brighter. One of these was a composition of lime, the ashes of certain vegetables, and tallow. They used various arts also to make the hair of their heads grow thick and long; which last was considered as a mark of dignity and noble birth. Boadicea, queen of the Iceni, is described by Dio with very long hair, flowing over her shoulders, and reaching down below the middle of her back. The Britons shaved their beards, all but their upper lips; the hair of which they, as well as the Gauls, allowed to grow to a very in-

convenient length. In after times, the Anglo-Saxons and Danes, also considered fine hair as one of their greatest ornaments, and were at great pains in dressing it. Young ladies before their marriage wore their hair uncovered and untied, flowing in ringlets over their shoulders; but as soon as they were married they cut it shorter, tied it up, and put on a head-dress. To have the hair entirely cut off was so great a disgrace, that it was a punishment inflicted on women guilty of adultery. The Danish soldiers who were quartered upon the English, in the reigns of Edgar and of Ethelred II, were particularly attentive to the dressing of their hair; which they combed at least once every day, and thereby captivated the affections of the English ladies. Gregory of Tours assures us, that, in the royal family of France, it was long the peculiar mark and privilege of kings and princes of the blood to wear long hair, dressed and curled: all others wore it polled, or cut round, in sign of inferiority. Some say that there were different cuts for all the different qualities and conditions, from the prince who wore it at full length, to the slave or villain who was quite cropt. To cut off the hair of a prince under the first race of French kings, was to declare him excluded from the right of succeeding to the crown. In the eighth century, people of quality had their children's hair cut the first time by persons they had a particular esteem for; who hence were reputed a sort of spiritual parents or godfathers. And, long before this, Constantine sent the pope the hair of his son Heraculus, as a token that he desired him to be his adoptive father.

Pope Anicetus is said to have been the first who forbade the clergy to wear long hair: but the prohibition is of an older date in the churches of the east; and the letter, wherein that decree is written, is much later than that pope. The clerical tonsure is related, by Isidorus Hispalensis, as of apostolical institution. Long hair was anciently held so odious, that there is a canon still extant, of 1096, importing, that such as wore long hair should be excluded coming into church while living, and not be prayed for when dead. Luitprand made a furious declamation against the emperor Phocas, for wearing long hair. The French historians have been very exact in describing the hair of their kings. Charlemagne wore it very short; his sons shorter; Charles II. had none at all. Under Hugh Capet it began to appear again; but the priests excommunicated all who let their hair grow. Peter Lombard expostulated so warmly with Charles VI. that he cut off his hair: and his successors for some generations wore it very short. A professor of Utrecht, in 1650, wrote expressly on the question, Whether it be lawful for men to wear long hair? and concluded for the negative. Another divine, named Reves, who had written for the affirmative, replied to him. The clergy both secular and regular were obliged to shave the crowns of their heads, and keep their hair short, which distinguished them from the laity; and several canons were made against their concealing their tonsure, or allowing their hair to grow long. The shape of this clerical tonsure was the subject of long and violent debates between the

English clergy on the one hand, and those of the Scots and Picts on the other; that of the former being circular, and that of the latter only semi-circular. Some, who pretended to superior sanctity, inveighed with great bitterness against the long hair of the laity; and labored to persuade them to cut it short, in imitation of the clergy. Thus St. Wulstan, bishop of Worcester, declaimed with great vehemence against luxury of all kinds, but chiefly against long hair as most criminal and most universal. 'When any of those vain people who were proud of their long hair,' says William of Malmesbury, 'bowed their heads before him to receive his blessing, before he gave it, he cut a lock of their hair with a little knife, which he carried about with him for that purpose; and commanded them by way of penance of their sins, to cut all the rest of their hair in the same manner. If any of them refused to comply with this command, he denounced the most dreadful judgments upon them, reproached them for their effeminacy, and foretold, that, as they imitated women in the length of their hair, they would imitate them in their cowardice when their country was invaded; which was accomplished at the landing of the Normans.' Anselm, archbishop of Canterbury, went so far as to pronounce the then terrible sentence of excommunication against all who wore long hair, for which pious zeal he is very much commended. Serlo, a Norman bishop, acquired great honor by a sermon which he preached before Henry I., in 1104, against long and curled hair, with which the king and all his courtiers were so much affected, that they consented to resign their flowing ringlets, of which they had been so vain. The prudent prelate gave them no time to change their minds, but immediately pulled a pair of shears out of his sleeve, and performed the operation with his own hand. Another incident happened about twenty-five years after, which gave a temporary check to the prevailing fondness for long hair.

Though the external surface of the body is the natural place for hairs, we have many well-attested instances of their being found also on the internal surface. Amatus Lusitanus mentions a person who had hair upon his tongue. Pliny and Valerius Maximus say, that the heart of Aristomenes the Messenian was hairy. Cælius Rhodiginus relates the same of Hermogenes the rhetorician; and Plutarch, of Leonidas, king of Sparta. There have been, however, various and indisputable observations of hairs found in the kidneys, and voided by urine. Hippocrates says, that the glandular parts are the most subject to hair; but bundles of hair have been found in the muscular parts of beef, and in parts of the human body equally firm. Hair has been often found in abscesses and imposthumations. But, of all the internal parts, there is none so much subject to an unnatural growth of hair as the ovaries of females. Cardan relates, that he found hair in the blood of a Spaniard; Sionatius in that of a gentlewoman of Cracovia; and Schultetus declares, from his own observation, that those people, who are afflicted with the *plica polonica*, have very often hair in their blood.

Hair makes a very considerable article in com-

merce, especially since perukes have been worn. The hair of the growth of Britain, and other northern countries, is valued much beyond that of Italy, Spain, the south parts of France, &c. The goodness of hair consists in its being well fed, and neither too coarse nor too slender. Its length should be about twenty-five inches; the more it falls short of this the less value it bears. There is no certain price for hair. It is sold at from 5s. to £5 per oz., according to its quality. Hair is also used in various other arts and manufactures. The hair of beavers, hares, conies, &c., is the principal substance of which hats are made. Spread on the ground, and left to putrefy on corn-lands, hair, like all other animal substances, proves good manure.

The scarcity of gray and white hair has made the dealers fall upon methods of reducing other colors to this. This is done by spreading the hair to bleach on the grass like linen, after first washing it out in a lixivious water. This lie, with the force of the sun and air, brings the hair to so perfect a whiteness, that the most experienced person may be deceived; there being scarcely any way of detecting the artifice, but by boiling and drying it, which leaves the hair of the color of a dead walnut-tree leaf. There is also a method of dyeing hair with bismuth, which renders such white hair as borders too much upon the yellow of a bright silver color: boiling is the proof of this too, the bismuth not being able to stand it. Hair may also be changed from a red, gray, or other disagreeable color, to a brown or deep black, by a solution of silver. The liquors sold under the name of hair waters, are at bottom only solutions of silver in aquafortis, largely diluted with water, with the addition perhaps of other ingredients which contribute nothing to their efficacy. The solution should be fully saturated with the silver, that there may be no more acid in it than is necessary for holding the metal dissolved; and, besides dilution with water, a little spirit of wine may be added for the further dulcification of the acid. It must be observed, that for diluting the solution, distilled water, or pure rain water, must be used; the common spring waters turning it milky, and precipitating a part of the dissolved silver. If the liquor touches the skin, it has the same effect on it as on the hair, changing the part moistened with it to an indelible black. Hair may also be dyed of any color in the same manner as wool. Hair which does not curl or buckle naturally, is brought to it by boiling and baking it—thus: After having picked and sorted the hair, and disposed it in parcels according to its lengths, they roll them up and tie them tight down upon little cylindrical instruments, either of wood or earthenware, a quarter of an inch thick, and hollowed a little in the middle, called pipes; in which state they are put in a pot over the fire, to boil for about two hours. When taken out they let them dry; and when dried they spread them on a sheet of brown paper, cover them with another, and, making a crust round them of common paste, set them in an oven till the crust is about three-fourths baked. The end by which a hair grew to the head is called the head of the hair; and

the other, with which they begin to give the buckle, the point. Formerly the peruke-makers made no difference between the ends, but curled or wove them by either indifferently; but this made them unable to give a fine buckle; hair woven by the point never taking a right curl. Foreigners own themselves obliged to the English for this discovery, which was first carried abroad by a British peruke-maker.

HAIR OF PLANTS, or down, a general term expressive of all the hairy and glandular appearances on the surface of plants, to which they are supposed to serve the double purpose of defensive weapons and vessels of secretion. These hairs are minute threads of greater or less length and solidity; some of them visible to the naked eye; whilst others are rendered visible only by the help of glasses. Examined by a microscope, almost all the parts of plants, particularly the young stalks or stems, appear covered with hairs. These appear under various forms; in the leguminous plants they are generally cylindric; in the mallow tribe, terminated in a point; in agrimony, shaped like a fish-hook; in nettles, awl-shaped and jointed; and in some compound flowers, with hollow or funnel-shaped florets, they terminate in two crooked points. Probable as some experiments have rendered it, that the hairs on the surface of plants contribute to some original secretion, their principal use seems to be, to preserve the parts in which they are lodged from the bad effects of violent frictions, from winds, from extremes of heat and cold, and such like external injuries. M. Guettard, who established a botanical method, from the form, situation, and other circumstances of the hairy and glandular appearances on the surface of plants, has demonstrated, that these appearances are generally constant and uniform in all the plants of the same genus. The same uniformity seems to characterise all the different genera of the same natural order. The different sorts of hair which form the down upon the surface of plants, were imperfectly set down by Grew in 1682, and by Malpighi in 1686. M. Guettard was the first who examined the subject both as a botanist and a philosopher. His observations were published in 1747.

HAJYPOOR, a fertile district of Hindostan, in the province of Bahar, on the eastern side of the Ganges, and between 25° and 26° of N. lat. It is well cultivated, and produces opium, salt-petre, and a good breed of horses. It is now included in the collectorship of Sarrun.

HAJYPOOR, the capital of the above district, is situated on the north-east bank of the Ganges, at its confluence with the Gunduck. This town was founded 1350, by Hias Hajy, the second independent Mahommedan king of Bengal, who caused it to be fortified; and it was for a long time the residence of the governor of the district. In the year 1574 it was taken by the troops of Akbar, after a gallant resistance; since which period the fortifications have been neglected; but the town continues to flourish.

HAKE, *n.s.* } Goth. hackle. The stock-
HAKOT, *n.s.* } fish or poor-jack.

HAKI, is the English name of a fish common in the British sea, called by some zoologists

merlucius and lucius marinus. These fish were used of old dried and salted. Hence the proverb in Kent, As dry as a hake. See GARDUS.

HAKEWILL (George), a learned English divine, the son of a merchant in Exeter, where he was born in 1579. He was educated at Oxford, became fellow of Exeter College, and was afterwards elected rector of it. He was appointed chaplain to prince Charles, archdeacon of Surrey, and rector of Heanton; but was never promoted higher, on account of his zealous opposition to prince Charles's marriage with the infant of Spain, for which he was imprisoned in 1621. His chief work is, *An Apology or Declaration of the Power and Providence of God in the Government of the World*, folio, 1639. He died at Heanton in 1649.

HAKEWILL (William), elder brother to George, was educated at Exeter College; whence he removed to Lincoln's Inn, and became eminent in the law. He was a puritan, and had great interest with the republican party during the civil war. He wrote several tracts: particularly, *The Liberty of the Subject against the pretended Power of Impositions*; 1611, 4to.

HAKLUYT (Richard), a naval historian, supposed to have been born in London about 1533, and descended of a respectable family in Herefordshire. He was educated at Westminster, and in 1570 removed to Oxford; where he applied to the study of cosmography, and read public lectures in that science. Sir Edward Stafford being sent ambassador to France, in 1583, Mr. Hakluyt was one of his attendants. He was at this time M. A., and professor of divinity. In 1585 he was made prebendary of Bristol, during his residence at Paris. In searching the French libraries, he found a valuable history of Florida, which he published at his own expense, in French, and soon after revised and republished Peter Martyr De Orbe Novo. After five years residence in France he returned to England. In 1589 he published his *Collection of Voyages*, in one vol. folio, which, in 1598, was republished in three. In 1605 he was made prebendary of Westminster, which, with the rectory of Wetheringset, was the summit of his preferment. He died in 1616. He was a faithful historian. His works, besides those above mentioned, are, 1. *A Collection of Voyages and Discoveries*, a small volume. 2. *The Discoveries of the World*, from the Original to the year 1555, written in the Portugal tongue by Antony Galvano; corrected, much amended, and translated into English, by Richard Hakluyt. 3. *Virginia* richly valued by the Description of the Main Land of Florida, her next Neighbour, &c., written by a Portugal gentleman of Elvas, and translated by Richard Hakluyt. Besides these, he left several MSS. which were printed in Purchas's collection.

HAL, in local names, is derived like *al* from the Sax. *healle*, i. e. a hall, a palace. In Gothic *alh* signifies a temple, or any other famous building.

HALBERD, *n. s.* ? Fr. *halebard*, *halebard*. HALBERDIER, *n. s.* ? *halber*; Dutch, *halebard*, from *harde* an axe, and *hale* a court, halberds being the common weapons of guards. A battle-axe fixed to a long pole. Halberdier one who is armed with a halberd.

Advance thy halberd higher than my breast.

Shakspeare.

Our halberds did shut up his passage.

Id.

The duchess appointed him a guard of thirty halberdeers, in a livery of murrey and blue, to attend his person.

Bacon.

The king had only his halberdeers, and fewer of them than used to go with him.

Clarendon.

Four knives in garbs succinct, a trusty band,
Caps on their heads, and halberds in their hand,
Draw forth to combat on the velvet plain.

Pope.

HALBERDS, or HALBERTS, are a kind of spears, carried by the sergeants of foot and dragoons. The shaft is about five feet long, and made of ash or other wood. The head is armed with a steel point, not unlike the point of a two-edged sword. Besides this sharp point, which is in a line with the shaft, there is also a small cross bar of steel. This weapon is useful in determining the ground between the ranks, and adjusting the files of a battalion. It was anciently a common weapon in the army, where there were companies of halberdiers.

HALBERSTADT, a principality of Prussia, in the government of Magdeburg, having a territorial extent of about 580 square miles, and a population of 120,000. It is intersected by the Hartz Mountains and several rivers, as the Aller, the Bude, and the Halzemme, but the latter are only of secondary size. It is fertile in flax and pasturage. The independent bishopric of this name was formed in 1814, and secularised by the treaty of Westphalia by which it was given to Prussia.

HALBERSTADT, a city of Prussia, capital of the foregoing province, is situated in the great road from Brunswick to Leipsic. It is of good size and great antiquity: containing above 13,000 inhabitants. It had formerly, besides the cathedral, three collegiate chapters: which have been suppressed. The Catholics have still, however, three churches and two monasteries; the Lutherans five churches. The principal buildings, besides the cathedral, are the Jewish synagogue; the ancient palace, now converted into a town-house; and the excise office. There are also a cathedral school, with a library; a cabinet of natural history; a seminary for school-masters; and a school for midwifery; worth notice. In 1784 a literary society was established here, from which several publications have emanated. Here are several small manufactures of woollen, linen, leather, gloves, paper, wax, and cobalt. A remarkable diet of the German empire was held here in 1134. Twenty-eight miles south-west of Magdeburg, and sixty-two south-east of Hanover.

HALCYON, *n. s.* & *adj.* Latin *halcyo*. A bird, of which it is said that she breeds in the sea, and that there is always a calm during her incubation: hence the adjective figuratively signifies placid, quiet, still, peaceful.

Such smiling rogues, as these, sooth every passion,
Bring oil to fire, snow to their colder moods;
Rönege, affirm, and turn their halcyon beaks
With every gale and vary of their masters.

Shakspeare.

When great Augustus made war's tempest cease,
His halcyon days brought forth the arts of peace.

Denham.

Amidst our arms as quiet you shall be,

As *halcyons* brooding on a Winter sea. *Dryden.*

No man can expect eternal serenity and *halcyon* days from so incompetent and partial a cause, as the constant course of the sun in the equinoctial circle.

Benley

HALCYON. See **ALCEDO.**

HALCYON DAYS, in antiquity, a name given to seven days before, and as many after the winter solstice; when the halcyon, invited by the calmness of the weather, laid her eggs in nests built in the rocks, close by the brink of the sea. About this time the sea is generally calm, and hence the phrase became proverbial.

HALDANE (John), a very eccentric genius of the eighteenth century, born in Edinburgh about the end of the seventeenth. He was one of the old Covenanters, commonly called Cameronians, and adhered to their principles, both religious and political, in their most rigid form; of which he gave evidence by publishing various pamphlets in support of them. Of these the most remarkable was entitled *The Active Testimony of the true Presbyterians of Scotland*, against the late unjust invasion by Charles pretended prince of Wales, and William pretended duke of Cumberland, &c., published at Edinburgh, in 1746, 8vo. He died about 1770.

HALDE (John Baptist Du), a learned French Jesuit, born at Paris in 1674. He was well versed in Asiatic geography, and compiled a work entitled *Grand Description de la Chine* and *de la Tartarie*, from original memoirs of the Jesuitical missionaries, in 4 vols. folio. He was also concerned in a collection of letters begun by father Gobien, called *Des Lettres Edifiantes*, in 18 vols.; and published some Latin poems and orations. He died in 1743.

HALE, v. a. } Dut. *halen*; Fr. *huler*. To
HALER, n. s. } drag by force, or pull violently:
he who pulls and hales.

Give diligence that thou mayest be delivered from him, lest he *hale* thee to the judge. *Luke.*

He by the neck hath *haled*, in pieces cut,
And set me as a mark on every butt. *Sandys.*

Fly to your house;

The plebeians have got your fellow tribune,
And *hale* him up and down. *Shakspeare.*

My third comfort,

Starred most unluckily, is from my breast
Haled out to murder. *Id.*

Thither by harpy-footed furies *haled*,
At certain revolutions, all the damned
Are brought. *Milton.*

This sinistrous gravity is drawn that way by the great artery, which then subsideeth, and *haleth* the heart unto it. *Browne.*

Who would not be disgusted with any recreation, in itself indifferent, if he should with blows be *haled* to it when he had no mind. *Locke.*

In all the tumults of Rome, though the people proceeded sometimes to pull and *hale* one another about, yet no blood was drawn 'till the time of the Gracchi. *Swift.*

HALE (Sir Matthew), lord chief justice of the king's bench in the reign of Charles II., was the son of Robert Hale, esq., a barrister of Lincoln's Inn, and was born in 1609. He was educated at Oxford, where he made a considerable progress in learning; and, applying to the study of the law, entered into Lincoln's Inn. Noy, the

attorney general, and Mr. Selden, took much notice of him. During the civil wars, he was employed in his practice by the king's party; and was appointed by the parliament one of the commissioners to treat with the king. After the death of king Charles he was appointed with several others to consider of the Reformation of the law. In 1653 he was by writ made sergeant at law, and soon after appointed one of the justices of the common pleas. Upon the death of Oliver Cromwell, he refused to accept of the new commission offered him by Richard his successor, and was returned for Gloucestershire in the parliament which called home Charles II. Soon after he was made lord chief baron of the exchequer; but declined the honor of knighthood, till lord chancellor Hyde, sending for him upon business when the king was at his house, said, 'There is your majesty's modest chief baron;' upon which he was unexpectedly knighted. He was one of the principal judges that sat in Clifford's Inn, in order to adjust the differences between landlord and tenant, after the fire of London, in which he behaved to the satisfaction of all parties concerned. In his post of chief baron he acted with inflexible integrity. He dismissed a duke, who wished to state to him a cause he was to bring before him, with an intimation that he never received ex parte or private evidence. The duke complained of his rudeness to the king, who told him he verily believed he would have used him no better had he gone to solicit him in his own cause. In one of his circuits, a gentleman who had a trial at the assizes sent him a buck for his table. When judge Hale therefore heard his name, he asked 'if he was not the person who had sent him the venison?' and, finding he was, told him, 'that he could not suffer the trial to go on till he had paid him for his buck.' In 1671 he was advanced to be lord chief justice of the king's bench; but about four years after this promotion, his health declining, he resigned his post in February 1675-6, and died in December following. This excellent man, who was an ornament to the bench and to his country, wrote, 1. *An Essay on the Gravitation and Non-gravitation of Fluid Bodies.* 2. *Observations touching the Torricellian Experiment.* 3. *Contemplations, Moral and Divine.* 4. *The Life of Pomponius Atticus*, with political and moral Reflections. 5. *Observations on the Principles of natural Motion.* 6. *The primitive Origination of Mankind.* He also left a great number of MSS. in Latin and English, upon various subjects; among which are, his *Pleas of the Crown*, since published by Mr. Emlin in 2 vols. folio; and his *Original Institution, Power, and Jurisdiction, of Parliaments.*

HALES (John), an English theologian, was born at Bath in 1584, and educated at Corpus Christi College, Oxford, where he took the degree of B.D. In 1605 he was elected a fellow of Merton College, through the influence of the warden, Sir Henry Saville, whom he assisted in preparing for the press his edition of *St. Chrysostom*. In 1612 he was appointed professor of Greek at Oxford, and in 1613 was made a fellow of Eton. In 1618 he went to the Hague, as chaplain to the English ambassador, Sir Dud-

ley Carleton, and attended the synod of Dort, of the proceedings of which he wrote an able account. These debates occasioned his conversion from Calvinism to Arminianism. In 1639 he was made a canon of Windsor, but held the office only till the beginning of the civil war. He afterwards remained for some time in seclusion, and, having in 1645 been deprived of his fellowship, was obliged to sell his library to obtain the means of subsistence. This latter circumstance however is not reconcilable with the fact of his having made considerable bequests in his will. He published nothing of importance during his life; but a collection of his writings appeared in 1659, entitled *Golden Remains of the ever-memorable Mr. John Hales, of Eton College*, 4to.

HALES, LORD. See DALRYMPLE.

HALES (Stephen), D.D. and F.R.S., a celebrated divine and philosopher, born in 1677. In 1696 he was entered at Benet College, Cambridge; admitted a fellow in 1703, and became B. D. in 1711. He soon discovered a genius for natural philosophy. Botany was his first study, which he often prosecuted among Gogmagog hills, along with Dr. Stukely. He likewise studied astronomy, chemistry, and anatomy; and invented a curious method of obtaining a representation of the lungs in lead. Having made himself acquainted with the Newtonian system, he contrived a machine for showing the phenomena on much the same principles with that of the orrery, afterwards made by Mr. Rowley. About 1710 he was presented to the perpetual cure of Teddington, near Twickenham; afterwards to the living of Porlock, in Somersetshire, which he exchanged for that of Faringdon, in Hampshire. On the 13th of March, 1718, he was elected F.R.S.; and on the 5th of March, 1719, he published an account of some experiments he had made on the effect of the sun's warmth in raising the sap in trees, which procured him the thanks of the society. On the 14th of June, 1725, he exhibited a treatise on the same subject, which, being highly applauded by the society, he enlarged and improved; and in April, 1727, published it under the title of *Vegetable Statics*. This work he dedicated to the prince of Wales, afterwards king George II.; and he was the same year chosen one of the council of the Royal Society. A second edition of this work was published in 1731; in the preface to which he promised a sequel, which he published in 1733, under the title of *Statistical Essays*, &c. In 1732 he was appointed one of the trustees for establishing a new colony in Georgia. On the 5th of July, 1733, the University of Oxford made him D.D., although he had been educated at Cambridge. In 1734 he published, anonymously, *A friendly Admonition to the Drinkers of Brandy and other spirituous Liquors*; and a Sermon preached at St. Bride's before the rest of the trustees for establishing the colony in Georgia. In 1739 he printed *Philosophical Experiments on Sea-water, Corn, Flesh, and other Substances*, 8vo. dedicated to the lords of the admiralty. In 1739 he also exhibited to the society an account of some experiments towards the discovery of medicines for dissolving the

stone in the kidneys and bladder, and preserving meat in long voyages; for which he received Sir Godfrey Copley's gold medal. In 1740 he published some account of *Experiments and Observations on Mrs. Stephens's Medicines for dissolving the Stone*, in which their dissolvent power is enquired into and demonstrated. In 1741 he read before the society an account of a ventilator, for conveying fresh air into mines, hospitals, prisons, and the close parts of ships. In 1743 he read before the society a description of a method of conveying liquors into the abdomen during the operation of Tapping; afterwards printed in their *Transactions*. In 1745 he published some *Experiments and Observations on Tar-water*, which he had been induced to make by the publication of a work called *Siris*, in which Dr. Berkeley, bishop of Cloyne, had recommended tar-water as a universal medicine. In 1746 he communicated to the Royal Society a proposal for bringing small passable stones soon, and with ease, out of the bladder. In the *Gentleman's Magazine* for July, 1747, he published an Account of a very considerable Improvement of a Back-heaver, by which it became capable of clearing corn of the very small grain, seeds, blacks, smut-balls, &c., to such perfection as to make it fit for seed-corn. In 1748 he communicated to the society a proposal for checking the progress of fires; with two memoirs, one on ventilators, and the other on some experiments in electricity. All these papers were printed in the Royal Society's *Transactions*. In 1749 his ventilators were fixed in the Savoy prison; and the benefit was so great, that though from eighty to 100 in a year often died of the gaol distemper before, yet, from 1749 to 1752 inclusive, only four persons died, and, of those four, one died of the small-pox, and another of intemperance. In 1750 he published some considerations on the causes of earthquakes; occasioned by the shocks felt that year in London; and exhibited an examination of the strength of several purging waters, especially that of Jessop's well. Both these are printed in the *Philosophical Transactions*. He had now been several years honored with the friendship of Frederick prince of Wales: who frequently visited him at Teddington. Upon that prince's death in 1750 he was appointed almoner to the princess dowager. In 1752 he was chosen by the college of physicians to preach the sermon called *Crowne's Lecture*: Dr. W. Crowne having left a legacy for a sermon to be annually preached on 'the wisdom and goodness of God displayed in the formation of man.' Dr. Hales's text was in Job xii. 12. In 1753 Dr. Hales was elected a member of the Academy of Sciences at Paris. This year he published in the *Gentleman's Magazine* *Farther Considerations about the best Method of drawing the Foul Air out of the Sick Rooms of occasional Army Hospitals and Private Houses in Town*; with many other curious particulars on the Use of Ventilators: also a Description of a Sea Gauge, which he invented to measure unfathomable depths. This paper he had drawn up about 1732 or 1733 for the late Colin Campbell, esq., who employed the ingenious Mr. Hawksbee to make the machine it describes, which was tried

in various depths, and answered with great exactness, but was at last lost near Bermuda. In 1754 he communicated to the society some experiments for keeping water and fish sweet with lime-water; an account of which was published in the Philosophical Transactions. He continued to enrich their memoirs with many useful articles from this time till his death, particularly a method of forwarding the distillation of fresh from salt water, by blowing showers of fresh air up through the latter during the operation. Being nominated by king George II. a canon of Windsor, he engaged the princess to request his majesty to recal his nomination. He died at Teddington, 1761, aged eighty-four; and the princess of Wales erected a monument to his memory in Westminster Abbey.

HALESIA, in botany, a genus of the monogynia order, and dodecandria class of plants: natural order eighteenth, bicornes: CAL. quadridentated, superior: COR. quadrifid: the nut quadrangular and dispermous.

HALF, <i>n. s. & adv.</i>	} Pl. halves. Saxon
HALF-BLOOD, <i>n. s.</i>	
HALF-BLOODED, <i>adj.</i>	
HALF-CAP, <i>n. s.</i>	
HALF-ENDEAL, <i>n. s.</i>	
HALF-FACED, <i>adj.</i>

HALF-HEARD, <i>adj.</i>	
HALF-MOON, <i>n. s.</i>	
HALF-PENNY, <i>n. s.</i>	
HALF-PIKE, <i>n. s.</i>	
HALF-PINT, <i>n. s.</i>	
HALF-SCHOLAR, <i>n. s.</i>	
HALF-SEAS-OVER,	
HALF-SIGHTED, <i>adj.</i>	
HALF-SPHERE, <i>n. s.</i>	
HALF-STRAINED, <i>adj.</i>	
HALF-SWORD, <i>n. s.</i>	
HALF'WAY, <i>adj. & adv.</i>	} Half-seas-over is a familiar phrase to describe a person half drunk. When added to any word denoting personal qualities, it generally notes contempt: the other compounds are too obvious to require a minute explanation. This word in some instances has a plural signification when a number is divided. Halfendeal, Sax. half and ðæl.
HALF-WIT, <i>n. s.</i>	
HALF-WITTED, <i>adj.</i>	

An *half* acre of land. 1 Sam. xiv. 14.

— on Monday next, at quarter night
Shall fall a rain, and that so wild and wood
That *half* so gret was never Noes flood.

Chaucer. *The Milleres Tale.*

I crouche thee from elves and from wightes
There with the nightspæl said he, anon, rightes
On foure *halves* of the house aboute,
And on the threshold of the dore withoute. *Id.*

Yeve us a bushel whete, or malt, or reye,
A goddes kichel, or a trippe of chese,
Or elles what you list, we may not chese;
A goddes *halfpenny*, or a masse peny,
Or yeve us of your braun.

Chaucer. *The Sompnoours Tale.*

Proud inroaching tyranny
Burns with revenging fire, whose hopeful colours
Advance a *half-faced* sun, striving to shine.

Shakspeare.

With certain *half caps* and cold moving nods,
They froze me into silence. *Id.*

This same *half-faced* fellow, Shadow; give me this man: he presents no mark to the enemy: the foeman may with as great aim level at the edge of a penknife. *Id.*

Bardolph stole a lute-case, bore it twelve leagues, and sold it for three *halfpence*. *Id.*

I thank you; and sure, dear friend, my thanks are too dear of a *halfpenny*. *Id.*

The let alone lies not in your good will.

—Nor in thine, lord.

—*Half-blooded* fellow, yes. *Id.*

There shall be in England seven *halfpenny* leaves sold for a penny. *Id.*

Many might go to heaven with *half* the labour they go to hell, if they would venture their industry the right way. Ben Jonson

Well chosen friendship, the most noble

Of virtues, all our joys makes double,

And into *halves* divides our trouble. Denham.

See how in warlike muster they appear,

In rhombs and wedges, and *half-moons* and wings. Milton.

Or what but riches is there known,

Which man can solely call his own;

In which no creature goes his *half*,

Unless it be to squint and laugh? Hudibras.

Had the land selected of the best,

Half had come hence, and let the world provide the rest. Dryden.

I am *half-seas* o'er to death;

And, since I must die once, I would be loth

To make a double work of what's *half* finished. *Id.*

I go with love and fortune, two blind guides,

To lead my way; *half* loth, and *half* consenting. *Id.*

No mortal tongue can *half* the beauty tell;

For none but hands divine could work so well. *Id.*

He cheats for *halfpence*, and he doffs his coat

To save a farthing in a ferry-boat. *Id.*

Which shall be heir of the two male twins, who, by the dissection of the mother, were laid open to the world? Whether a sister by the *half-blood* shall inherit before a brother's daughter by the whole blood? Locke.

Of our manufacture foreign markets took off one *half*, and the other *half* were consumed amongst ourselves. *Id.*

The various ways of paying the salute with the *half-pike*. Tatler.

The council is made up *half* out of the noble families, and *half* out of the plebeian. Addison.

Half the misery of life might be extinguished, would men alleviate the general curse by mutual compassion. *Id.*

Her beauty in thy softer *half*

Buried and lost, she ought to grieve. Prior.

Here, thick as hailstones pour,

Turnips, and *half-hatched* eggs, a mingled shower.

Among the rabble rain. Gay.

Natural was it for a prince, who had proposed to himself the empire of the world, not to neglect the sea, the *half* of his dominions. Arbuthnot.

Not added years on years my task could close;

Back to thy native islands mightest thou sail,

And leave *half-heard* the melancholy tale. Pope.

One *half-pint* bottle serves them both to dine;

And is at once their vinegar and wine. *Id.*

Never admit this pernicious coin, no, not so much as one single *halfpenny*. Swift.

You will wonder how Wood could get his majesty's broad seal for so great a sum of bad money, and that the nobility here could not obtain the same favor, and make our own *halfpence* as we used to do. *Id.*

We have many *half-scholars* now a-days, and there is much confusion and consistency in the notions and opinions of some persons. *Watts.*

HALLETOS. See FALCO.

HAL-BEIGH, first dragoman, or interpreter at the grand seignior's court in the seventeenth century, was born of Christian parents in Poland; but, having been taken by the Tartars when a boy, they sold him to the Turks, who brought him up in their religion in the seraglio. His original name was Bobowski. He learned many languages, and Sir Paul Ricaut owns he was indebted to him for several things, which he relates in his *Present State of the Ottoman Empire*. He held a great correspondence with the English, and intended to return into the Christian church, but died in 1675, before he could accomplish his design. Dr. Hyde published his book *Of the Liturgy of the Turks, their Pilgrimages to Mecca, &c.*, at Oxford, 1691. He translated the catechism of the church of England, and the Bible, into the Turkish language. The MS. is lodged in the library of Leyden. He wrote likewise a Turkish grammar and dictionary.

HALIBUT, *n. s.* A sort of fish.

HALICARNASSUS, in ancient geography, a principal town of Caria, built by the Argives, and situated between two bays, the Ceramicus and Jasius. It was anciently called Zephyra, and was the royal residence of Mausolus.

HALIDOM, *n. s.* *palig dom*, holy judgment, or *palig* and dame, for lady. Our blessed lady. In this sense it should be *halidam*.

By my *halidom*, quoth he,

Ye a great master are in your degree. *Hubberd.*

HALIFAX, a very ancient, populous, and flourishing market town and parish of England, in the West Riding of Yorkshire, famous for the clothier trade. The parish contains above 12,000 people, and is above thirty miles in circumference. Besides the established church at Halifax, and sixteen meeting-houses, it has twelve chapels, two of which are parochial. The principal articles now manufactured, in and about Halifax, are shalloons, plain Russels, lastings and amens, serges, moreens, tammies, wildbores, calamancoes, &c. For the convenience of the manufacturers, there has been erected an elegant edifice called the Piece Hall; it is in the form of an oblong square, occupying a space of 10,000 square yards, having 315 distinct rooms for the lodgment of goods, which are open for sales once a week. The weavers of the surrounding district bring their goods undressed to this market. The inhabitants here and in the neighbouring towns are so entirely employed in these manufactures, that agriculture is little minded. Most of their provisions are brought from the North and East Ridings, and from Lancashire, Cheshire, Nottinghamshire, and Warwickshire. The markets are much crowded. The houses are of stone, but irregularly built. Halifax lies sixteen miles south-west of Leeds, forty-two south-west of York, and 107½ N. N.W. of London.

HALIFAX, a county of the province of Nova Scotia, containing Halifax, the capital, the townships of Londonderry, Truro, Onslow, Colchester, Lawrence, Southampton, Canoe, and Tim-

mouth. It has numerous bays and rivers, which render it accessible from the sea.

The town of Halifax is situated on the west side of a spacious bay or harbour called Chebuctoo, where 1000 of the largest ships might ride with safety. It is 236 feet above the level of the sea; and is laid out in oblong squares, all the streets being at right angles. The town and suburbs are about two miles in length, and about a quarter of a mile in breadth. At the north extremity is the king's naval yard, supplied with stores of every kind. The harbour is open at all seasons of the year. Halifax is entrenched with forts of timber. The country around the town is barren; but the imports of Great Britain alone, into the port, amounted in 1810 to £600,000. It is forty miles south-west from Truro, eighty-four east from Annapolis on the bay of Fundy, and 157 south-east from St. Ann in New Brunswick. Population 8000. Some accounts state it much higher. Long. 63° 35' 45" W., lat. 44° 44' N.

HALIFAX, a county of Virginia, United States, bordering on the state of North Carolina. It is about forty-two miles long, and thirty-nine broad.

HALIFAX, one of the middle districts of North Carolina, bounded on the north by the state of Virginia, east by Edenton district, west by Hillsborough, and south by Newbern. It is divided into seven counties, namely, Northampton, Halifax, Martin, Edgecomb, Warren, Franklin, and Nash.

HALIFAX, a county of North Carolina, in the above district, bounded north by Northampton, south by Edgecomb, east by Bertie, and west by Warren.

HALIAX, the chief town of the above county, is situated on the west bank of the Roanoke, and regularly laid out. Seventy-five miles north-east from Fayetteville, and 255 west by south from Philadelphia.

HALIMASS, *n. s.* *palig* and mass. The feast of All-souls.

She came adorned hither like sweet May;

Sent back like *halimass*, or shortest day.

Shakspeare.

HALIOTIS, the ear-shell, a genus of insects belonging to the order of vermes testacie. This is an animal of the snail kind, with an open shell resembling an ear. There are seven species, distinguished by the figure of their shells.

HALITUOUS, *adj.* Lat. *halitus*. Vaporous; fumes.

We speak of the atmosphere as of a peculiar thin and *halituous* liquor, much lighter than spirit of wine.

Boyle.

HALL, *n. s.* Sax. *pal*; Dut. *halle*. A court of justice; a manor-house; so called because in it were held courts for the tenants. The public room of a corporation: the vestibule, or first large room in a mansion.

For why? me thouten by Sainet Gile
That all was stone of berile
Bothe the castell and the toure,
And eke the hall and every toure.

Chaucer. House of Fame

And she the moste servicable of all,
Hath every chamber arraided, and his hall.

Id. The Clerkes Tale.

Min is the ruin of the high *halls*
The falling of the towers and of the walls
Upon the minour or the carpenter.

Id. The Knights Tale.

That light we see is burning in my *hall*.
Shakspeare.

Courtesy is sooner found in lowly sheds
With smoky rafters, than in tapstry *halls*
And courts of princes. *Milton.*

With expedition on the beadle call,
To summon all the company to the *hall*. *Garth.*
Captain Sentry, my master's nephew, has taken
possession of the *hall* house, and the whole estate.

Addison.

O lost too soon in yonder house or *hall*. *Pope.*

And thus they wandered forth and hand in hand,
Over the shining pebbles and the shells,
Glided along the smooth and hardened sand,
And in the worn and wild receptacles

Worked by the storms, yet worked as it were
planned,

In hollow *halls*, with sparry roofs and cells,
They turned to rest. *Byron. Don Juan.*

HALL (John), an English surgeon, who flourished in the reign of queen Elizabeth, at Maidstone in Kent. He was born in 1529, and published, 1. A Compendium of Anatomy; and, 2., A Collection of Hymns, with musical notes, in 1565: besides several tracts on medicine and surgery.

HALL (John), a poet of distinguished learning, born in Durham, in 1627, and educated at Cambridge. In 1646, when he was but nineteen years of age, he published his *Horæ Vacivæ*, or Essays; and the same year appeared his Poems. He translated from the Greek, Hierocles upon the golden verses of Pythagoras: to which is prefixed an account of the translator and his works, by John Davies of Kidwelly. He also translated Longinus, and died in 1656, aged twenty-nine.

HALL (Joseph), an eminent English prelate, born at Ashby de la Zouch, in 1574, and educated at Cambridge. He became professor of rhetoric in that university, and was made rector of Halesford, prebendary of Wolverhampton, dean of Worcester, bishop of Exeter, and lastly of Norwich. His works testify his zeal against popery, and are much esteemed. In July 1616 he attended lord Doncaster into France, and upon his return was appointed by king James one of the divines who should attend him into Scotland. In 1618 he was sent to the synod of Dort, and appointed to preach a Latin sermon before that Assembly. Being obliged to return before the synod broke up, on account of his health, he was by the states presented with a gold medal. He wrote, 1. *Miscellaneous Epistles*; 2. *Mundus alter et idem*; 3. *A Just Censure of Travellers*; 4. *The Christian Seneca*; 5. *Satires*, in six books; 6. *A Century of Meditations*; and many other works, which, besides the satires, make 5 vols. He died in 1656.

HALL, in architecture Vitruvius mentions three kinds of halls; the tetrastyle, with four columns supporting the platform or ceiling; the Corinthian, with columns all round let into the wall, and vaulted over; and the Egyptian, which had a peristyle of insulated Corinthian columns, bearing a second order with a ceiling. The hall is properly the finest as well as first member of

an apartment: and in the houses of ministers of state, magistrates, &c., is the place where they despatch business, and give audience. In very magnificent buildings, where the hall is larger and loftier than ordinary, and placed in the middle of the house, it is called a saloon. The length of a hall should be at least twice and a quarter its breadth; and in great buildings, three times its breadth. The height may be two-thirds of the breadth; and, if made with an arched ceiling, it will be much handsomer, and less liable to accidents by fire. In this case, its height is found by dividing its breadth into six parts, five of which will be the height from the floor to the under side of the key of the arch.

HALL, or SCABIAN HALL, a fortified town of Wirtemberg, the capital of the circle of the Jaxt, is beautifully situated on the Kocher. The town-house, the academy, and the church of St. Michael, are worthy of notice. It has two suburbs; and 5500 inhabitants, chiefly Lutherans, who derive their chief means of support from the brine springs, which produce annually from 70,000 to 80,000 cwt. of salt. Here was concluded, in 1610, a famous convention or union of the Protestant princes of the empire. Fourteen miles east of Lowenstein, and thirty north-east of Stutgard. Long. 9° 50' E., lat. 49° 6' N.

HALL IN INNTHAL, a town of the Tyrol, having a celebrated mint; but still more remarkable for its salt works, which produce annually above 270,000 cwt. of salt. The salt, found in mines about four miles off, is dissolved in large pits; and the process of evaporation takes place in the town. Nine miles north-east of Inspruck, and forty-eight north of Brixen.

HALLAND, a mountainous province of Sweden, in South Gothland, bounded by West Gothland, Smaland, Scania, and the Cattegat. Its superficial extent is about 1465 square miles, and its population 73,600. It is covered by large woods of oak and birch.

HALLE, a large town of Prussia, in Saxony, government of Merseburg, standing on both sides of the Saale, over which it has five bridges. It is an irregular square, having several suburbs; of which two, Glaucha and Neumarkt, are, strictly speaking, separate towns. The population, including these, amounts to 25,000. Here a military academy of ancient date was converted by the elector of Saxony, in 1699, into a university, which has always maintained a high reputation. In the Glaucha is the orphan hospital, and Canstein's establishment for printing, erected in 1712: this is said to have produced since that time nearly 1,000,000 of New Testaments, and 2,000,000 of Bibles. Here are two public libraries. Among the minor establishments are a cabinet of natural history and mechanics, and an apothecaries' hall. Halle has given birth to a great number of men of eminence, as Hoffmann, Unze, Michaelis, Nemeier, and Handel. It contains several buildings which, if not splendid, are remarkable—such as the red tower, which rises to a height of 260 feet, the church of St. Ulrich, and the hotel de ville, which contains the hospital. Of its castle only one wing now remains, used as a Calvinist church. The Luther-

ans have here seven parish churches, and the Jews a synagogue. The inhabitants have manufactures of woollens, stockings, silk, leather, buttons, hardware, &c.; but the principal is that of starch. In a valley between the town and the Saale is a celebrated salt spring, whose annual produce is 4000 tons: on the other side of the river is another, wrought by the government, which produces nearly 12,000 tons more. Pit-coal is found in the neighbourhood.

Halle, three days after the battle of Jena, was the scene of an obstinate conflict between the Prussians and French. Twenty-two miles south-east of Eisleben, twenty-two south-west of Dessau, and fifty-six south by east of Magdeburg.

HALLEIN, a town in the duchy of Salzburg, on the Salze, belonging to Austria. It has manufactures of needles and cotton; and the salt works, which are carried on on account of the government, are of great importance: the quantity yearly sold being from 13,000 to 15,000 tons, worth about £120,000 sterling, of which the half is said to be clear profit. The salt is found in masses in the interior of a mountain called Durnberg, about four miles from the town.

HALLELUJAH, *n. s.* Heb. הללוי, praise ye the Lord. A song of thanksgiving.

Then shall thy saints

Unfained *hallelujahs* to Thee sing,

Hymns of high praise.

Milton.

Singing those devout hymns and heavenly anthems, in which the church militant seems ambitious to emulate the triumphant, and echo back the solemn praises and *hallelujahs* of the celestial choirs.

Boyle.

HALLELUJAH, or ALLELUJAH, is a term of rejoicing, first introduced from the Jewish into the Christian church, by St. Jerome. It occurs in several of the Psalms, particularly from Ps. cxlv. to cl. For a considerable time it was only used once a year in the Latin church, viz. at Easter; but in the Greek church it was much more frequent. St. Jerome mentions its being sung at the interments of the dead, which still continues in that church, and on some occasions in Lent. Gregory the Great appointed it to be sung all the year round in the Latin church, which raised some complaints against him; as introducing the ceremonies of the Greek church into the Roman. But he excused himself by asserting that it had been the ancient usage of Rome, and introduced under pope Damasus.

HALLER (Albert Van), an eminent physician, born at Bern on the 16th of October, 1708. He very early showed a great genius for literature; and his progress in his studies was rapid almost beyond belief. When other children were beginning only to read he was studying Bayle and Moreri; and at nine he was able to translate Greek, and beginning to study Hebrew. His education was interrupted by the death of his father, when he was in his thirteenth year. After this he was sent to the public school at Bern, where he was not only distinguished for his knowledge in Greek and Latin, but also for his poetical genius. His poetical essays, published in the German language, were read and admired throughout the empire. In his sixteenth

year he began to study medicine at Tubingen, under Duvernoy and Camerarius; and continued there for two years, when the great reputation of Boerhaave drew him to Leyden. Ruysch was also still alive, and Albinus was rising into fame. Animated by such examples, he spent all the day and great part of the night in the most intense study; and the proficiency which he made gained him the universal esteem both of his teachers and fellow students. From Holland, in 1727, he came to England, where he was honored with the friendship of Douglas, Cheselden, and Sir Hans Sloane, P. R. S. He next went to France; where, under Winslow and Le Dran, he had new opportunities of prosecuting the study of anatomy. But his zeal was greater than popular prejudice, even in the enlightened city of Paris, could tolerate. An information being lodged against him for dissecting dead bodies, he was obliged to make a precipitate retreat to Basil, where he became pupil to the celebrated Bernouilli. Thus improved by the most distinguished teachers of that period, and endued with uncommon natural abilities, he returned to Bern in his twenty-sixth year, where he stood candidate first for the office of physician to an hospital, and afterwards for a professorship. But he was disappointed in both; and it was even with difficulty that he obtained the appointment of keeper of a public library at Bern. This, though by no means suited to his great abilities, afforded him an opportunity for that extensive reading by which he has been so justly distinguished. The neglect of his merit neither diminished his ardor for medical pursuits, nor detracted from his reputation at home or abroad. Soon after he was nominated a professor in the university of Gottingen, by king George II. The duties of this important office he discharged, with honor to himself and advantage to the public, for seventeen years. Nor was it long necessary for him, in this arduous undertaking, to labor alone. The example of the preceptor was followed by his pupils. Zinn, Zimmerman, Caldani, and many others, labored to prosecute and to perfect the discoveries of their great master. Nor were the labors of Dr. Haller, during his residence at Gottingen, confined to one department of science. To him the Anatomical Theatre, the School of Midwifery, the Chirurgical Society, and Royal Academy of Sciences at Gottingen, owe their origin. Such distinguished merit could not fail to meet with a suitable reward. King George II. not only honored him with every mark of attention himself, but procured him letters of nobility from the emperor. On the death of Dillenius he had an offer of the professorship of botany at Oxford; the states of Holland invited him to the chair of the younger Albinus, and the king of Prussia was anxious that he should be the successor of Maupertuis at Berlin. Marshal Keith wrote to him in the name of his sovereign, offering him the chancellorship of the university of Halle. Count Orlov invited him to Russia, in the name of the empress, offering him a distinguished place at St. Petersburg. The king of Sweden conferred on him an unsolicited honor, by raising him to the rank of knight of the polar star; and the emperor of Germany

honored him with a personal visit. He continued, however, at Gottingen, anxious to extend the rising fame of that medical school. But, after seventeen years' residence, an ill state of health rendering him less fit for the important office which he held, he obtained permission from the regency of Hanover to return to Bern. His fellow citizens were now as sensible as others of his superior merit. A pension was settled upon him for life, and he was elected into the most important offices in the state. He was the first president, as well as the great promoter, of the (E)conomical Society at Bern; and may be considered as the founder of the Orphan Hospital there. He continued to write till within a few days of his death, which happened in his seventieth year, on the 12th of December, 1777. His *Elementa Physiologiæ* and *Bibliotheca Medicinæ* afford undeniable proofs of his penetrating genius and solid judgment. But he was not more distinguished as a philosopher than beloved as a man; and not more eminent for his improvement in every department of medical science, than for his piety to God, and benevolence to mankind.

HALLERIA, in botany, African fly-honey-suckle, a genus of the angiospermia order, and didynamia class of plants; natural order forthieth, personate: CAL. trifid: COR. quadrifid; the filaments longer than the corolla; the berry inferior and bilocular. Species two only; natives of the Cape.

HALLEY (Dr. Edmund), an eminent astronomer, was the only son of a soap-boiler in London, and was born in 1656. He first studied the languages and sciences, but at length devoted himself entirely to astronomy. In 1676 he went to the island of St. Helena to complete the catalogue of fixed stars, by the addition of those which lie near the south pole; and having delineated a planisphere, on which he laid them all down in their exact places, he returned to England in 1678. In 1680 he took a tour through Europe, accompanied by the celebrated Mr. Nelson. Between Calais and Paris he obtained a view of the famous comet in its return from the sun. He had in November before seen it in its descent; and now hastened to complete his observations upon it from the royal observatory of France. His design in this part of his tour was to settle a correspondence between the royal astronomers of Greenwich and Paris; and to improve himself under the great Cassini. He went thence to Italy, where he spent great part of 1681; but he soon after returned to England. In 1683 he published his *Theory of the Variation of the Magnetical Compass*; in which he supposes the globe to be a great magnet, with four magnetical poles, or points of attraction; but afterwards, thinking that this theory was liable to great exceptions, he procured an application to be made to king William, who appointed him commander of the *Paramour Pink*, with orders to seek by observations the discovery of the rule of variations, and to lay down the longitudes and latitudes of his majesty's settlements in America. He set out on this attempt on the 24th of November 1698; but having crossed the line his men grew sickly; and, his lieutenant mutinying, he returned home in June 1699.

Having had the lieutenant tried and cashiered, he sailed a second time in September following, with the same ship and another of less bulk, of which he had also the command. He now traversed the vast Atlantic from one hemisphere to the other as far as the ice would permit him: and having made observations at St. Helena, Brasil, Cape Verd, Barbadoes, the Madeiras, the Canaries, the coast of Barbary, and many other latitudes, arrived in September 1700; and published a general chart, in 1701, showing at one view the variation of the compass in all those places. Captain Halley had been at home little more than half a year, when he was sent by the king, to observe the course of the tides, with the longitude and latitude of the principal head-lands in the British channel; which having executed, with his usual accuracy, he published a large map of the channel. Soon after the emperor of Germany resolving to make a convenient harbour for shipping in the Adriatic, captain Halley was sent by queen Anne to view the two ports on the coast of Dalmatia. He embarked on the 22nd of November 1702; passed over to Holland; and, going through Germany to Vienne, he proceeded to Istria; but the Dutch opposing the design it was laid aside. The emperor made him a present of a rich diamond ring from his finger, and honored him with a letter of recommendation, written with his own hand, to queen Anne. Soon after his return, he was sent again on the same business; when passing through Hanover, he supped with the electoral prince, afterwards king George I., and his sister the queen of Prussia. On his arrival at Vienne, he was the same evening presented to the emperor, who sent his chief engineer to attend him to Istria, where they repaired and added new fortifications to those of Trieste. Mr. Halley returned to England in 1703; was made professor of geometry in the university of Oxford, and received the degree of LL.D. He was scarcely settled at Oxford, when he began to translate into Latin, from the Arabic, Apollonius *De Sectione Rationis*; and to restore Apollonius's books *De Sectione Spatii*, from the account given of them by Pappius; and he published the whole work in 1706. Afterwards he had a share in preparing for the press Apollonius's *Conics*, and ventured to supply the whole eighth book, the original of which is lost. He likewise added Serenus on the section of the cylinder and cone, printed from the original Greek, with a Latin translation, and published the whole in folio. In 1713 he was made secretary of the Royal Society; in 1720 king's astronomer at the royal observatory at Greenwich; and, in 1729, a member of the Academy of Sciences at Paris. He died at Greenwich in 1742. His principal works are, 1. *Catalogus Stellarum Australium*. 2. *Tabulæ Astronomicæ*. 3. *An Abridgment of the Astronomy of Comets*, &c.

HALLIARDS, corrupted from haul and yard, the ropes or tackles usually employed to hoist or lower any sail upon its respective mast or stay. See *FRAYS*.

HALLIFAX (Samuel), a learned English bishop, born at Cheshirefield, in 1730, and educated at Cambridge, where he was regius profes-

sor of civil law. In 1781 he was made bishop of Gloucester, and 1789 bishop of St. Asaph. He published an Analysis of Civil Law, and Sermons on the Prophecies. He died in 1790, aged sixty.

HALL-OO, *interj.*, *v. a.*, & *v. n.* The original of this word is controverted; some imagine it corrupted from *à lui*, to him! others from *allous*, let us go! and Skinner from *haler*, to draw.—Johnson A word of encouragement when dogs are let loose on their game. Fr. *haler des chiens*. To cry aloud, either in contempt or by way of cheering and encouragement; to cry after dogs, or hounds; to chase with shouts.

If I fly, Marcius,

Halloo me like a hare.

When we have found the king, he that first lights on him,

Halloo the other.

A cry more tuneable

Was never *halloed* to, nor cheered with horn.

Country folks *halloed* and *hooted* after me, as the arrantest coward that ever shewed his shoulders to his enemy.

Some popular chief,

More noisy than the rest, but cries *halloo*,

And, in a trice, the bellowing herd come out.

If, whilst a boy, Jack ran from school,

Fond of his hunting-horn and pole,

Though gout and age his speed detain,

Old John *halloos* his hounds again.

To **HALL-OW**, *v. a.* Sax. *þalgtian*, *þalg*, holy. To consecrate; to make holy; to reverence as holy, thus we say 'hallowed be thy name.'

When we sanctify or *hallow* churches, it is only to testify that we make them places of publick resort; that we invest God himself with them, and that we sever them from common uses.

It cannot be endured to hear a man profess that he putteth fire to his neighbour's house, but yet so *hal-loweth* the same with prayer, that he hopeth it shall not burn.

Is't Cade that I've slain, that monstrous traitor? Sword, I will *hallow* thee for this thy deed,
And hang thee o'er my tomb, when I am dead.

Shakspeare.

My prayers

Are not words duly *hallowed*, nor my wishes

More worth than vanities; yet prayers and wishes

Are all I can return.

Id. Henry VIII.

God, from work

Now resting, blessed and *hallowed* the seventh day,

As resting on that day from all his works,

But not in silence holy kept.

Milton.

Then banished faith shall once again return,

And vestal fires in *hallowed* temples burn.

Dryden.

No satyr lurks within this *hallowed* ground;

But nymphs and heroines, kings and gods abound.

Granville.

But, swain forsworn! whoe'er thou art,

This *hallowed* spot forbear;

Remember Colin's dreadful fate,

And fear to meet him there.

Tickel. Colin and Lucy.

The Sabbath comes, a day of blessed rest;

What *hallows* it upon this Christian shore?

Lo! it is sacred to a solemn feast.

Byron. Childe Harold.

HALLUCINATION, *n. s.* Lat. *hallucinatio*. Error; blunder; mistake; folly.

A wasting of flesh, without cause, is frequently termed a bewitched disease; but questionless a mere *hallucination* of the vulgar.

Harvey.

This must have been the *hallucination* of the transcriber, who probably mistook the dash of the I for a T.

Addison.

HALM, *n. s.* Sax. *þealm*. Straw: pronounced *HAWM*; which see.

HALM-OTE, or **HALIM-OTE**, is the same with Court Baron, the word implying a meeting of the tenants of the same hall or manor. The name is still retained at Luston, and other places in Herefordshire. See **COURT**.
